Introduction

PART ONE LENAPE COUNTRY AND NEW AMSTERDAM TO 1664

1. First Impressions *The physical setting. From Ice Age to Indian ecosystems. European exploration of the lower Hudson Valley in the sixteenth century.*
2. The Men Who Bought Manhattan *Holland breaks with Spain. The Dutch West India Company, the fur trade, and the founding of New Amsterdam in 1626.*
3. Company Town *New Amsterdam's first twenty years. Race, sex, and trouble with the English. Kieft's War against the Indians.*
4. Stuyvesant *Peter Stuyvesant to the rescue. Law and order. Slavery and the slave trade. Expansion of settlement on Manhattan and Long Island.*
5. A City Lost, a City Gained *Local disaffection with Stuyvesant's rule and the organization of municipal government. Stuyvesant's conflict with Jews, Lutherans, and Quakers. Anglo-Dutch war and the English conquest of 1664.*

PART TWO BRITISH NEW YORK (1664-1783)

6. Empire and Oligarchy *The persistence of Dutch law and folkways under the duke of York's lenient proprietorship. Slow economic and demographic expansion. The Dutch briefly recapture the city.*
7. Jacob Leisler's Rebellion *Taut times in the 1680s. Protestants and Catholics, English and Dutch, new grandees and disaffected commoners. Leisler's uprising as Dutch last stand and "people's Revolution."*
8. Heats and Animosityes *The English anglicize New York: church and state, docks and lots, scavengers and constables, Stadthuis to City Hall. Privateering, piracy, and Captain Kidd. Domestic politics and international conflict through Queen Anne's War (1715).*

9. In the Kingdom of Sugar *The West Indian connection: white gold, black slaves, yellow fever. The town that trade built: shipyards and refineries, barristers and Jack Tars. Germans and Irish, Catholics and Jews.*
10. One Body Corporate and Politic? *A new charter establishes the colonial city as self-governing corporation. Rules and regulations for dealing with disobedient servants, rebellious slaves, the disorderly poor.*
11. Recession, Revival, and Rebellion *Trade slump. The Zenger affair, religious revivals, and the “Negro Conspiracy” of 1741.*
12. War and Wealth *Imperial wars in the 1740s and 1750s as route to riches: provisioners and privateers. Empire and industry. Refined patrician precincts, artisanal wards, municipal improvements.*
13. Crises *Peace and depression. Hardship after 1763. The British crackdown and local resistance. The Sons of Liberty and Stamp Act rioters. A temporary victory.*
14. The Demon of Discord *Renewed imperial extractions. Revived opposition to Great Britain, 1766-1775. Popular politics and religion. Whigs and Tories.*
15. Revolution *Radical patriots take control of the city, 1775-1776. The Battle of Long Island. New York falls to the British.*
16. The Gibraltar of North America *The military occupation of New York City, 1776-1783. Washington’s triumphal return.*

PART THREE MERCANTILE TOWN (1783-1843)

17. Phoenix *Rebuilding the war-ravaged city. The radical whigs take power. New New Yorkers. The Empress of China.*
18. The Revolution Settlement *Hamilton negotiates a rapprochement between radical and conservative whigs, securing the revolution. Daughters of Liberty, the reconstruction of slavery.*
19. The Grand Federal Procession *Adoption and ratification of the Constitution. The great parade of July 1788. Washington’s Inauguration in 1789.*
20. Capital City *New York as seat of the national government, 1789-1790. Hamilton, Duer, and the “moneyed men.” From capital city to city of*

capital. First banks, first stock market, first Wall Street crash.

21. *Revolutions Foreign and Domestic Impact of the French Revolution. Party struggles in the 1790s. The election of 1800. Prying open the municipal franchise. The Burr-Hamilton duel.*
22. *Queen of Commerce, Jack of All Trades The city's explosive growth in the 1790s as local merchants take advantage of war in Europe, westward expansion, and the demand for southern cotton. Transformation of the crafts, the end of slavery.*
23. *The Road to City Hall Demise of municipal corporation, rise of city government. Attending to civic crises: water, fever, garbage, fire, poverty, crime. A new City Hall.*
24. *Philosophes and Philanthropists Upper-class life styles in the 1790s and early 1800s. Learned men and cultivated women. Republican benevolence: charity, education, public health, religious instruction.*
25. *From Crowd to Class Artisan communities. Turmoil in the trades. Infidels, evangelicals, and the advent of Tom Paine. Africans and Irishtown. Charlotte Temple and Mother Carey's bawdy house.*
26. *War and Peace The drift toward a second war with Britain, 1807-1812. Embargo and impressment, destitute Tars and work-relief. Battles over foreign policy. Washington Irving and Diedrich Knickerbocker. Thegridding of New York. War: 1812-1815.*
27. *The Canal Era Postwar doldrums give way to the 1820s boom. Erie Canal, steamboat, packet lines, communication, emporium and financial center. Real estate boom and manufacturing surge. The role of government.*
28. *The Medici of the Republic Upper-class religion, fashion, domesticarrangements, invention of Christmas, Lafayette returns, Greeks revive, patricians patronize the arts and architecture (Cooper, Cole, et al.).*
29. *Working Quarters Callithumpian bands, plebeian neighborhoods, women and work, sex and saloons, theater and religion, jumping Jim Crow, "running wid de machine."*
30. *Reforms and Revivals Poverty and pauperism, urban missionaries, schools, reformatories, poorhouses, hospitals, jails.*

31. *The Press of Democracy Fanny Wrightists, democrats and aristocrats, workers and bosses, birth of the penny press.*
32. *The Destroying Demon of Debauchery Finney v. Fanny, temperance and Graham crackers, Magdalens and whores.*
33. *White, Green, and Black Catholics and nativists, drawing the color line, white slaves and smoked Irish, abolitionists and the underground railroad.*
34. *Rail Boom Railroads, manufacturing, real estate, stock market, housing high and low. Brooklyn: the Second City. Good times, pleasure gardens.*
35. *Filth, Fever, Water, Fire Garbage, cholera, Croton, and the Great Blaze.*
36. *The Panic of 1837 Labor wars, equal rights, flour riot. The boom collapses, whys and wherefores.*
37. *Hard Times Life in depression. Battles over relief and the role of government. Revivals and Romanism. Gangs, police, and P. T. Barnum.*

PART FOUR EMPORIUM AND MANUFACTURING CITY (1844-1879)

38. *Full Steam Ahead The great boom of the 1840s and 1850s: immigration, foreign trade, manufacturing, railroads, retailing, and finance. The Crystal Palace and the Marble Palace.*
39. *Manhattan, Ink New York as national media center: telegraph, newspapers, books, writers, art market, photography.*
40. *Seeing New York Flaneuring the city. Crowds and civilization. Lights and shadows. Mysteries and histories. Poe, Melville, Whitman, and the city as literary subject.*
41. *Life Above Bleecker The new bourgeoisie repairs to its squares. Uppertendom opulence and middle-class respectability. Sex, feminism, baseball, religion, and death.*
42. *City of Immigrants New immigrant and working-class neighborhoods in the 1840s and 1850s. Irish and Germans at work and play. Jews and Catholics. B 'hoys and boxing. The underworld and the world of Mose.*
43. *Co-op City Plebeian opposition to the new urban order: the Astor Riot, land reform, co-ops, nativism, red republicanism, unionism.*

44. Into the Crazy-Loved Dens of Death *Upper- and middle-class reformers debate laissez-faire and environmentalism. Welfare, education, health, housing, recreation. Central Park.*
45. Feme Decovert *The homosocial city. Female discontents and feminist demands. Prostitution exposed. Abortion defended. Free love and fashion. Jenny Lind and commercial culture.*
46. Louis Napoleon and Fernando Wood *Eyeing Haussmann's Paris. City-building, Tammany style. Municipal politics indicted. Mayor Wood as civic hero. The loss of home rule. Police riots and Dead Rabbits.*
47. The Panic of 1857 *The boom falters. New Yorkers divide over how to deal with hard times.*
48. The House Divides *Sectional and racial antagonisms. Republicans, blacks, the struggle for civil rights. John Brown's body.*
49. Civil Wars *The city's mercantile elite first backs the South, then swings into the Union camp. B'hoys, g'hals, and reformers to war. New York's role in financing and supplying the war effort forges the Shoddy Aristocracy. Carnage and class.*
50. The Battle for New York *The politics of Emancipation and death. The Draft Riots. The plot to burn New York.*
51. Westward, Ho! *The merchant community, its historic ties to the South ruptured, turns westward. Railroading sustains boom into the late 1860s and 1870s. Wall Street and the West. The West and Wall Street.*
52. Reconstructing New York *Radical Republicans seek to reform housing, health, and fire fighting and to win the black franchise.*
53. City Building *Boss Tweed builds roads, bridges, sewers, rapid transit, and parks. Urban expansion: upper Manhattan, Brooklyn, and Queens. Rapid transit and Brooklyn Bridge. Downtown business districts: finance, rails, communication, Ladies' Mile, and the Radio.*
54. Haut Monde and Demimonde *The wealthy fashion a culture of extravagant pleasure, modeled on the lifestyle of Parisian aristocrats (plus a dash of Dodge City).*
55. The Professional-Managerial Class *The middle class expands in size, deepens in self-awareness, elaborates distinctive patterns of domesticity,*

education, religion, amusement, and politics.

- 56. *Eight Hours for What We Will* The laboring classes at work, at home, at play. Resurgent union, radical, and nationalist movements.
- 57. *The New York Commune? The Tweed Ring* toppled in early 1870s, for running up a massive municipal debt and for failing, at a time when the Paris Commune has unnerved local elites, to “manage” the Irish working class (as evidenced in the bloody Orange riots along Eighth Avenue).
- 58. *Work or Bread!* The boom collapses in 1873, pitching the city into long-lived depression. Working class demands for unemployed assistance, paced by German socialists, are met by grim assertion of order at Tompkins Square, and cutbacks in welfare.

PART FIVE INDUSTRIAL CENTER AND CORPORATE COMMAND POST (1880-1898)

- 59. *Manhattan, Inc.* The economy revives. New York facilitates national industrialization, spawns corporate economy. Banks, exchanges, trade, advertising, marketing, communication flourish, housed in ever taller commercial buildings.
- 60. *Bright Lights, Big City* T. A. Edison, J. P. Morgan, and the electrification of the city.
- 61. *Châteaux Society* New industrial and financial elites gatecrash old mercantile society. Manhattan Medici create lavish upper-class order, for genteel cultural institutions.
- 62. “The Leeches Must Go!” Henry George’s 1886 mayoralty campaign. Irish nationalists, German socialists, radical priests, and unionists vs. Tammany Hall, Catholic hierarchy, and propertied reformers.
- 63. *The New Immigrants* Jews, Italians, Chinese.
- 64. *That’s Entertainment!* The Broadway stage, Pulitzer, vaudeville, Tin Pan Alley, boxing, baseball, Coney Island. New York generates cultural commodities, hawks them to the nation.
- 65. *Purity Crusade* Henry George militancy and burgeoning immigrant quarters rouse middle-class reporters, writers, ministers. Genteel

reformer uphold decency, oppose sin—particularly prostitution and saloons.

66. *Social Gospel Salvation Army, Crane, Charity Organization Society, the institutional church, YWCA, ethical culture, settlement houses, Howells and Crane, Jacob Riis.*
67. *Good Government Collapse of the economy in 1893. Genteel and business reformers capture City Hall in 1894. Eastern sound-money forces, headquartered in NYC, beat back western challenge to corporate order in 1896 presidential campaign.*
68. *Splendid Little War Teddy Roosevelt, José Martí, William Randolph Hearst, and Empire as Rx for depression.*
69. *Imperial City Manhattan, Brooklyn, Queens, the Bronx, and Staten Island consolidate—not without acrimony—forming Greater New York.*

Introduction

The origin of many a great city lies swaddled in myth and legend.

In Nepal, so the story goes, there was once a mountain valley filled with a turquoise lake, in the middle of which floated a thousand-petaled lotus flower. From it emanated a radiant blue light—a manifestation of the primordial Buddha—and the devout came from near and far to meditate upon the flower. At first they had to live in caves along the shore, but then the sage Manjushri flew down from the north and sliced through the southern valley wall with his flaming sword of wisdom, draining the lake and allowing the city of Kathmandu to rise upon the valley floor.

In Meso-America, according to another urban origin myth, the Aztecs departed their ancestral home and wandered south for centuries, searching for the sign priests had prophesied would reveal their new homeland. Finally, guided by Huitzilopochtli, the Hummingbird God, they reached Lake Texcoco, where, as foretold, an eagle perched on a cactus was devouring a serpent. There the Aztecs built Tenochtitlán, the precursor of Mexico City.

Many European metropolises also traced their beginnings to wandering and divinely guided heroes. Aeneas, Virgil tells us in the *Aeneid*, led a group of Trojan War survivors to the mouth of the Tiber. There he founded Lavinium, parent town of Alba Longa, from whence Romulus and Remus—offspring of the war god Mars—would later go forth to found the city of Rome. Londoners, too, long believed their metropolis had been established by a group of exiled Trojans and called their ur-London Trinovantum (New Troy). Lisbon, according to Portuguese tradition, was begun by Ulysses himself. The citizens of Athens were thus unusual in believing themselves autochthonous—sprung, as Homer claimed in the *Iliad*, from the soil itself. “Other cities, founded on the whim of the dice, are imported from other cities,” the playwright Euripides had one of his characters say pridefully, but Athenians “did not immigrate from some other place; we are born of our earth.”

“THE THRICE RENOWNED AND DELECTABLE CITY OF GOTHAM”

These origin stories celebrated the founding of urban civilizations as epic acts. Each narrative provided its city with a symbolic bedrock, conferring upon the citizenry a sense of legitimacy, purpose, identity. The cities Europeans built in the New World, however, were of too recent a vintage to allow for legendary beginnings, a fact Washington Irving bemoaned when he sat down to write *A History of New York* (1809). Irving regretted that his town was bereft of the imaginative associations “which live like charms and spells about the cities of the old world, binding the heart of the native inhabitant to his home.” Indeed Irving found New Yorkers sadly disconnected from their past; few of his fellow citizens “cared a straw about their ancient Dutch progenitors” or even knew the town had once been called New Amsterdam.

In the very opacity of Manhattan’s origin, however, Irving discerned a literary opportunity. Its annals were open, “like the early and obscure days of ancient Rome, to all the embellishments of heroic fiction.” Irving decided to portray his native city as “having an antiquity thus extending back into the regions of doubt and fable.” He would piece together a saga out of local memories and written records, supplemented with the workings of his lively imagination, and provide New York an epic pedigree, one that ran “from the Beginning of the World to the End of the Dutch Dynasty.”

In truth, Irving’s *History* is a cheeky mock-epic, a potpourri of fact and fiction that plays knowingly and ironically with myth and history. Its invented narrator, the pedantic and pompous Diedrich Knickerbocker, envies his predecessors “Dan Homer and Dan Virgil” for being able to summon up “waggish deities” to descend to earth and “play their pranks, upon its wondering inhabitants.” So Knickerbocker spins a foundation story of his own, a takeoff on a tale Virgil tells in the *Aeneid* of how Queen Dido tricked Libyans out of the land on which she founded Carthage. The Dutch, Knickerbocker says, struck an “adroit bargain” with the local Indians by asking “for just so much land as a man could cover with his nether garments,” then producing Mynheer Ten Broeck (Mr. Ten Breeches) as the man whose underwear would be so deployed. The “simple savages,” Knickerbocker goes on, “whose ideas of a man’s nether garments had never

expanded beyond the dimensions of a breech-clout, stared with astonishment and dismay as they beheld this bulbous-bottomed burgher peeled like an onion, and breeches after breeches spread forth over the land until they covered the actual site of this venerable city.”

Irving had begun his efforts at coining a lineage for New York in the *Salmagundi* papers (1807), a set of sardonic essays, penned with two equally irreverent and youthful colleagues, in which he affixed the name Gotham to his city. Repeatedly *Salmagundi* referred to Manhattan as the “antient city of Gotham,” or “the wonder loving city of Gotham.” In the context of the pieces—mocking commentaries on the mores of fashionable New Yorkers—the well-known name of Gotham served to underscore their depiction of Manhattan as a city of self-important and foolish people.

Gotham—which in old Anglo-Saxon means “Goats’ Town”—was (and still is) a real village in the English county of Nottinghamshire, not far from Sherwood Forest. But Gotham was also a place of fable, its inhabitants proverbial for their folly. Every era singles out some location as a spawning ground of blockheads—Phrygians were accounted the dimwits of Asia, Thracians the dullards of ancient Greece—and in the Middle Ages Gotham was the butt of jokes about its simpleminded citizens, perhaps because the goat was considered a foolish animal.

The Gothamite canon, which had circulated orally since the twelfth century, was eventually printed up in jest books, the first being *Merie Tales of the mad men of Gotam* (c. 1565). It included such thigh-slappers as the one about the man who rode to market on horseback carrying two heavy bushels of wheat—upon his own shoulders, in order not to burden his mount. Another tells of the man of Gotham who, late with a rent payment to his landlord, tied his purse to a quick-footed hare, which ran away.

Manhattanites would not likely have taken up a nickname so laden with pejorative connotations—even one bestowed by New York’s most famous writer—unless it had redeeming qualities, and indeed some of the tales cast Gothamites in a far more flattering light. In the early 1200s—went the most famous such story—King John traveled regularly throughout England with a retinue of knights and ladies, and wherever the royal foot touched earth became forever after a public highway (i.e., the King’s). One day, John was heading to Nottingham by way of Gotham, and he dispatched a herald to announce his arrival. The herald reported back that the townspeople had

refused the king entry, fearing the loss of their best lands. The enraged monarch sent an armed party to wreak vengeance, but the townsfolk had prepared a scheme to turn aside John's wrath. When the knights arrived, they found the inhabitants engaged in various forms of idiotic behavior: pouring water into a bottomless tub; painting green apples red; trying to drown an eel in a pool of water; dragging carts atop barns to shade the wood from the sun; and fencing in a cuckoo. The chortling knights reported back to the monarch that the townsfolk were clearly mad, and John accordingly spared them.

THE
MERRY TALES
OF THE MAD-MEN
OF GOTTAM.

Gathered together by *A. B.* of Physicke Doctor.

Printed at London by *B. A.* and *T. F.* for *Micha[l]*
Sparke, dwelling in *Greene Arbor* at the signe of
the *Blue-Bible*, 1630.

The people of Gotham, according to another of the tales, reasoned that as spring disappears when the cuckoo flies away, capturing the bird would ensure the season's eternal duration. They therefore corralled a cuckoo—in a roofless fence—and when summer came, it flew away. This image is taken from a 1630 edition of the *Merie Tales*. (General Research, The New York Public Library, Astor, Lenox and Tilden Foundations)

This rival variant—that Gothamites merely acted silly to gain their ends—was reflected in the old English saying “More fools pass through Gotham than remain in it” (and echoed in Shakespeare’s depiction of Edgar in *Lear*, “this fellow’s wise enough to play the fool”). It was doubtless this more beguiling—if tricksterish—sense of Gotham that Manhattanites assumed as an acceptable nickname.*

THE \$24 QUESTION

Irving’s pseudo-classical foundation story never passed into popular lore, but a simpler version did, and it too plays with the notion of New York as a city of tricksters. Encapsulated in a sentence, it asserts: the Dutch bought Manhattan from the Indians for twenty-four dollars. For a century and a half now, this story, like all proper myths, has been transmitted from generation to generation, through all the capillaries of official and popular culture—by schoolteachers and stand-up comics alike—and to this day is well known to New Yorkers young and old, and even to many far from the Hudson’s shore.

On its face, the twenty-four-dollar story is not a legend on the order of, or in the same dramatic league as, that of Kathmandu or Rome. Nor is it mythic in the commonplace sense of being readily proved false. Though no deed of sale exists, the event is generally accepted as having taken place. In a 1626 letter, a Dutch merchant reported he had just heard, from ship passengers newly disembarked from New Netherland, that representatives of the West India Company had “purchased the Island Manhattes from the Indians for the value of 60 guilders.” In 1846, using then-current exchange rates, a New York historian converted this figure into twenty-four U.S. dollars. In 1877, another historian asserted (on the basis of no apparent

evidence) that the sum had been paid over in “beads, buttons, and other trinkets.”

What gives the story its legendary quality is the host of meanings attached to the event, starting with the notion—smuggled in via the word “purchased”—that the “Island Manhattes” was a piece of property that could be owned and transferred. This was a European conception, and whatever transpired in 1626 was almost certainly understood by the local side in a profoundly different way.

More to the point, the tale is almost always recounted with glee. What tickles the tellers is that the Dutch conned the Indians into handing over—in exchange for a handful of worthless trinkets—what became the most valuable piece of real estate in the world. There’s racial condescension here, with primitive savages dazzled by baubles of civilization. There’s urban conceit as well: New Yorkers love yarns about city slickers scamming rural suckers. The selling of the Brooklyn Bridge to country bumpkins is another staple of local lore. But the twenty-four-dollar hustle stands alone. It is our Primal Deal.

One can also recognize the tale’s mythic dimension in its invulnerability to carping critics and deconstructionists. It’s possible, for example, to raise an eyebrow at the figure’s imperviousness to inflation. If recalculated in current dollars, with the conversion rate pegged to the quantity of gold in the early-seventeenth-century guilder, the sum would come out—so Amsterdam’s Nederlandsche Bank tells us—to \$669.42. Yet, a variable-rate myth being a contradiction in terms, the purchase price remains forever frozen at twenty-four dollars.

Still, even \$669.42 is a bargain basement price by today’s standards, and in contemporary Dutch terms, too, sixty guilders was a trifling sum. In 1628, by way of comparison, the capture of a single Spanish treasure fleet netted fifteen million guilders. This fact cannot be gainsaid by indulging in “what if” financial legerdemain, as do those who suggest that if the Indians had invested their twenty-four dollars at 6 percent interest for three and a half centuries they would now have, before adjusting for inflation, somewhere in the vicinity of sixty-two billion dollars, a figure more in line with current Manhattan real estate prices.

A more cogent objection to the “great steal” scenario notes that the values were in fact incommensurable. When the Dutch “bought” Staten Island, we know, they paid for it in axes, hoes, needles, awls, scissors, knives, and kettles. If similar trade goods were involved in the Manhattan arrangement, then the Dutch were engaged in high-end technology transfer, handing over equipment of enormous usefulness in tasks ranging from clearing land to drilling wampum.

More telling still, it appears from a later repurchase agreement that the people who made the original arrangement didn’t live in Manhattan and so were in no position to offer up even use-rights or visiting privileges. Perhaps it was the credulous Europeans who got skinned.

But once again mere facts are beside the point. The story, like all good myths, has easily resisted such assaults because it ratifies the popular conviction that deal driving and sharp practice and moneymaking and real estate lie somewhere near the core of New York’s genetic material.

The twenty-four-dollar story is also mythically akin to Aztec and Roman fables in bestowing on New York a fundamental legitimacy. It proclaims a city whose acquisition was based not on conquest but on contract. As another local historian put it in 1898: “It was an honest, honorable transaction worthily inaugurating the trade and traffic of America’s mercantile and financial capital; satisfying the instincts of justice and equality in the savage breast.”

Here, quite apart from the underlying implication that history didn’t begin until the Europeans arrived, the myth glosses over uncomfortable realities. It is true and important that in North America the Dutch preferred purchase to pillage. But they were prompted less by ethical niceties than by realistic appraisals of the Indians’ superior strength and their indispensability as trade partners. The Dutch, however, were no shrinking tulips: when their power waxed and their need waned, they would engage in ferocious wars of conquest, and Indian heads would roll—quite literally—down Bowling Green.

Finally, however, as is usually the case with myths and legends, the notion that New York is rooted in a commercial transaction gets at a deeper kind of truth.

New York would not become a warrior city, living by raids on its hinterland. Even when centuries later it emerged as an imperial center, it was never a military stronghold. True, the most prominent building in the Dutch town was a fort. But it was never much of one—pigs rooted at its foundations and cows wandered in and out of its crumbling walls—and the Netherlands never assembled here the kind of military resources they deployed elsewhere in their empire. For all their occasional bellicosity, the Dutch were a trading people, and their town would ever after bear the imprint of its creators.

Nor would New York become an urban theocracy, a citadel of priests. No shrines or temples were erected to which swarms of pilgrims flocked to pay religious tribute or receive inspiration. Despite the formidable number of churches established here, Mammon ruled, not God.

Nor would New York become a great governmental hub, with grand baroque avenues radiating out from imposing seats of state power. There was no regal court to dispense largesse to all comers or lure peasants to bask in its splendors. No monarch founded seats of learning so preeminent as to attract truth-seekers from the ends of the earth. Its civic chieftains would be merchants, bankers, landlords, lawyers; its mightiest buildings, office towers.

As the twenty-four-dollar saga suggests, New York would become a city of deal-makers, a city of commerce, a City of Capital. This book will trace the nature and consequences of that development.

POINTS OF VIEW

We are going to present New York's story as a narrative. Our book will journey along through time, taking each moment on its own terms, respecting its uniqueness. We will adopt the perspective of contemporaries as we relate their experiences, remaining mostly in their "now." Yet, like all histories, *Gotham* is not the simple reflection of an underlying reality, but a construction. The narrative embodies our selections, our silences. It is organized around patterns we discern amid the swirl of events.

So what's our take, our angle, our shtick? Do we concentrate on a particular slice of the city's story? Is this primarily an economic history? Social? Cultural? Intellectual? Political? In truth it's all of the above, or,

more precisely, it's about making connections between aspects of municipal life that are usually, of necessity, best studied in isolation. This book is only possible because in recent decades a host of scholars has investigated afresh every imaginable aspect of New York's history: sex and sewer systems, finance and architecture, immigration and politics, poetry and crime. Our intention is to suture these partial stories together and present a picture of urban life as a rounded whole, something that probably only novelists can really do well but that nevertheless seems a goal worth aspiring to.

Do we then have a central argument that has allowed us to reduce New York's mammoth story—especially as defined in such an all-encompassing fashion—to manageable (if hefty) proportions? In fact, no overarching plot line or tidy thesis unfolds incrementally throughout this book; the history of New York is not reducible to a sound bite or bumper sticker. Every page, however, does bear the mark of our central conviction: that it is impossible to understand the history of New York City by looking only at the history of New York City, by focusing, that is, exclusively on events that transpired within the boundaries of what are now its five boroughs. It's hard to understand any place in isolation but utterly hopeless here, because linkages—connections to the wider world—have been key to the city's development.

We do not believe that municipal history was determined from the outside. Rather our claim is that external events provided the context within which the men and women of New York, in conflict and compromise, repeatedly reshaped their city. It seems useful, however, to summarize at the outset those framing forces we think had the greatest impact on local actors. Those inclined to get on with the narrative can turn immediately to chapter i, which takes up the prehistory of the Primal Deal—recounting Europeans' expansion into the New York area and chronicling their fateful intersection with local peoples. But for those who would prefer to reconnoiter the vast forest that lies ahead before plunging off into its trees, we offer in the remainder of this introduction a sketch of some of our principal arguments.

EDGE TO CENTER

At our highest level of analysis, we chart the ways New York's development has been crucially shaped by its shifting position in an

evolving global economy.

From its beginnings as a constellation of Indian communities encamped around the mouth of the Hudson River, the area was pulled into the imperial world system Europeans had begun fashioning in the aftermath of Columbus's voyages. Founded as a trading post on the periphery of a Dutch mercantile empire, New Amsterdam lay at the outermost edge of a nascent web of international relationships. It remained a relatively inconsequential backwater, to which its Dutch masters paid but minimal attention, as they had far greater interest in harvesting the profits available in Asia (spices), Africa (slaves), and South America (sugar).

Once forcibly appended to the rising British Empire, however, New York assumed a more prominent role in the global scheme of things. It became a vital seaport supplying agricultural products to England's star colonial performers—the Caribbean sugar islands—while also serving the English as a strategic base for hemispheric military operations against the French, the latest entrants in the imperial sweepstakes.

After the American Revolution, New York emerged as the fledgling nation's premier linkage point between industrializing Europe and its North American agricultural hinterland. The city adroitly positioned itself with respect to three of the most dynamic regions of the nineteenth century global economy—England's manufacturing midlands, the cotton-producing slave South, and the agricultural Midwest—and it prospered by shipping cotton and wheat east while funneling labor, capital, manufactured and cultural goods west.

After the Civil War, the metropolis became the principal facilitator of America's own industrialization and imperial (westward) expansion. Capital flowed through and from its great banking houses and stock exchanges to western rails, mines, land, and factories; it became the preeminent portal for immigrant laborers; and it exported the country's industrial commodities as well as its traditional agricultural ones.

By century's end, New York had gained the ability to direct, not just channel, America's industrialization. Financiers like J. P. Morgan established nationwide corporations and housed them in the city, making Manhattan the country's corporate headquarters. When World War I ended

European hegemony, and the United States became a creditor nation, New York began to vie with London as fulcrum of the global economy.

It finally captured that position after World War II when the United States emerged as a superpower. In subsequent decades, when American corporations and banks expanded overseas, New York became headquarters for the new multinational economy; and the arrival of the United Nations made New York a global political capital as well as a financial one. When European and Japanese competitors revived in the latter decades of the twentieth century, the emergence of a more decentered transnational capitalism challenged New York's former preeminence, but it remained most prominent among the handful of world cities directing the workings of the global capitalist order.

Since its inception, therefore, New York has been a nodal point on the global grid of an international economy, a vital conduit for flows of people, money, commodities, cultures, and information. Its citizens were always well aware of this, and in the intermittent jubilees we call Festivals of Connection, they hailed each development—ratification of the Constitution, opening of the Erie Canal, laying of the Atlantic Cable, Lindbergh's solo flight to Paris—that wove the city tighter into the networks of trade and communication on which its livelihood depended.

More than simply a point of confluence, however, New York was a place of ever-increasing potency in global affairs, and as the United States evolved from colony to empire, the city migrated from the edge to the center of the world.

CITY AND COUNTRY

In its relations with the country, New York traveled a more bell-shaped trajectory.

When still a Dutch town, tiny New Amsterdam was as peripheral to the continent as it was to the planet, and it affected relatively few people beyond the Indians with whom it traded or warred. When integrated into England's empire, its impact grew as it drew an expanding hinterland into widening networks of regional and international commerce. New York became the political capital of the new nation after the Revolution but soon lost that status, in part because southern gentry were leery of leaving affairs

of state in the ambit of northern merchants. Departure of the Federal City meant that New York would never become the urban colossus of the United States, the way London was for England, or Paris was for France.

Though no longer *de jure* capital, New York emerged as *de facto* capital over the course of the nineteenth century, its centrality reflected in the accepted custom of identifying points in its landscape with nationwide functions. Wall Street supplied the country with capital. Ellis Island channeled its labor. Fifth Avenue set its social trends. Madison Avenue advertised its products. Broadway (along with Times Square and Coney Island) entertained it. Its City Hall, as befit an unofficial capitol, welcomed heroes and heroines with keys and parades and naval flotillas, and paid farewell respects to national leaders by organizing processions along Manhattan's black-draped streets. New York, moreover, was the nation's premier source for news and opinion; like a magnet, it attracted those seeking cosmopolitan freedom; and as the biggest city of the biggest state it exercised extraordinary influence in national politics.

Hegemony generated ambivalence. The country envied and emulated the city, but feared and resented it too. Farmers, planters, and industrialists needed its capital but disliked their indebted and dependent status. New York's connections to Europe gave it a glamorous sheen but made it seem the agent of imperial powers and host to an "alien" population that spawned political machines, organized crime, labor unions, anarchists, socialists, Communists, and birth controllers. In the 1920s, relations between New York and its national hinterland came to a rancorous boil, and Governor Al Smith's defeat in 1928 stemmed in part from widespread repudiation of his metropolis.

With Franklin Roosevelt's accession to the presidency, however, New York's national influence expanded again. Under his aegis, unionists, settlement workers, professors, and politicians flocked to Washington, winning a tremendous expansion of federal power to deal with the Depression (along lines pioneered in the city). Ironically, the New Dealers' success undermined their city's position. Strengthening Washington saved New York from catastrophe but also directed a huge and transforming flow of resources to the West and South, converting former dependencies into regional rivals—a process accelerated by the Second World War.

The power of the federal state was enhanced yet again during the Cold War, in part at the behest of a New York-based foreign policy elite. In terms of U.S. relations with the world, Washington and New York emerged as partners: the city on the Hudson the multinational empire's commercial center, the city on the Potomac its military core. In domestic matters, however, no such parity existed. Washington commanded the heightened federal taxing power; New York was just another hard-pressed metropolis. Cold War Washington, moreover, speeded the transfer of wealth from Northeast to Sunbelt, from cities to suburbs. The arms economy bypassed the demilitarized city, industrial jobs fled to other states, and other harbors undercut the aging port. Population shifts diminished New York State's power in federal councils. The consequences for the city became evident in the urban crises of the 1960s, the so-called fiscal crisis of the 1970s ("Ford to City: Drop Dead"), and the 1980s ascendancy to national power of suburban and Sunbelt/Gunbelt constituencies.

MUNICIPAL REMAKINGS

As the city shifted position and function in global and national arenas, the ways in which its citizens went about earning their livings and generating wealth for collective endeavors underwent repeated rearrangement.

Indian peoples lived off the bounty of the harbor, fields, and hills—fishing, farming, and hunting. The Dutch supported themselves and developed a rudimentary infrastructure chiefly by trading with the Indians for beavers (a rodent duly honored in the city's seal). The English-era merchants who oversaw New York's transformation into a significant seaport accumulated their profits from the West Indian trade—as supplemented by privateering, slaving, fencing pirate loot, and provisioning British forays against the French. These enterprises in turn spawned a subsidiary artisanal sector, which manufactured the tools of trade (ships, barrels) and processed raw materials (sugar, hides).

From the Revolution to the Civil War, New York remained preeminently a seaport, as did the adjacent city of Brooklyn, but a host of associated enterprises sprang up to accommodate and enhance the city's mercantile outreach. New Yorkers built canals and railroads; established banks, insurance companies, and a stock market; developed means of

communication (newspapers, telegraph); fostered new forms of wholesale and retail merchandising (auction houses, department stores); and augmented their capacity for hosting and entertaining (hotels, restaurants, theaters). Manufacturing capacity surged as entrepreneurs and workers churned out consumer goods for the new markets tapped and created by an expanding commercial network, and New York became the nation's largest manufacturing center. An ever-widening stream of immigrants provided the labor power for all these activities and, in swelling the internal market, further increased demand for clothing, food, housing, and popular amusements.

Between the 1870s and the 1940s, New York's mercantile sector underwent relative decline. The financial sector, meanwhile, expanded to underwrite continental industrialization and western expansion. A business services sector emerged to manage the new corporate economy and merchandise its products. The industrial sector burgeoned, fueled by new immigrants. And the entertainment industry emerged as an independent powerhouse, with New Yorkers hawking plays, vaudeville acts, books, magazines, newspapers, sheet music, records, movies, and radio shows to the nation.

V-E Day ushered in a brief Augustan age when New York was simultaneously major port, largest manufactory, financial center, headquarters of a corporate sector rapidly expanding to multinational dimensions, and vortex of cultural production. But World War II's convoys proved the seaport's last hurrah, and though its loss was partially counterbalanced by expanded air traffic, the growth of alternative hubs—notably West Coast ports attuned to Pacific Rim trade—undermined its gateway status. Manufacturing, which had begun to slip away into the national hinterland, now scattered across the globe, its departure offset only in part by the expansion of local government services. The culture industry remained potent, though regional competitors (and federal funding) continued to undermine its former predominance. Pieces of the corporate command post were dismantled and reassembled in outer suburbs, leaving finance, once an inconsequential component of the city's economy, as its central and precarious prop.

OSCILLATING RHYTHMS

These large-scale municipal remakings provide our book its macrostructure, its division into parts. There are five such parts in this volume, the first two of which—“Lenape Country and New Amsterdam to 1664” and “British New York (1664-1783)”—hinge on the establishment or loss of imperial power. The remaining parts encompass eras marked by relatively coherent and stable macroeconomies, with transitions between them marked, provoked, or accelerated by war, economic crisis, and/or internal conflict. These eras include “Mercantile Town (1783-1843),” “Emporium and Manufacturing City (1844-1879),” and “Industrial Center and Corporate Command Post (1880-1898).” The last of these closes out this volume with an account of the consolidation of once separate cities and townships into Greater New York, whose hundredth anniversary we marked in 1998.

When blocking out the city’s centuries-long story as a whole, it is these grand epochs of municipal development that command our attention. But when telling New York’s story on a year-by-year basis, a more sinuous rhythm demands consideration: the alternation of peaks of prosperity with troughs of hard times that dominated the experience of everyday life.

When the city was still subordinate to the interests of either Holland or Great Britain, the pattern of ups and downs was shaped primarily by imperial decisions. Irving’s brief Dutch “dynasty” had time for only one such cycle. In the twenty years preceding the mid-1640s, while the Dutch empire prospered, New Netherland’s fortunes ebbed; in the twenty subsequent years, when the empire declined, the town’s situation improved. Under the subsequent century of English rule, imperial dynamics of war and trade sustained an undulating cadence of abundance and adversity.

It was in the nineteenth and twentieth centuries, however, when imbricated in the U.S. nation-state and the world capitalist economy, that New York commenced its characteristic roller-coaster ride in earnest, now surging to heights of affluence, now plunging into sloughs of depression. The city first rose to national preeminence in the wartime trade boom of the Napoleonic nineties; then its ascent was punctured by embargo and peace. The canal era boom of the 1820s and 1830s raced to culmination and crisis in 1837, then tumbled into a seven-year depression. The rail-spurred prosperity of 1844-57 was interrupted by the Panic of 1857, reignited by the Civil War, then snuffed out by the Panic of 1873, which inaugurated a lengthy period of hard times.

Industrialization-based resurgence in the 1880s gave way to depression in the 1890s. Corporate consolidation and war with Spain ushered in prosperity in the 1900s, which subsided after the Panic of 1907. World War I and a consumer goods revolution led to the 1920s boom, which collapsed into the 1930s depression. Lifted again by the Second World War, the city flourished during the long postwar boom, until laid low by the mid-1970s recession. A 1980s quasi-boom buckled in 1987, making way for the stagnant early 1990s and the brisker but still problematic *fin de siècle*.

These cycles created characteristic and remarkably similar cultures of boom and bust. The jaunty and expansive 1830s, 1850s, 1900s, 1920s, 1950s, and 1980s (times of comparably frenetic construction and high living in the city) gave way to the depressed 1840s, 1870s, 1890s, 1930s, and 1970s (periods marked by unemployment, homelessness, and contentious protest movements).

This pattern inscribed itself in the city's skyline and streetscape. In boom times, speculative capital cascaded into real estate, generating frenzied building sprees. When the fever broke, office and housing construction halted abruptly. By the time the economy regathered its energies, a new generation of promoters and architects had come along, new cultural fashions were in vogue, new technologies and construction practices had materialized, and the latest spurt of building bore little resemblance to its predecessor. This spasmodic evolution of New York's spatial geography allows us to "read" the cityscape, rather as archaeologists decipher stacked layers of earth, each of which holds artifacts of successive eras. Here, remnants of built environment offer clues to New York's periodization.

Working from the bottom up, we find traces of New Amsterdam's prosperous upswing in the archaeological remains of the gabled Stadt Huys (the Dutch City Hall) uncovered beneath Pearl Street, visible now through a Plexiglassed hole in the ground. Nearby Fraunces Tavern, a conjectural reconstruction of the De Lancey family's urban town house, recalls a heyday of England's mid-eighteenth-century empire. Federal mansions betoken 1790s affluence. The upsurge of the 1830s is immortalized in Wall Street Greek temples like the Merchants' Exchange and Federal Hall, and that of the 1850s lives on in Italianate mansions like the Salmagundi Club and Litchfield Villa. Turn-of-the-century flush times are traceable in neo-Roman artifacts like the New York Stock Exchange, and remains of the

1920s boom include exuberant art deco skyscrapers like the Chrysler Building. The post-Second World War surge is invoked in modernist glass boxes, from modest Miesian beginnings to berserk apotheosis at the World Trade Center, built just before the crash of the mid-1970s. And the totems bequeathed by the economic upsurge of the 1980s are postmodernist structures ranging from the World Financial Center to AT&T's (now Sony's) jocular pink Chippendale tower.

PAST AS PROLOGUE

It is indeed remarkable that so many tangible traces of earlier eras remain, given that few structures in New York were ever hallowed by mere age. As the city's economy shifted from commercial to industrial to corporate, older buildings were exuberantly torn down to make way for newer ones—higher, more fashionable, more convenient, more profitable—and these ruthless remakings gave the cityscape a chameleon-like, quicksilver quality that matched the mutability of its economy, its populace, and its position on the planet.

The city's well-merited reputation as a perpetual work-in-progress helps explain why from Washington Irving's day New Yorkers were famous for being uninterested in their own past. "New York is notoriously the largest and least loved of any of our great cities," wrote *Harper's Monthly* in 1856. "Why should it be loved as a city? It is never the same city for a dozen years together. A man born in New York forty years ago finds nothing, absolutely nothing, of the New York he knew."

One of our ongoing avenues of inquiry follows New Yorkers as they slowly developed the conviction that their past was worth knowing, even worth preserving. Indeed we believe there is a greater degree of interest in Gotham's history today than was ever the case before. We hope to nourish this ripening historical sensibility by telling the city's story in a spirited way—a relatively easy task given that it's intrinsically dazzling, a claim we think transcends both the fond boasting of all historians for their subject and the legendary conceitedness of New Yorkers (we notorious braggarts).

More difficult, perhaps, because it goes against the American ahistorical grain, we also hope to show that temporal analysis can be as useful as it is entertaining, that it can be helpful for New Yorkers (and Americans) to

better situate themselves in time. This does not mean adopting the narrow presentism that runs through some of the narratives advanced by present-day commentators—sagas of rise and dirges of decline aimed at providing a pedigree for their purveyors' optimistic or pessimistic takes on the state of the contemporary city.

Optimists portray New York as a magnificent and never-better metropolis. They point to the inrush of new immigrants, no longer streaming past the Statue in the harbor but airlifting their way into Kennedy, as evidence that much of the world sees New York as a place of opportunity, a mecca for the talented and ambitious. The newcomers' belief that they can survive and prosper (say the optimists) rests on solid foundations. Wall Street's enormous corporate and financial sector churns out professional and business services jobs. New York hosts the nation's publishing, advertising, fashion, design, and network television industries. Its museums, concert halls, playhouses, nightclubs, and festivals draw vast numbers of tourists, who in turn help sustain an enormous array of restaurants and hotels. Some see a high-tech, Silicon Alley, bio-medical future lying just around the corner.

New housing blooms amid the outer borough ruins, these boosters note, and new capital improvements head toward completion. Refurbished subways are cleaner and swifter. Crime is down dramatically. The City University of New York, though under attack, provides opportunities for the newly arrived and the less advantaged, while the city's tradition of social caring sustains a network of public support services, albeit one in parlous condition. Despite cultural antagonisms, moreover, the city remains a model of rough-hewn cosmopolitanism and multicultural tolerance, with an astonishing mix of peoples living side by side in reasonable harmony. Indeed the incessant interplay among its heterogeneous citizens makes New York a font of creative human energy, an unsurpassed site for personal development, a stupendous collective human accomplishment, and the glorious, glamorous, greatest city in the world.

Pessimists reject this cheery portrait and fashion from the shards of morning headlines and nightly newscasts a grim mosaic of urban decay. They point to the homeless who line up at soup kitchens, camp out in parks or under bridges until driven off by police, or burrow into subterranean warrens: subway tunnels, abandoned railway shafts, the roots of

skyscrapers. A vast army of the unemployed poor subsists on welfare, living in squalid ex-hotels, rat-ridden tenements, bleak housing projects. Infant mortality rates in parts of the city match, even surpass, those of “underdeveloped” countries. And its vaunted opportunities are, as they long have been, largely limited to those with the means to seize them. “You can live as many lives in New York as you have money to pay for,” ran a contemporary judgment in *The Destruction of Gotham*, an apocalyptic novel of 1886, which also recorded the maxim that the “very first of the Ten Commandments of New York [is]: ‘THOU SHALT NOT BE POOR!’”

Perched one precarious step above these nether ranks are millions more working poor—the sporadically or marginally employed who cobble together a living from minimum-wage jobs that might vanish in an instant—for jobs, the city’s lifeblood, have been draining away for decades. Hundreds of thousands of manufacturing slots, many of them unionized and decently paid, have vanished since the 1960s (though it is true that a new sweatshop sector is busy being reborn, with immigrants once again serving as entrepreneurs and exploited workforce, a dubious achievement). Many corporate headquarters have departed, downsized, or dispatched their back offices elsewhere, and the financial sector remains all too vulnerable to the next downturn. Giant department stores have gone bankrupt, and while mailed superstores replenish some retail positions they (together with soaring commercial rents) knock out mom-and-pop shops. The seaport is long gone to Jersey—only rotted wharves and tombstone pilings recall the once flourishing waterfront—and rusted railyards have been converted to high-priced condos, with airport and truck traffic picking up only some of the slack.

Despite recent improvements, pessimists note, a once magnificent infrastructure continues to crumble. Ancient water tunnels explode, flooding brownstones, drowning avenues, shorting out decrepit subway lines. Tired bridges and eroded highways close repeatedly for repairs. Pitted streets clog with traffic. JFK has been voted the world’s worst airport. Garbage has piled to mountainous heights in Staten Island. More oil lies beneath the streets of Brooklyn than was spilled by the *Exxon Valdez*. For all the brave new housing efforts, block after Bronx block remains lined with shuttered factories and abandoned apartment houses, while the tendrils of a long-stymied nature creep through the rubble of burned-out buildings.

Those who present such stark readings of New York's present and future often supply matching versions of the past. Those convinced of New York's decline recall its glory days, the better to indulge in rueful nostalgia or stoke a bitter anger at what has come to pass. They see the past as a reverse *Guinness Book of Records*—a catalog of fabulous accomplishments now, alas, never to be surpassed. Those more sanguine about New York's future assemble an indictment of the bad old days. They seize on catastrophes past: the British invasion and torching of the town; the great fever and cholera plagues, when coffin carts rattled through the streets and rats swam across the East River to gnaw the corpses piled high on Blackwell's Island; the horrific draft riots when African-American New Yorkers were lynched from lamp poles and armies bivouacked in Gramercy Park; the tenement squalor and sweatshop misery; the horrors of the Great Depression and myriad littler ones. Such a legacy, they argue, renders contemporary misfortunes modest by comparison.

We strongly endorse the idea of New Yorkers' turning to the past for perspective on their present—comparing different eras can bring balance to contemporary judgments—but *Gotham* is not about ransacking the past for evidence of Spenglerian decline or Panglossian progress. Straight-line scenarios, whether optimistic or pessimistic, usually pose false questions and offer false alternatives. Our hope, rather, is that a history that respects the complexity and contingency of human affairs can offer well-grounded insights into our current situation.

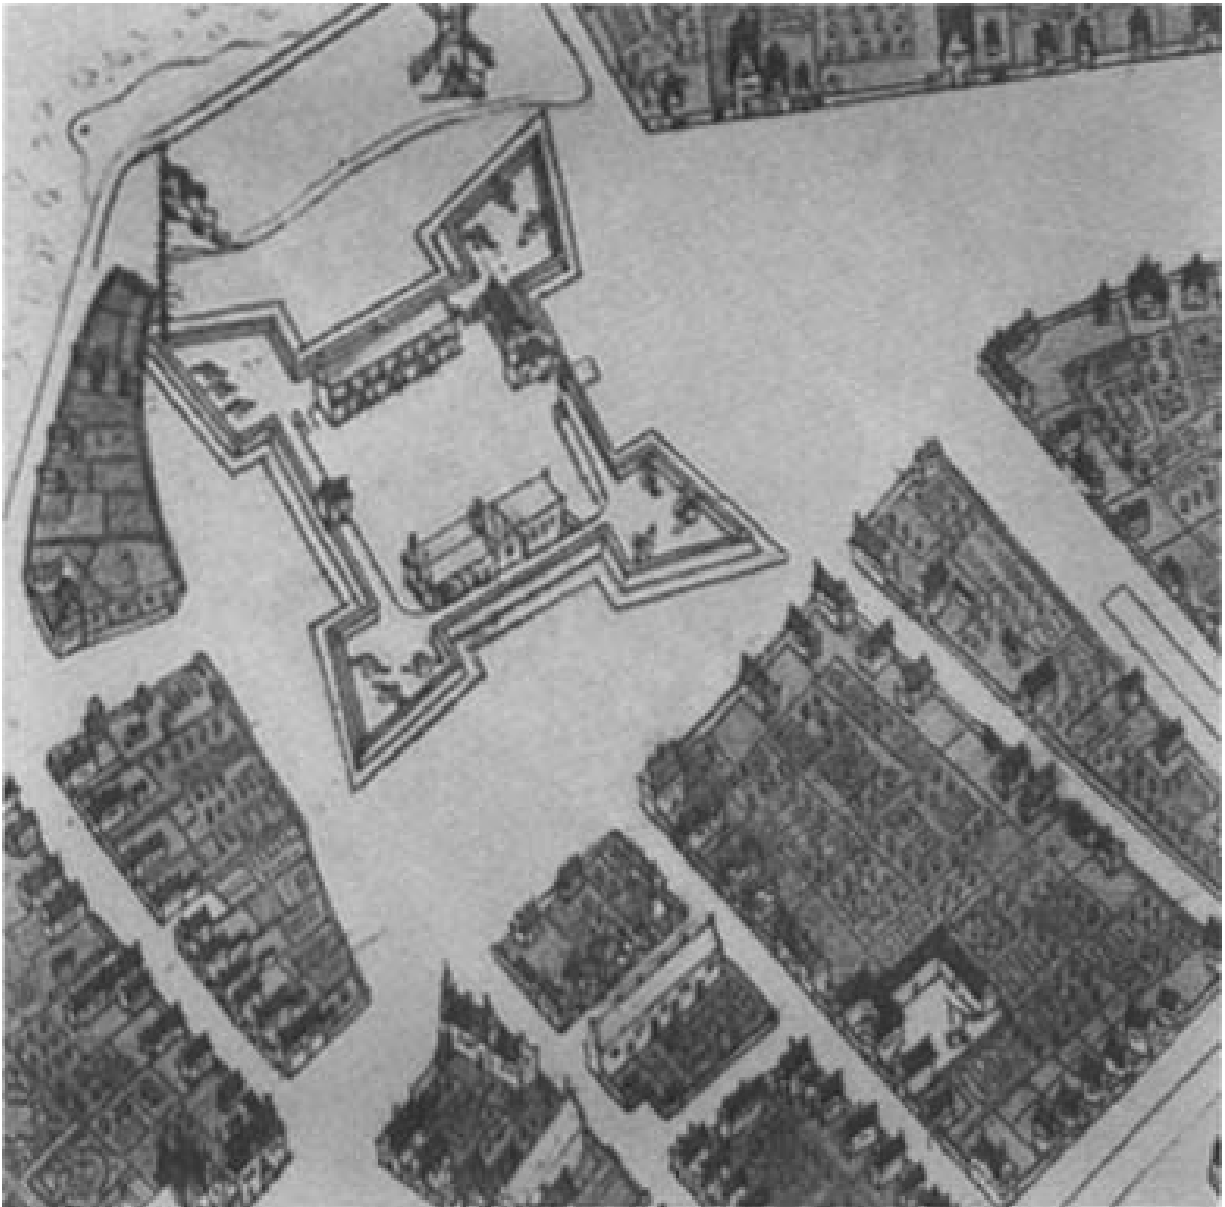

We believe that the world we've inherited has an immense momentum; that actions taken in the past have bequeathed us the mix of constraints and possibilities within which we act today; that the stage onto which each generation walks has already been set, key characters introduced, major plots set in motion, and that while the next act has not been written, it's likely to follow on, in undetermined ways, from the previous action. This is *not* to say that history repeats itself. Time is not a carousel on which we might, next time round, snatch the brass ring by being better prepared. Rather we see the past as flowing powerfully through the present and think that charting historical currents can enhance our ability to navigate them.

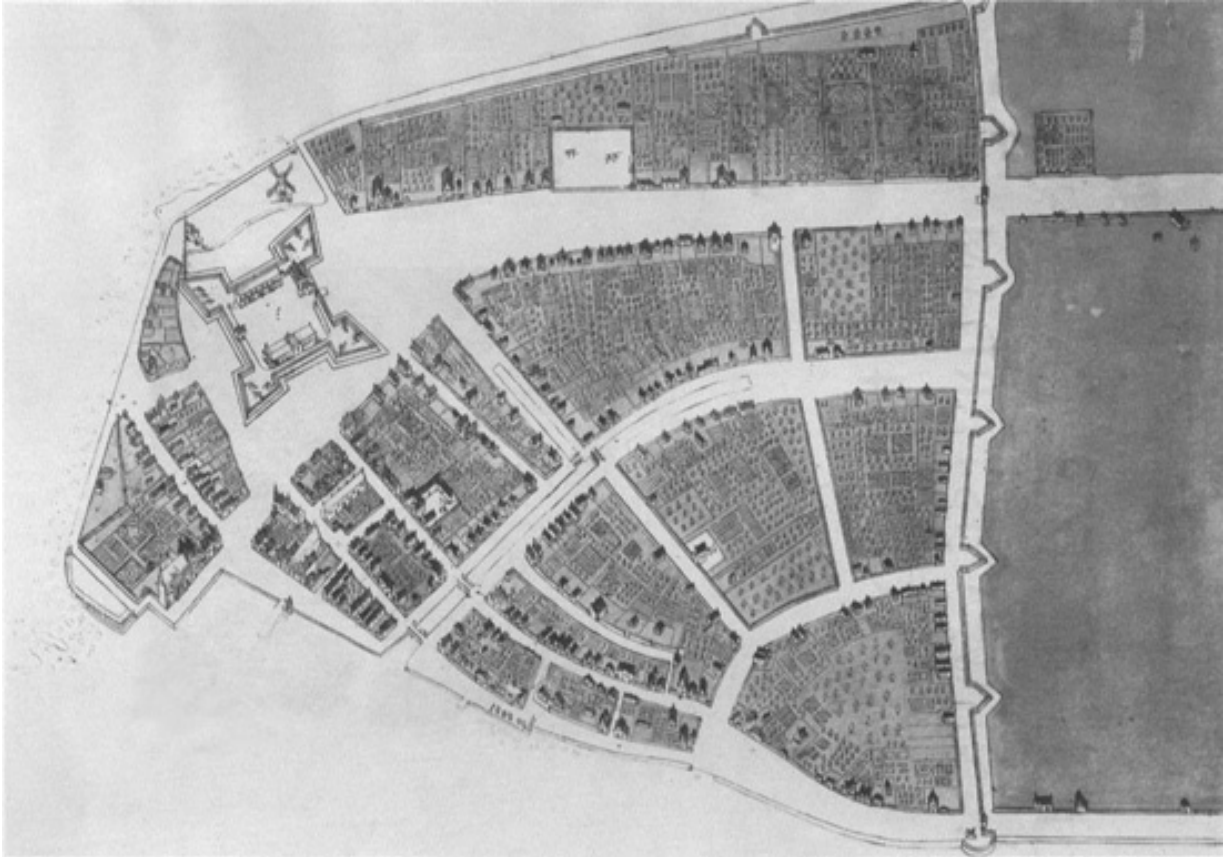

We are historians, not mythmakers, but like Washington Irving we appreciate the power of the past and its centrality to the life of a place, and our choice of title represents a tip of the hat to his endeavor. Our *Gotham* is

not Irving's, but like Diedrich Knickerbocker we think that the more we know about the city's past the more we will care about its future. We therefore dedicate this book to the citizens of New York City and to the many historians who have labored to tell its story.

Now, on with the show.

PART ONE
LENAPE COUNTRY AND NEW AMSTERDAM
TO 1664

The Castello Plan of New Amsterdam, c. 1660. (I. N. Phelps Stokes Collection. Miriam and Ira D. Wallach Division of Art, Prints and Photographs. The New York Public Library. Astor, Lenox and Tilden Foundations)

1

First Impressions

O this is Eden!” exulted the Dutch poet Jacob Steendam. A “terrestrial *Canaan*” echoed the English essayist Daniel Denton, “where the Land floweth with milk and honey.”

That was the usual reaction of the Europeans who began to settle the lower Hudson Valley and the islands of New York’s harbor, three and a half centuries ago. Nowhere else in North America would the beauty and abundance of the physical environment evoke such consistently extravagant praise.

Initially it was what Denton called the “sweetness of the Air” that bewitched explorers and travelers. “Dry, sweet, and healthy,” Adriaen van der Donck wrote. “Sweet and fresh,” the missionary Jaspar Danckaerts noted in his journal as his ship came up past Sandy Hook. “Much like that of the best parts of France,” declared the Rev. John Miller. What could produce such air, or where it came from, was the subject of extensive speculation. Miller traced it to the surrounding “hilly, woody Country, full of Lakes and great Vallies, which receptacles are the Nurseries, Forges and Bellows of the Air, which they first suck in and contract, then discharge and ventilate with a fiercer dilation.” Denton, too, emphasized the region’s sweeping woods and fields, “curiously bedecked with Roses, and an innumerable multitude of delightful Flowers” whose fragrance could be detected far out at sea. The effect was magical, and there was speculation that it might cure colds, consumption, and other respiratory ailments.

But it was the miraculous size and quantity and variety of things—the sheer prodigality of life—that left the most lasting impression. Travelers spoke of vast meadows of grass “as high as a mans middle” and forests with towering stands of walnut, cedar, chestnut, maple, and oak. Orchards bore apples of incomparable sweetness and “pears larger than a fist.” Every spring the hills and fields were dyed red with ripening strawberries, and so many birds filled the woods “that men can scarcely go through them for the whistling, the noise, and the chattering.” Boats crossing the bay were escorted by schools of playful whales, seals, and porpoises. Twelve-inch

oysters and six-foot lobsters crowded offshore waters, and so many fish thrived in streams and ponds that they could be taken by hand. Woods and tidal marshlands teemed with bears, wolves, foxes, raccoons, otters, beavers, quail, partridge, forty-pound wild turkeys, doves “so numerous that the light can hardly be discerned where they fly,” and countless deer “feeding, or gamboling or resting in the shades in full view.” Wild swans were so plentiful “that the bays and shores where they resort appear as if they were dressed in white drapery.” Blackbirds roosted together in such numbers that one hunter killed 170 with a single shot; another bagged eleven sixteen-pound gray geese in the same way. “There are some persons who imagine that the animals of the country will be destroyed in time,” mused Van der Donck, “but this is an unnecessary anxiety.”

IMMIGRANT ICE

The formation of this lush ecosystem had begun seventy-five thousand years earlier, when packs of glaciers crept down from Labrador into the almost featureless plain that then stretched east of the Allegheny Mountains to the Atlantic, and halted in the middle of modern New York City. Approximately fifty thousand years ago, a sheet of ice a thousand feet thick lay across the area. Its immense weight, and the continual flow of ice from the north, crushed and flayed the land beneath, depressing riverbeds, scooping out deep valleys, and dragging along boulders, gravel, sand, and clay like a huge conveyor belt. In parts of Manhattan and the Bronx, it peeled away everything above the bedrock—layers of gneiss, marble, and schist, five hundred million years old, that now lie naked to the passing eye, scarred and battered by their ordeal. So much of the earth’s water was captured in this and other ice sheets that the sea level fell three hundred feet or more and the shoreline bulged out a hundred miles. Arctic gusts blew off its face across a desolate tundra, inhabited only by mosses and lichens, that reached as far south as Philadelphia.

About seventeen thousand years ago, the climate of the northern hemisphere began to warm. As the ice sheet melted back, the line of its furthest advance was marked by a terminal moraine—the still-visible ridge of glacial debris that arcs down from northern Queens through places named Jamaica Hills, Highland Park, Crown Heights, and Bay Ridge (which in turn overlook such neighborhoods as Flatbush and Flatlands,

settled on the ice sheet's sandy outwash plain). Extending across to the south side of Staten Island, the moraine reaches its maximum elevation of 410 feet at Todt Hill (the highest natural point on the Atlantic seaboard south of Maine), then turns north across New Jersey and Pennsylvania.

Trapped behind the moraine, runoff from the retreating ice pooled into icy lakes that drowned the region for several thousand years before their waters broke through a mile-wide gap, now called the Narrows, and drained off toward the ocean. Scrubby pines and birches took root in the thawing tundra, then gave way, perhaps twelve thousand years ago, to stands of spruce and fir, interspersed with open meadows. Woolly mammoths, mastodons, bison, musk oxen, bears, sloths, giant beavers, caribou, sabertoothed tigers, and other large animals moved in. Trailing behind them came small bands of nomadic hunters—the region's first human occupants—who stalked game for a couple of thousand years, leaving behind only flint spear points and heaps of bones as evidence of their presence.

The hunters left nine thousand years ago, when the effects of continued climatic warming drove away the big beasts on which they depended. Hardwood forests of oak, chestnut, and hickory took over from the pines and spruce. Fed by the melting ice packs, the ocean rose again, inundating coastal lowlands and pouring back through the Narrows, creating the commodious Upper Bay that would serve as the harbor of New York. In the glacially scoured terrain north of the terminal moraine, it sculpted a fantastic topography of new islands, fjords, inlets, tidal marshes, and peninsulas. The Hudson River gorge was transformed into a broad estuary, while drowned valleys became Long Island Sound, the Harlem River, the East River, and Arthur Kill. Below the Narrows, protecting the Upper Bay from the Atlantic Ocean, sprawled the great Lower Bay—a hundred-square-mile watery expanse whose entrance was guarded by Rockaway Peninsula, a barrier beach on the Queens shore of Long Island, and by Sandy Hook, a long sandspit that jutted up from New Jersey. A broad underwater sandbar running between Sandy Hook and Coney Island, pierced here and there by navigable channels, presented arriving mariners with the only natural obstacle to the 770 miles of waterfront that lay beyond.

WHERE THE LENAPES DWELL

About sixty-five hundred years ago, this altered environment attracted a second generation of human residents. The newcomers were small-game hunters and foragers who subsisted on a diet of deer, wild turkey, fish, shellfish, nuts, and berries. Although they possessed a limited repertoire of tools, their campsites may have been occupied by as many as two hundred people at a time. Roughly twenty-five hundred years ago, they discovered the use of the bow and arrow, learned to make pottery, and started to cultivate squash, sunflowers, and possibly tobacco. Later, about a thousand years ago, they may also have begun to plant beans and maize. These changes supported larger populations. By the time Europeans appeared on the scene, a mere five hundred years ago, what is now New York City had as many as fifteen thousand inhabitants—estimates vary widely—with perhaps another thirty to fifty thousand in the adjacent parts of New Jersey, Connecticut, Westchester County, and Long Island. Most spoke Munsee, a dialect of the Delaware language in which their name for themselves was Lenape—“Men” or “People.” Their land was Lenapehoking—“where the Lenapes dwell.”

The Lenapes comprised a dozen-odd groups living between eastern Connecticut and central New Jersey. To the west were the Raritans (of Staten Island and Raritan Bay), the Hackensacks (of New Jersey’s Hackensack and Raritan river valleys), the Tappans (northern New Jersey), and the Rechgawawanches (Orange County). Their counterparts (and sometime enemies) to the east included the Wiechquaesgecks (northern Manhattan, the Bronx, and Westchester) and the Siwanoy (along the northern banks of the East River and Long Island Sound as far as the Connecticut line), as well as the Matinecocks, Massapeguas, Rockaways, Merricks, and others of Long Island.

These weren’t the well-defined, organized “tribes” or “nations” that populated the imaginations of European colonizers. Except under very unusual circumstances, the Lenapes identified themselves primarily with autonomous subgroups or bands consisting of anywhere from a few dozen to several hundred people. Nor did they reside in “villages” as that word was understood by Europeans, but rather in a succession of seasonal campsites. In the spring or early summer, a band could be found near the shore, fishing and clamming; as autumn approached, it moved inland to harvest crops and hunt deer; when winter set in, it might move again to be

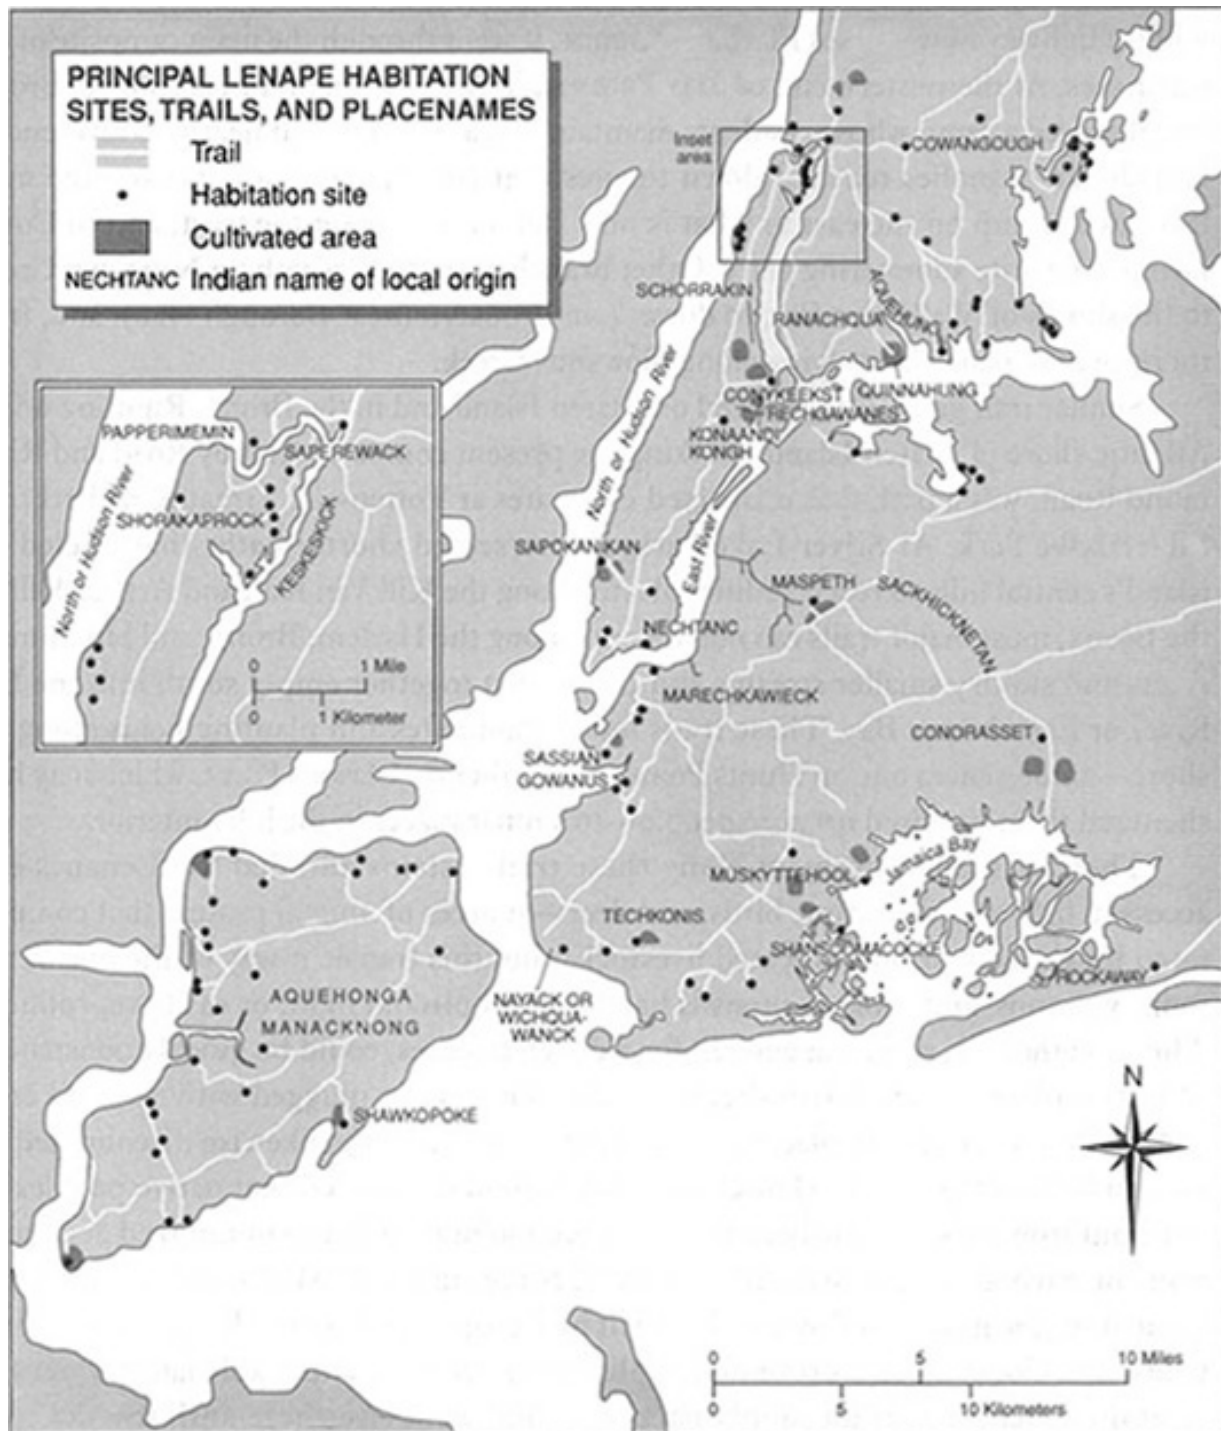

nearer reliable sources of firewood and sources of smaller game. As the Rev. Charles Wolley put it, the Lenapes lived “very rudely and rovingly, shifting from place to place, accordingly to their exigencies, and gains of fishing and fowling and hunting, never confining their rambling humors to any settled Mansions.”

Within the five boroughs of modern New York alone, archaeologists have identified about eighty Lenape habitation sites, more than two dozen planting fields, and the intricate network of paths and trails that laced them all together. On Manhattan, the primary trail ran along the island’s hilly spine from what is now Battery Park in the south to Inwood in the north. Just north of City Hall Park it passed by an encampment near a sixty-foot-deep pond, fed by an underground spring, which together with adjacent meadow and marsh lands almost bisected the island. Farther north, where the trail passed Greenwich Village, a secondary path led west to Sapokanikan, a site of fishing and planting on the Hudson River near the foot of Gansevoort Street. At about 98th Street and Park Avenue the trail ran by a campsite known as Konaande Kongh and, on the broad flats of Harlem just to the north, still more fishing camps and planting fields. (From an East River landing at about 119th Street, fishermen paddled out in tree-trunk

The largest Lenape habitation sites were occupied by several hundred or more people and probably resembled these villages

depicted in western New Netherland, but without the enclosing palisade. Detail from a map by Nicolaes Visscher, 1656. (I. N. Phelps Stokes Collection. Miriam and Ira D. Wallach Division of Art, Prints and Photographs. The New York Public Library. Astor, Lenox and Tilden Foundations)

canoes to net or spear striped bass.) Its northern terminus was a cluster of three camps along the Harlem River, two of which now actually lie on the mainland, severed from Manhattan by the Harlem Ship Canal.

Across the East River, in Brooklyn and Queens, another major artery ran just below the terminal moraine, following the present course of Jamaica Avenue west from the Nassau County line. At Evergreen Cemetery, on the Brooklyn-Queens border, it dropped down along the route of Kings Highway, looped across the outwash plains of south Brooklyn, then swung west along Bay Ridge Parkway toward the Narrows. Where Kings Highway now crosses Flatbush Avenue, it went through the main campsite of the Canarsees. At the western end of Bay Parkway, in the Fort Hamilton section of Brooklyn, it passed a camp whose residents maintained planting fields at nearby Gravesend. A half-dozen branches reached down to sites that ringed Jamaica Bay from the main Rockaway camp on the east to what is now Bergen Beach on the west, and to Coney Island, a favorite summering place. Other branches ran to Maspeth on Newtown Creek, to the shores of Wallabout Bay, to downtown Brooklyn (near Borough Hall), and, from there, over to maize lands lying along Gowanus Creek.

Similar trail grids can be traced on Staten Island and in the Bronx. Running up the Atlantic shore of Staten Island, marking the present course of Amboy Road and Richmond Road, was a path that connected campsites at Tottenville, Great Kills Park, and Silver Lake Park. At Silver Lake Park, it intersected shorter paths that circled the island's central hills to reach additional sites along the Kill Van Kull and Arthur Kill. In the Bronx, most major trails ran north-south along the Harlem, Bronx, and Hutchinson rivers and sundry smaller streams and creeks that together empty south into the East River or Eastchester Bay. These trails linked campsites and planting fields along the shore—among them one on Hunts Point and another on Clasons Point, which may have sheltered three hundred or more people—to similar places in the hilly interior.

Their seasonal movement along these trail systems afforded the Lenapes easy access to fish, shellfish, game birds, and deer—sources of animal protein that compensated for the lack of domesticated livestock—but this transient way of life meant that tools, weapons, and cooking utensils had to be simple and light, or easily reproduced. Their longhouses, some big enough for a dozen families, could be quickly constructed of bent saplings

covered with sheets of bark, the crevices plugged with clay and cornstalks. Moving from one place to the next every few months likewise discouraged the accumulation of property. (Dutch fur traders soon discovered that native peoples did not want iron pots in trade because they were too heavy.) It also minimized accumulations of garbage and waste—though Pearl Street in lower Manhattan would get its name from the mounds of oyster shells left by Lenape bands along the East River shore. Constant relocation also prevented depletion of firewood and arable land: when supplies dwindled, the group simply packed up and went elsewhere until the site could again support human habitation. And by discouraging the storage of more food than could be carried to the next camp, seasonal relocations helped minimize the human impact on local plant and animal populations, giving them a chance to rebound before the Lenapes returned the next year.

Lenape bands prepared and maintained their woodland planting fields by the slash-and-burn method, clearing out all but the largest trees and bushes, then burning off the rubbish and undergrowth every spring. This brought fallow land into cultivation quickly and returned essential nutrients to the soil, extending its productive life well beyond the two or three years possible with the European system of crop rotation. Sowing a variety of crops together in the same field—maize, sunflowers, beans, squash, melons, cucumbers, and tobacco—maintained high concentrations of nitrogen; it also required less work, because cornstalks, for example, could support the beans as well as man-made poles. What was more, the simple stone and wood implements of the Lenapes turned the soil easily without the damage caused by European plows and draft animals.

No less than the colonists who came after them, in other words, the Lenapes had “settled” the land by manipulating it to their purposes. Consciously or not, they used it in ways that extended the diversity of plant and animal life on which their survival depended. The heavy use of firewood around their principal habitation sites, combined with the annual spring burnoff of active planting fields, left vast, open, parklike forests where deer, rabbit, birds, and other game flourished. Their abandoned planting fields became the meadows and prairies that were home to a tangle of flowers and edible berries. And because Lenape spiritual beliefs emphasized the interdependence of all life, hunting was an enterprise loaded with such supernatural significance that excessive killing was

avoided. The abundance that so amazed early European visitors was thus no mere accident of nature, for “nature” was an artifact of culture as well as geology.

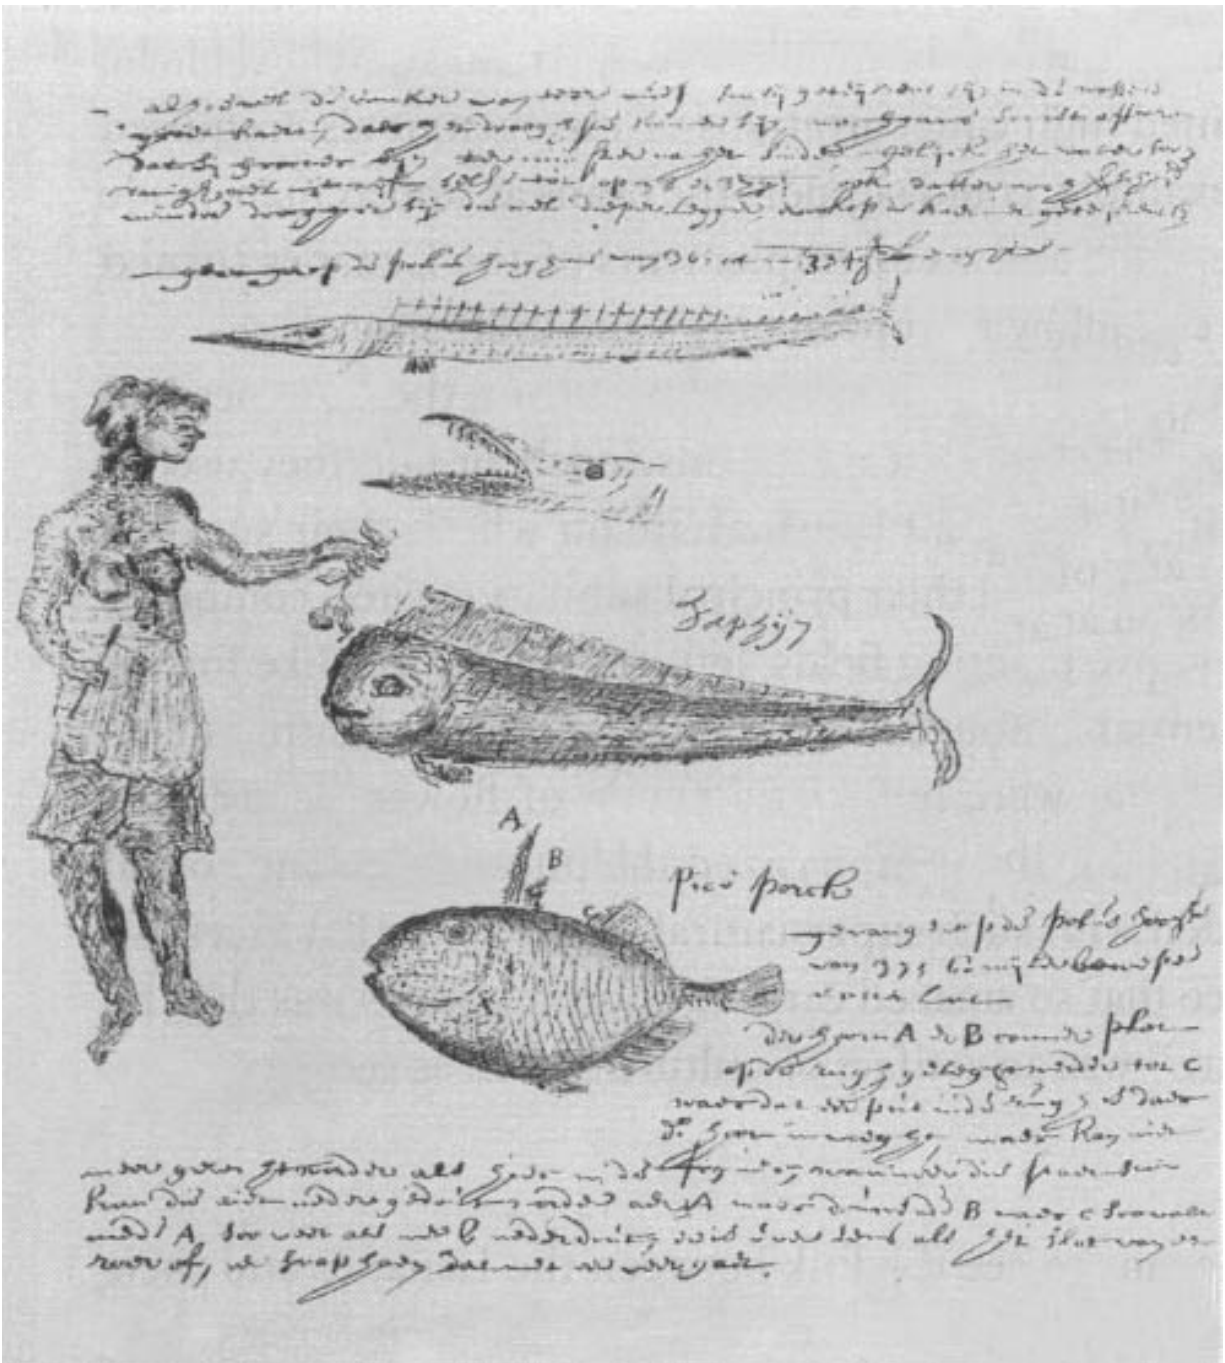

LAZY AND BARBAROUS PEOPLE

Nothing made it harder for Europeans to see the link between the Lenapes and their environment than the fact that kinship—not class—was the basis of their society. Private ownership of land and the hierarchical relations of domination and exploitation familiar in Europe were unknown in Lenapehoking. By custom and negotiation with its neighbors, each Lenape band had a “right” to hunt, fish, and plant within certain territorial limits. It might, in exchange for gifts, allow other groups or individuals to share these territories, but this did not imply the “sale” or permanent alienation known to European law. In the absence of states, moreover, warfare among the Lenapes was much less systematic and brutal than among Europeans. As Daniel Denton said disdainfully: “It is a great fight where seven or eight is slain.”

More perplexing still, kinship in Lenape society was traced matrilineally. Families at each location were grouped into clans that traced their descent from a single female ancestor; phratries, or combinations of two or more clans, were identified by animal signs, usually “wolf,” “turtle,” and “turkey.” Children belonged by definition to their mother’s phratry: if she was a turtle, they were turtles. Land was assigned to clans, and the family units that comprised them, for their use only: they did not “own” it as Europeans understood the word and had no authority to dispose of it by sale, gift, or bequest. If the land “belonged” to anyone, it belonged to the inhabitants collectively.

On one point European and Lenape societies seemed similar: the division of labor by gender. Lenape women, along with cooking and childrearing, did the bulk of agricultural work—planting, weeding, harvesting, drying, packing, sorting—which made them responsible for as much as 90 percent of the food supply. During seasonal changes of settlement, it was also their job to strike and rebuild dwellings as well as to carry the communal goods.

Lenape men, by contrast, thought agriculture unmanly and devoted their energies to hunting and fishing. European observers were often appalled to find them relaxing after their return while their women toiled away in the fields, though this reaction had less to do with sympathy for the women than with ideas about “laziness.” Europeans believed that agriculture was a respectable occupation for men, while hunting and fishing were chiefly recreational: one was work, the other mere sport. (“They labour not much, but in absolute necessity,” Charles Lodwick reported to the Royal Society, and “mostly employ themselves in hunting and fishing.”) Indeed, the apparent reluctance of their men to work only reinforced the impression that the Lenapes had done little to subdue and develop the land.

Pen and ink sketch of a Native American woman and local fish by Jaspar Danckaerts, c. 1679/1680. (United States History, Local History & Genealogy Division. The New York Public Library. Astor, Lenox and Tilden Foundations)

The sexual division of labor and the matrilineal organization of clans and phratries accorded women considerable importance in communal affairs.

Each sachem was chosen from among the sons—sometimes even daughters—of a sister of the old sachem, and the actual choice might well have been made by the older women of his phratry. There is also evidence that after divorce, which was a simple matter for Lenape women (as well as for men), they retained possession of all household effects and that their children invariably remained with them because they were of the same lineage.

Seasonal habitation sites, few tools and personal possessions, the lack of domesticated animals, disorderly planting fields, a classless and stateless social system, matrilineal kinship, indifference to commerce—what all of this added up to, for many Europeans, was a deeply inferior way of life, mired in primitive poverty. It seemed the very antithesis of civilized existence, a devilish inversion of the proper order of things. To the Dutch, all Indians were *wilden*—savages—while the English likened them to the despised “wild Irish,” whose seasonal migrations with their sheep and cattle appeared utterly incompatible with civilization.

True, they didn’t appear to be suffering. “It is somewhat strange,” Nicholaes van Wassenauer admitted, “that among these most barbarous people, there are few or none cross-eyed, blind, crippled, lame, hunch-backed or limping men; all are well-fashioned people, strong and sound of body, well fed, without blemish.” “Some have lived 100 years,” Charles Lodwick marveled. “Also,” Jasper Danckaerts added, “there are among them no simpletons, lunatics or madmen as among us.”

Indeed, that the Lenapes lived so contentedly in what looked to Europeans like a setting of wonderful “natural” abundance made them all the more contemptible. How could people living in such a place fail so utterly to take advantage of the opportunities that lay all around them? They ought to have been civilized and rich, but they weren’t. It was only a short step to the conclusion that they didn’t deserve to be there at all.

THE FUR TRADE

A map of the New World drawn by Juan de la Cosa in the first decade of the sixteenth century hints that Europeans—probably anonymous fishermen looking for cod—may have visited Lenapehoking when Christopher Columbus was still exploring the Caribbean. The first solid evidence of such a visit, however, conies with the arrival of a French vessel, *La*

Dauphine, piloted by the Florentine navigator Giovanni da Verrazzano. King Francis I of France and a syndicate of Lyons silk merchants had commissioned Verrazzano to find a northern route to China and Japan—the same “Indies” that Columbus dreamed of finding. In March 1524, after a fifty-day crossing from Madeira, *La Dauphine* began crawling up the coast from Cape Fear. By mid-April she passed Sandy Hook and anchored in the Narrows between Staten Island and Brooklyn.

As they had already done many times before, the crew of *La Dauphine* lowered the ship’s longboat and rowed out to see what they could see. They soon found themselves, Verrazzano said, in “a very beautiful lake”—the Upper Bay—where they were surrounded by several dozen small boats whose occupants, “clad with feathers of fowls of diverse colors,” greeted them “very cheerfully, making great shouts of admiration.” This happy encounter ended almost as soon as it began, however. A sudden squall forced *La Dauphine* to stand out to sea again, so Verrazzano decided to resume his search further to the north—“greatly to our regret,” he added, for this was a “hospitable and attractive” country, “and, we think, not without things of value.” He dubbed the “lake” Santa Margarita, in honor of the king’s sister, and the surrounding land Angouleme, the name of the king’s principal estate. (When the Verrazano Narrows Bridge opened in 1964, the Triborough Bridge and Tunnel Authority, in its wisdom, spelled the explorer’s name with one z rather than two.)

One year after Verrazzano’s brief visit, Esteban Gomez, a black Portuguese pilot who had sailed with Magellan, ventured a fair distance up the Hudson (which he named Deer River) before concluding it didn’t lead to China. Various French and English pilots are thought to have scouted the region as well in the years that followed. An Englishman supposedly crossed the Hudson in 1568 during an epic overland trek from the Gulf of Mexico to Canada. Marooned sailors and fishermen are rumored to have wintered along the Delaware or lower Hudson rivers in the late 1590s and early 1600s. On occasion, English and Spanish skippers raided the area to take slaves, an enterprise inspired by Gomez, who had seized fifty-seven New England Indians for sale on the Lisbon slave market.

But the most numerous and persistent successors of Verrazzano and Gomez were fur traders. Furs had always figured importantly in the European luxury trades; beaver in particular was highly prized for both its

soft, deep pelt and its alleged medicinal properties. As Adriaen van der Donck would explain midway through the seventeenth century, beaver oil cured rheumatism, toothaches, stomachaches, poor vision, and dizziness; beaver testicles, rubbed on the forehead or dried and dissolved in water, made an effective antidote to drowsiness and idiocy.

Traditionally, most of the furs marketed in Europe came from Russia. Trapped in Siberia or along the shores of the Baltic, they were dressed and marketed in the ancient city of Kiev. But when French explorers and traders opened the St. Lawrence River valley in the 1580s, the influx of Canadian skins created a wider market in Europe and prompted rival traders to seek additional sources of supply elsewhere in North America. By 1600 exchanging beaver and other pelts for European wares had become routine for at least some Indian peoples along the Atlantic coast, the Lenapes undoubtedly among them. European trade goods from the 1570s have turned up in habitation sites well into the interior of New York State, and Dutch traders claimed to have “frequented” the lower Hudson Valley as early as 1598, “but without making any fixed settlements, only as a shelter in winter.”

Not all the Lenapes were anxious to do business with Europeans. Some must have heard stories of captives carried off into slavery. Others seemed unwilling to get into the spirit of a market economy. “They take many beavers,” Johannes de Laet remarked in 1615, “but it is necessary for them to get into the habit of trade, otherwise they are too indolent to hunt the beaver.” Even a half century later, Daniel Denton would note that many Long Island Lenapes still showed a marked indifference to material possessions. “They are extraordinarily charitable to one another,” he wrote, “one having nothing to spare, but he freely imparts it to his friends, and whatsoever they get by gaming or any other way, they share to one another, leaving to themselves commonly the least share.”

What the Europeans offered the Lenapes—blankets, brass kettles, iron drills, hoes, knives, combs—were nonetheless obvious improvements on familiar things and could readily be incorporated into prevailing patterns of production and exchange. Slowly at first, then more rapidly after the addition of guns and alcohol as trade goods, even reluctant curiosity would give way to habit, and habit to dependency. By the early seventeenth

century, the demand for items of European origin among the Lenapes had begun to undermine their way of life.

Even as the first colonists arrived on the scene, Lenape men were devoting more and more of their time to gathering furs for exchange with Europeans rather than for the use of their families and clans. They were away from home longer and returned with less food, which every spring left a few more communities a little closer to real famine when their stores from the previous harvest finally gave out (and in time virtually exterminated fur-bearing animals throughout the lower Hudson region). Then, too, as the work of men shifted from stalking to setting and checking traps, territorial boundaries became a matter of escalating controversy. The reciprocity that sustained complex kin networks weakened. Bands dissolved, re-formed, and dissolved again in a search for stability. Old intergroup alliances broke up. War became increasingly likely and, with the spread of firearms, increasingly deadly.

As European commodities supplanted their Lenape equivalents, a widening array of traditional skills, duties, and knowledge became less and less important. Lenape women assumed ever greater responsibility for supplying the camp with food and managing its internal affairs. Lenape sachems gained new prestige as the managers of trade with Europeans, though every year it would be more and more difficult to manage their often conflicted communities, let alone mobilize them for resistance. Alcohol hastened the disruption of earlier ways. As early as 1624 Nicolaes van Wassenauer could report that excessive drinking had destroyed the authority of at least one sachem, who “comes forward to beg a draught of brandy with the rest.”

Another danger for the Lenapes had meanwhile appeared to the north in the form of the Iroquois League. According to legend, the idea of the league originated around the middle of the sixteenth century with a Huron prophet and philosopher named Deganawidah, who wandered among the Iroquois-speaking peoples of upper New York State preaching a gospel of unity, brotherhood, and equality. Around 1570, assisted by a certain Ha-yo-went'-ha (Longfellow's Hiawatha), Deganawidah brought the Mohawk, Oneida, Onondaga, Cayuga, and Seneca “nations” together in a single federation known as the League of the Great Peace. The league stretched from the Hudson to Niagara, encompassing perhaps a dozen semipermanent,

stockaded villages whose combined population approached fifteen thousand.

Once Deganawidah and Ha-yo-went'-ha had gone—not died, it was said, merely moved on to spread their message among less fortunate peoples elsewhere—the league entered a new, aggressively expansionist phase. Its armies, sometimes numbering more than a thousand warriors, ranged west to the banks of the Mississippi, south to Virginia and the Carolinas, east into New England, and north, across the St. Lawrence, deep into Canada. Not unlike the crusading chivalry of medieval Christendom, they ventured out among the infidel with news of the Great Peace of Deganawidah and Ha-yo-went'-ha, a scourge to all who opposed them. Like the crusading chivalry, too, they had practical motives as well.

Their initial encounters with European commodities and weapons, which must have occurred around the same time that Deganawidah and Ha-yo-went'-ha were finishing their work, impressed upon the Iroquois the importance not only of direct access to the traders but also of controlling the supply of furs. In the 1580s, a decade or so after the league had been formed, the Iroquois attempted to establish a foothold on the St. Lawrence but were turned back by a combined force of Hurons and Algonkians, armed with French weapons. The erection of a French trading post at Quebec in 1609 completed the Iroquois defeat and enabled the Hurons and their allies to organize a vast, complex trading empire in which they used European goods to obtain food from agricultural peoples living above Lake Erie, exchanged the food for skins brought in by hunting groups in the far north, then brought the skins to Quebec and exchanged them for more trade goods.

In desperation, the Iroquois turned south toward the Susquehanna, Delaware, and Hudson valleys. Before 1600 they had subjected or driven off many of their original inhabitants. The Algonkian-speaking Mahicans who lived on the west side of the Hudson, near modern Albany, were the next in line. If they too succumbed—when they succumbed—all the peoples of the lower Hudson would be endangered in turn. With Europeans at their front door and Iroquois at their back, the Lenapes were doomed.

The Men Who Bought Manhattan

On the second day of September 1609, a three-masted Dutch carrack, the *Halve Maen* (Half Moon) dropped anchor off Sandy Hook. Her skipper, an English seaman named Henry Hudson, had started out six months earlier to find an Arctic shortcut to the Indies. Blocked by ice in the waters off Novaya Zemlya, and with his half-frozen crew threatening mutiny, Hudson then turned west and ran five thousand miles across the Atlantic to Nova Scotia. Since July, the *Halve Maen* had been scouting the coast between Cape Cod and Chesapeake Bay in search of the same northwest passage that Verrazzano failed to find eighty years before.

For more than a week Hudson and his men explored the Lower Bay, marveling at its wild beauty and fertility. Robert Juet, one of Hudson's officers, said the surrounding hills were "as pleasant with Grasse and Flowers, and goodly Trees, as ever they had scene, and very sweet smells came from them." The inhabitants seemed "very glad of our comming, and brought greene Tabacco, and gave us of it for Knives and Beads," Juet added. "They appear to be a friendly people," Hudson himself reported, "but are much inclined to steal, and are adroit in carrying away whatever they take a fancy to." That may explain why the situation suddenly turned ugly. A fight broke out, a crewman named Coleman was killed with an arrow through the neck, and Hudson decided to move on.

On September 12 Hudson guided the *Halve Maen* through the Narrows between Staten Island and Long Island. Crossing the Upper Bay, he warily purchased "Oysters and Beanes" from some "people of the Country" who paddled out to his ship in canoes, then entered the river that now bears his name—"as fine a river as can be found," in the words of another contemporary report, "wide and deep, with good anchoring ground on both sides." One week later and ninety miles upstream, near the present site of Albany, Hudson realized that he wasn't going to reach the Pacific. He turned back, disappointed yet deeply impressed by what he had seen. "The land is the finest for cultivation that I ever in my life set foot upon," he asserted, "and it also abounds in trees of every description. The natives are a very good people; for, when they saw that I would not remain, they

supposed that I was afraid of their bows, and taking the arrows, they broke them in pieces, and threw them in the fire.”

Nor did he leave empty-handed. The “loving people,” in Juet’s words, “came flocking aboard, and brought us Grapes and Pompions, which wee bought for trifles. And many brought us Bevers skinnes, and Otters skinnes, which wee bought for Beades, Knives, and Hatchets.” That they made better hosts than the inhabitants of the seaboard was confirmed as the *Halve Maen* sailed down “that side of the River that is called *Manna-hata*” and dodged a hail of arrows fired by “savages” on the shore. (The meaning of “Manna-hata” has been debated ever since; the preferred translation nowadays is “hilly island.”)¹

MIGHTY AMSTERDAM

Though Hudson’s reconnaissance was no more successful than that of Verrazzano or Gomez, it proved the more important because the political climate of Europe had changed markedly by the early 1600s. At issue was the condition of Hapsburg Spain, still the most powerful European state but surrounded now by adversaries. Over the course of the sixteenth century, under Charles V and his son Philip II, the Spanish had absorbed Portugal, taken possession of the Holy Roman Empire, overrun the principal islands of the Caribbean, subdued Mexico and Peru, and invaded the Philippines. At the same time, they became involved in a series of costly military adventures aimed at rolling back the Protestant Reformation. Eventually, despite the riches extracted from its far-flung possessions, the crown ran out of money and embarked on a disastrous program of forced loans and debt repudiations that sent shock waves through European political and financial systems. France and England, would-be entrants on the global imperial stage, preyed mercilessly on Spanish shipping and launched their own colonizing projects in those parts of the western hemisphere where Spanish power seemed weakest.

Nowhere were Spain’s afflictions more apparent than in the Low Countries, or Netherlands. Inherited by Charles V and subsequently granted by him to Philip II, they had flourished under Spanish rule. Their leading cities—Antwerp, Bruges, Brussels—grew rich as the marketplaces where Spain obtained, with gold and silver from the New World, the food, clothing, manufactures, naval stores, and luxuries that it could not produce

for itself. But when Protestantism spread across the Netherlands in the 1560s, a revolt broke out against Spain. The seven Dutch-speaking provinces of the northern Netherlands formed the United Provinces or Dutch Republic (foreigners called it Holland after the largest and wealthiest of the seven). Its governing body was the States General, in which each province had a single vote.

The United Provinces occupied a mere corner of Europe, not much bigger than the states of Connecticut, Massachusetts, and Rhode Island combined, and inhabited by fewer than two million people. Its struggle for independence would nonetheless become a central event of the early modern era. Year after year, Spanish armies ravaged the Netherlands. Year after year, the rebels fought back, fired by Calvinist zeal and led by the brilliant Prince William of Orange. Along the way they assembled the greatest fleet in Christendom, owning, Sir Walter Raleigh once estimated, more ships than eleven other nations combined.

Even before Dutch fireships helped England fend off the Spanish Armada in 1588, the war in the waters had spread far beyond the confines of Europe. Dutch squadrons, flying their orange, white, and blue banners, plundered Spanish ports throughout the Americas, Asia, and Africa. *Oranje boven!* was their war cry—"Orange above!" They hounded Spanish shipping in the Caribbean and swept Spain's Portuguese allies from the Indian Ocean. Dutch troops fought in Puerto Rico, Africa, South America, India, China, Japan, and Malaysia. Holland was already one of the world's great maritime powers when, in 1609, weary, frustrated, and bankrupt, the Spanish at last agreed to a twelve-year truce that gave their former subjects *de facto* independence.

Although true independence did not come for another forty-odd years, Holland's Golden Age had begun. Dutch traders, never far behind the fleets and armies, cornered the international markets in African slaves, Brazilian sugar, Russian caviar, Italian marble, Hungarian copper, fish from the North Sea, and furs from the Baltic. "The factors and Brokers of Europe," Daniel Defoe called them. "They *buy to sell* again, *take in to send out*, and the greatest Part of their vast Commerce consists in being supply'd from All parts of the World, that they may supply All the World again."

The fates of faraway kingdoms were decided in the countinghouses of Dutch bankers. Dutch investors bought Russian grain fields and German

vineyards. Dutch engineers taught foreign princes the most advanced methods of building forts and draining swamps. Rich merchants and aristocrats across Europe collected the works of Dutch painters, filled their homes with the fine china and glass produced by Dutch artisans, and shipped their sons off to Dutch universities to study at the feet of scholars and philosophers who were changing the face of Western law and science.

Integral to Holland's success was the city of Amsterdam. Protected by a forbidding network of estuaries, Amsterdam rose to international prominence as the home base, nerve center, and symbol of the Dutch revolt. It expanded rapidly as the struggle wore on, nourished by the spoils of war and the capital of merchants fleeing the devastated cities of the south. With them came religious outcasts of every denomination—Walloons (French-speaking Protestants from what is now Belgium), Huguenots (French Protestants, many of whom joined Walloon churches), Baptists, Quakers, Sephardic Jews, and a party of English Calvinists (known to their day as Separatists and to ours as the Pilgrims)—all drawn by the city's tolerance for diversity and dissent. Together they made Amsterdam one of Europe's liveliest and most cosmopolitan urban centers. In 1585, the year that a Spanish army laid waste to Antwerp, Amsterdam's population numbered a mere thirty thousand. When Spain and Holland called their truce in 1609 it had risen to nearly sixty thousand. By mid-century it would exceed 150,000.

Amsterdam's burghers, moreover, were open to newer ways of doing business. Profitmaking and capital accumulation, still the objects of medieval scorn in much of Europe, were civic virtues in Amsterdam. Before the seventeenth century was more than a decade old, the city could already boast of the world's most up-to-date credit and banking facilities. It had Europe's most important stock exchange, specialized commodity exchanges, and a legal system swept clean of medieval obstructions to the free circulation of money and goods. Out of its well-equipped shipyards came swarms of privateers and fleets of a cheap but efficient new cargo ship—the *vlieboot* or flyboat—with which Dutch traders prowled the seas in search of gain. When they returned, holds bulging with the merchandise of distant lands, it was to an ingenious new system of canals that linked the waterfront with blocks of new warehouses and municipal markets, sharply

reducing the time needed to find buyers, make up an outward-bound cargo, and set off again.

In time, half Europe's foreign trade would be in Dutch hands, and half its ships would have been built in their yards. Andrew Marvell, the English poet, linked the city's preoccupation with moneymaking to what he thought was its appalling indifference toward dissenters. "Staple of sects and mint of schism," he called Amsterdam—a "bank of conscience, where not one so strange/Opinion but finds credit and exchange."

THE WEST INDIA COMPANY

Amsterdam was also the headquarters for a pair of giant trading companies whose fortunes would determine the course of Dutch exploration and settlement around the world. Their purpose was to reduce destructive competition among smaller firms while simultaneously prosecuting the war with Spain. To that end, each had its own private army and navy, almost unlimited powers of peace and war, and control over vast human and material resources.

Senior of the two was the Vereenigde Oost-Indische Compagnie—the United East India Company—created in 1602 by the States-General to manage all Dutch trade east of the Cape of Good Hope. Capitalized at over six million guilders, an enormous sum at the time, the giant company quickly established Holland as a global power. East India Company merchants, backed by the company's own armed forces, set up trading posts, or "factories" (not to be confused with modern industrial enterprises), at Bandar-Abbas (Gombroon) near the mouth of the Persian Gulf, at Batavia on the vital Sunda Strait in the Spice Islands, at Chinsura in Bengal, and at Canton in China. They negotiated exclusive trading privileges in Nagasaki, the only Japanese port open to Europeans. Company troops expelled the English from Bantam, close by Batavia, and they seized a whole network of strategic bases from the Portuguese, including Malacca, Colombo, Cochin, Negapatam, and Macassar.

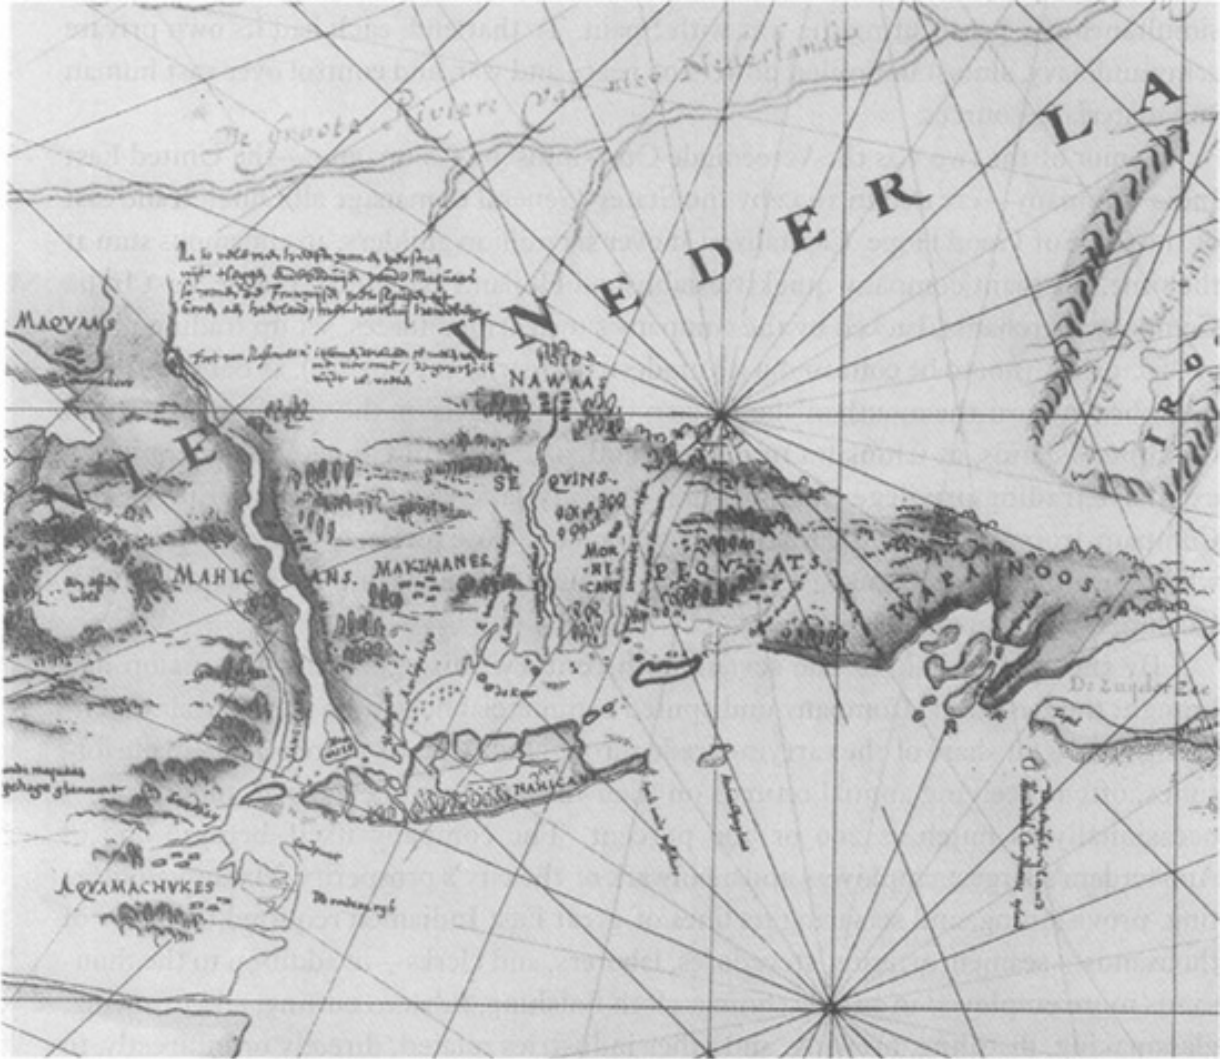

By the second half of the seventeenth century, this aggressive expansion had brought the East India Company undisputed commercial hegemony in the Malay archipelago and a fat share of the carrying trade throughout Asia. Its shareholders made fortunes, often receiving annual returns on their

investments in excess of 30 percent—occasionally as much as 200 or 300 percent. The company itself became one of Amsterdam’s largest employers and a bulwark of the city’s prosperity. Manning, outfitting, provisioning, and servicing its lines of great East Indiamen required the labor of thousands—seamen, artisans, stevedores, laborers, and clerks—in addition to the thousands more employed in sugar refining, cloth finishing, tobacco cutting, silk throwing, glassmaking, distilling, brewing, and other industries related, directly or indirectly, to the company’s operations.

In 1609, encouraged by the prospect of a long truce with Spain, the East India Company commissioned Henry Hudson to find a northeast route to the Orient. When he failed, it turned its attention to other matters, not least of all the 329 percent dividend it had just declared for 1610. For merchants outside the company, though, Hudson’s report that he and the crew of the *Halve Maen* had carried on a brisk trade in furs with obliging natives was tantalizing news. Despite the recent settlement of a French trading post at Montreal, the European market for furs remained so strong that smaller traders could still expect high returns with only a modest initial investment and little risk.

In 1610 a company of Amsterdam *particuliere kooplieden* (private merchant-traders) sent a single ship to the river “called Manhattes from the savage nation that dwells at its mouth” (soon renamed the Mauritius and, eventually, the North River). Rivals were close behind, and in the vigorous competition that followed, flinty Dutch captains like Hendrick Christiaensen, Cornelis May (after whom Cape May is named), and Adriaen Block won fame if not fortune.

Block’s voyage of 1613—14, his fourth to the Hudson, must have been the talk of the Amsterdam waterfront. When fire destroyed his first ship, the *Tyger*, he and his men wintered on Manhattan and, with Indian help, built a new ship, the *Onrust* (Restless), with which they explored the East River and Long Island Sound in the spring of 1614.

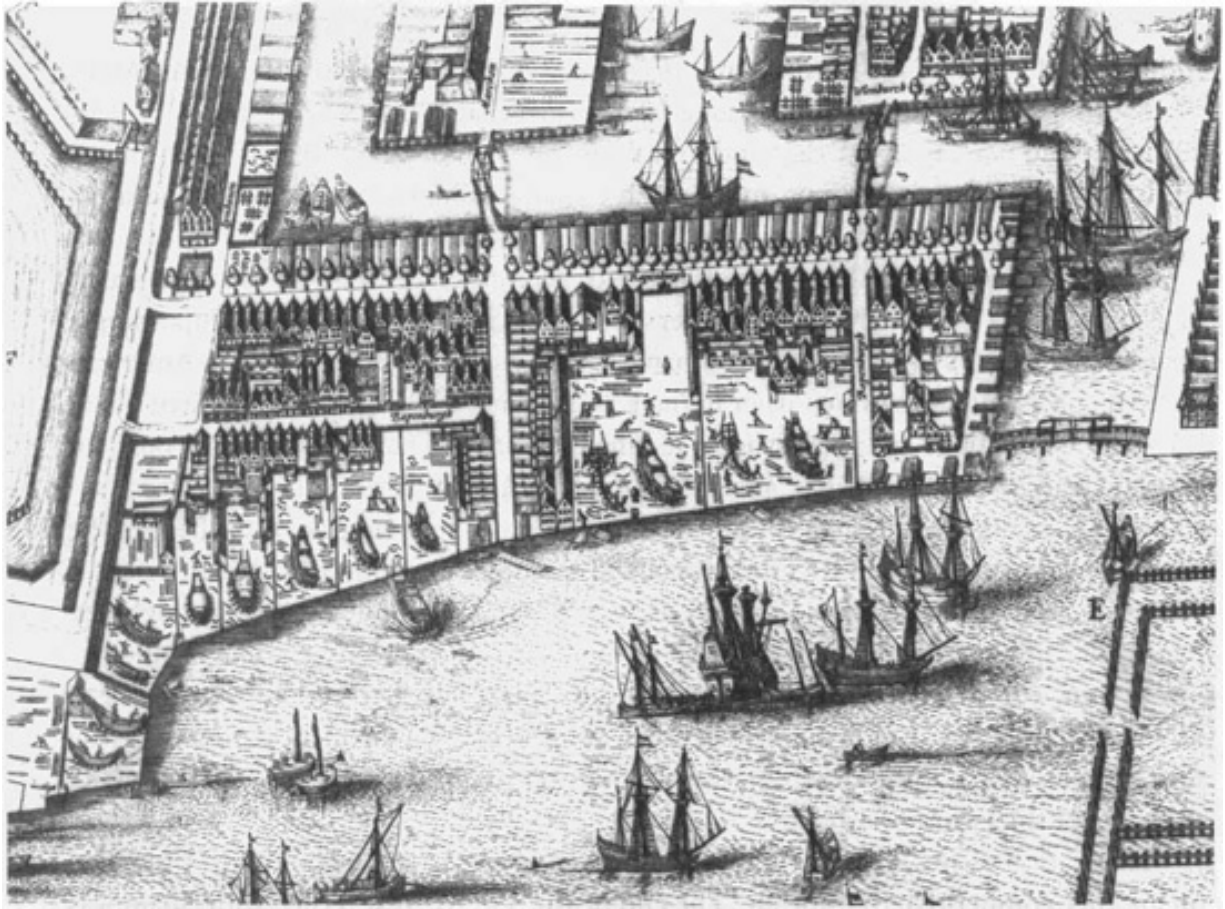

New Netherland, 1613/1614 Detail of the chart drawn by Adriaen Block. (© Collection of The New-York Historical Society)

(A mulatto from San Domingo named Jan Rodrigues remained on Manhattan with a stock of goods to organize trade pending Block's return.) The "Figurative Map" that Block brought back to Amsterdam later that year was the first to apply the name "Manhates" to Manhattan, first to show Long Island as an island, first to show the Connecticut River and Narragansett Bay, and first to use the name "New Netherland" for the lands between English Virginia and French Canada. (Block's monument is the small island off the eastern end of Long Island that bears his name.)²

In 1614, knowing that competition was better for discovery than for profits, a group of Amsterdam's principal merchants persuaded the States-General to set up a single firm, the United New Netherland Company, with exclusive rights to traffic in American pelts (much as had been done earlier in the East Indian trade). The company sent out at least four expeditions and established a fortified year-round factory, or trading post, on Castle Island in the North River, just below modern Albany. It was called Fort van Nassouwen (Nassau), a name already applied to two other Dutch factories elsewhere in the world, one on the Amazon River in Brazil and the other at Mouree, in West Africa. A contemporary report described the fort as "a redoubt, surrounded by a moat eighteen feet wide" and garrisoned by ten or twelve men with a dozen-odd cannon. Under its protection, company traders began to tap the river's "great traffick in the skins of beavers, otters, foxes, bears, minks, wild cats, and the like." A smaller "redoubt or little fort," apparently not intended for year-round occupation, was erected the following year "about the Island Mannhattans."

Expiration of the New Netherland Company's charter at the end of 1617 touched off another competitive free-for-all. The end of the Twelve Year Truce with Spain was approaching, moreover, and a controversy raged about what would come next. One party, known as the Remonstrants because of their opposition to dogmatic Calvinism, advocated peace; the other, whose less tolerant interpretation of Calvinist doctrine gave them the name Counter-Remonstrants, urged the resumption of all-out war. The war party scored its first major victory in 1619 at the Synod of Dordrecht (Dort in English), which gave the Dutch Reformed Church a strictly orthodox foundation and identified it irrevocably with a new, more aggressive Dutch nationalism.

A second Counter-Remonstrant victory came in 1621, when the States-General handed New Netherland and the fur trade over to a new and far larger enterprise, the Geoctroyerde West-Indische Compagnie, or West India Company. Capitalized at 7.5 million guilders, the West India Company received a monopoly over all Dutch trade with west Africa and the Americas. Like the East India Company, it had two purposes: to make money by trade and to make money by making war on Spain.³

Amsterdam's waterfront The West India Company's compound can be seen at the foot of the bridge on the right. Detail of a map by Balthasar van Berckenrode, 1626. (Municipal Archives, Amsterdam)

Shares in the West India Company sold briskly, and the company geared up for business. In 1623 it launched a campaign to seize the Portuguese sugar plantations in Brazil. In 1624 it sent out some seventy ships to prey on Spanish commerce. In 1625 it attacked and sacked San Juan, Puerto Rico. Over the next dozen years it would dispatch some seven hundred additional ships manned by sixty-seven thousand men. They took over five hundred prizes worth almost forty million guilders. Counting damages as well as booty, they are said to have cost Spain alone nearly 120 million guilders. *Oranje boven!*

NEW NETHERLAND

Nor did the company neglect its interests in North America. As early as 1622, according to a contemporary English account, its agents had appeared along “the river Manahata and made plantation there, fortifying themselves in two several places” where “they did persist to plant and trade.” One of the company’s ships spent the winter of 1623-24 trading in the Hudson and Long Island Sound. She was still anchored in the East River in the early summer of 1624 when Captain Cornelis May brought in the *Nieu Nederlandt* with thirty families, mostly Walloons from Leyden who had previously tried without success to get permission to settle in Virginia. May immediately sent eighteen families north to establish a base along the west bank of the Hudson, not far from the site of Fort Nassau (now fallen into disrepair), which they called Fort Orange. Some sixty years later a female survivor recalled that “as soon as they had built themselves some hutts of Bark,” the people there were doing a good business in furs with the local Mahicans, who were “all as quiet as Lambs.”

The remaining families of colonists were sent to establish outposts along the Delaware and Connecticut rivers—the western and eastern boundaries, respectively, of New Netherland. (Perhaps because no one could think of a better name, the Delaware site, like its North River counterpart, was also called Fort Nassau.) A small party also occupied Noten (now Governors) Island and were soon at work clearing and planting at least one farm on nearby Manhattan.

By December of that same year, the company’s ships had returned to Amsterdam with pelts worth fifty thousand guilders and the cheerful news that New Netherland had begun “to advance bravely and to live in friendship with the natives.” And such was the region’s astounding abundance and fertility, according to one report, that the colonists lacked almost nothing. “Had we cows, hogs, and other cattle fit for food (which we daily expect in the first ships) we would not wish to return to Holland, for whatever we desire in the paradise of Holland, is here to be found.”

Several more company ships arrived in the spring of 1625. Led by Willem Verhulst, who replaced May as director of New Netherland, this second expedition deposited over a hundred additional colonists (again, mostly Walloons) plus a wide variety of livestock (103 head in all) and a mountain of supplies—wagons, plows, tools, clothing, food, seeds, plant shoots, firearms, and cheap goods for the fur trade. The cattle were put to

pasture on Manhattan (“a convenient place abounding with grass”), and Verhulst ordered more land there to be cleared for planting wheat, rye, and buckwheat.

Verhulst and Cryn Fredericks, an engineer, also chose Manhattan’s southern tip as the best location for a massive fortification whose masonry walls, bristling with cannon, would anchor West India Company operations throughout New Netherland (in light of the fact, it was said, that “the Spaniard, who claims all the country, will never allow any one to gain a possession there”). They called it Fort Amsterdam, and Fredericks had the site staked out before the end of the year.

Nobody liked Verhulst. He bullied the colonists, doctored the books, and managed to lose track of vast quantities of trade goods. In the spring of 1626 he was replaced as director by forty-year-old Peter Minuit, a Walloon whose family had lived in Wesel, Germany, until driven out by a Spanish army a couple of years earlier.

FARMS OR FACTORIES?

Verhulst was really the least of New Netherland’s problems, however. Far graver was a sharp division of opinion within the West India Company itself about its long-range expectations for the colony.

The original idea for the company had come from Willem Usselinx, a wealthy Flemish refugee who believed that its primary objective should be settlement, not the establishment of trading posts. To his way of thinking, Holland in particular and the Protestant cause in general would never throw off Spanish rule until Spain’s grip on the New World and its resources had been broken. The surest way to do that, he reasoned, was to establish extensive colonies where free European farmers and converted Indians could produce agricultural commodities for the markets of Europe. The company’s preoccupation with conventional trade and warfare left Usselinx bitterly disappointed, and he refused its repeated offers of employment. At least a few of its directors nonetheless thought he had been on the right track. Led by Kiliaen van Rensselaer, an Amsterdam diamond merchant, these dissidents fought for years to make something more out of the company’s American holdings than a collection of thinly populated trading posts.

From the very beginning, consequently, New Netherland's status was anomalous. In 1624, just before the Walloons set out with Captain May on the *Nieu Nederlandt*, the West India Company promulgated a set of regulations for the colony known as the Provisional Orders. The Orders implied that it would be run as a collection of thoroughly typical factories in which the company's interests came first, the company made the rules, and the company decided what was best. Prospective colonists were explicitly warned "to obey and to carry out without any contradiction the orders of the Company then or still to be given, as well as all regulations received from the said Company in regard to matters of administration and justice." The company would tell them where to live. The company would tell them what to plant on their land. They would work on the construction of fortifications and public buildings at the direction of the company. Their able-bodied men would perform military service for the company as needed.

Yet the Provisional Orders also hinted that other intentions besides those of the company were to be served as well. Perhaps because the Walloons had driven a hard bargain, colonists bound for New Netherland were promised things that matter only to people seeking to put down roots: cheap livestock, easy credit for the purchase of supplies, freedom of conscience in private worship, and, after six years' service to the company, free land on which to settle. The company likewise instructed the director to appoint some of them to a council that would advise him on matters of general concern. It was this council that in 1626 brought in Minuit to replace the unpopular Verhulst.

WAR AND WAMPUM

Complicating the company's confusion about its purposes in New Netherland were momentous changes in the organization of the fur trade. Intensive trapping had severely depleted the Lenape peltries of the lower Hudson Valley by the mid-1620s, with the result that more and more of the furs exported from New Netherland were now coming from Mahicans who lived on the west bank of the Hudson around Fort Orange. The Dutch were not alone in appreciating the significance of this development. Iroquois-speaking Mohawks, recently repulsed from the St. Lawrence by the French and Hurons, saw a chance to recoup their losses by wresting control of the

fur trade away from the Algonkian-speaking Mahicans. War between the Mohawks and Mahicans broke out in 1624 and escalated rapidly.

Concurrently, both Dutch and English discovered the value of “sewan” or “wampum.” True wampum consisted of long strings of tiny purple and white beads sewn together into belts; a large belt, six feet or so in length, would have contained six or seven thousand beads (“loose” or unstrung wampum was never considered the genuine article). The beads themselves were made from certain clam and whelk shells that could be found only along the shores of Narragansett Bay and Long Island Sound—Sewan-hacky was in fact the Lenape name for Long Island—and the peoples native to those regions had long been accustomed to collecting, drilling, and stringing the shells for trade with groups far into the interior of the continent. With the introduction of European metal awls or drills, perhaps as early as the final quarter of the sixteenth century, it became possible for them to manufacture wampum in significantly greater quantity.

In 1609 Hudson’s men received “stropes of Beades” from some upriver Indians, but it was a crafty Dutch fur trader named Jacob Eelkes (or Eelckens) who became the first European to grasp the significance of wampum. In 1622 Eelkes seized a Pequot sachem on Long Island and threatened to cut off his head unless he received “a heavy ransom.” The sachem gave him over 140 fathoms of wampum, which Eelkes then discovered would fetch more furs than conventional European trade goods. Before long West India Company agents were buying up all the wampum they could get from the coastal Algonkians and trekking it north to Fort Orange to buy furs from the Mahicans—which made the Mahicans all the more inviting a target for the Iroquois, who relied heavily on wampum for ceremonial and diplomatic purposes. Isaack de Rasieres, a Walloon serving as the company’s chief commercial agent and the colony’s official secretary, took the news of wampum up to Governor William Bradford of Plymouth, a settlement of English Separatists founded in 1620. Bradford spread the word, and almost overnight, as he put it, “a great alteration” was wrought in the affairs of the entire region.⁴

Suddenly the fur trade was no longer a simple matter of direct barter between assorted Europeans and assorted native American peoples. Henceforth it would also involve a pair of transactions in which wampum functioned rather like money. In the first, European traders and coastal

Algonkians exchanged manufactured goods for wampum; in the second, European traders used wampum (as well as manufactured goods) to obtain furs at Fort Orange. Not too many years later, wampum would become legal tender throughout both New England and New Netherland.

NEW AMSTERDAM

As the Mohawk-Mahican war intensified, the West India Company weighed the idea of an alliance with the Mahicans. But after Mohawk warriors killed three soldiers from the Fort Orange garrison and “well roasted” a fourth, the company’s managers lost confidence in the Mahicans and cast their lot with the Iroquois. Realizing that New Netherland’s far-flung trading posts couldn’t be defended if they were caught up in the fighting, the company also resolved to abandon those on the Connecticut and Delaware rivers and move the women and children from Fort Orange to an encampment on the southern tip of Manhattan. This was an attractive site because company agents stationed there could still supervise the flow of commerce out of the Hudson Valley and Long Island Sound. It was big enough for the company to maintain its own farms and herds for provisioning the camp. Apparently, too, many of the island’s original inhabitants had recently succumbed to epidemic disease or been driven away by rival groups. (De Rasieres, writing c. 1628, noted that only about two or three hundred of “the old Manhatans” still lived on the island. Along the East River, he added, “is a little good land, where formerly many people have dwelt, but who for the most part have died or have been driven away by the Wappenos [Wappingers].”)

In May or June of 1626, shortly after taking over from Verhulst, Director Minuit began to implement the new policy by “purchasing” Manhattan from the Lenapes for sixty guilders’ worth of trade goods. It’s impossible to say which Lenapes, or what kind of trade goods, because no deed or bill of sale has survived—if indeed there ever was one. However, when he and five other colonists also “bought” Staten Island on August 10, 1626, they paid the local sachems “Some Dimes [duffle cloth], Kittles [kettles], Axes, Hoes, Wampum, Drilling Awls, Jew’s Harps, and diverse other other wares”—probably the same kind of trade goods with which they had obtained Manhattan. (Probably, too, those “drilling awls” were the very kind used by coastal Algonkians to manufacture wampum.)

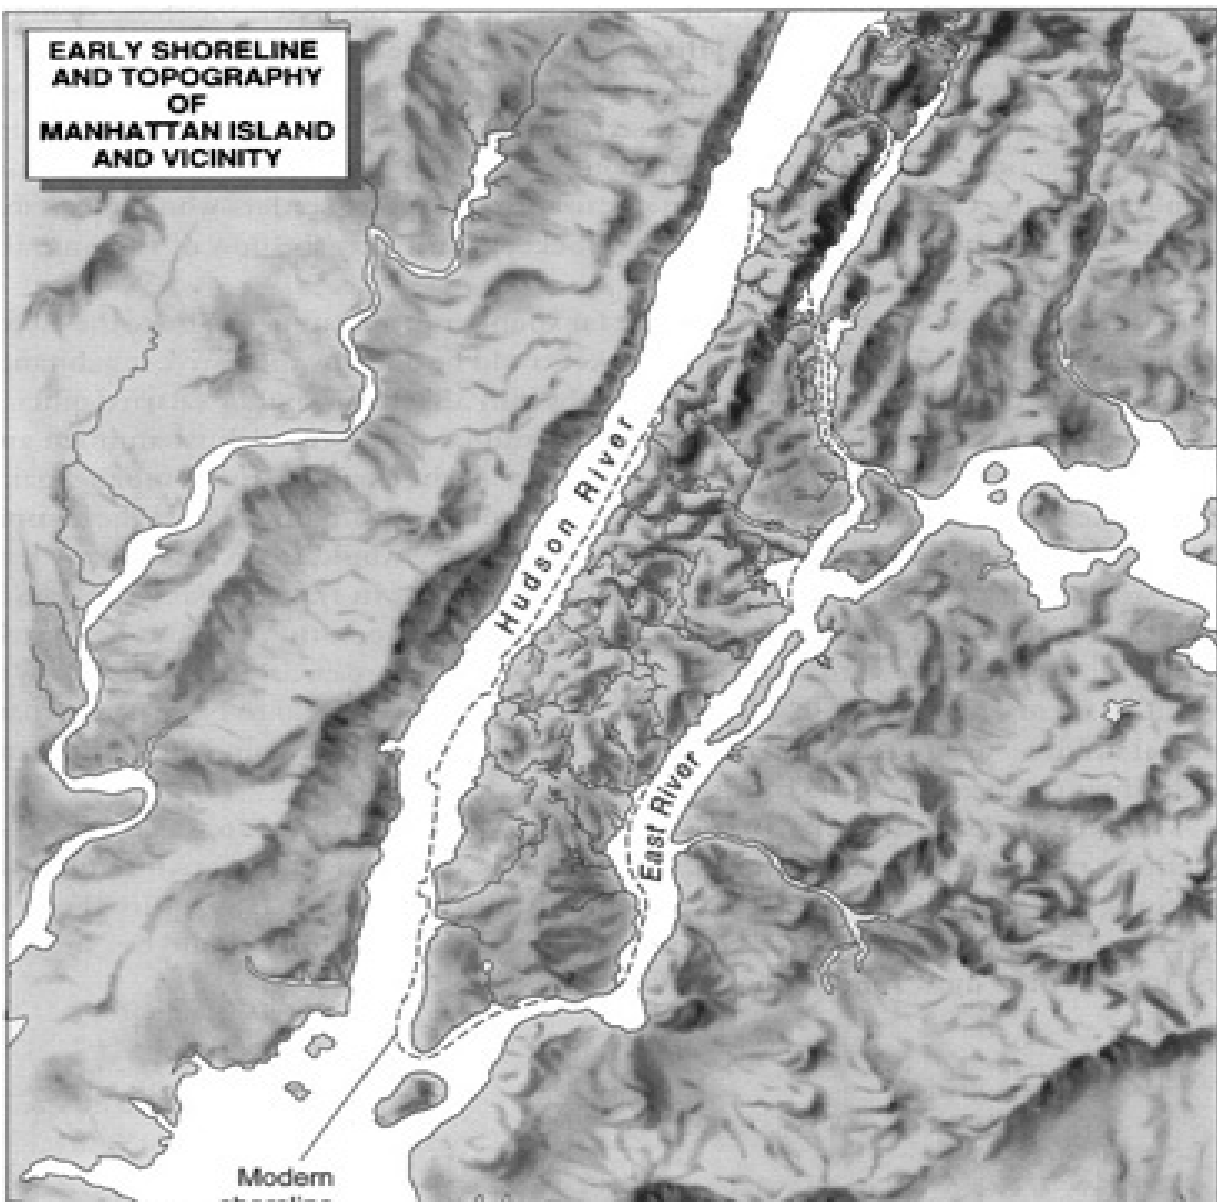

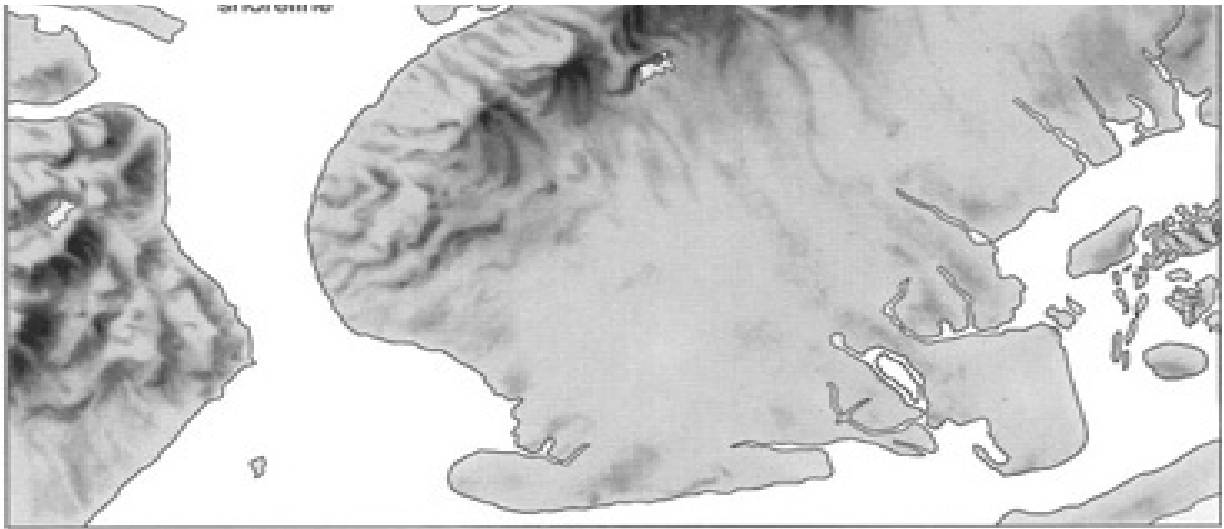

New Amsterdam, c. 1626. Perhaps drawn by Cryn Fredericks, the company's engineer, this view greatly exaggerates the size of the fort but accurately depicts the mill and cabins that huddled outside its walls. Engraved and published by Joost Hartgers in 1651. (© Museum of the City of New York)

Engineer Fredericks and his workers meanwhile scaled back their plans for a real fortress and threw up a simple blockhouse surrounded by a palisade of wood and sod. Other workmen hurriedly erected a sawmill on Noten (Governors) Island, then heavily wooded, and used the lumber to build thirty cabins. These were followed by a stone countinghouse “thatched with reed” and “a horse-mill, over which shall be constructed a spacious room sufficient to accommodate a larger congregation.” The mill was to have a tower where bells captured the year before at the sack of San Juan would be hung. The new settlement was dubbed New Amsterdam. It had about 270 inhabitants, including a handful of newborn infants.

Was it a settlement, though? Many of those 270 inhabitants, undoubtedly the Walloons and perhaps Minuit as well, wouldn't have objected to the term. They saw themselves as settlers and thought—not without reason, considering the terms of the Provisional Orders—that the West India Company did too.

A majority of the company's shareholders saw things differently. Continuing to favor trade over colonization, they viewed New Amsterdam as a commercial "factory" or trading post indistinguishable from dozens of other such installations scattered along the coasts of Africa, India, Malaysia, and China. It wasn't a beachhead of imperial conquest or a citadel to overawe a subject population. It wasn't a seedbed for transplanting Dutch culture in the New World. It wasn't a workshop or plantation for the production of commodities. It was, purely and simply, a place where cheap European manufactured goods (knives, axes, blankets, iron pots, nails) would be exchanged for those items of local origin (dressed and cured pelts) that would fetch a good price back home.

From this perspective, the company would actually do itself more harm than good by promoting a proper colony in New Amsterdam. Settlers would require constant support and protection—both of which cost money—and the more there were, the trickier it would be for the Company to maintain its authority. Besides, settlers would inevitably squabble with the Indians over land and livestock, jeopardizing the flow of furs into the company's storehouses.

As a factory, New Amsterdam seemed a far sounder proposition. Because the laborintensive drudgery of preparing furs for market could be done by the native inhabitants, the colony would be able to get along very nicely with a skeleton staff of salaried officials plus a small number of hired artisans, soldiers, and laborers. A few husbandmen and farmers could keep it supplied with fresh food (just as, for example, the company maintained cattle herds on Bonaire to feed Curacao). Employees wouldn't expect the company to provide much in the way of amenities, either. They would sleep in company barracks, work with company tools and equipment, and eat in the company mess. Nor would the company have to be particular about who they were: they needn't be Dutch, and they surely didn't need to be respectable. It wasn't even essential for the company to have all of them on the payroll: anyone, strictly speaking, could go to New Amsterdam and deal in furs—as long as they sold them to the company, at the company's price, and bought their trade goods at the company's stores.

Thus the little community that gathered on Manhattan in 1626 was a hybrid—something more than what a majority of West India Company

directors intended yet something less than what many of its inhabitants must have hoped, a confused mix of private and public aspirations, of commerce and colonization, of employees and settlers. It wasn't the most solid of foundations.

3

Company Town

According to Nicolaes van Wassenauer, the Dutch physician-journalist who published a semiannual compilation of intelligence from America, New Amsterdam's first year had gone remarkably well. "Men work there as in Holland," he rejoiced. "One trades, upwards, southwards and northwards; another builds houses, the third farms. Each farmer has his farmstead on the land purchased by the Company, which also owns the cows; but the milk remains to the profit of the farmer; he sells it to those of the people who received their wages for work every week. The houses of the Hollanders now stand outside the fort, but when that is completed, they will all repair within, so as to garrison it and be secure from sudden attack."

People with firsthand knowledge of conditions on Manhattan were less sanguine. Isaack de Rasieres worried that few colonists had come prepared to establish anything more than a grubby little trading post. Some, not having contracted to perform manual labor, expected the company to provide them with food and shelter while they got rich in the fur trade. The rest, de Rasieres wrote in a letter home, were a "rough lot who have to be kept at work by force." "I cannot sufficiently wonder at the lazy unconcern of many persons, both farmers and others, who are willing enough to draw their rations and pay in return for doing almost nothing," he added.

De Rasieres's criticism paled alongside the fulminations of Dominie Johannes Michaelius, New Amsterdam's first regular minister of the gospel. Fresh provisions were scarce and overpriced, Michaelius wrote angrily to friends back in the Netherlands; it was impossible to get a horse or a cow, rations distributed by the company were disgusting—"hard stale food, such as men are used to on board ship"—and there were no decent houses, only "hovels and holes" where the colonists "huddled rather than dwelt." Nobody seemed really interested in improving things, either. Some of the Walloons had already given up and gone home. A few years later, the dominie himself followed.

Criticism of New Amsterdam flared at company headquarters as well. Expenses were running well ahead of initial projections, and income from

the fur trade hadn't lived up to expectations. After two or three profitless years, investors as well as directors were clamoring for the company to cut its losses, abandon Manhattan, and concentrate on operations in the West Indies and Brazil.

PATROONS AND PURITANS

New Amsterdam's future brightened temporarily when Admiral Piet Heyn, commanding a flotilla of thirty-one company vessels and three thousand men, captured the Spanish treasure fleet outside Havana in 1628. Heyn returned to Amsterdam with two hundred thousand pounds of silver, 135 pounds of gold, and a mountain of sugar, pearls, spices, hides, and other merchandise—worth, all told, a whopping fifteen million guilders. This triumph of organized banditry enabled the company to pay a fat 50 percent dividend and made Heyn a national hero. Over the next half-dozen years, largely financed by Heyn's coup, company forces would drive the Portuguese from their lucrative sugar plantations in Brazil and seize Curasao, which commanded the vast salt pans on nearby Aruba and Bonaire.

In the general euphoria that followed Heyn's coup, the prosettlement faction led by Kiliaen van Rensselaer persuaded the West India Company to give New Netherland a second chance. In the Freedoms and Exemptions of 1629 (also known as the Charter of Liberties) the company agreed to give large chunks of New Netherland to "patroons" who would promise to buy the land from the Indians and import fifty or more settlers at their own expense. It also agreed to supply the colonists with slaves and to build a better fort on Manhattan. The reward for these concessions would be continued control of New Netherland's trade: all goods coming into and out of the colony, furs included, would have to travel in company vessels at company rates and pay specified duties to company agents at New Amsterdam.

Van Rensselaer promptly applied to the company for a "patroonship" called Rensselaerswyck, a seven-hundred-thousand-acre domain surrounding Fort Orange. A half-dozen other directors associated with Van Rensselaer followed with applications for their own patroonships. Michael Pauw set his sights on Pavonia, which included Staten Island and the west bank of the Hudson across from Manhattan. Most of the projects existed

only on paper, however, quietly forgotten when the would-be patroons came to their senses or failed to overcome the skepticism of potential investors. Pauw did build a house on the site of present-day Jersey City but lost too much money, quarreled with the local Indians, and ultimately sold his rights to Pavonia to the company in 1637. Rensselaerswyck alone survived, a thorn in the company's side for years.

The patroonship fiasco was compounded by the vigorous expansion of settlement in neighboring New England. In 1630 Puritan immigrants founded the town of Boston in a colony they called Massachusetts Bay; thousands more followed over the next decade. They were a doctrinaire and disputatious people, and dissidents soon began streaming out of Boston to plant a crop of new settlements elsewhere in Massachusetts as well as in New Hampshire, Rhode Island, Connecticut, and eastern Long Island.

From the West India Company's point of view, the Puritans couldn't have showed up at a less opportune moment. As trappers and traders from Massachusetts joined those from Plymouth and fanned out across the dwindling peltries of northern New England, the company's chances of turning a profit in the fur trade grew steadily slimmer. What was more, the arrival of actual settlers—besides undermining Dutch claims to the Connecticut River Valley and Long Island—threatened the wampummanufacturing Lenapes who lived along Long Island Sound. Their displacement or conquest by the English would strike directly at the company's ability to obtain furs from the Mohawks at Fort Orange.

An all-out buildup of Dutch settlement along the New England frontier might still save the situation. The question was whether the West India Company, distracted by big-budget campaigns in the West Indies and Brazil, cared enough to work out an acceptable alternative to patroonships.

THE CASE FOR COLONIZATION

Back in New Amsterdam, it seemed that everyone had fixed the blame for the colony's lack of progress on Peter Minuit ("a slippery man," fumed Dominie Michaelius, "who under the treacherous mask of honesty is a compound of all iniquity and wickedness.") The company decided to replace Minuit with Wouter van Twiller, a twenty-seven-year-old former

clerk in its Amsterdam headquarters and, not unimportantly, the nephew of Kiliaen van Rensselaer.

Van Twiller arrived in 1633 with a hundred-odd soldiers, the first regular troops to be stationed in the colony. He made a show of sealing the border between New Netherland and New England by erecting a fortified trading post called the House of Good Hope (now Hartford) on the Connecticut River, but to no avail. The English coolly ignored the House of Good Hope, and the callow Van Twiller, unwilling to make a fight of it, abandoned the company's jurisdiction over the Connecticut River Valley.

Van Twiller's administration of New Amsterdam was no more successful. He attempted to rehabilitate the fort and did manage to build a new bakehouse, a "small house" for the midwife, a goathouse, and a proper church. He drank too much, on the other hand—once, in an alcoholic rage, he even chased Dominie Everardus Bogardus, Michaelius's replacement, around town "with a drawn knife"—and spent too much time scheming to acquire land for himself and his cronies under the company's patroonship plan. At one time or another Van Twiller owned what are now Governors, Wards, and Roosevelt islands, as well as tobacco plantations in what are now Greenwich Village and the Red Hook section of Brooklyn. (Easily grown on fields already cleared by the Lenapes, tobacco was a profitable and popular crop.)

Ironically, although the West India Company hadn't yet decided to try again to promote settlements outside New Amsterdam, Van Twiller's landgrabbing helped establish the first Dutch colonists across the East River on Long Island. Between 1636 and 1638 he registered the "purchase" from various Lenape sachems of better than fifteen thousand acres of land at three locations in what is now Brooklyn. One site, in Gowanus, belonged to William Adriaense Bennett and Jacques Bentyn. Another, on Wallabout Bay, belonged to Joris Jansen de Rapalje, a Walloon. The third site, by far the best and largest, lay on the broad, treeless plains just to the north and west of Jamaica Bay where the Canarsees had maintained planting fields. Part of it was reserved by Van Twiller for his own use, part belonged to Jacob van Corlear, and part was held by two partners, Andries Hudde and Wolphert Gerritsen (for whom Gerritsen Beach is named).

Only Hudde and Gerritsen attempted to occupy their portion—known variously as Achtervelt (i.e., after or beyond the plains or flats of south-

central Brooklyn), New Amersfort (Gerritsen's hometown in Holland), or simply Flatlands. The two partners broke ground in 1636 near where the Flatlands Dutch Reformed Church now stands at the intersection of Flatbush Avenue and Kings Highway. An inventory made two years later reveals that they had put up a house, barn, and hayrick. The house was twenty-six feet long, twenty-two feet wide, and forty feet high, "covered above and all around with boards" and "surrounded by long, round palisades"—evidently a precaution against Indian attack. The partners had thirty-two acres of land sown with summer and winter grain as well as a garden planted with fruit trees. Their livestock included a half-dozen cows, several oxen, and five horses. This brave little beginning didn't inspire others to follow in their footsteps, however: a full decade would pass before the West India Company could point to more than a sprinkling of settlers anywhere on Long Island.

While New Amsterdam struggled along, Holland was seized by the Tulip Mania, a bizarre speculative frenzy that boosted the price of tulip bulbs to unheard-of levels before it collapsed in February 1637, wiping out innumerable unwary investors and generating widespread unemployment. The States-General began to talk of exporting the indigent to New Netherland—at which point it became more obvious than ever that the West India Company had done little over the previous decade to populate the colony or protect it from being overrun by the English. Under pressure to remedy the situation or surrender New Netherland to the nation, the company's directors decided to act.

Their first move was to fire Van Twiller and annul his various land purchases. The second, which took two years to complete, was a revision of the Freedoms and Exemptions that made the first deliberate provision for settlements outside New Amsterdam. Prospective emigrants to New Netherland were now promised cheap transportation, up to two hundred acres of land, and a schoolmaster for the education of their children. Except for minor regulatory taxes on imports and exports, the company also consented to permit free trade in the colony, abandoning the commercial monopoly it had so jealously guarded for twenty years.

The fate of the new policy hinged on the company's third move, its appointment of Willem Kieft as director of New Netherland. Kieft was a merchant with excellent family connections and a reputation for learning.

He was also rumored to be something of a crook. According to one story, he had recently left France “in a hurry.” According to another, he had once absconded with money raised to ransom Christians imprisoned by the Turks. Considering the havoc Kieft would wreak on New Netherland over the coming eight or nine years, the company’s directors would have done well to inquire into such talk a bit more closely.

PERSONNEL AND CHATTEL

When Kieft stepped ashore in 1638, New Amsterdam was a collection of eighty or ninety structures occupied by four hundred or so people—not much bigger, in other words, than it had been a dozen years earlier in the days of Peter Minuit. (Boston, four years younger, already boasted a thousand inhabitants.) Most of the town lay along crooked footpaths to the east and south of the ramparts of Fort Amsterdam. A string of buildings followed the East River shore along what is now Pearl Street as far as a sluggish creek known as Blommaert’s Vly (Broad Street). No more than a handful stood on the far side of Smit’s Vly (the foot of Maiden Lane).

Everything in sight belonged to the West India Company, and the company had never been diligent about maintenance, let alone appearances. Everywhere Kieft looked he saw chaos, squalor, and dilapidation. Fort Amsterdam, he informed the West India Company, was “totally and wholly in a ruinous condition, so that people could go in and out of said fort on all sides.” The director’s house needed “considerable repairs,” as did the company’s five stone workshops, the wooden church built by Van Twiller, and the smith’s house. The thirty cabins built a decade earlier were still standing, though many were now occupied by sheep and pigs. Of the four windmills belonging to the company, only one gristmill and one sawmill remained in operation. Owing to a recent fire, “the place where the Public store stood can with difficulty be discovered.” North of town, along the axis still called the Bowery, the company’s five farms lay “vacant and fallen into decay; there was not a living animal on hand belonging to the Company on said Bouweries.” (In New Netherland, a “bouwerie” was a fully developed farm with livestock, in contrast to a “plantation,” which produced tobacco and other crops.)

As for the inhabitants of New Amsterdam, they had a good claim to being the motliest assortment of souls in Christendom. Probably only a

narrow majority of the heavily male European population was Dutch, for Manhattan ran a distant fourth to Asia, Brazil, and the West Indies as a magnet for fortune seekers from the Netherlands. The rest were Walloons, English, French, Irish, Swedish, Danish, and German, among others—not to mention various Frisians sometimes confused with the Dutch, one Cicero Alberto (known around town as “the Italian”), and Anthony Jansen van Salee (a Muslim mulatto of mixed Dutch and Moroccan ancestry whom everyone called “the Turk”). Between them, Kieft told Father Isaac Jogues, a visiting Jesuit missionary, they spoke no fewer than “eighteen different languages.”

About the only thing they had in common was that nearly everyone was an employee of the West India Company. First among them—making up what might be called New Amsterdam’s official establishment—were the director, the provincial secretary, and the *schout-fiscall* (a combination sheriff and prosecutor). The director made rules and regulations for the colony by outright fiat; the director and his appointed council sat as a court to hear both civil and criminal cases brought by the *schout*. Others were a marshal or constable who acted as court messenger, a few commissaries and their assistants who ran the “public store” and kept track of company property, and a labor foreman. Dominie Everardus Bogardus was on the company payroll too, as were Catarina or “Tryn” Jonas, the official midwife, and New Amsterdam’s first schoolmaster, Adam Roelantsen.

Also in the company’s employ were fifty or sixty soldiers and officers stationed in the fort, various sailors who manned harbor lighters and North River sloops, and at least one mason, blacksmith, armorer, cooper, house carpenter, ship carpenter, shoemaker, hatter, brewer, baker, surgeon, wheelwright, tailor, locksmith, sailmaker, and miller. Often these artisans pursued more than one line of work to supplement their meager wages. Schoolmaster Roelantsen took in washing. Other employees worked company land as tenants, producing small crops of maize, beans, barley, and tobacco. They occupied the lowest level of New Amsterdam’s corporate hierarchy—except, that is, for the company’s slaves.

Slavery had most likely existed in New Amsterdam from the outset, although the details are sparse and ambiguous. In 1625 or 1626 the company imported eleven bondsmen, among them Paulo d’Angola, Simon Congo, Anthony Portuguese, and John Francisco. It acquired three female

slaves from Angola in 1628. Handfuls of others followed, women as well as men, and in 1635 Jacob Stoffelsen was hired as “overseer over the negroes belonging to the Company.” Stoffelsen used the men on a variety of official projects, from repairing the fort and cutting wood to “splitting palisades, clearing land, burning lime, and helping to bring in the grain in harvest time.” In 1641 he had them remove dead hogs from the streets of New Amsterdam, “to prevent the stench, which proceeds therefrom.” The women appear to have been employed as domestic labor, although an irate Dominie Michaelius said that as maidservants “the Angola slaves are thievish, lazy and useless trash.” By 1639 slave quarters were reportedly established on the East River shore across from Hog (now Roosevelt) Island, well outside of town.

None of this meant that the West India Company was ready to invest heavily in slave labor for New Netherland. Dutch opinion remained divided about the morality of owning and selling human beings, and the company (which consulted theologians on the matter) had shied away from the slave trade before 1637, when it captured the Portuguese station at Elmina on the west coast of Africa and began to take over the key sources of supply. Not indeed until 1640, when Portugal broke away from Spain and lost the *asiento*, the license to supply slaves to Spanish colonies, did the company become systematically involved in the trade. And despite occasional promises to import slaves for use on the bouwerries and plantations of New Netherland, it did so only twice before the mid-1650s. As a result, there were never more than a few dozen or so slaves at a time throughout the colony, most of them contraband seized from the Spanish or Portuguese or purchased from the occasional visiting privateer (Virginia settlers bought their first slaves in 1619 from a West India Company warship). Not all were Africans, either: some may have been Indians or even captured Spanish or Portuguese sailors. Few if any were privately owned.

Nor was slavery in New Netherland the system of absolute racial subjugation it would later become. The West India Company never tried to formalize the status of slaves in the colony, and local custom accorded them a measure of respect and autonomy. Slaves were subject to the same laws and judicial procedures as whites. They could own property and testify in court. They could bear arms in time of emergency. They were encouraged to attend services and to observe religious holidays. They could marry and

have their matrimonial bonds registered in the Dutch Reformed Church, the first such surviving record being a double wedding in 1641 that united Anthony van Angola with Catalina van Angola, and Lucie d'Angola with Laurens van Angola.

Blacks were hardly considered equals, to be sure. Adulterous intercourse with “heathens, blacks, or other persons” was banned by a 1638 ordinance. Whites convicted of serious crimes were made to work in chains next to the blacks, while company policy excluded slaves from employment in skilled trades, avoiding possible conflict with white labor. Similarly, punishments meted out to blacks were calculated less to maintain racial supremacy than to ensure a tractable labor force. In 1641 eight slaves confessed “without torture or shackles” to murdering a ninth. Plainly reluctant to hang all eight, the court decided to hang one, chosen by lot. The choice fell on Manuel of Gerrit de Reus, but when the executioner pushed him off the ladder with “two good ropes” around his neck, both ropes broke and the bystanders “very earnestly” called for mercy. The court thereupon pardoned him and the other slaves “on promise of good behavior and willing service”—which was doubtless what they were most concerned about anyway.

All nine of the slaves involved in the 1641 incident—including Big Manuel, Little Manuel, Simon Congo, Paulo d'Angola, and Anthony Portuguese—were among those who received something called “half-freedom” in 1644. They had petitioned the company for emancipation, and Kieft thought it was a good idea, observing that they “are burthened with many children so that it is impossible for them to support their wives and children, as they have been accustomed to do, if they must continue in the Company’s service.” He therefore granted the men “and their wives” their liberty and gave or leased them land on which to support themselves. They weren’t completely free, however. Kieft required them to pay an annual tribute of “thirty skepels of Maize or Wheat, Pease or Beans, and one Fat hog” or forfeit their freedom; they had to work for the company, for wages, whenever it called on them; and their children remained in bondage.¹

Half-freedom for slaves offered the company manifold practical advantages. It lifted the burden of providing for those who were older and less productive—some of the 1644 petitioners had already served for eighteen or nineteen years—while allowing the company to employ their labor as needed. Allowing manumitted slaves to take up land was also

expedient, for “the Negroes’ Farms,” as they became known, were situated on the outskirts of town where their presence would help alert New Amsterdam to the danger of an Indian attack. Some lay just north of the present site of City Hall, near a former Lenape encampment on the pond that the Dutch called Kalch-hook (meaning “lime-shell point,” from the shell-covered promontory above it). Others lay above what is now Houston Street, between Lafayette Street and the Bowery. A third group was concentrated in what is now Greenwich Village. Domingo Anthony’s plot occupied the southwest corner of today’s Washington Square Park; most ran along the marshy banks of Minetta Creek, with Paulo d’Angola’s lying between Minetta Lane and Thompson Street.

Not on this roster of New Amsterdam’s personnel and chattel were the “free inhabitants” who lived outside the company’s authority. Some Walloons still raised cattle and wheat on the outskirts of New Amsterdam, staying to themselves except when they came in to trade at the company store. There were also various independent merchants and their families, a few widows, and a handful of former (or part-time) company servants who, like Hudde and Gerritsen, had begun to set up as farmers on Long Island.

WILD WEST ON THE HUDSON

The diversity of New Amsterdam’s inhabitants when Kieft arrived was matched only by their turbulence. Fully one-quarter of the town’s buildings were “grog-shops or houses where nothing is to be got but tobacco and beer,” he reported, and immoderate drinking caused daily “mischief and perversity.” This probably came as no surprise to company officials back in the Netherlands, as their profits from liquor sales ran second to those from the fur trade. For years the company had operated a brewhouse, which gave Brouwer Straet its name. It also sold imported wines and brandies at the company store and wholesaled liquor to the inhabitants, who were urged to retail it from their homes. Kieft himself proceeded to establish, on Staten Island, the first distillery in New Netherland.

During his first year in office alone, the new director heard over forty criminal cases involving slander, theft, assault, adultery, rape, and murder, with much of the trouble stemming from a skewed sex ratio as well as excessive drinking. Because the company had shown so little interest in promoting permanent settlement, there were many more men in town than

women—and too many of those men were footloose bachelors, down-and-out adventurers, fugitive husbands, runaway servants, and waterfront riffraff who had decided to spend a few years toiling for the company while on their way from wherever to God-only-knows.

Particularly troublesome were the men of the Fort Amsterdam garrison, one or another of whom was always up on charges for drunkenness, fighting, destruction of civilian property, larceny, sleeping on duty, refusing to work, desertion, or insubordination. In June 1638 Kieft and the council hired Nicolaes Coorn as the company sergeant, explaining that “it is necessary to have some one to drill the soldiers in the proper use of arms” (a striking admission in its own right). Within months, however, doom’s unmilitary conduct had the barracks in an uproar. He stole from the troops and looked the other way when the troops in turn stole “turnips, chickens and tobacco pipes” from the company. He traded company property to the Indians for furs, then hid the contraband in his bunk. “Likewise,” according to the *schout*, he “has at divers times had Indian women and Negresses sleep entire nights with him in his bed, in the presence of all the soldiers.” The council eventually broke Coorn to the rank of private and condemned two fellow soldiers “to ride two hours on the wooden horse”—a military version of the pillory in which the culprit was made to straddle a high sawhorse, with weights up to fifty pounds attached to each leg. But nothing changed. The very next year a soldier named Gregoris Pietersen was executed by firing squad for urging the troops to mutiny.

Not only were there too few women in New Amsterdam, but too few women disposed to Calvinist order and decorum. In Europe, unmarried Dutch women struck foreigners, especially the French, as shockingly improper, given to public kissing, lewd talk, and a general lack of regard for chastity, though married housewives were as a rule accounted pillars of sobriety and virtue. On the colonial frontier, mores grew even more relaxed. Over and over again the magistrates came up against bawds and doxies like Nanne Beeche, who went to a party at the house of wheelwright Claes Cornelissen and, “notwithstanding her husband’s presence, fumbled at the front of the breeches of most all of those who were present,” setting off a near riot. Grietjen Reyniers, wife of Anthony “the Turk” Jansen, was said to have “pulled the shirts of some sailors out of their breeches and in her house measured the male members of three sailors on a broomstick”—

which perhaps explained why when the crew of a departing ship caught sight of her on the shore they began chanting, “Whore, Whore, Two pound butter’s whore!” When she and her husband were finally expelled in 1639, they took up farming on Long Island in the vicinity of what is now New Utrecht. Their place was known for years as Turk’s Plantation.

A further complication here was the proximity of native women who seemed entirely lacking in sexual restraint—“utterly unchaste and shamefully promiscuous,” in the words of Adriaen van der Donck. They “are exceedingly addicted to whoring,” agreed Dominie Johannes Megapolensis, who arrived in 1642 to serve as the minister to Rensselaerswyck. “They will lie with a man for the value of one, two or three schillings, and our Dutchmen run after them very much.” The dominie’s point was clear: not until this sexual carnival had been brought under control (by way of law as well as the immigration of respectable women from Europe) could New Amsterdam be considered a properly settled colony, much less a stable community.

DEVELOPMENT

It seemed for a while that Kieft might succeed in taming New Amsterdam. He forbade the sale of liquor except at the company store. He promulgated ordinances to prevent “adulterous intercourse with heathens, blacks, or other persons; mutiny, theft, false testimony, slanderous language and other irregularities.” He prohibited householders from harboring “fugitive servants” from other colonies (a frequent source of trouble) and forbade sailors from vessels in the harbor from staying ashore overnight. He told company craftsmen and laborers to go to work punctually “when the bell rings” and to keep working “until the bell rings again to break off.” He ordered the construction of a two-story stone inn on the East River called the Stadts Herbergh, or City Tavern, later designated as the site for public auctions and the posting of official notices. Inside Fort Amsterdam, Kieft saw to the erection of “a pretty large stone church” as well as a new residence for himself “quite neatly built of brick” (and decreed “that no one shall make water within the Fort”). Although the church was built by contractors from the English colony of New Haven, and the Stadts Herbergh provided food and lodging for many visiting New England traders, Kieft served notice on the English that the West India Company

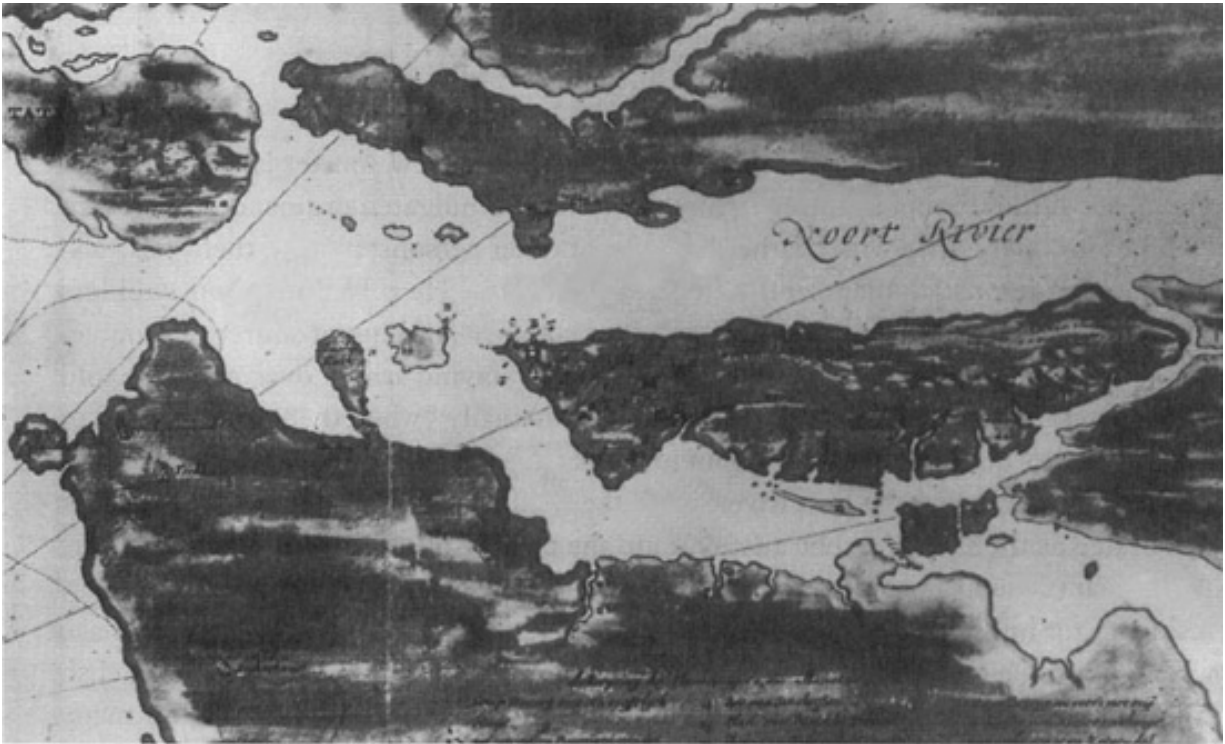

would defend New Netherland's borders. He also vigorously protested when former director Minuit planted a colony of Swedes on the lower Delaware in 1638 and began diverting the local fur trade away from the Dutch.

That same year, moving to implement the company's decision to promote largescale settlement, Kieft began to buy extensive tracts of land from the Lenapes in what are now Kings, Queens, and Bronx counties, as well as Jersey City on the western side of the Hudson. He obtained the area between Wallabout and Newtown Creek, as far inland as "the Swamps of Mespaetches"—later known as Bushwick—for "eight fathoms of duffels [cloth], eight fathoms of wampum, twelve kettels, eight chip-axes [adzes] and eight hatchets and some knives, beads, and awls." At the same time, in a major step toward the institution of private property in New Netherland, Kieft also authorized the first "ground-briefs" or deeds for "free people" who took up land in the colony.

Thus the same Andries Hudde who began farming Achtervelt in 1636 received, in 1638, a patent giving him the right "peaceably to possess, inhabit, cultivate, occupy and use, and also therewith and there of to do, bargain and dispose" of a tract of land lying north of New Amsterdam in what is now Harlem. In return, Hudde agreed that after ten years he would pay the company "the just tenth of the products with which God may bless the soil, and from this time forth annually for the House and Lot, deliver a pair of capons to the Director for the Holidays." That stipulation resembles what would have been called a quitrent in English law, not rent in the ordinary sense. Hudde now "owned" the land and could do with it as he pleased, but he (as well as his heirs or anyone who bought the land from him) would be required to acknowledge the sovereignty of the West India Company with a yearly payment that "quit" or absolved him of any other obligations to the company.

Soon enough the inhabitants of New Amsterdam were buying, selling, and leasing land among themselves, just like the inhabitants of settled European communities—land that only a few years earlier, when occupied by the Lenapes, had supported a fundamentally different network of social and productive relations. Not all land in the colony was turned over to private owners, to be sure, and the company continued to rent its remaining

property to tenants as well as to hire farmers and laborers (and buy slaves) to work its bouwerries.

Manhattan Lying on the North River, c. 1639, also known as the Manatus Map. Possibly drawn by Andries Hudde, a surveyor as well as farmer, it depicts the recent settlement of twenty-two bouwerries and plantations in upper Manhattan, Brooklyn, Staten Island, the Bronx, and New Jersey. The presence of Lenape longhouses in Brooklyn was a pointed reminder that Europeans were still heavily outnumbered throughout the region. The house said to have been provided for company slaves can be seen on the Manhattan shore across from what is now Roosevelt Island. {© Collection of The New-York Historical Society)

Over the succeeding four or five years, free settlers did trickle into New Netherland, and the colony began to flesh out a bit. On western Long Island men named Ryker, Wyckoff, Stoothoff, Teunessen, and Francisco the Negro settled at places they called, informally, Amersfoort, Boswijk, Breuckelen, and Midwout (Vlachte Bos)—not the compact, open-field villages of New England, but isolated, fortified cabins and farmsteads. An initial motive for

this dispersion was to trade with the Indians without paying required duties to nosy agents of the West India Company. But when a ferry began operating across the East River in the early 1640s, settlers began to furnish New Amsterdam with tobacco, corn, wheat, and cattle (Kieft opened New Amsterdam's first annual cattle fair in 1641 on the Marktveldt, just outside the walls of the fort). Similar settlements sprang up on Staten Island under the leadership of David de Vries, a ship captain who had been involved in the ill-fated Swanendael patroonship, and Cornells Melyn, an Antwerp merchant and sometime director of the West India Company.

Outside the half-dozen Dutch settlements of Long Island, however, many of these colonists, perhaps as many as half of them, represented the same broad mixture of nationalities as New Amsterdam itself. Among them were Swedes, Germans, French, Belgians, Africans, and Danes (such as a certain Jonas Bronck who owned a five-hundred-acre farm on the mainland near what is now Morrisania, and who left his name on the Broncks or Bronx River—whence the modern borough of that same name). Their presence didn't, in the long run, augur well for the company's ability to preserve New Netherland as a Dutch colony.

Most serious were the mounting numbers of English dissidents seeking refuge in New Netherland from the Puritan regime of Massachusetts. In 1639 Kieft ordered all Englishmen in the colony to swear an oath of allegiance to the States-General. The next year a small group from Lynn, Massachusetts—eight men, one woman, and one child—tried to take up land at Schout's Bay (now Manhasset) on the north shore of Long Island, but Kieft drove them away with troops.

For reasons that aren't clear, and over the objections of powerful men like Kiliaen van Rensselaer, Kieft dealt more leniently with subsequent arrivals. In 1642 he allowed the Rev. Francis Doughty and his followers, fugitives from Plymouth, to settle a thirteen-thousand-acre tract at Mespat (Newtown). That same year he also permitted the Rev. John Throgmorton and thirty-five families, mostly Quakers, to take up land on Throg's Neck, only twenty-five miles from New Amsterdam on the shore of Long Island Sound; shortly thereafter, Anne Hutchinson, perhaps Puritan New England's most famous nonconformist, settled nearby on what is now Pelham Neck.

DISASTER

Despite the colony's development, Kieft failed to win the hearts and minds of its inhabitants. Prominent colonists complained of his arrogance and his contempt for the council, which he reduced to a single member on the grounds that no one else was qualified to advise him (he did, after all, write his letters in Latin and was a talented watercolorist). His law-and-order campaign lost momentum, and Dominie Bogardus, for one, was furious that Kieft "permitted the officers and soldiers to perform all kinds of noisy plays during the sermon, near and around the church, rolling ninepins, bowling, dancing, singing, leaping, and other profane exercises." (Kieft, in turn, accused Bogardus of frequently delivering his Sunday sermon in a drunken stupor.) Everybody quickly found out, too, that Kieft was a grafter whose cunning and greed made Van Twiller look like a saint. His morals were compared to those of ravens, "who rob whatever falls in their way." In the end, though, it was Kieft's Indian policy that brought the opposition to a head and nearly finished off the colony.

New Amsterdam's first dozen years hadn't been happy ones for its Lenape neighbors. With the influx of colonists came the unfamiliar diseases—smallpox, typhus, measles, diphtheria—that would in time cut the Lenape population to a mere 10 percent of what it had been at the beginning of the century. Their conflicts with settlers, magnified by the increasing availability of guns and alcohol, grew more frequent as well as more violent. European cows and swine trampled their planting fields, while heavy cutting for firewood and building materials wiped out the forests where they hunted game. The Lenapes retaliated by killing the livestock (and occasionally their owners), but this shrinking resource base left them increasingly dependent on the production of maize and wampum to obtain trade goods.

As suppliers of wampum, the Lenapes became increasingly tempting prey for rival fur-trading interests. After the fighting between them ended in 1628, both the Mohawks and Mahicans sent raiding parties to collect tribute from Lenape groups in the lower Hudson region. In the bloody Pequot War of 1637, the New England colonies won control of wampum production on the shores of Long Island Sound. The Dutch were slower to act, and cancellation of the West India Company's monopoly touched off a furious competition for pelts by independent traders called *bosch loopers* (runners

of woods), many of whom were former company functionaries, tradesmen, and farmers. By the time Kieft arrived on the scene, protecting their sources of wampum—now legal tender in New Amsterdam—had become a matter of real urgency.

In 1639, on the preposterous theory that the West India Company was protecting them from their enemies, Kieft demanded “contributions” in wampum, maize, and pelts from Lenape bands living near New Amsterdam. They were perplexed and irritated by the idea: Kieft “must be a very mean fellow,” the Tappans grumbled, “to come to live in this country without being invited by them, and now wish to compel them to give him their corn for nothing.” The following spring angry Raritans drove a Dutch trading party off Staten Island in a shower of arrows.

In the summer of 1641, when the Raritans again refused to pay and allegedly killed some swine from David de Vries’s new plantation on Staten Island, Kieft dispatched Provincial Secretary Cornelius van Tienhoven with eighty-odd soldiers to teach them a lesson. After the soldiers slew three or four Indians and tortured the sachem’s brother “in his private parts with a piece of split wood,” the infuriated Raritans fell upon De Vries’s plantation, killed four of his people, and burned all the buildings. To the nervous inhabitants of New Amsterdam this Pig War, as it came to be known, was entirely Kieft’s fault (De Vries himself charged that company soldiers, not Indians, had killed his pigs). In a bid to placate the critics, Kieft invited the heads of families in New Amsterdam to choose twelve men to help him decide what to do next.

And what, Kieft asked the Twelve, should be done about the recent killing of an elderly Dutch wheelwright, Claes Smits, by Wiechquaesgecks? If they refused to hand over the culprit—and the sachem allegedly said “he was sorry that twenty Christians had not been murdered”—“shouldn’t his whole village be ruined?” Of course, replied the Twelve, Smits must be avenged. But that wasn’t the only issue, they added, and handed Kieft a list of demands for the creation of a responsible municipal government. Furious, Kieft threw out the list and in January 1642 ordered the Twelve to disband.

He didn’t, however, abandon the idea of punishing and extracting tribute from the Lenapes. Over the summer of 1642 another Dutch colonist was killed by a Hackensack near Pavonia, just across the Hudson River. Kieft

told the Hackensacks to give him the murderer, but they refused. Some months later, at the very beginning of 1643, a large and well-armed raiding party of Mahicans attacked Tappan and Wiechquaesgeck settlements above Manhattan, killing seventy and driving over a thousand survivors to seek protection of the Dutch at New Amsterdam. The Wiechquaesgecks still hadn't turned over the murderer of Claus Smits, and when they chose to make camp at Pavonia with the Hackensacks, who also continued to harbor the murderer of a Dutchman, Kieft saw the opportunity to strike.

On the night of February 25, vowing to "wipe the mouths of the savages," he launched a surprise attack on the Pavonia encampment. Company troops massacred scores of men, women, and children, Wiechquaesgecks as well as Hackensacks. At daybreak, wrote David De Vries, the exulting soldiers returned to Manhattan with stories of how infants were "torn from their mother's breasts, and hacked to pieces in the presence of the parents, and the pieces thrown into the fire and in the water, and other sucklings, being bound to small boards, were cut, stuck, and pierced, and miserably massacred in a manner to move a heart of stone." Some of the victims, De Vries added, "came to our people in the country with their hands, some with their legs cut off, and some holding their entrails in their arms." Volunteers attacked a smaller Wiechquaesgeck camp at Corlear's Hook, the bulge on the East River side of Manhattan, with similar results. The heads of more than eighty victims were brought back to New Amsterdam for display, and Kieft made a little speech congratulating his forces on their valor.

The carnage at Pavonia and Corlear's Hook touched off full-scale war. Within weeks eleven major Lenape groups representing virtually the entire native population of the lower Hudson Valley had banded together to fight the Dutch. According to one contemporary account, the enraged Indians "killed all the men on the farm lands whom they could surprise" and "burned all the houses, farms, barns, stacks of grain, and destroyed every thing that they could come at." Among the casualties that year were the New England exile Anne Hutchinson and fourteen of her followers, slain on the banks of the river that now bears her name.

As the panic-stricken survivors streamed into New Amsterdam for safety, Kieft's authority crumbled. Two attempts were made on his life in March. In September, with an angry crowd gathered outside his house, he

agreed to the formation of a Council of Eight to advise him in the crisis. The Eight at once dispatched a memorial to the company directors, detailing the colony's desperate circumstances. Virtually every other settlement had been abandoned, and their former inhabitants now "skulk, with wives and little ones that still survive, in poverty together, in and around the Fort at the Manahatas where we are not safe for an hour." There were only a few score poorly equipped company soldiers in the fort and two hundred men able to bear arms—hardly enough to hold off an estimated fifteen hundred Lenape warriors. The fort itself looked more like "a molehill than a fort against an enemy."

Salvation arrived in the person of John Underhill, a hard-drinking, short-tempered Indian fighter renowned for his brutality in the Pequot War of 1637 as well as for a pamphlet extolling the charms of New Netherland. Underhill and a small contingent of New England troops rallied the Dutch over the winter of 1643-44, attacking Indian villages in Connecticut, on Staten Island, and on Long Island, killing hundreds and taking many prisoners. Some of the captives were brought back to the fort, and an eyewitness reported that Kieft "laughed right heartily, rubbing his right arm and laughing out loud" as they were tortured and butchered by his soldiers. The soldiers seized one, "threw him down, and stuck his private parts, which they had cut off, into his mouth while he was still alive, and after that placed him on a mill-stone and beat his head off." Secretary Van Tienhoven's mother-in-law allegedly amused herself all the while by kicking the heads of other victims about like footballs. In a later raid on an Indian camp near Pound Ridge in Westchester, Underhill and the Anglo-Dutch force were said to have slaughtered somewhere between five hundred and seven hundred more with a loss of only fifteen wounded.

Before the war finally ended in the summer of 1645, some sixteen hundred Indians and scores of colonists had died. Dozens of settlements throughout Long Island, Staten Island, present-day Westchester County, and southern Connecticut had been abandoned or destroyed. As one observer summed up the situation, Kieft's misguided attempts to wring tribute from the Indians had "in a short time nearly brought this country to nought." With the States-General again fretting that New Netherland would be lost to the English, the directors of the West India Company decided that Kieft

would have to go. Orders for his recall were on their way to New Amsterdam before the year was out.

LOSING GROUND

During a lull in the fighting in the summer of 1643, it occurred to Kieft that New Amsterdam would be safer if more people lived in its immediate vicinity. Stepping up the pace of private land grants, he distributed nearly two dozen patents to prospective settlers whose farmsteads, mostly on Long Island, would create a buffer around Manhattan and serve as tripwires in the event of further attacks. (The following summer, to the same end, he would begin to settle manumitted slaves north of New Amsterdam.)

First to accept Kieft's terms were Lady Deborah Moody and a phalanx of Anabaptists—ardent opponents of infant baptism and forerunners of Quakerism. Expelled from Massachusetts in the summer of 1643, they came down to New Netherland looking for a place to settle. They found it at a place they called Gravesend, on the sandy south shore of Long Island, just north of Coney Island. Kieft gave them a patent, but Canarsee raiders—possibly the same band that had just killed Anne Hutchinson—drove them away. The return of peace in 1645 brought them back, armed with a second patent from Kieft, and they soon had their town laid out for a second time.

Testifying to the links between Anabaptism and social egalitarianism, the Gravesend town plan was an unusual variation on the compact, open-field communities typical of New England. The village center—its ghost still visible 350 years later in the street pattern of modern Brooklyn—consisted of four squares or commons, each about four acres in extent and surrounded by ten house lots. Every male householder was assigned one of these house lots—twenty-three of the forty were distributed within the first year or two—as well as a hundred-acre farm or planter's lot in the fields outside the village.

Other English settlers established Hempstead in 1644, and the following year eighteen English families founded Flushing. The irony of an English town named Flushing in New Netherland would have been lost on no one. Its namesake, Vlissingen, was one of the first towns in Holland to revolt against Spain. When the States-General appealed to Queen Elizabeth for military and financial assistance, Flushing-Vlissingen was one of two

“cautionary” towns they allowed the English to occupy as a pledge of good faith. English forces held both for years, much as English settlers were now occupying towns in New Netherland.

Everywhere the West India Company’s directors looked, they seemed to be losing ground. A new round of fighting with Spain had gone badly, and the Portuguese were on the way to retrieving Brazil, despite the company’s tremendous and expensive efforts to fend them off. By mid-decade the directors confronted a million-guilder debt, half of it traceable to losses in New Netherland alone. The Board of Accounts, summarizing “the confusion and ruin” into which that unfortunate colony had fallen, wondered again if they shouldn’t give up and bring everyone home.

Stuyvesant

But the West India Company didn't abandon New Netherland. Instead, reasoning that it could be used to provision Brazil—and if Brazil were lost, that it might be the only Dutch possession of consequence in the New World—the company's directors resolved to make another attempt to get the colony on its feet. Their first step was to find a man tough enough to ride herd on its turbulent inhabitants, and the obvious choice was a company veteran named Petrus Stuyvesant.

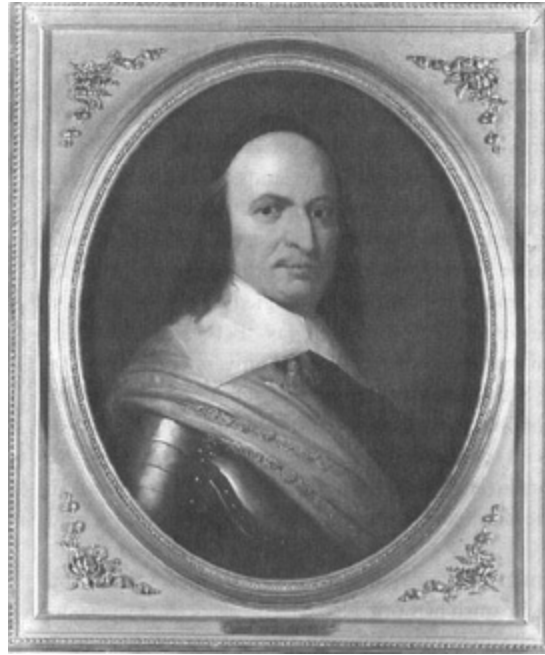

Stuyvesant came from Friesland, in the northern Netherlands, where his father, a Reformed clergyman, preached the stern, bellicose Calvinism of the Counter-Remonstrant party and the Synod of Dort. He enrolled in the University of Franeker at the age of twenty but was expelled two or three years later for seducing his landlord's daughter. His father then sent him to Amsterdam, where he wangled a job with the West India Company and began to make something of himself (as "Petrus" rather than "Pieter" because the Latin form of his name showed that he had university training). In 1630 the company appointed young Stuyvesant its commercial agent on Fernando de Noronha, a tiny island off the coast of Brazil used for operations against the mainland. He was transferred to Pernambuco in 1635, and in 1638 the company moved him to Curacao, now its American headquarters and principal naval base in the Caribbean. In 1642, barely thirty years old, he became acting governor of Curacao, Aruba, and Bonaire.

Stuyvesant's principal assignment on Curacao was to organize an expedition against the island of St. Martin. The Spanish had pried St. Martin away from the company some years earlier, and the Dutch sorely missed its valuable salt pans as well as its proximity to Puerto Rico, which had almost fallen to company forces in 1625 and remained an inviting target. In the early spring of 1644 Stuyvesant fell upon St. Martin with twelve ships and over a thousand men. When the Spaniards refused to surrender, he laid siege. He failed to prevent supplies getting through from Puerto Rico, however, and an enemy cannonball crushed his right leg. Surgeons amputated it just below the knee. Four weeks later, in excruciating

pain, he called off the assault. Later that year he went home to the Netherlands to recuperate and get fitted for a wooden leg. It was, he always said, a sign that God had spared him for great things. The West India Company, for its part, hailed Stuyvesant's peg-leg as a symbol of "Roman" sacrifice and named him director-general of New Netherland at the salary of three thousand guilders per year—fifty times the purchase price of Manhattan and twenty times the annual wages of a company sailor or seaman.

While waiting for the States-General to confirm his appointment, Stuyvesant married Judith Bayard, the daughter of a Huguenot clergyman from Breda. He and his bride left Amsterdam in December 1646. After a quick stop on Curacao, they reached New Amsterdam in August 1647.

The place was a wreck. Kieft's "land-destroying and people-expelling wars with the cruel barbarians," Stuyvesant later reported, had stripped the country of inhabitants, obliterated all but a handful of villages, and driven many settlers to head for home. Barely "250, or at farthest 300 men capable of bearing arms" remained in the entire colony. Around seven hundred people, still fearful of reoccupying their farms, cowered in makeshift huts around Fort Amsterdam, which "I found resembling more a mole-hill than a fortress, without gates, the walls and bastions trodden underfoot by men and cattle." Kieft himself was holed up in his quarters counting all the money he had made—reportedly more than four hundred thousand guilders—and drinking himself into oblivion. The rest of New Amsterdam's besotted inhabitants, Stuyvesant said, were "grown very wild and loose in their morals."

Petrus Stuyvesant, painted in New Amsterdam by Hendrick Couturier, c.1660. (© Collection of The New-York Historical Society)

Certain that this was the work for which the Lord had spared his life on St. Martin, the new director waded in with the same combination of ruthlessness and piety with which the English Puritans were just then consolidating their power under Oliver Cromwell. “I shall govern you as a father his children,” he informed the townsfolk.

TOWN BUILDING

Uppermost in Stuyvesant’s mind was the need to turn New Amsterdam into the kind of community that would appeal to the Dutch taste for well-regulated urban life. For the Netherlands (unlike, say, England) was a nation of town dwellers, known for their civic consciousness and for the love of public tidiness that had led them to adopt the broom as a symbol of national identity and purpose. No sooner had he arrived, therefore, than Stuyvesant began to sweep New Amsterdam into shape with a succession of edicts, decrees, and orders. They would continue to stream from his pen for the next seventeen years—joined, after 1653, by a torrent of ordinances from the burgomasters he appointed to New Amsterdam’s first municipal government.

One of his earliest targets was the town's confounding jumble of lanes and footpaths. Stuyvesant named three surveyors to establish reliable property lines and lay out regular streets, some of which even received names. He ordered the removal of building materials and other obstructions from the streets and imposed a speed limit on wagons and carts. In 1658 the residents of Brouwer (Brewer) Street received permission to pave their lane with cobblestones, creating New Amsterdam's first properly surfaced roadway, now Stone Street.

In 1648 Stuyvesant declared war on New Amsterdam's pigs, cows, goats, and horses. Residents had been accustomed to letting their animals forage freely through the town; while this helped remove accumulations of garbage it also damaged gardens and orchards, and rooting swine had pretty well ruined the fort's sodded ramparts. Henceforth, Stuyvesant announced, the *schout* would seize wayward animals and drag them to a public pound, and soldiers were authorized to shoot on sight any hog grunting its way toward the fort. What was more, residents were forbidden to throw "rubbish, filth, ashes, oyster-shells, dead animal or anything like it" into the streets. Householders were required to clean the road in front of their dwellings. Any privy that released excrement at ground level was banned, for it "not only creates a great stench and therefore great inconvenience to the passers-by, but also makes the streets foul and unfit for use." Butchers were warned not to discard offal in the streets. In 1657 an ordinance established five official sites for the dumping of garbage.

To guard against the danger of fire—"most of the houses here in New Amsterdam are built of wood and roofed with reeds," Stuyvesant explained, and "in some houses the chimneys are of wood, which is very dangerous"—he prohibited further construction of wooden chimneys; later, thatched roofs and haystacks were banned as well. Four fire wardens were appointed to see that all chimneys in town were regularly swept. The wardens banned the use of fireplaces on dangerously windy days. After 1647 a fire curfew required that each evening all fires must be put out or covered up. A decade later the burgomasters began to assemble a municipal firefighting apparatus. Two cordwainers (shoemakers) were hired to produce 150 leather fire buckets, copied from a Dutch sample, and after being painted with the city seal by glazier Evert Duyckinck—the town's first artist—they were placed at various street corners. The following year the town got ladders and fire

hooks. As conditions improved and a sense of permanence began to take hold, Dutch brick “*alia moderna*”—some imported as ship’s ballast, some turned out in local kilns—began to replace wood as a building material.

New Amsterdam, c. 1650-53, copied so often that it has become known as the “Prototype View.” On the far left, just east of what is now Bowling Green, stands the company gristmill, while to its right the twin gables of the Reformed church rise above the walls of the fort. At Schreyers Hook in the foreground—just below what is now the intersection of Whitehall and Pearl streets—are the company’s wooden wharf, crane, and a beam for weighing merchandise (which may also have served the burgeoning community as a gallows). At the extreme right, the City Tavern faces the East River shore on present-day Pearl Street, near the head of Coenties Slip. (© Museum of the City of New York)

From the outset, the company had supplied New Amsterdam with a succession of midwives and *zieckentroosters* (comforters of the sick)—lay

pastors who assisted ordained clergymen by reading Scripture and prayers to the ill. A year before the arrival of Governor Kieft, it sent over the first formally trained physician, Dr. Johannes La Montagne, a Huguenot refugee and graduate of the University of Leyden. The company balked at the expense of a proper hospital, however, until Stuyvesant decided that unsanitary conditions impeded the recovery of sick slaves and soldiers billeted in private homes. In 1658, as a result, New Amsterdam got its first hospital under the direction of matron Hilletje Wilbruch (in the Netherlands such charitable institutions were often run by women).

In 1649 and again in 1653, on the other hand, Stuyvesant refused requests to build an orphan asylum and appoint orphanmasters, claiming that the idea was inconsistent with “the weak state of this just beginning city.” Let the deacons of the church “keep their eyes open,” he said, and look after any destitute children they saw. Matters changed only after 1654, when company officials arranged with the burgomasters of Amsterdam to send children from that city’s orphan asylum to New Amsterdam, there to be bound out as apprentices and servants. Now Stuyvesant not only rented a house to lodge the first group—the town’s first public home for orphans—but, in 1656, established an Orphan Masters’ Court.

The company likewise resisted appeals to provide for the relief of the poor—a responsibility, it said with some justice, that properly lay with religious institutions. In 1653, accordingly, New Amsterdam’s Reformed Church opened an almshouse or “deacons’ house” for the aged poor on what is now Beaver Street. For funding, the deacons relied on contributions collected in church and at weddings, where guests dropped offerings in a poor box. In time, the system acquired a public character as the deacons began to assist the needy in general and were assigned revenues raised from municipal fines. In 1655 the first lottery took place in New Amsterdam as a fund-raising device for the almshouse.

Company involvement expanded in 1661, after the deacons complained that needy people from outlying villages had begun drifting into town for help, diminishing their ability to care for New Amsterdam’s own poor. Stuyvesant and his council enacted the colony’s first poor law, “to the end that the Lazy and Vagabond may as much as possible be rebuked, and the really Poor the more assisted and cared for.” The law required every village to take up weekly collections for its own poor. It also specifically relieved

the New Amsterdam Church from caring for nonresidents who could not present a certificate of character and poverty from the deacon at their place of residence.

So, too, the company responded grudgingly when New Amsterdam's residents asked for schools comparable to those in the Netherlands, where publicly funded education was widely available, even to the poor. The company had launched a common school in 1638, but it refused to build a schoolhouse, forcing teacher and pupils to find temporary quarters. Residents complained repeatedly—in 1649 they appealed again for construction of a “public school, with at least two good teachers”—but the company still declined to spend the money.

Townpeople petitioned as well for a Latin school that would provide more advanced instruction to the many children who could now read and write. The nearest grammar school, they pointed out, was in Boston, 250 miles away, and without an establishment of its own, New Amsterdam was not likely to become a “place of great splendor.” In 1659 the company belatedly agreed to help defray the expense of a teacher's salary (but not erection of a school building), and a certain Dominie Curtius, “late professor in Lithuania,” soon commenced classes with seventeen pupils. By 1664, with the additional assistance of private teachers—the only schooling available to non-Dutch-speaking children—probably a majority of New Amsterdam's white population could read and write. As in Holland, a larger number of women had received an education than was common in other European countries or their colonies.

The company also resisted establishing a police force until 1658, when, partly inspired by fears of Indian trouble, the magistrates organized a rattle watch. A captain and eight men received twenty-four stivers a night (plus an allowance for firewood) to walk around town and “call out how late it is, at all corners of the streets from nine O'Clock in the evening untill the *reveille* beat in the morning.” Given the absence of streetlights, keeping a lookout for crime or fire wasn't the easiest of tasks. If the watchmen discovered anything amiss, they were to use their rattles to rouse the populace.

Stuyvesant was, however, prepared to spend “a considerable amount of money” for “very proper and highly necessary public works”—by which he usually meant projects that enhanced the town's security, commerce, or

moral order. He had masons patch up the fort and oversaw renovations to the church. He established a post office and authorized a municipal pier on the East River, at the foot of what is now Moore Street. Drawing on Dutch skill in mastering marshy terrains, he had a sullen creek on the site of modern Broad Street deepened and widened into what became known as “the Ditch”—and then had its sides planked up to make a little canal, rather grandly called the Heere Gracht. The canal in the heart of town was both useful and, like the windmills, a comforting reminder of life in the Netherlands. To pay for all this the director-general placed “a reasonable excise and impost on wines, brandy and liquors which are imported from abroad.”

Within a decade of his arrival, and despite bouts of official penny-pinching, Stuyvesant’s campaign to tidy up New Amsterdam helped spur its evolution from a seedy, beleaguered trading post into a well-run Dutch town. His success was hardly total, and a conspicuous gap remained between prescription and practice: foraging swine, wooden chimneys, overflowing privies, smelly accumulations of garbage, and tavern brawls continued to frustrate municipal authorities for years. Nor indeed would he have been able to accomplish so much had he not also been able to resuscitate New Amsterdam’s economy.

A WELL-REGULATED ECONOMY

One of Stuyvesant’s most pressing concerns was to create more orderly markets in the city. To combat widespread fraud in the sale and transfer of real estate—the transition to private ownership in New Netherland had given rise to a rather chaotic land market—he announced that all conveyances of real estate would be invalid without his approval and until properly recorded by the provincial secretary. To regulate the sale of local produce and ensure an adequate supply of food—the indispensable precondition for municipal growth—Stuyvesant directed that a municipal market be held every Monday along the East River shore for “meat, bacon, butter, cheese, turnips, roots, straw, and other products of the farm.” Eight years later, in 1656, Saturday officially became the day when “country people” might offer their goods and wares to townsfolk “on the Beach or Strand, near the end of the Heere Gracht,” and farmers from Brooklyn, Gowanus, and Bergen sold produce from their boats parked in the canal,

their dickering with householders reminiscent of similar scenes in the Netherlands. Stuyvesant also established a ten-day free market, to be held every St. Bartholomew's Day (August 24). "Corresponding to the legal Amsterdam Fair," it would be a time when ordinary municipal regulations were suspended, prices would be subject only to the law of supply and demand, and no stranger could be arrested. In 1659, moreover, the burgomasters made the space in front of the fort available for a forty-day-long "market for fat and lean cattle" each autumn; soon the market would be housed in a new building with tiled roof, later called the Broadway Shambles. Proclamations for these events were issued in English as well as Dutch and attracted farmers and their herds from as far away as Southampton.

Stuyvesant kept close watch on retail markets too. He required all persons who kept a "private shop" in cellar or garret, or who carried "on any Trade by the small weight and measure," to use "genuine Amsterdam ells, measures and weights" that had been inspected at the fort. He was not, on the other hand, prepared to establish price controls. When townsmen petitioned him in 1657 about the high cost of "Necessary commodities and household supplies"—charging that not only "Merchants, but also, consequently, Shop-keepers, Tradesmen, Brewers, Bakers, Tapsters and Grocers, make a difference of 30, 40 & 50 percent when they sell their wares"—he took no action. Instead, he banned "Scotch traders"—itinerant merchants from Holland or elsewhere who began visiting the colony soon after the West India Company abandoned its monopoly on trade in 1639. By selling their wares at steep discounts and paying outrageous sums for beaver pelts, these "destroyers of trade," as Stuyvesant called them, could beggar the town's permanent residents. He therefore prohibited anyone from doing business in New Amsterdam who had not built a "decent citizen dwelling" and lived in it for three consecutive years. The directors of the West India Company were avid supporters of free trade, however, and they overruled his ban on "Scotch traders."

Stuyvesant was prepared to impose stricter controls on artisans than on merchants, especially in such vital local enterprises as brewing, slaughtering, and baking. In the face of repeated complaints about the supply and quality of "black" bread—a mainstay of the local diet—he established the assize of bread customary in the Netherlands, ordering

bakers to produce only eight-, four-, or two-pound loaves, at fixed prices, using unadulterated wheat or rye flour “as it came from the mill.” At the same time, to stimulate domestic production, Stuyvesant handed out monopolies for the manufacture of tile, bricks, potash, salt, and other products (it isn’t clear how many such enterprises were actually launched, or how long they survived). Here again West India Company officials rejected policies they thought might discourage prospective settlers. Interference with the law of supply and demand, they explained, reduced “the expectation of gain” that “is the greatest spur to induce people to go thither.” Similarly, Stuyvesant’s monopolies seemed “very pernicious and impracticable especially in a new country, which begins only to develop, and must be peopled and made prosperous by general benefits and liberties to be granted to everybody.”

Soon, however, the burgomasters were issuing ordinances to the same effect. “All bakers, brewers, shopkeepers and merchants” should “sell their goods at reasonable prices to the people,” they announced in 1658. Porters, cartmen, tradesmen, and laborers were told what they could charge for their services; outsiders or “strangers” were forbidden to offer their wares for sale except at stated times and places.

Now it was the bakers who protested, openly defying the ordinance requiring them to sell coarse bread at fixed prices. Squeezed by the rising cost of grain, they routinely sifted their flour with bran, short-weighted loaves, and surreptitiously produced more of the higher-priced white bread and cakes than the law allowed. In 1661 the most frustrated bakers, led by Joost Teunissen, suspended work altogether on the grounds they could no longer earn a living. The magistrates were sympathetic but unrelenting: they warned the bakers to resume production or face the loss of their licenses, raised the fines for substandard loaves, and appointed inspectors to check the weight and quality of all bread sold within New Amsterdam. As the court told Reynier Willemsen, the public interest always came first: to practice your trade in New Amsterdam, you must agree to “bake good and fit bread for the best possible accommodation of the community.”

Stuyvesant did address one of the greatest concerns of the bakers, and of everyone else in the colony: the steady inflation of wampum, New Netherland’s principal currency. Too much of it, Stuyvesant observed, wasn’t the genuine article—“unpierced and only half-finished, made of

stone, bone, glass, shells, horn, nay even of wood, and broken.” As always, bad money drove out the good, and people were complaining that “they cannot go to market and buy any commodities, not even a little white bread or a mug of beer, from the traders, bakers and tapsters.” At the same time, the quantity of wampum in circulation was rising sharply. The New England colonies had recently demonetized wampum, started to coin their own money, and begun to dump huge quantities of wampum, good and bad, on their Dutch neighbors. Wages and prices in New Amsterdam soared, and it was getting hard for anyone to make a living in the fur trade.

Stuyvesant responded by ordering that all wampum used as money must henceforth be strung (“upon a wire, as hitherto it has usually been done”) and that its value would be fixed at the rate of six white or three black beads per stiver for high-quality “merchantable” or “trade” wampum and eight white or four black beads per stiver for inferior wampum. Shopkeepers and tradesmen who refused to accept the poorer grade, if properly strung, faced stiff fines. Stuyvesant also pleaded with the company to ship over enough hard coinage to serve the colony’s needs or let it mint coins of its own, as the English had done. Neither he nor the company considered demonetizing wampum, however, and it remained legal tender.

But Stuyvesant’s most far-reaching suggestion for New Amsterdam’s economic revitalization came in response to events unfolding on the international scene. In 1648 the Dutch finally won their long struggle for independence—a boon for the nation’s private merchants but a disaster for the West India Company, which had always depended on war with Spain to justify its existence and generate income. Soon after Stuyvesant arrived in New Amsterdam, the company’s prospects looked grimmer than ever. By 1649 it couldn’t afford to launch a single ship for the defense of Brazil, and the price of its shares on the Amsterdam Exchange had sunk to an all-time low.

As Brazil slipped from its grasp, the company instigated a momentous revolution in the Atlantic slave trade. During the 1630s and 1640s it had imported nearly thirty thousand slaves from Africa to work the Brazilian sugar plantations. The increasing precariousness of those markets prompted the company to direct its attention elsewhere—above all to the British and French West Indies, where white indentured servants had been producing tobacco on myriad small holdings. On one island after another, company

agents as well as independent Dutch merchants not only convinced the planters to adopt slave labor but loaned them money and equipment to make the switch to sugar, several times more profitable than tobacco. By the early 1650s sugar was well on its way to becoming the principal crop of the Caribbean, large plantations were emerging as the basic unit of production, and the company was funneling tens of thousands of African slaves every year into the region. (On Barbados, richest of the new sugar colonies, the black population soared from a few thousand to better than thirty-two thousand by the 1670s.) Dutch slavers had even started probing Virginia and Maryland, and there was good reason to believe that Chesapeake planters would soon follow their West Indian counterparts in adopting slavery.

It was in this context that it occurred to Stuyvesant and company strategists that New Amsterdam would make a convenient entrepot for the slave trade in North America and a source of vital supplies for the plantation economies developing to the south. It might also be profitable to establish a local market for slaves, perhaps even bring them directly from Angola, thus bolstering New Amsterdam's labor force, hastening the reoccupation of its hinterlands, and securing the entire colony against encroachment from New England. Stuyvesant was one of the new policy's most ardent supporters. His tour of duty on Curaçao coincided with the construction there of vast pens capable of holding thousands of slaves at a time, and it was he who suggested the administrative unification of Curaçao with New Netherland.

Nieu Amsterdam, mid-seventeenth century. The figures in this Dutch print—two colonists, a woman holding a basket of fruit and a man with tobacco leaves, as well as the bare-chested slaves behind them—are identical to those in a contemporary depiction of Barbados, except they are seen here with New Amsterdam in the background. Which came first is unknown, but this version nicely conveys the West India Company's growing involvement with slavery and the slave trade in New Netherland. (I. N. Phelps Stokes Collection. Miriam and Ira D. Wallach Division of Art, Prints and Photographs. The New York Public Library. Astor, Lenox and Tilden Foundations)

The last Dutch stronghold in Brazil fell to the Portuguese in 1654, and implementation of the new policy got underway the very next year. A company ship, the *Witte Paert* (White Horse), anchored in the East River with nearly three hundred Guinea slaves—the first specifically intended for

local buyers—stowed below decks in conditions so cramped and filthy that residents must have been able to smell the ship from the far side of town. Additional shipments arrived before the end of the decade, though the real surge of imports did not come until after 1660, when some four hundred slaves were sold at public auction in the space of three or four years. By the mid-1660s New Netherland had about seven hundred slaves all told, three hundred of whom were held in New Amsterdam, far outnumbering its seventy-five or so free blacks and constituting over 20 percent of the town's total population.

That population had meanwhile grown rapidly, for at the same time it began importing slaves, the West India Company had mounted its most ambitious campaign yet to attract free colonists. It issued a more liberal set of Freedoms and Exemptions and published a barrage of promotional pamphlets praising New Netherland's abundance of rich, easily cultivated land.

Although immigration figures are incomplete and inexact, it appears that the company's efforts—in tandem with Stuyvesant's reform program—succeeded admirably. By the mid-1650s New Netherland's population had climbed to perhaps thirty-five hundred men, women, and children; a decade later, to nine thousand. Of that number, some fifteen hundred lived in New Amsterdam alone, roughly three times as many as Stuyvesant found fifteen years earlier. Only one-fourth of the town's three hundred adult white males could claim to have lived there longer than he had. The newcomers were as diverse as ever, too: half of them hailed from Germany, England, France, and the Scandinavian countries. By the mid-1660s, indeed, only 40 percent of New Netherland's population was actually Dutch, while 19 percent was German and 15 percent English. But these weren't the same kind of people who had been drawn to the colony during its first twenty or thirty years. Seventy percent came over in family groups, many of them couples in their early twenties with small children. Only one in four was a single male, and for the first time a small but significant proportion, about 6 percent, were single women. Better than half were farmers or skilled craftsmen (a few fishermen showed up as well). Only one in eight was a laborer or servant. The rest were soldiers.

“PERSONS OF QUALITY”

Travelers disembarking at the new East River pier in these years would have found themselves near the heart of a bustling, cosmopolitan little seaport. Directly in front of them, facing the river, lay the Strand, a two-block stretch of Paerle Straet (Pearl Street) crowded with taverns, workshops, warehouses, cottages, and brick residences built in the Dutch manner, one or two stories tall, gable-ends out. Just upriver, one block to the right, was the entrance to the Heere Gracht, now lined with houses almost up to what is now Exchange Place. A block to the left stood Stuyvesant's new Great House, a "costly and handsome" two-story residence of whitewashed stone—later known as the White Hall (whence the present Whitehall Street)—which boasted extensive gardens and a private dock for the director-general's barge of state. From there it was a short walk across the Marktveld, past Brugh (Bridge), Brouwers (Brewers, now Stone), and Marktveld (Marketfield) streets—all densely built up—to the parade-ground (now the site of Bowling Green) at the front gate of Fort Amsterdam. The Heere Wegh (Broadway), which led north from the parade-ground, past the company's garden, was only beginning to attract construction, though. Indeed most of the area beyond the upper end of the Heere Gracht was still occupied by orchards, gardens, and grazing cows.

Although the physical transformation of New Amsterdam was remarkable enough, the really striking change, less apparent to the casual observer, was the appearance of an embryonic class system where once there had been only employees of the West India Company. At the top of this new social order stood a few dozen wealthy, socially established, and politically well-connected private merchants from Holland. They were a new phenomenon in town, so much so that in 1656 an embarrassed *schout* had to ask where he should jail "persons of quality, or of good name and character," who broke the law. (He was told they could be held in a tavern, if they had the money to pay for their lodgings.)

Some of these "persons of quality" were representatives of the handful of Dutch commercial syndicates that dominated the colony's trade after the West India Company abandoned its monopoly in 1639. Their business consisted for the most part of exchanging a few basic items of local origin (furs, skins, tobacco, timber) for imported essential trade goods (duffel cloth, liquor, gunpowder). Johannes Pietersen Verbrugge and his cousin Johannes Gillissen Verbrugge came over for the firm of Gillis Verbrugge

and Company; Allard Anthony, a prosperous Amsterdam merchant, served as New Amsterdam agent for the firm of Pieter Gabry and Sons. Other important newcomers—Abel de Wolff, Cornelis Steenwyck, Jan Baptiste van Rensselaer, and William Beekman—enjoyed close family and professional ties with leading West India Company stockholders, private merchants, government officials, and military men. Cornelis van Werckhoven had served as governor of the Amsterdam poorhouse and was an officer in that city's burgher guard. Arent van Hattem was a nobleman and former alderman of the city of Culemborg.

Women like Annetje Jans played a major part in the accumulation of wealth by this nascent upper class. Jans was one of two daughters of Tryn Jonas, the West India Company's midwife. Around 1630 Annetje married Roeloff Jansen, an Indian trader and agricultural foreman up at Fort Orange. Thanks largely to her business acumen, the couple prospered, and later they moved down to Manhattan, where they occupied a sixty-acre farm along the North River shore near the foot of what is now Jay Street. Roeloff's sudden death in 1636 left Annetje with several children to raise on her own but with an attractive estate. Two years later, after getting him to sign a prenuptial agreement that protected the interests of her children by Jansen, she married Dominie Bogardus, moved into his new house near the fort, and leased out her North River farm. Over the next ten years, while bearing several more children, she parlayed the farm's income into a modest real estate empire. After the dominie's death in 1647 she did not remarry but continued to manage her various properties and the marriages of her numerous children. By the time of her own death in 1663 she had become the titular head of a large and powerful clan that included affluent merchants and entrepreneurs (women as well as men), influential magistrates, and the colony's only physician.

Annetje's younger sister, Marritje, was equally gifted at making her way in the world. Her first husband was the West India Company's chief shipwright on Manhattan, her second a carpenter turned farmer. When she married for the third and last time it was to Govert Loockermans, a fur trader and landowner who was probably New Amsterdam's richest man at the time of their marriage in 1649. As it happened, Govert's sister, Anneken, had married Oloff Stevensen van Cortlandt, one of the soldiers who came over with Van Twiller. Although Oloff, like Govert, had a talent

for making money and knew the right people (Kieft helped him along with the job of company commissary), it was Anneken who guided the family fortunes for thirty-odd years. She invested heavily in real estate around New Amsterdam (acquiring along the way a big farm in what is now Greenwich Village), and she is said to have talked Oloff into opening a lucrative brewery by the fort. Like her sisters-in-law Annetje and Marritje Jans, she also passed her business and social talents on to her children. One daughter, Maria, having run the family brewery while still in her teens, married Jeremias van Rensselaer and ran Rensselaerswyck by herself for fifteen years after his death. Two other daughters found husbands in the Philipse and Schuyler families, while a son, Stephanus, would become one of the colony's greatest landowners.

None of this would have seemed odd or unusual back in the Netherlands, where strong and assertive Dutch wives were commonplace. In Dutch law, a unique mixture of Roman and Germanic antecedents, women enjoyed far greater autonomy than they did in the patriarchal English-speaking world. A Dutch woman had recourse to legal process and could file claims against a man. She could own property and retain control of it after marriage. With her husband's permission, she could borrow money, conduct business, and make contracts in her own name. Prenuptial agreements spelling out these rights were mandatory, and the law allowed husbands and wives to prepare mutual wills stipulating that the death of one would not deprive the other of their common property. A Dutch wife wasn't her husband's peer: the law gave him extensive authority to control her actions and allowed him, among other things, to sell or bequeath their common property without her consent. Even so, culturally as well as legally, his power was qualified by the conviction that a submissive wife was incompatible with a strong household.¹

In other ways as well—and in sharp contrast to the bulk of New Amsterdam's inhabitants—the members of this emerging municipal elite were unmistakably Dutch in taste, manner, and outlook. They commissioned comfortable brick and stone townhouses whose steeply pitched gables, high stoops, double doors, and manicured gardens of roses, tulips, and lilies wouldn't have looked out of place in one of Amsterdam's better neighborhoods. Those who could afford to followed Stuyvesant's example in furnishing their houses, as did wealthy inhabitants of

Amsterdam, with furniture of rare woods, paintings, fine china, and heavy silver. Wives of wealthy merchants dressed in the fashionable styles of Amsterdam and Paris, with dresses sent over from Europe or made locally by seamstresses. Their husbands' tastes ran to silk or velvet breeches and to coats flowered with silver lace. Emulating the merchant nabobs of the Dutch empire in the East Indies, they surrounded themselves with servants and slaves. Many imported spinets and virginals to satisfy their love of music. A few amassed modest libraries. Jonas Bronck, for one, owned twenty printed books, eighteen pamphlets, and seventeen manuscript books. Some even wrote themselves: Jacob Steendam, a man of substance with interests in the slave trade and local real estate, found time to compose poetry. His "Complaint of New Amsterdam to her Mother"—the city's first poem—presented the town-as-narrator describing ill treatment at maternal hands ("I, of Amsterdam, was born/Early of her breasts forlorn," etc.).

They were highly sociable, too. The director, the council, the burgomasters, and the orphanmasters frequently held meetings in taverns. Many commercial bargains were struck in the taprooms where merchants gathered to exchange and discuss news. Jollier still were the drinking clubs whose members gathered at favorite taverns to eat and drink. Arguably the best-known establishment was the Stadts Herbergh or City Tavern on the East River. Its ground-floor taproom was always thronged with merchants, sea captains, and Indian traders, and it was one of three places in town designated for the posting of official notices. Metje Wessels's tavern over on Pearl Street was noted for its terrapin feasts. On the Sabbath, after the sermon, many families dined at an inn, and some publicans provided bowling greens, where customers could play ninepins at all times except during divine service. The more vigorous enjoyed ice-skating, boat racing, and angling parties, especially up at an island in the middle of the Kalchhook pond where the Lenapes once fished.

COMMON FOLK

Below the mercantile elite of New Amsterdam's new social hierarchy were the white working people of modest means, not exclusively Dutch, who provided the growing community with its basic goods and services. The backbone of this middling class consisted of a hundred or so skilled

craftsmen and their families, plus a few dozen innkeepers, boardinghouse owners, surgeons, and notaries.

Only a few artisans still worked for the West India Company. Back in 1644, surveying the havoc wrought by Kieft's War, the company's Board of Accounts had recommended slashing the number of its salaried "officers and servants" throughout New Netherland. "Carpenters, masons, smiths and such like ought to be discharged," the board added, "and left to work for whomsoever will pay them." The directors evidently concurred, for over the next ten or twenty years company employees became a distinct and shrinking minority of the colony's population. In New Amsterdam, counting everyone from Stuyvesant down to the poorest laborer, only seventy-five of the town's adult white males, roughly one in four, remained in the company's service after 1660.

Many former employees stayed on and put down roots in New Amsterdam. Abraham Willemsen, for example, had been a seaman in the company's service who married a local girl in 1647, petitioned the court to release him from his obligations to the company, and settled in town as a carpenter. (It's more than likely that he'd been moonlighting as a carpenter for some time already. As Stuyvesant explained to his superiors in 1659, a common soldier employed by the company, "except on extraordinary expeditions, has only to go on guard duty in his garrison every third day" and the rest of the time endeavored "to earn elsewhere something to supplement his small pay and board-money"—no better, in most cases, than thirty guilders per month.)

By the early 1660s old-timers like Willemsen had been joined by a new generation of immigrant artisans representing a wide variety of trades. Coopers made the barrels, hogsheads, pipes, and kegs in which merchants exported flour, salted meats, fish, and beer. The town's bakers (ten of them now) made bread, special cakes for festivals and weddings, and the hard biscuits that formed a large part of the diet of sailors at sea. Evert Duyckinck, the glazier and fire-bucket artist, installed leaded glass, painted with family coats of arms, in the windows of the church at two and a half beaver skins a pane. There were brewers like Isaac and Joannes Verveelen, who ran the famous Red Lion Brewery, carpenters like Frederik Flipsen and Thomas Lambertsen, shoemakers like Coenraet ten Eyck, and tailors like

Hendrick Kip, along with twelve butchers, several tanners, three silversmiths, and assorted hatters and masons.

These middling people of New Amsterdam tended to live in houses like the one built for schoolmaster Roelantsen. Made entirely of wood, it was thirty feet long, eighteen feet wide, and eight feet high, with a small garret above the beams. The single chamber served as a combination dining room, living room, and bedroom, with a built-in corner bedstead for the husband and wife (children slept on straw pallets in the garret). It was illuminated by transom windows by day, homemade candles at night. In the rear was the fireplace, where Mevrouw Roelantsen kept her iron pots and pans, and a door to the back garden, where she grew Indian corn. In quarters like these, furniture was crude, books few, and paintings absent. With the arrival of housewives skilled in domestic arts, however, came an increase in the apparatus of domestic production—vessels and implements for making butter, cheese, candles and soap, for spinning and dyeing yarn, and for cutting and stitching imported duffle cloth into articles of clothing. These shirts and shifts, along with household linen, were washed and dried by the housewife or her young daughter, down by the grassy banks of a pebbly brook that ran from Nassau Street to the East River, along what is today Maiden Lane.

The remainder of New Amsterdam's free white inhabitants comprised a diverse, shifting lower class of laborers, cartmen, transient sailors, apprentices, soldiers, minor West India Company functionaries, farmhands, and indentured servants (too many of the latter, Stuyvesant complained, were runaways)—the same kind of people who until recently had made up the bulk of the colony's population.

Popular culture in New Amsterdam centered on the town's always numerous taverns, grogshops, and pothouses, where noisy, pipe-smoking crowds of men and women drank, gambled, and played games like backgammon, handball, and bowling. (Women were particularly fond of a pipe, Nicasius de Sille observed in 1654. "Young and old, they all smoke.") The Wooden Horse, a particular favorite of sailors and soldiers, was located in a thatched cottage on the corner of Whitehall and Stone streets. In its small single room, boasting only one window and reeking of smoke and stale beer, men sat at long wooden tables, dimly lit by flickering candles, drinking West Indian rum, French brandy, and local brews. The owner was

a Frenchman named Philip Gerard, who had once been sentenced to ride the wooden horse in his days as a soldier for the West India Company.

Places like the Wooden Horse tended to treat the nine o'clock closing law casually, and their patrons often disturbed the peace with drunken brawls, sometimes involving knives, cutlasses, and pikes. Jan Peeck, a cantankerous old Indian trader, lost his license for entertaining “disorderly people” in his taproom near Smits Vly on the East River shore. (His equally troublesome wife would be banished from New Amsterdam ten years later for selling liquor to the Indians.)

The upsurge of immigration to New Netherland during the mid-1650s and early 1660s was accompanied by an exuberant revival of holidays long associated with popular culture in Europe. For centuries, peasants and craftsmen, soldiers and sailors had periodically thrown restraint to the winds and indulged themselves with feasts, games, mock courts, races, processions, and wild merrymaking that inverted the everyday order of society. A King of Misrule presided over Twelfth Night festivities, maidens chased young men about the streets on St. Valentine’s Day, servants frolicked in the market on Pinkster (Whitsunday or Pentecost to the English), and whole villages cavorted about maypoles on May Day. In the Netherlands, the Shrove Tuesday festivities, marking the end of Carnival and the beginning of Lent, involved Rabelaisian consumption of meat and drink (hence Mardi Gras, “Fat Tuesday”).

By the end of Stuyvesant’s first decade in office, the people of New Amsterdam were celebrating these and other *volksvermaken* or “folk pleasures” with gusto. Just as in the Netherlands, they greeted Pinkster with singing and dancing while a “Queen of the Feast” or “flower bride,” dressed in white and holding a May-branch in her hand, led a procession of maidens through the streets of the town. In 1663 the tranquility of Harlem was shattered by young men “shouting, blowing horns, etc.” around a maypole. Shrove Tuesday, too, was now routinely commemorated by the traditional bacchanal of eating and drinking while, as in Europe, young men dressed up like women and paraded about the streets. Another traditional bit of Shrove Tuesday fun, likewise resurrected in New Netherland, was Pulling the Goose. In this rough country sport, a live bird, its neck smeared with oil or soap, was tied by a rope between two poles: contestants on horseback

then rode at full gallop toward the tethered goose and tried to yank off its head.

THE NEGROES' LOT

The bottom rungs of New Amsterdam society were occupied by Africans, though their lives and working conditions varied widely. Most still belonged to the West India Company and worked on important agricultural, public, and military projects. In 1660 Stuyvesant requested additional slaves be sent up from Curacao for company use: "They ought to be stout and strong fellows," he explained, "fit for immediate employment on this fortress and other works; also, if required, in war against the wild barbarians, either to pursue them when retreating, or else to carry some of the soldiers' baggage." Four years later he reported that he had utilized a recent shipment of slaves to harvest food, chop wood, and repair ox carts.

In time, because of the company's chronic unwillingness to spend money, its slaves were also trained for more highly skilled tasks. In 1657 Stuyvesant appealed to the directors in Amsterdam to send him some ship's carpenters, only to be told that Dutch workmen were far too expensive and that carpentry, bricklaying, and other trades "ought to be taught to the Negroes as it was formerly done in Brazil." He appears to have followed orders, inasmuch as contemporary deeds begin referring to Negro caulkers, blacksmiths, and carpenters.

Other of New Amsterdam's slaves worked in private households, either as domestic servants or agricultural laborers. Stuyvesant himself acquired forty slaves, far more than anyone else in the colony; some were domestics, the rest labored in the fields and orchards of his private *bouwerie*, a country estate lying between what are now 5th and 20th streets, east of Fourth Avenue all the way to the East River—a "place of relaxation and pleasure" (as one admiring visitor described it) that Stuyvesant acquired by taking over, either by purchase or fiat, several of the "Negro Lots" or "Negroes' Farms" the West India Company had previously set aside for former slaves. (Nicholas Bayard, his son-in-law, combined six others into a two-hundred-acre farm nearby.) Most privately owned slaves in the colony, however, belonged to farm families in outlying villages like Flatbush, where they and their masters often slept in the same houses, ate the same food, and worked

side by side in the fields. Overall, they were predominantly male—roughly 130 men for every hundred women.

The Peasant Dance, by Pieter Bruegel the Elder. After 1650, such scenes of fun and frolic were becoming more common in New Amsterdam and neighboring villages. (Art Resource, Inc./ Kunsthistorisches Museum, Vienna)

Some Africans were free because the company continued with its half-freedom policy of conditional manumissions. In 1662 three slave women were liberated, on condition that one of them do housework for the director-general each week. The next year Mayken, an old and sickly black woman, was granted outright freedom by the West India Company, “she having served as a slave since the year 1628.” Mayken was almost certainly one of the original three females imported from Angola thirty-five years earlier, whom Dominie Michaelius had accounted “lazy and useless trash.”

Disparities in condition and location made it difficult for Africans in New Amsterdam to establish communities of culture, yet not impossible.

Men and women formed families against great odds—there were twenty-six black marriages recorded in the Dutch Reformed Church between 1641 and 1664—although the dominies were increasingly reluctant to baptize either slaves or their children. In 1664 Dominie Henricus Selyns informed the Classis of Amsterdam that he and his colleagues had halted the latter practice altogether—“due to their lack of knowledge and faith, and because of their worldly aims. The parents wanted nothing else than to deliver their children from bodily slavery, without striving for Christian virtues.” In some instances couples adopted orphans, gathering them into kin units at great cost. In 1661 free blacks Emanuel Pietersen and his wife, Dorothy Angola, sought freedom “for a lad named Anthony Angola, whom they adopted when an infant and have since reared and educated.” Their petition was granted, after they paid the West India Company three hundred guilders (five times the original purchase price of Manhattan).

A City Lost, a City Gained

Although New Motherland appeared to be recovering nicely, Stuyvesant grew increasingly fearful that its very progress had undermined the authority of the West India Company. The arrival of thousands of settlers—too many, he said, lured by “an imaginary liberty in a new and, as some pretend, a free country”—seemed only to have raised the level of irreligion, immorality, and lawlessness in the colony. This was the worry as well of New Amsterdam’s Reformed dominies: Johannes Megapolensis, formerly the pastor at Rensselaerswyck, whom Stuyvesant had persuaded in 1649 to lead the “feeble lukewarm and faint hearted congregation” that still worshiped in the church in the fort; and Samuel Drisius, who came over in 1652 to assist Megapolensis. Staunch Calvinists, the two dominies would join with Stuyvesant (himself the son of one clergyman and son-in-law of another) in an attempt to establish order and righteousness in the colony before it was too late.

Stuyvesant and the dominies were especially troubled by the resurgence of popular holidays, feasts, and carnivals in the colony. For well over a century, European churches, militant Protestant and reforming Catholic alike, had been waging a campaign to stamp out or regulate all such folk pleasures, both because they had popish (or pagan) roots and because they often spilled over into riot or rebellion. Like its Puritan counterparts in England, the Dutch Reformed Church had been very vigorous in this regard. Since the 1580s—and inseparably linked to the struggle for national independence—synods of the Reformed Church had repeatedly attacked popular music, maypoles, plays, dances, and even such apparently innocent amusements as filling children’s shoes, on the feast of St. Nicholas, with sweets and toys. Ecclesiastical suppression of these traditional practices was also strongly endorsed by the Dutch upper classes, who though once willing to join in the general merriment were now cultivating distinctively genteel patterns of recreation, entertainment, speech, and conduct.

In the Netherlands, the outcome of this great conflict over the form and content of public culture was as yet far from certain, for the ever pragmatic Dutch had struck a series of compromises between religious and secular

imperatives, between Calvinism and humanism, between sobriety and festivity. In New Netherland, however, Stuyvesant and the dominies had no intention of compromising. When told about a man who “last Shrove Tuesday walked along the street in woman’s clothes,” Stuyvesant announced that while such behavior “may be tolerated and looked at through the fingers in some places in the Fatherland,” he wouldn’t permit it on this side of the Atlantic.

In 1654, accordingly, Stuyvesant banned all Shrove Tuesday festivities, calling it “altogether unprofitable, unnecessary and censurable for subjects and neighbors to celebrate such pagan and popish feasts and to practice such evil customs in this Country.” Two or three farmers’ servants defied the ban and were caught at a game of Pulling the Goose. Hauled before Stuyvesant to account for themselves, the culprits behaved “in an insolent and contumacious manner, threatening, cursing, deriding and laughing at the chief magistracy.” Stuyvesant, in a sulfurous rage, threw them into prison and reiterated his determination to combat the “sins, scandals, debaucheries and crimes” to which the “rabble” of the colony were prone.

In an effort to reform popular manners and morals, Stuyvesant likewise ordered all “brewers, tapsters, and innkeepers” to close their doors at nine P.M. and directed them to apply to him for proper licenses. He warned the people against “quarreling, fighting and hitting each other” and imposed harsh new penalties (up to a year and a half at hard labor on a diet of bread and water) for those convicted of fighting with knives or swords. He outlawed sexual intercourse with Indians and (because “we see and observe daily drunken Indians run along the Manhatans”) forbade the sale of liquor to them under any circumstances. Unlike officials in Amsterdam, he favored the building of a proper schoolhouse, not only (or even primarily) for the sake of learning but “to keep the youth off the street, and bring them under discipline.” He and the magistrates decreed that “no male and female shall be allowed to keep house together like man and wife, before they have legally been married,” and he summarily deported women “of bad reputation.”

Mindful that the residents of New Amsterdam were indifferent churchgoers, Stuyvesant scheduled Sunday services for the afternoon as well as the morning and charged “all officials, subjects and vassals” of the West India Company to attend both. He enjoined everyone from “going on

pleasure parties in a boat, cart, or wagon” on the Sabbath and banned “all tapping, fishing, hunting and other usual occupations, handicrafts and business, be it in houses, cellars, shops, ships, yachts or on the streets and market places.” In the same spirit, he set aside the first Wednesday of every month for fasting and obligatory prayer. The travails of “our sister state of Brazil,” Stuyvesant said, should serve as a premonition of the wrath that would rain down “from a sky laden with vengeance” if the people of New Amsterdam failed to mend their ways. Observed one townsman, “Stuyvesant is starting a whole reformation here.”

The rabble continued nonetheless to have their fun, which may help to explain why Stuyvesant and the magistrates resorted to more and more draconian punishments. In 1658 a man found guilty of deserting his bride-to-be after the publication of their marriage banns was sentenced to have his head shaved and his ears bored, then to be flogged and put to work for two years with the company slaves. In 1660 a soldier convicted of a “crime condemned by God as an abomination” was ordered “to be taken to the place of execution and there stripped of his arms, his sword to be broken at his feet and he then to be tied in a sack and cast into the river and drowned till dead.” (Sodomy had been fiercely punished once before, in 1646, when a black man named Jan Creoli was sentenced “to be conveyed to the place of public execution, and there choked to death, and then burnt to ashes”; Manuel Congo, “a lad ten years old, on whom the above abominable crime was committed,” was tied to a stake and flogged.) In 1662 a runaway servant was hanged for resisting arrest and his head set on a stake as an example to others. In 1664 Lysbet Antoniosent—one of the three children of half-freed slaves whom the company had kept in bondage—set her master’s Nieuw Utrecht house on fire. The court ordered her chained to a stake, strangled, and burned, though it commuted the sentence on the day appointed for her execution.

SERVANTS OF BAAL

Vexing Stuyvesant as much as the intransigence of traditional popular culture were challenges to the supremacy of the Reformed Church. The revised Freedoms and Exemptions of 1640 and 1650 had stipulated that “no other religion shall be publicly admitted in New Netherland except the Reformed,” as defined by the Synod of Dort. That was the rule in the

Netherlands as well, where it had been interpreted over the years to mean that other Protestants, Roman Catholics, and Jews wouldn't be molested by the authorities so long as they worshiped in private. The West India Company expected that similar allowances would be made for immigrants to New Netherland who didn't belong to the Reformed communion: they could worship as they pleased, providing they did so out of the public eye. But the company underestimated Stuyvesant's fanatical loyalty to the national church. On several important occasions during the 1650s it would be embarrassed to discover that he, Megapolensis, and Drisius seemed bent on imposing a degree of religious conformity on the colony that was unthinkable as well as impracticable in the Netherlands.

First to feel the heat of Stuyvesant's displeasure was New Amsterdam's growing Lutheran population—mostly Swedes, Germans, and Finns. At issue was their opposition to the Reformed rule that at baptism both parents be present and acknowledge the authority of the Synod of Dort. In 1653 the Lutherans asked Stuyvesant to let them organize their own church. He refused, and New Amsterdam's two dominies urged the Classis of Amsterdam to advise the directors of the West India Company to support Stuyvesant's decision. If they didn't, the two said, other sects would want similar privileges and "our place would become a receptacle for all sorts of heretics and fanatics." The directors did as asked.

The Lutherans didn't go away, though, and in 1656 Stuyvesant learned they were holding conventicles—unauthorized services—in Newtown and perhaps elsewhere on Long Island. He issued a strongly worded ordinance banning all such gatherings and threw a few offenders in jail. Unluckily for him, the directors of the West India Company (three of whom were Lutherans) now began to worry that too much zeal would discourage settlement. They told Stuyvesant to let the Lutherans enjoy "free religious exercises in their houses." He did so, but it was all he did, and the controversy continued to simmer for years. (Megapolensis and Drisius were pointedly warned that if they failed to accept the compromise the company would replace them with younger ministers who weren't "infected with scruples about unnecessary forms, which cause more division, than edification.")

As with the Lutherans, so with the Jews. New Amsterdam's first known Jewish residents, two traders from Holland named Solomon Pietersen and

Jacob Barsimson, arrived in the summer of 1654. A little while later, around the beginning of September, they were joined by twenty-three exhausted refugees from Brazil. Mostly Sephardim, the newcomers—four couples, two widows, and thirteen children—had been trying to get to Holland since Recife fell to the Portuguese the previous January. After their first ship was captured by Spanish pirates, they were rescued by a French privateer, which then took them to New Amsterdam.

Their ordeal was far from over, however. When they couldn't raise the money to pay for their passage, the magistrates authorized the French captain to auction off whatever property they had brought with them and held a few in jail as hostages until the entire sum had been paid. Stuyvesant let it be known that he wanted no Jews in New Amsterdam. "Their usual usury and deceitful business towards the Christians" made them undesirable colonists, he explained to his superiors in the company.

More Jews arrived from Holland in 1655—five wealthy merchants and their families, to whom the company gave passports, partly in the hope they would "take care of their own poor." Rumors flew around New Amsterdam that many others were on their way and that construction would soon begin on the town's first synagogue. To Stuyvesant, Drisius, and Megapolensis, this sounded even more ominous than conventicles of Lutherans. "For as we have here Papists, Mennonites and Lutherans among the Dutch; also many Puritans or Independents, and many atheists and various other servants of Baal among the English," Megapolensis told the Classis of Amsterdam, "it would create a still greater confusion, if the obstinate and immovable Jews came to settle here." After all, he grumbled, "These people have no other God than the Mammon of unrighteousness, and no other aim than to get possession of Christian property."

The company's managers didn't see it that way. Under pressure from Amsterdam's Jewish leaders, they rebuked Stuyvesant for his intolerance and pointed out to him that it would be "unreasonable and unfair" to expel the Jews from New Amsterdam, because they had done so much for the defense of Brazil and also—no small point—"because of the large amount of capital, which they have invested in this Company." They ought to have the same civil and political rights in America as in Holland, the directors concluded, "without giving the said Jews a claim to the privileges of exercising their religion in a synagogue." Stuyvesant obediently withdrew

an order expelling the Jews from New Amsterdam “forthwith,” but his persistent harassment of them forced the directors of the company to rebuke him again in 1656. The next year he reluctantly admitted the Jews to full citizenship in New Netherland. Although neither he nor the company was ready to let them build their synagogue, they were allowed to worship in a private house on the corner of the Heere Gracht (Broad Street) and Slyck Steegh (Mill Lane). Asser Levy, one of the Recife refugees, pressured Stuyvesant for even more extensive civil rights. He eventually won the right to serve in the militia, to engage in retail trade, to be licensed as a butcher, and to own a house—the first Jew to do so in New Amsterdam or anywhere in North America.

Stuyvesant had no better luck with the various radical sectarians, mostly English, who arrived in New Amsterdam during the later 1650s. Unlike the Presbyterians, Congregationalists, and other mainstream Calvinists whose views broadly conformed to the Reformed creed, these newcomers appeared to reject all existing forms of religious and political authority. In 1656 one William Wickendam—“a troublesome fellow, a cobbler from Rhode Island,” said Megapolensis—began to preach at Flushing, claiming “he had a commission from Christ.” When he started baptizing people in the East River as well, it became obvious that Wickendam was some kind of Baptist or Mennonite. Stuyvesant promptly threw him out of the colony.

One year later, in 1657, a boatload of English Quakers showed up and astounded everyone with their behavior. Their ship flew no flag and fired no salute; their leader, one Robert Fowler, spoke with Stuyvesant but (Megapolensis said) “rendered him no respect, but stood still with his hat firm on his head, as if a goat.” Fowler departed on the next tide, leaving behind two young women who immediately “began to quake and go into a frenzy and cry out loudly in the middle of the street, that men should repent, for the day of judgment was at hand.” Megapolensis added dryly, “Our people, not knowing what was the matter, ran to and fro, while one cried ‘Fire,’ and another something else.” The *schout* marched them both off to prison “by the head,” and they too were soon on their way out of the colony.

Only a few months later, another Quaker, one Robert Hodgson, began preaching to enthusiastic crowds in the English towns of Long Island. Stuyvesant, informed of Hodgson’s arrest at Hempstead, had him bound to a cart and dragged back to Manhattan, there to be thrown in a dungeon,

tried and convicted without an opportunity to defend himself, and sentenced “to work at the wheelbarrow two years with the negroes.” When he refused, Stuyvesant had him hung in chains and whipped until near death. After a number of appeals for clemency from the shocked inhabitants of New Amsterdam, Stuyvesant deported the unfortunate Hodgson to Rhode Island —“a place of errors and enthusiasts,” Megapolensis explained.

Stuyvesant now issued a proclamation that any ship bringing a Quaker into New Netherland would be confiscated and anyone caught harboring a Quaker would pay a stiff fine. In December 1657 thirty-one residents of Flushing signed an eloquent defense of religious toleration—known ever after as the Flushing Remonstrance—declaring that they couldn’t in good conscience abide by such regulations. Remember, they said, that in the Netherlands, the “law of love, peace and libertie” extended even to “Jews, Turks and Egyptians.” Dismissing the Remonstrance as a “seditious, mutinous and detestable letter of defiance,” Stuyvesant ordered the arrest of the town’s officials.

The Quakers, who thrived on persecution, continued to gain adherents on Long Island, prompting Stuyvesant in January 1659 to order a day of fasting and prayer throughout the colony against their “unheard of abominable Heresy.” The effect, if any, was short-lived. By the summer of 1662 the magistrates of Jamaica advised him that a majority of the town’s inhabitants attended Quaker conventicles at the Flushing home of John Bowne. Stuyvesant had Bowne returned to New Amsterdam for trial and, following the now predictable conviction, banished him to Holland. Soldiers were quartered in Jamaica while the town’s officials attempted to administer an anti-Quaker oath to its inhabitants. When Bowne shrewdly took his case to the West India Company, however, the company’s directors decided that, once again, Stuyvesant had gone too far. Quakers might well be disagreeable, they rebuked him in early 1663, but trying to “force people’s consciences” would almost certainly discourage immigration.

“OUR GREAT MUSCOVY DUKE”

In matters of government, too, Stuyvesant was forced to accept limitations on his authority. The company’s instructions to him (as to his predecessors) had vested the “supreme government” of New Netherland in a council composed of the director, a vice- or deputy director, and the *schout*.

Stuyvesant made it clear from the outset that this system left no room for discussion, much less dissent. “We derive our authority from God and the West India Company,” he thundered, “not from the pleasure of a few ignorant subjects.” When Cornelis Melyn asked for a retrospective investigation of Kieft’s administration, Stuyvesant warned him that private citizens had no business questioning the conduct of lawful authorities, even a scoundrel like Kieft. When Melyn suggested that only company employees need obey the council, Stuyvesant had Melyn clapped in irons for sedition and banished. Ironically, Melyn sailed for home on the same ship that carried Kieft and Dominie Bogardus. Kieft and Bogardus were drowned when the ship foundered off the English coast, but Melyn survived. To Stuyvesant’s dismay, the States-General suspended Melyn’s sentence and allowed him to return to New Amsterdam, where he continued to stir up opposition.

Stuyvesant’s expectation of obedience from the residents of New Amsterdam quickly ran up against their own expectation, derived from conventional Dutch practice, of a proper municipal government. The Netherlands had no landed aristocracy to speak of, urban capital dominated its agricultural production, and a decentralized political system ensured the power of merchant oligarchies over its cities. So the more Stuyvesant insisted on his authority, the more he was resented—above all among the colony’s burgeoning merchant elite. “Our great Muscovy Duke,” they called him (behind his back). He set up an advisory council of prominent colonists—the Board of Nine, it was called—but only made matters worse by treating them too with contempt. He often “burst into a violent rage,” they complained, “if we in our advice didn’t fall in with his humor.” Some thought he was mad. His “head is troubled,” one said; he “has a screw loose.”

After a year or so of intolerable abuse, the Board of Nine became the nucleus of a loose alliance of men who called themselves the “commonality” of New Amsterdam and agitated tirelessly to have Stuyvesant recalled. They derided him for issuing proclamations that nobody paid any attention to. They accused him of paying too much attention to the company’s balance sheets and too little to the well-being of the colony. They blamed him for arbitrary taxation, political favoritism, and corruption.

Stuyvesant responded by arresting their ringleader, the suave young Adriaen van der Donck, and throwing him too out of the colony. Van der Donck and ten current or former members of the board then sent off a blistering “Remonstrance” to the States General that depicted Stuyvesant as a “vulture [who] is destroying the prosperity of New Netherland.” “All the permanent inhabitants, the merchant, the burgher and peasant, the planter, the laboring man, and also the man in service,” despised him, declared Van der Donck and his allies (who included Melyn as well as former director Wouter van Twiller). The only solution was for the West India Company to surrender the colony and let the States-General provide it with a regular government of “godly, honorable and intelligent” men. Besides, now that the conflict with Spain had ended, what good was the debt-ridden West India Company anyway?¹

“Frivolous talk!” Secretary Van Tienhoven scoffed in reply. “Gross ingratitude.” Yet for a time it seemed that the States-General might indeed revoke the company’s charter and assume direct control of New Netherland. Plainly nervous, Stuyvesant’s superiors warned him to be more circumspect. “Govern the people with the utmost caution and leniency,” they wrote, “for you have now learned by experience, how too much vehemence may draw upon you the hatred of the people.”

What saved Stuyvesant, in the end, was the threat of war between England and the Netherlands. The Puritans had now executed Charles I, and Parliament was aflame with plans to protect the nation’s trade—primarily from the Dutch, who were driving the English out of one market after another in Europe and the Caribbean. In 1650 Parliament authorized privateers to begin seizing Dutch vessels; the following year it adopted the first of numerous Navigation Acts that restricted trade with England and English colonies to English merchants. For the Dutch, whose prosperity hinged on freedom of the seas, this belligerence on the part of their sometime ally was alarming indeed. By the spring of 1652, reluctant to tamper with things in New Netherland at so critical a juncture, the States-General had decided against revocation of the West India Company’s charter. The company in turn decided to keep Stuyvesant as director-general. To placate his critics, however, he was told to equip New Amsterdam with a proper municipal government—“a Burgher

Government,” the company emphasized, with a *schout-fiscall*, two burgomasters (co-mayors), and five *schepens* (aldermen).

Naval warfare between the Netherlands and England erupted three months later. Close to home, the fighting went badly for the Dutch, who lost twelve hundred ships and thousands of seamen in clashes off the coast of Britain. Elsewhere, however—in the Baltic, the Mediterranean, the Caribbean, and Asian waters—English losses ran so high that within a year Parliament had declared its willingness to make peace.

THE STRUGGLE FOR POWER

Early in February 1653, as he had been instructed to do, Stuyvesant launched New Amsterdam’s first municipal government in a large second-floor room of the Stadt’s Herbergh (soon renamed the Stadhuis, or City Hall). Clad in their long cloaks and huge bell-crowned hats, the burgomasters and *schepens* appointed by Stuyvesant solemnly took their oath of office and bowed their heads for a benediction. “We thank Thee that . . . it has pleased Thee to make us the rulers of the people in this place,” they prayed. “Incline also the hearts of the subjects to dutiful obedience,” they added somewhat apprehensively. They would have done better to pray for Stuyvesant’s cooperation.

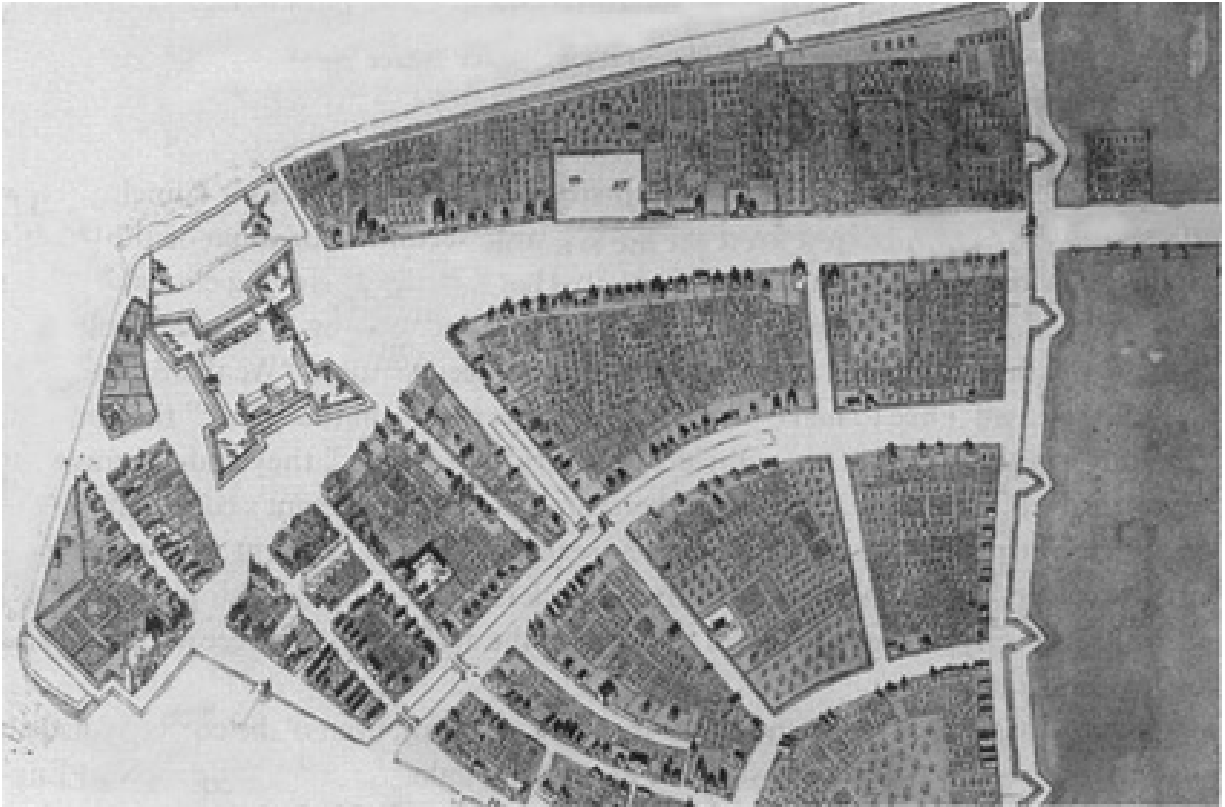

For as the magistrates settled into their seats it still wasn’t evident who in fact governed New Netherland. Were they really “the rulers of the people in this place”? Or did ultimate authority in the colony still reside with the authoritarian director-general and his advisory council?

There wasn’t time to get an answer from the company, even if the company had an answer, for the spring and early summer of 1653 brought warnings that the New England colonies were preparing to attack Manhattan. Captain Underbill, moreover, had called for the English inhabitants of Hempstead and Flushing, where he was now the *schout*, to throw off “the iniquitous government of Peter Stuyvesant.” Ordered out of New Netherland, Underbill went to Rhode Island to raise troops for an invasion of the Dutch colony.

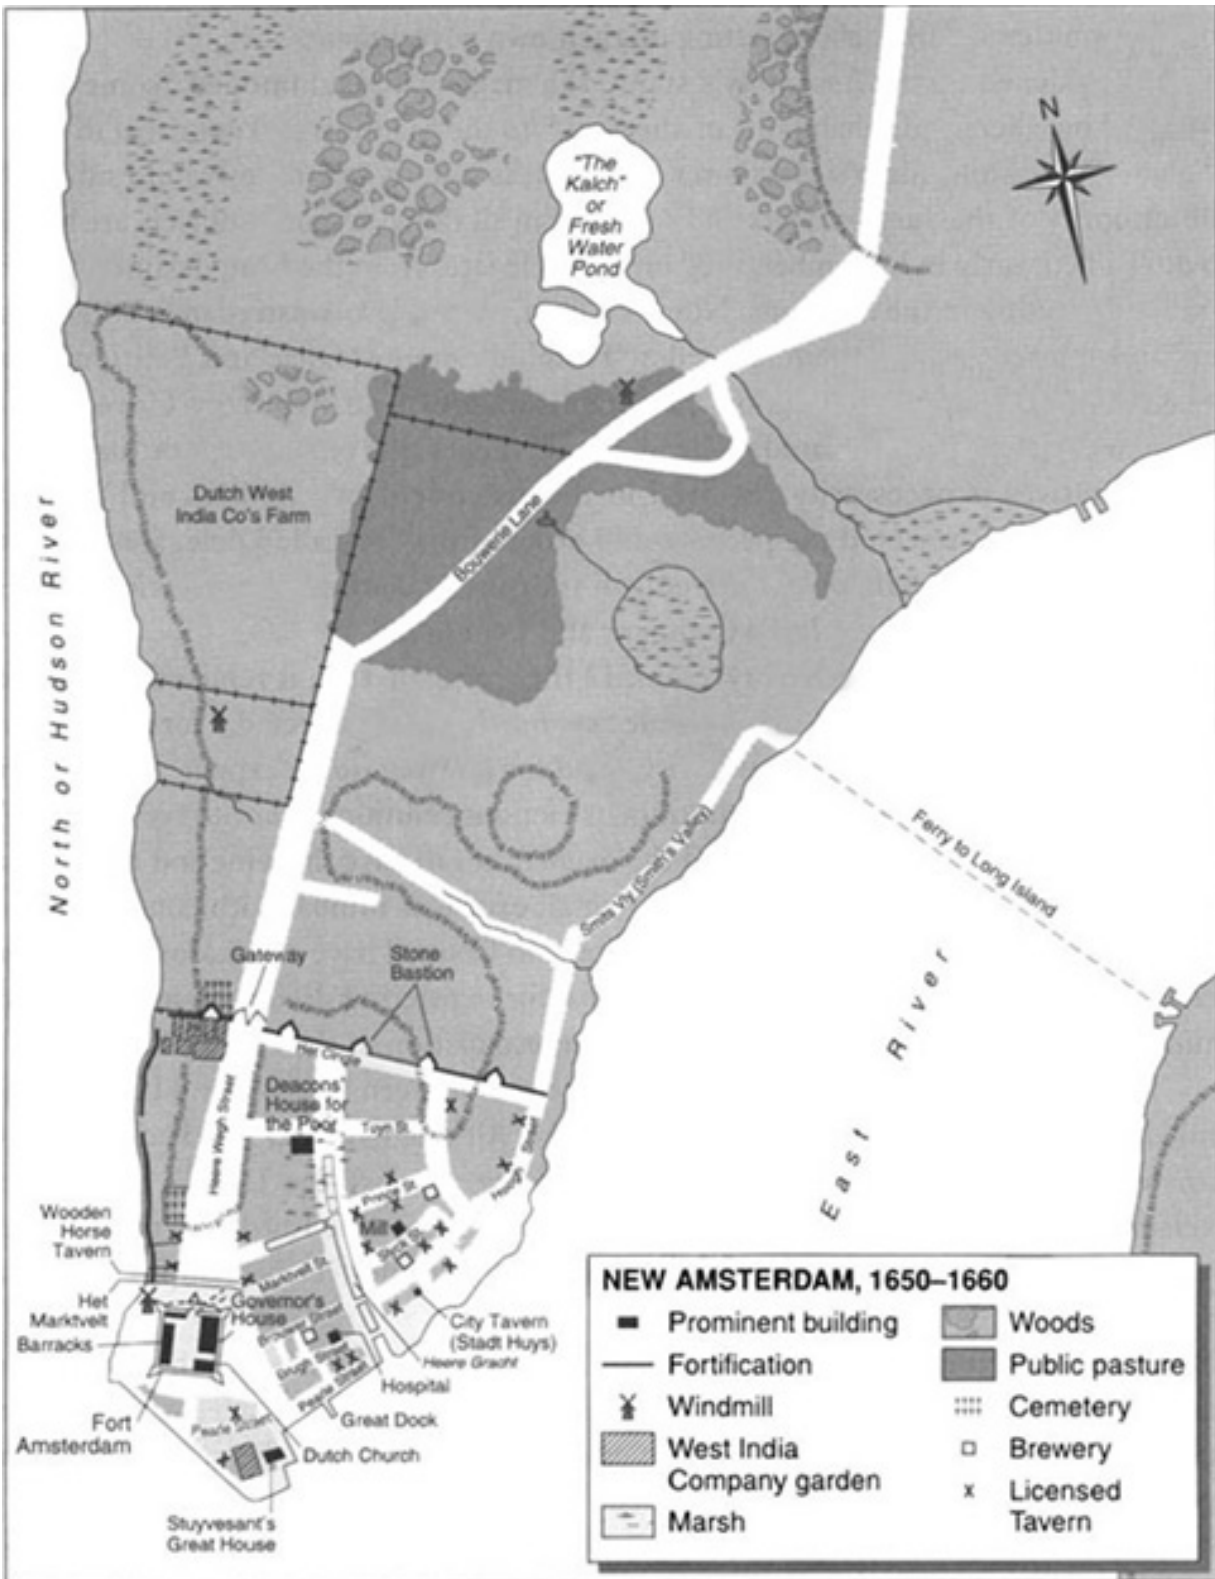

At an emergency meeting between Stuyvesant, his council, and the magistrates, it was agreed that repairs should begin immediately on Fort Amsterdam. It was also decided to build a “high stockade and a small

breastwork” across the town’s northern frontier (the site of present-day Wall Street). Stuyvesant contributed the labor of “the Company’s Negroes,” and the magistrates collected five thousand guilders from New Amsterdam’s forty-three wealthiest citizens, who loaned the funds at 10 percent interest, creating the town’s first municipal debt. Ironically, the stockade’s fifteen-foot planks and oaken posts were supplied by an Englishman, Thomas Baxter. (In the early 1660s the wall would be strengthened by the addition of six bastions with brass cannon and two gates—the Water Poort at the East River road, today the corner of Wall and Pearl, and the Landt Poort, at what is now the intersection of Wall and Broadway.) No sooner was the wall finished, though, than Stuyvesant demanded more money to complete work on the fort and pay for weapons distributed to the public from the company armory.

Coolly, the magistrates informed Stuyvesant that they had run out of funds and wouldn’t think of soliciting more until he turned the wine and beer excise over to the municipal treasury. An independent revenue, they knew, would allow the municipal government to be something more than a rubber stamp for the director-general. Impossible, Stuyvesant said: without the excise he couldn’t pay the soldiers in the fort, and the city would be left defenseless. When this argument failed to impress, he announced that he was calling in all the West India Company’s “outstanding debts [and] the tithes and other royalties that are due” from the town’s inhabitants. The magistrates stood their ground.

In 1660 surveyor Jacques Cortelyou drew up a map of the town that served as the basis for this bird's-eye view (sometimes called the Castello Plan because it was discovered in a villa of that name near Florence). There were now over three hundred houses in New Amsterdam, but when the directors of the West India Company saw this plan of the city, they complained that the place still didn't seem built up enough. Much of the property below the "Cingle," the area adjoining the new city wall, was in fact being used for gardens or orchards while the owners waited for property values to rise. (I.N. Phelps Stokes Collection. Miriam and Ira D. Wallach Division of Art, Prints and Photographs. The New York Public Library. Astor, Lenox and Tilden Foundations)

A showdown of sorts occurred in the autumn of 1653, when Stuyvesant convened a “General Assembly” of delegates from New Amsterdam and

the Long Island towns, English as well as Dutch. He wanted them to deal with the Englishman Thomas Baxter, who, having sold the town the lumber for its wall, had promptly turned pirate and was now preying on vessels of New Netherland and New England alike. The delegates, however, wanted to discuss the management of the colony, and they threatened to suspend the payment of taxes to the West India Company unless they were allowed to do so; a few muttered darkly about setting up their own government.

Emboldened by the Assembly's stand, the magistrates summoned "some of the principal burghers and inhabitants of this City" to the Stadhuis and got them to sign a pledge—New Amsterdam's Mayflower Compact, as it were—that they would submit to the authority of the burgomasters and *schepens* "in all things as good subjects are bound to do." Then, early in December, they invited delegates from the Long Island towns to a second meeting in the Stadhuis. Nineteen men, all of New Amsterdam's burgomasters and *schepens* among them, signed a "Humble Remonstrance and Petition" that described their "apprehension of the establishment of an Arbitrary Government among us." It was, they declared, "one of our privileges that our consent or that of our representatives is necessarily required in the enactment of . . . laws and orders." Stuyvesant curtly rejected the petition and ordered the "so-called delegates" to disperse at once "under pain of our extreme displeasure and arbitrary correction." They sent the petition to the West India Company and went home.

The company sided with Stuyvesant. In the spring of 1654 it rebuked the magistrates for allowing themselves to become "stirred up by the disaffected," for holding "an independent Assembly without authority," and for drawing up "inexpedient" petitions containing "forged pretexts for an imminent factious sedition." Yet Stuyvesant didn't win everything. The company allowed the magistrates to have the wine and beer excise and authorized them to collect "any new small excise or impost with consent of the Commonality . . . unless the Director General and Council have any reason to the contrary." The magistrates also received a city seal for registering deeds and mortgages on municipal real estate and were given permanent occupation of the City Hall.

The summer of 1654 brought news that the war between England and Holland had ended with the signing of a formal treaty of peace. Although neither side had won, New Amsterdam at least was safe—for the time

being. “Praise the Lord!” Stuyvesant exclaimed in his official proclamation of the event. “Praise the Lord!” In mid-August the town celebrated its deliverance with a giant bonfire and free beer supplied by the magistrates.

Over the next decade, Stuyvesant and the magistrates jointly ran the town, constantly bickering over precedence and maneuvering for petty advantages with no clearcut division of duties between them. On one important measure, however, they managed to cooperate without apparent difficulty, and that was the creation, in 1657, of a two-tiered system of municipal citizenship. Any native-born resident of the town, anyone who had lived there (“kept fire and light”) for at least one year and six weeks, or anyone willing to spend twenty guilders for the privilege was eligible for the common or small burgher-right. This provided full freedom of New Amsterdam and the all-important right to practice a trade or carry on business. For fifty guilders, city residents, ministers of the gospel, and military officers could purchase the great burgher-right, qualifying them to fill all “offices and dignities within this City, and consequently be nominated thereto.” Both the great and small burgher-rights were open to women.

Stuyvesant and nineteen others immediately had themselves enrolled as great burghers. Their ranks included one woman, Ragel (Rachel) van Tienhoven, wife of Cornelius. An additional 238 persons subsequently received the small burgher-right, among them ten carpenters, six shoemakers, five tailors, four coopers, two masons, two smiths, two sawyers, one pot baker, one chimney sweep, and one carter.

IMPERILED PERIPHERY

In 1650 Stuyvesant journeyed up to Hartford to resolve the long-standing boundary dispute between New Netherland and the New England colonies. The resulting Treaty of Hartford recognized English control over all of Connecticut east of Greenwich and over Long Island east of Oyster Bay. It wasn’t a bad deal, since the English had previously claimed sovereignty over the whole of New Netherland, but New Amsterdam’s resurgence underscored the need for settlements on western Long Island and upper Manhattan—both to provision its growing population and to create a buffer against the English and Indians. For obvious reasons, Stuyvesant hoped that their inhabitants would be Dutch and that they would see the need to live

together in compact villages, like the people of New England. Yet here too his authority came under attack, and things didn't turn out as he wanted.

New Amersfoort (Flatlands), the oldest Dutch village on the periphery of New Amsterdam, came closest to fulfilling Stuyvesant's expectations. Its few dozen residents—Schencks and Strykers, Van Sigelens and Van Kouwenhovens—lived close by one another in palisaded farmhouses near the intersection of Flatbush Avenue and Kings Highway, not far from where Andries Hudde and Wolphert Gerritsen first broke ground in the mid-1630s. Breuckelen, chartered by Kieft in 1646, was somewhat larger and less well defended. Dominie Henricus Selyns, who arrived there in 1660 to preach the gospel, counted 134 people in thirty-one households, predominately Dutch, scattered along what is now Fulton Street, not far from the ferry landing—"an ugly little village with the church in the middle of the road," he said.

In 1651 Stuyvesant set out to organize a new settlement in the thickly wooded land between Breuckelen and New Amersfoort. He christened it Middlewout, or Midwout; to its residents and neighbors it was also known as Vlachte Bos (Flatbush). Land was distributed to settlers, and in 1654 they received a formal charter permitting them to choose their own magistrates, to raise taxes, to build a church and school, and to provide for their common defense.

Despite Stuyvesant's repeated demands and warnings, the residents of Midwout stubbornly refused to live near one another, as did the English or their New Amersfoort neighbors. After much argument, he ordered them to lay out forty-odd plots of about fifty acres each along an Indian trail (now Flatbush Avenue) that ran down from Breuckelen to Jamaica Bay. Where Church Avenue now crosses Flatbush Avenue, he had them build a stockade and blockhouse as well as a small house of worship for the village's first dominie, the Rev. Johannes Polhemus, who arrived in 1654 from Brazil.

In 1652, the year after creating Midwout, Stuyvesant permitted fifty-odd English Independents and Presbyterians to settle west of Flushing Creek near Mespat Kill. He called the place Middelburgh after the capital of Zeeland; they called it Newtown. The West India Company didn't want them there under any name, however, for with war looming between Parliament and the States-General, the English settlements in New Netherland looked too much like "serpents in our bosom, who finally might

devour our hearts.” Stuyvesant realized his mistake when Middleburgh joined Gravesend, Hempstead, and Flushing in the clamor against him. In retaliation, he reneged on his promise to give Middleburgh a charter and slammed the door on further English settlements in the colony.

Stuyvesant’s settlement-building program very nearly came to grief when he turned his attention to New Sweden, a colony of four-hundred-odd fur traders and tobacco planters on the western flank of New Netherland. For a dozen years the West India Company had done little or nothing to dislodge the Swedes, but after 1650 they became more troublesome, building new trading posts along the Delaware and Schuylkill rivers and harassing Dutch merchants. Stuyvesant vowed to erase New Sweden from the map, and in the autumn of 1655 he descended on the Delaware community with four heavily armed ships and several hundred soldiers. The Swedes gave up without firing a shot.

There was no time to celebrate, however, for bad news had arrived from New Amsterdam. In Stuyvesant’s absence, nearly two thousand Hackensacks, Mahicans, Wappingers, and assorted other “river Indians” came down the Hudson to raid Canarsee camps on Long Island. While gathering food and water on Manhattan, one of their women was killed by a Dutchman for taking peaches from his orchard. That night, enraged Indians poured into town, hammering on doors, ransacking houses, and terrifying the residents. Though no one was seriously injured, the panicky burgomasters, urged on by Secretary Van Tienhoven, organized a militia and drove them away with the loss of several lives on both sides. The Indians then turned their wrath against settlers in upper Manhattan and on Staten Island. Colonists on Long Island feared they would be next.

Before the so-called Peach War sputtered out a month or so later, several dozen of the invaders and fifty whites lay dead. More than a hundred whites, mostly women and children, had been taken captive. Twenty-eight bouweries were destroyed, along with six hundred head of cattle and twelve thousand bushels of grain. Stuyvesant, who hurried back from the Delaware to marshal the colony’s defenses, was shocked at the extent of the destruction. New Netherland has “gone backward so much,” he wrote pessimistically to the States-General, “that it will not be in the same flourishing state for several years.” The burgomasters complained to the company that Stuyvesant and Secretary Van Tienhoven had failed to protect

New Amsterdam and again demanded their immediate recall. Stuyvesant survived, but the company sacked Van Tienhoven. (He later vanished, and his hat and cane were found floating in the river. Suicide? Murder? No one knew.)

Despite Stuyvesant's initially dismal assessment of its impact, the Peach War marked the end of Lenape resistance to European expansion on western Long Island. Not long after the fighting ended, a Massapequa sachem named Tackapousha pleaded with Stuyvesant not to exact revenge on his people. They had done no harm to the Dutch, he said, "even to the value of a dog." In 1656, on behalf of a half-dozen Lenape groups, including the Canarsees and Rockaways, Tackapousha signed a treaty with Stuyvesant accepting the governor of New Netherland as their "protector" and vowing to live in peace with settlers.

After Tackapousha's treaty, the pace of Dutch settlement on the island picked up noticeably. Stuyvesant approved the "purchases" of at least a half-dozen large tracts of land from Lenape groups during the later 1650s and early 1660s. As colonists moved in, many of the Lenapes drifted away, often merging with Algonkian-speaking peoples in New Jersey, Pennsylvania, and further west; those who remained fell prey to one or more epidemics of smallpox. By the mid-1660s, less than fifty years after Minuit's purchase of Manhattan, virtually all of modern Kings and Queens counties lay in European hands.

The pacification of Tackapousha's followers didn't necessarily strengthen Stuyvesant's authority in the villages around New Amsterdam, however, least of all in Nieuw Utrecht. Situated on the headlands of western Long Island overlooking the Narrows—including also what are now the Bay Ridge and Fort Hamilton sections of Brooklyn—Nieuw Utrecht originally belonged to the inhabitants of a Lenape campsite called Nayack. In 1652 Cornelis van Werckhoven, a sometime magistrate of Utrecht and major shareholder in the West India Company, persuaded two Nayack chiefs to sell him the entire area, a thousand or more acres in all, for "six shirts, two pairs of shoes, six pairs of socks, six axes, six hatchets, six knives, two scissors, [and] two combs." (When the Nayack realized that Van Werckhoven expected them to leave, they asked for, and got, a second payment of "six coats, six kettles, six axes, six hatchets, six small looking glasses, twelve knives and twelve combs" before decamping to Staten

Island.) Van Werckhoven himself died shortly thereafter, but the project went ahead under the leadership of Jacques Cortelyou, Nicasius de Sille, and others, who received an official charter from Stuyvesant in 1657.²

By the terms of the charter, twenty initial settlers would each receive fifty acres, divided between small house lots in a central village and elongated out-lots behind it. Despite repeated warnings, though, many grantees failed to build on or enclose their land, and three years later Nieuw Utrecht consisted of only eleven houses and one barn. Its inhabitants were bitterly divided by allegations of fence stealing and by disputes over use of the common meadows, the organization of a watch, and the construction of a palisade.

Stuyvesant came out for a personal inspection of the troubled town. Its residents raised the Dutch flag and gave him “a dinner or public entertainment in as good a stile as the place could afford.” In return, he obligingly let them borrow some slaves to finish the palisade and sent “a half dozen shackles with an iron rod and a good lock” to help maintain law and order. But Nieuw Utrecht wasn’t going to be built in a day. A year later Stuyvesant learned that it was still torn by “controversies, misdeeds, and difficulties” and that new measures were needed “to stimulate the people to build dwelling houses, a block house and public pound, and to dig wells for the benefit of the community.”

In Nieuw Haarlem, by comparison, things proceeded rather more smoothly. Several attempts had been made between the later 1630s and the early 1650s to plant settlements on the rich flats that bordered the Manhattan side of the Harlem River, several miles to the north of New Amsterdam. None had survived Kieft’s War and subsequent Indian troubles, but the land was too valuable to ignore, and settlers there would form an important line of defense for New Amsterdam. (Dutch residents of the colony wouldn’t have forgotten how Nieuw Haarlem’s namesake in the Netherlands put up a legendary seven-month resistance to the Spanish army before capitulating.)

In 1658 Stuyvesant tried again. Grants of between forty and fifty acres of arable land were offered to prospective colonists, along with promises of a court, a minister, and regular troops in time of danger. Two parallel streets, cutting the modern block pattern diagonally, were laid out to meet the Harlem River between the present 125th and 126th streets. The first twenty-

odd house lots were sandwiched between them in two ranges, with garden plots and planting fields assigned to each on the surrounding flats. To emphasize his support for the fledgling settlement, Stuyvesant set company slaves to work on a wagon road linking it with New Amsterdam.

Within a few years Nieuw Haarlem had thirty male residents. Most were heads of families and landowners; some were probably tenants of well-to-do investors in New Amsterdam who had begun to speculate in real estate. They nonetheless made up a strikingly diverse group, including eleven Frenchmen, four Walloons, four Danes, three Swedes, three Germans, and seven Dutchmen. One, Jean La Montaigne, was a veteran colonist, an experienced Indian fighter, and a perennial member of Stuyvesant's council. The majority of La Montaigne's fellow settlers, by contrast, were recently arrived tradesmen who had little or no experience with farming. One was a butcher, one a carpenter, another a mason. Others had previously occupied themselves with making barrels, shoes, pots, soap, or beer. Their diversity and inexperience seem not to have been sources of conflict, however, and they appear to have escaped the troubles that beset their counterparts elsewhere in New Netherland.

Despite the differences among these and a half-dozen other such towns and villages, they were the raw material out of which a distinctive rural society was taking shape on the outskirts of New Amsterdam. These Dutch towns and villages were quite different from the closed, self-sufficient, egalitarian, organic communities of New England. Their inhabitants were essentially strangers, often of widely mixed national backgrounds—imagine the confusion of tongues in Nieuw Haarlem—and they had been brought together by nothing more elevated or complex than the West India Company's promises of land and protection. None had the history of communal sacrifice and struggle, much less radical dissent, that solidified early New England towns, although Flatbush residents strove to maintain a rough equality in the ownership of land and to emphasize cooperative rather than competitive behavior (each household, for example, owned a share of the village's public brewery).

Nor did the Dutch towns encourage the broad popular participation characteristic of their English counterparts. As a rule, each was governed by a court—made up of three *schepens* and a *schout*—who were appointed by the director in New Amsterdam. Although many of the English towns of

New Netherland had contrived to obtain charters with more liberal provisions for self-government, they never felt at ease with the West India Company's unwillingness to relax its grip on New Amsterdam's hinterland.

JAMES STUART, DUKE OF YORK

The challenges to Stuyvesant's authority in and around New Amsterdam might not have mattered so much as they did, or mattered so quickly, were it not for events unfolding abroad. Although the first Anglo-Dutch War had ended without a clear-cut victor, England now had the Netherlands on the defensive. In 1655, just a year after the loss of Brazil, parliamentary forces seized Jamaica from Spain and turned that strategically located island into a base for the further expansion of English influence in the Caribbean. By the end of 1655, as word of New Netherland's recent Indian troubles deepened the gloom on the Amsterdam exchange, West India Company stock had sunk to 10 percent of par, an all-time low. It soon fell to 5 percent, then 3.

Then, in 1660, after a decade of Puritan rule, Parliament restored the Stuarts to the throne. Charles II, the new king, was a cordial and witty man, conciliatory by temperament and conviction. Trailed by mistresses and illegitimate children—his court nicknamed him “Old Rowley” after one of the stallions in the royal stud—he would give his country twenty-five years of jolly sexual intrigue, extravagant private entertainments, and baroque scandals. When Parliament refused him enough money to pay for it all, he accepted secret bribes from Louis XIV of France.

The Restoration didn't derail England's pursuit of the Dutch, however, for even royalists now believed that the proper business of the state was business. Within months of Charles II's accession, Parliament adopted a second Navigation Act reiterating Britain's intention to drive the Dutch out of the American colonial trade. The new measure stipulated that the most valuable colonial products—sugar, tobacco, and indigo—could be shipped only to England in English ships, while all goods imported into British colonies from elsewhere were required to pass first through English ports. Concurrently, Charles II created a new body, the Lords of Trade, to supervise relations between the colonies and the mother country. The first imperial customs collectors weren't far behind.

The King's younger brother, James—duke of York, lord high admiral, master of vast estates in England and Ireland, and a far more conscientious man—played a key role in charting the course of British commercial policy. During the early 1660s, not quite thirty years old, he joined a circle of peers, navy officers, and great merchants whose envy of the Dutch was exceeded only by their visions of the rewards to be reaped in the field of colonial enterprise. Their diverse activities included the organization of several firms to spearhead the British assault on Dutch commercial supremacy. One, the Royal Fishery Company, undertook to break Dutch control over the lucrative Baltic fishing industry. Two others, the Morocco Company and the Company of Royal Adventurers Trading to Africa (later reorganized as the Royal African Company), both led by the duke, aimed to smash the Dutch West India Company's domination of the slave trade and to monopolize the importation of slave labor into the British colonies of the Caribbean and North America. The first expedition of the Royal Adventurers, sent out in 1663 in vessels borrowed from the Royal Navy, quickly captured almost every West India Company factory on the African coast, a blow that doomed the company's hope of making New Amsterdam a base for the slave trade.

The duke's circle also collected detailed accounts of rising Anglo-Dutch tensions along the borders of New Netherland. Only a few years earlier, Gravesend's troublesome magistrates had raised Parliament's colors over the town and declared that it would henceforth be subject only to the "laws of our nation and [the] Republic of England." Stuyvesant threw them into jail. Despite the Hartford Treaty of 1650, however, and despite his efforts to reestablish Dutch communities in their path, Stuyvesant was powerless to stem the flood of English settlers into his colony. By the early 1660s thirteen English towns had been planted on Long Island as against only five Dutch. In 1663, then again in 1664, Stuyvesant tried to bolster the authority of the West India Company by inviting all the towns to send delegates to provincial meetings, but it didn't work.

Connecticut governor John Winthrop Jr. meanwhile opened a campaign to bring the English towns on Long Island and Westchester under the authority of his government. Connecticut agents stirred up support for the idea; in Gravesend, where they caused "a greate Hubbub and furie," it was rumored that armed parties were planning to put both "English & Dutch to

fyre & to Sword.” With the entire island in an uproar, the English towns rejected Winthrop’s meddling and banded together in a combination with an adventurer named John Scott as their president. Scott tried to force the Dutch towns into the combination as well, assisted by none other than Captain John Underbill, lately returned to Flushing. Justifiably alarmed, the West India Company ordered Stuyvesant to hold the line. But in February of 1664, with the situation completely out of hand, Stuyvesant arranged a one-year truce with Scott. The alternative, he explained, was “an inevitable surprise and capture of all the Dutch villages on Long Island.”

As New Netherland disintegrated, York and his friends closed in. Ousting the Dutch from North America, they reasoned, would make Britain master of the whole eastern seaboard from Maine to Cape Fear, linking settlements of the Chesapeake and New England and clearing the way for more effective enforcement of the Navigation Acts. By virtue of New Amsterdam’s position at the southern end of the Hudson-Champlain corridor to Montreal, its conquest would also give Britain an invaluable base of operations against the French in Canada and their Indian allies. This would mean not only enhanced security for the frontier of New England but a stronger grip on the fur trade as well.

Furthermore, as the West India Company too had known, the plantation economies of the West Indies needed an entrepot on the mainland from which they could obtain slaves and food in exchange for raw sugar and molasses. Because it was the only city of any size between Boston and Havana, New Amsterdam was the obvious choice: to wrest it from the Dutch West India Company would be an act of mercantile acumen, not to mention the highest patriotism.

The acquisition of New Netherland promised to improve the duke’s own finances too. According to his personal Commission of Revenue, possession of the colony could bring him between ten and thirty thousand pounds a year in rents and customs duties. (On the Amsterdam exchange in 1664, Stuyvesant’s annual salary of three thousand guilders was the equivalent of just three hundred pounds.) Finally, as many people suspected but few knew for certain, the duke was about to abandon Anglicanism for Roman Catholicism. An American province the size of New Netherland would make an attractive refuge for his sorely oppressed coreligionists, and perhaps for himself as well.

NEW YORK, NEW YORK

In March 1664 York persuaded the king to make him the proprietor of all the territory between the Delaware and Connecticut rivers, plus part of Maine and various islands off the coast—the entirety, that is, of New Netherland. In return for this vast domain, he was to acknowledge the sovereignty of the king with a token gift of forty beaver skins a year. At his own expense, York immediately dispatched Colonel Richard Nicolls with four frigates and nearly two thousand fighting men to secure the “entyre submission and obedience” of his new estate. Nicolls anchored in Gravesend Bay on August 26 and began disembarking his troops. An advance party of 450 soldiers and sailors marched up from Gravesend to seize the ferry at Breuckelen, just across the East River from Manhattan. A smaller force occupied Staten Island.

Loyal to the end, Stuyvesant prepared to make a fight of it. He had little to work with, however. Fort Amsterdam was (as usual) in no condition to withstand an assault, and its 150 or so soldiers were short on guns and ammunition. The town itself had no more than 250-odd men capable of bearing arms, and owing to the recent arrival of nearly three hundred slaves, its reserves of food were insufficient for a siege. After years of acrimonious strife with Stuyvesant, moreover, few of its residents were willing to risk themselves and their property for him or the West India Company.

So when Nicolls sent him a letter guaranteeing “every man in his Estate, life, and liberty” if New Amsterdam capitulated peacefully, Stuyvesant showed it to no one, certain that the revelation of its contents would only increase “popular murmurs and disaffections” in the town. Three days later he tore up a “friendly” letter from Governor Winthrop of Connecticut repeating Nicolls’s offer and begging him to “avoid effusion of blood.” But word of both letters had leaked out. A crowd of irate workmen and magistrates gathered at the Stadhuis, where they made Stuyvesant reassemble Winthrop’s letter and read it aloud. That same afternoon he suffered a second humiliation when Nicolls moved his frigates up through the Narrows and trained their guns on the town. Stuyvesant climbed the bastion of the fort and made ready to open fire, but Dominie Megapolensis took him firmly by the arm and led him down again.

Early the next day, ninety-three of New Amsterdam's most prominent men, including virtually every present or former municipal officeholder as well as his own seventeen-year-old son, sent Stuyvesant a petition reiterating the folly of resistance against "so generous a foe." Finally accepting the hopelessness of his position, Stuyvesant informed Nicolls that he would give up. Negotiators from both sides met at his *bouwerie* and drafted formal Articles of Capitulation.

On September 8, 1664, the West India Company's colors were struck, and the soldiers of the garrison marched down to the East River shore, drums beating and flags flying, to board a ship for the long trip home. Scarcely had it raised anchor than Nicolls announced that in honor of his master Fort Amsterdam would henceforth be called Fort James, while Fort Orange would become Albany. Both New Amsterdam and New Netherland would be known as New York.

When he received news of New Netherland's capitulation, the Dutch ambassador in London hurried to the court to demand that Charles II return the colony at once. Not only did the king refuse—the Dutch had no right to be there in the first place, he said—but the duke of York added an angry warning that the crown was as determined to put the States-General in its place as Cromwell had been. The idea of another fight with Holland was in fact becoming more and more popular by the day. Parliament appropriated the money for it in February 1665; in March Charles II declared war.

The West India Company had meanwhile ordered Stuyvesant home to explain what had happened. He gathered his papers—including a testimonial from the magistrates that he had always been "an honest proprietor and patriot of the province and a supporter of the reformed religion"—and left for Amsterdam in the spring of 1665. The company, he discovered on his arrival, wanted a scapegoat. It publicly accused him of lying, incompetence, and cowardice, adding that New Amsterdam's merchants and clergy hadn't exactly distinguished themselves, either. Stuyvesant angrily rebutted the charges in a remonstrance to the States-General. If anything, he wrote, it was the company's own penny-pinching stupidity that had lost the colony, not his eighteen years of "trouble, care, solicitude and continued zeal."

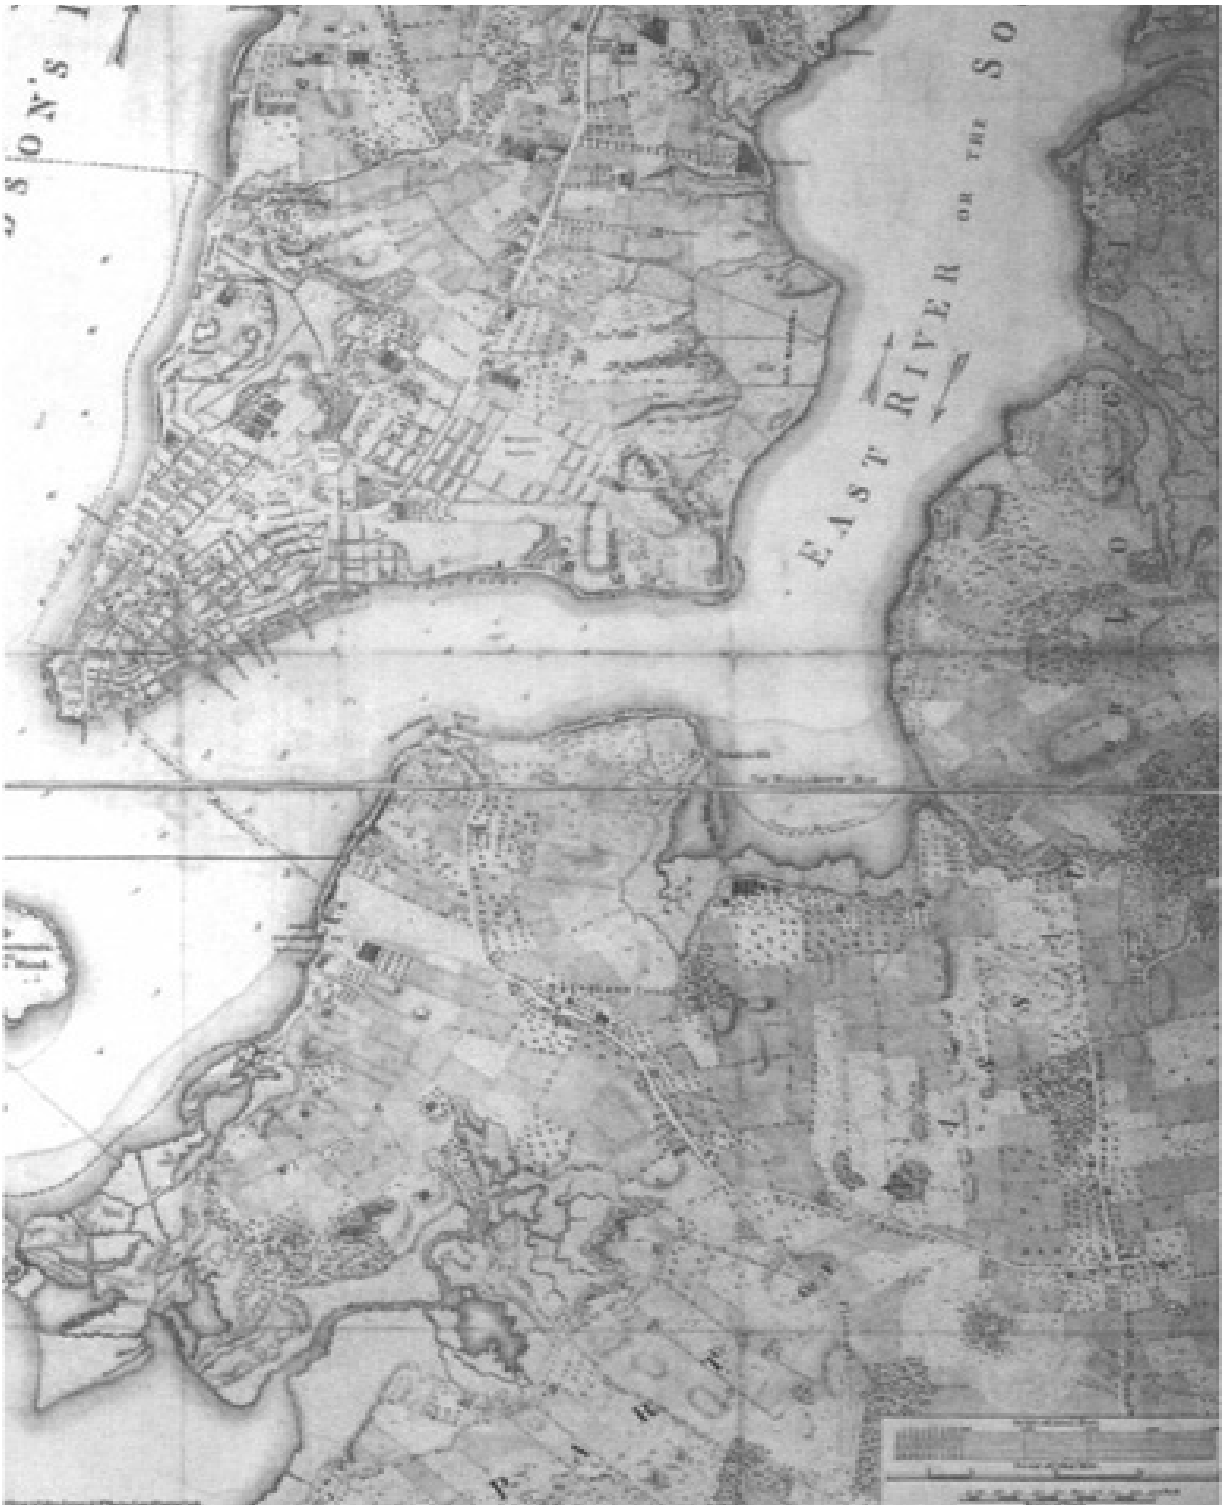

The States-General had other things to think about, though. Its war with England was going better than expected, and in June 1667 a Dutch fleet

sailed boldly up the Thames, burned three British men-of-war, and towed off the *Royal Charles*, pride of His Majesty's navy. This blow, falling less than a year after the Great Fire that destroyed much of London, prompted Charles II to sue for peace. In the negotiations that ensued, the States-General agreed to let the English keep New Netherland in exchange for Surinam (Dutch Guiana), whose slaves and sugar plantations were more highly valued by the West India Company. Aware that his quarrel with the company was now moot, Stuyvesant returned to Manhattan in the spring of 1668. He, Judith, their children, and their slaves lived quietly on his beloved bouwerie until his death in February 1672.

Empire and Oligarchy

The surrender of New Amsterdam didn't, strictly speaking, mean a shift from Dutch to English rule but from that of the Dutch West India Company to that of James Stuart, the duke of York. As its proprietor, the duke of York wielded greater power in his new province than his brother the king did over England. His charter gave him personal title to all its "lands, islands, soils, rivers, harbors, mines, minerals, quarries, woods, marshes, waters, lakes, fishings, hawking, hunting and fowling." He had "full and absolute power and authority to correct, punish, pardon, govern, and rule" its inhabitants—with no duty to establish a representative assembly and subject only to the requirement that his "statutes, ordinances, and proceedings" conform as nearly as possible to those of England. Landholders in the colony would be his tenants, obliged to pay him an annual quitrent in lieu of personal service. He decided who could trade with his colony, and he could impose duties on its imports and exports. Nowhere else in British America were the rights and privileges of colonists so limited, or those of government so vast.

The harshness of these provisions was mitigated, however, by the Articles of Capitulation, which were the essence of moderation, conciliation, and even compassion. There would be no punitive expulsion of Dutch settlers, no expropriation of Dutch property (including slaves), no assaults on Dutch culture. Dutch settlers could stay or freely leave, with all of their possessions, as they pleased. Those who stayed, providing they took an oath to the king, wouldn't be deprived of their ships, goods, houses, or land, nor would they be compelled to take up arms against the United Provinces in the future. They wouldn't have to change their religion, language, or inheritance customs. Contracts between them would continue to be enforced "according to the manner of the Dutch," and the Reformed Church could still collect taxes, run schools, and hold services in Dutch.

In negotiating the Articles with Stuyvesant, Nicolls had been generous because both he and the duke knew that no useful purpose would be served by acting "rigorous and scrupulous." With few English merchants as yet residing in New York, and with taxes and customs duties expected to supply

the bulk of ducal revenues, the oppression of the colony's Dutch inhabitants and the disruption of established commercial interests could well ruin the proprietary and leave the duke with little or nothing to show for his efforts. It would certainly damage the fur trade, which depended on satisfying the Indian demand for cheap Dutch duffel (a coarse woolen cloth). Religious toleration, too, made sense if someday the duke wanted to make New York a haven for English Catholics.

The Dutch seemed prepared to cooperate. Not only did few of them leave, but the town's former Dutch magistrates thanked the duke for sending "so gentle, wise, and intelligent a gentlemen" as Nicolls to be their governor and expressed the hope that he would make New York "bloom and grow like the Cedars on Lebanon." Johannes van Brugh, an affluent merchant and son-in-law of Annetje Jans, hosted a dinner where Nicolls and his entourage could meet the town's leading citizens. Nicolls came away more convinced than ever that without "ill usage" the Dutch would make tractable and productive subjects. New York City itself, he told the duke, was "the best of all his Majesty's towns in America."

COLLABORATORS

It was the kind of people who asked him to dinner that Nicolls got along with best, and over the next several years he cultivated their good will with numerous courtesies and concessions—above all, allowing them to continue direct trade with the Netherlands. Toward the end of the second Anglo-Dutch war, Nicolls pleaded with the crown to exempt New York completely from the Navigation Acts. He also confiscated what remained of the West India Company's property, a cause for celebration among the burghers who had for years chafed under company rule. He reaffirmed the law, first embodied in the Burgher Right of 1657, that only freemen of the city could conduct business there. He let the powerful Van Rensselaers keep their patroonship and became fast friends with ex-director Stuyvesant, whiling away many pleasant evenings at his *bouwerie* outside of town. Nicolls even introduced the burghers to the gentlemanly sport of horse racing, laying out the first racetrack in North America on Long Island's Hempstead Plain.

In June 1665 Nicolls formally confirmed the right of the residents of New York City to govern themselves "according to the custom of England in other [of] his Majesty's corporations," changing the offices of

burgomaster, *schout*, and *schepen* to mayor, alderman, and sheriff, respectively. Nicolls also filled the new municipal administration with men who wouldn't be offensive to the Dutch. A majority of the aldermen was Dutch, and the first mayor, Thomas Willett, was an English merchant who had lived in New Netherland for years and become friendly with former director Stuyvesant. The first sheriff, Allard Anthony, had also lived among the Dutch for years and served Stuyvesant as *schout*. A few years later, New York even got a Dutch mayor, Cornelis Steenwyck. Nicholas Bayard, Stuyvesant's nephew and Steenwyck's sometime business partner, held a number of lucrative municipal posts too.

Well-to-do Dutch New Yorkers, pragmatic men and women, began to admit that New Netherland might be gone for good. As Jeremias Van Rensselaer said, "it has pleased the Lord that we must learn English." In the years that followed, more and more people of his class and connections likewise began to "anglicize"—speaking English, reading English books, observing English holidays, and allowing their sons and daughters to marry into English families.

When the duke called Nicolls back to England in 1668, New York's most prominent citizens gave him a sumptuous farewell dinner, then escorted him to his ship with a grand procession that included two brand-new militia companies, the first reorganization of the city's burgher guard since the conquest. If Stuyvesant attended the festivities, he must have marveled at how positively amiable the burghers had become since forcing him to hand over the city four years earlier.

Colonel Francis Lovelace, Nicolls's successor, proved equally solicitous. To stimulate trade, he slashed import duties by 30 percent and named as customs collector a Dutchman who immediately threw out most port regulations. By fiat, Lovelace gave city merchants a monopoly of the Hudson River carrying trade and ordered Long Island farmers, even those for whom New England markets were more convenient, to ship all their surplus produce through Manhattan. He fixed grain prices to benefit exporters and required that hogs must be brought to the city for slaughter, a boon to local butchers and coopers.

To improve the flow of news, Lovelace arranged monthly mail deliveries between the city and Boston, the first regular postal service in any of the colonies. Near the present intersection of Pearl, Broad, and Bridge streets,

where a small bridge crossed the town's canal and merchants liked to gather for business, he established the city's first mercantile exchange, complete with a bell and a drop-box for transatlantic mail. Communication with England remained maddeningly unpredictable, even so; Lovelace complained that it could be counted on to occur, like the reproduction of elephants, no more than once every two years.

Besides continuing the horse races on Hempstead Plain, Lovelace strengthened the proprietary's ties with influential Dutch New Yorkers by organizing one of the town's earliest social clubs. Once or twice a week its sixteen members—ten Dutch, six English—gathered at one another's houses to discuss matters of common concern and drink punch from silver tankards. "I find some of these people have the breeding of courts," Lovelace later told the king. He didn't mention that he'd become involved in extensive private dealings with a number of the very same people, including Cornelis Steenwyck. Nor did he reveal that, at his own expense, he'd built a tavern right next to the old Stadhuis, now called City Hall, and equipped it with a connecting door that opened directly into the chambers of the municipal court, a convenience for which it may be supposed the magistrates were often grateful.

By the early 1670s, thanks in no small measure to the attentions of Nicolls and Lovelace, New York's economy was showing signs of life again, and people with names like Van Rensselaer, Schuyler, Van Cortlandt, and Beekman were both richer and more securely in control of the town than ever. Former mayor Steenwyck, reportedly Manhattan's wealthiest resident, had just built an opulent house on the corner of Bridge and Whitehall streets that would become famous for its Russia-leather chairs, French cabinets, oils by old Antwerp masters, statuary, and other luxuries.

The rewards of collaboration with the English shone even more brilliantly, perhaps, in the career of Margaret Hardenbroeck. She had first come to New York in 1659 as the agent for an Amsterdam merchant and soon after her arrival married a local trader named Rudolphus de Vries. De Vries dealt in such diverse commodities as lumber, bricks, sugar, furniture, tobacco, and wine. He also owned quite a bit of land and was one of a group of investors who in 1660 established the village of Bergen, just across the Hudson from New Amsterdam. After his death in 1661, Hardenbroeck inherited his various interests and went into business for

herself, becoming one of New Amsterdam's richest citizens, known throughout the province for her "miserable covetousness" and "terrible parsimony."

In 1662 Hardenbroeck married a former West India Company carpenter, now turned trader, named Frederick Vlypse (also spelled Flipsen or Flypsen), with whom she formed a highly profitable partnership. They were among the merchants who pressured Stuyvesant not to oppose the English invasion, and in its aftermath they became intimates of Nicolls and Lovelace, a connection that earned them valuable privileges and exemptions from English trade regulations. In time they owned all or part of fifteen vessels that ranged from Albany to Europe to Virginia to the West Indies with cargoes of furs, lumber, tobacco, hides, and wine. One of Hardenbroeck's ships was the *King Charles*, and another, partly owned by Governor Lovelace and Cornelis Steenwyck, was the *Duke of York*—a choice of names that suggests the lengths she would go to flatter authority.

Ten years after the conquest, Hardenbroeck and Vlypse had amassed an empire that included, besides ships and goods, extensive real estate holdings throughout the lower Hudson Valley and a plantation in Barbados; Vlypse himself was a moneylender, wampum manufacturer, land speculator, and mill owner as well. It was around this time, too, that he changed his name to the more English-sounding Philipse.

DISSIDENTS

Steenwyck, Philipse, Hardenbroeck, and others of their ilk thought the transition from Dutch to English government was going well. Others didn't, the duke of York among them. He worried that trade with England failed to develop as rapidly as his bookkeepers would have liked. No more than a few English merchantmen were ever in the harbor at once, and in the entire decade following the conquest, only five are known to have made a direct voyage from England to Manhattan.

Some of this was the duke's own fault. He never actually set foot in New York and, like the West India Company, didn't always put a high priority on its interests. In 1665, for example, he impulsively gave all of the colony between the Hudson and Delaware rivers to two old Civil War cronies, John Lord Berkeley and Sir George Carteret. They called it New Jersey and

began handing out land to prospective settlers. No one informed Nicolls, however, and he had been doling out the same land on his authority as governor of New York. The ensuing legal confusion crippled the development of New Jersey for years. What was more, by removing the west bank of the Hudson from New York's jurisdiction, the duke foolishly divided an economic whole into political parts.

Communities to the north and east of Manhattan had other reasons to be dissatisfied with the transition from Dutch to English rule. One of Nicolls's first decisions after the conquest had been to incorporate Long Island, Staten Island, and Westchester into an English-style county named (inevitably) Yorkshire. Its inhabitants assumed that he intended to set up the self-contained, nearly autonomous, English-style local governments for which they had been clamoring over the previous two decades. But at a special meeting in Hempstead in 1665—attended by delegates from thirteen English and four Dutch towns as well as from Westchester—Nicolls promulgated a code of laws for Yorkshire that granted nothing of the kind.

The Duke's Laws, as they came to be known, made no provision for freemanship (i.e., the right to a voice in town affairs) or for representative government on the provincial level. The code obliged townsfolk to submit to new land surveys and registration fees, to pay taxes they didn't consent to, and to practice religious toleration. Obviously, Nicolls admitted, this was "not contrived so Democratically" as the codes of other colonies: his goal had been to "revive the Memory of old England amongst us" and establish the "foundation of Kingly Government in these parts, so farre as is possible, which truely is grievous to some Republicans." The disappointed Long Island towns were indeed crawling with Stuart-hating commonwealthmen, and their staunch opposition to the Duke's Laws, sometimes spilling over into violence against justices of the peace and tax collectors, caused the proprietary government no end of trouble. As the representative of one of the greatest landowners in the realm in an age of rural insurrection, Nicolls found it all too familiar. "The Late Rebellion in England, with all ye ill consequences thereof, began with the selfe same steps and pr'tences," he grumbled.

The largest group of malcontents were New York's five or six thousand Dutch inhabitants, who together constituted almost 70 percent of the population of the colony and as much as 75 or 80 percent of the population

of the city. One of their continuing grievances was the conduct of what Stuyvesant called the “dissolute English Soldiery.” Nicolls had had to quarter many soldiers in Dutch households, and their lack of regard for persons or property was a source of frequent conflict. Wherever there were garrisons or posts—in New York City, in Albany, in Kingston—hard words, fisticuffs, and rioting between troops and citizens were endemic.

Maria Abeel Duyckinck (1666-1738), portrait by her husband, Gerrit Duyckinck, c. 1700. Mrs. Duyckinck, who inherited large tracts of real estate around Albany as well as on Manhattan, was one of the many second- and third-generation Dutch residents of New York who did not eagerly accommodate themselves to English rule. (© Collection of The New-York Historical Society)

The major targets of Dutch resentment, however, were the men and women of their own nation who had collaborated with the English. Merchants like Steenwyck and Hardenbroeck were particularly despised for their prosperity and arrogance. Within the Reformed church, anti-English factions regarded Megapolensis and the other dominies as little better than English flunkies because of their friendship with Nicolls and Lovelace. When some congregations attempted to withhold the dominies’ salaries as punishment, their English patrons had them paid out of public tax monies instead—which only made the dominies more odious still in the eyes of their parishioners.

NEW ORANGE

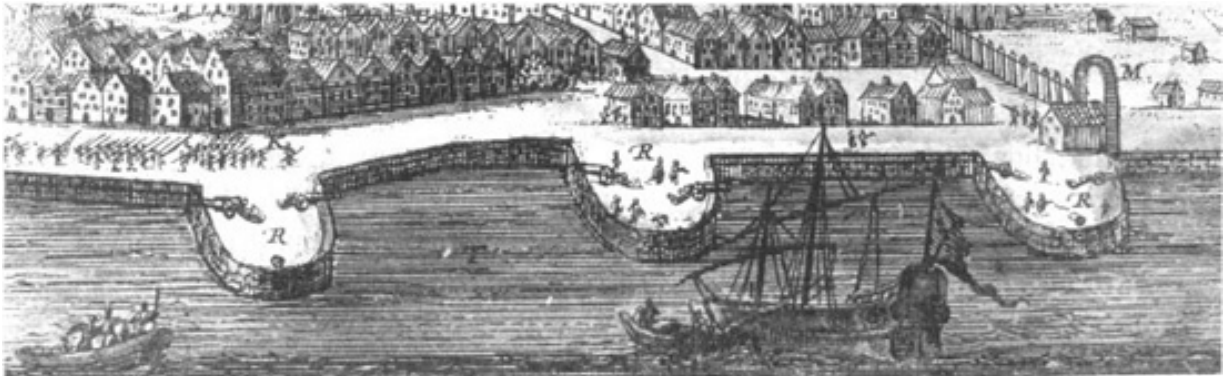

Stung by his failure to defeat the Netherlands in the second Anglo-Dutch War, Charles II had begun preparations for a third. In 1670 he signed a secret accord with Louis XIV of France that committed both nations to combine forces against the Dutch. All he lacked was a plausible excuse to open hostilities, and that came in the spring of 1672, when English and Dutch naval forces clashed in the Channel. Within days, both England and France had declared war. Rallied by the young Prince William of Orange, the Dutch fought back (one of their first victims was Colonel Richard Nicolls, felled by a Dutch cannonball as he stood next to the duke of York on the deck of an English warship). Before the year was out, they had dispatched a heavily armed squadron to raid English and French possessions in America.

In the spring of 1673, led by Admiral Cornelis Evertsen—whose derring-do on the high seas had earned him the nickname of “Kees the Devil”—the Dutch squadron attacked British possessions in the Caribbean, seizing a fortune in sugar and slaves. Evertsen then headed for Virginia and Maryland. In midsummer he entered the Chesapeake, capturing or destroying numerous English ships and making off with thousands of hogsheads of tobacco. His next target was New York.

At the end of July 1673 the Dutch squadron dropped anchor off Sandy Hook just below the Narrows. Some Dutch farmers from New Utrecht made their way out to Evertsen’s flagship to complain “about the hard rule of the English.” They also said that Governor Lovelace was away on business in Connecticut, that Fort James was in no condition to repel an invasion, and that the town would welcome the Dutch. Evertsen decided to attack.

On the twentieth, while Dutch saboteurs spiked the guns on the East River shore near City Hall, Evertsen brought his frigates within range of the fort and ordered its temporary commander, Captain John Manning, to surrender. “We have come to bring the country back under obedience to their High Mightinesses the Lords States General,” he announced. When Manning stalled, Evertsen bombarded the fort and landed Captain Anthony Colve with six hundred marines on the Hudson shore near the present site of Trinity Church. Cheered on by “demonstrations of joy” among the Dutch

populace, Colve and his marines advanced down Broadway and took possession of the fort without firing a shot. With “enemy in our Bowells,” Manning glumly explained, resistance was impossible. Evertsen promptly renamed the city New Orange in honor of Prince William. He also declared that the entire colony would again be known as New Netherland and designated Captain Colve its governor-general.

New Amsterdam formerly called New York, 1673, issued shortly after the Dutch reoccupation. Note the soldiers marching along the waterfront. (I. N. Phelps Stokes Collection. Miriam and Ira D. Wallach Division of Art, Prints and Photographs. The New York Public Library. Astor, Lenox and Tilden Foundations)

Evertsen sailed off in September to attack Newfoundland, leaving Colve to continue the work of restoring Dutch control—with the assistance of prominent men like Cornelis Steenwyck and Nicholas Bayard, whose patriotism seems to have overcome their close ties to the English. He restored the old Dutch forms of government, administered oaths of loyalty, collected taxes, strengthened the city’s defenses against an expected counterattack, and faced down the English villages of Long Island. For good measure, he confiscated the property of leading English officials and merchants; when Lovelace foolishly returned to town, Colve clapped him in jail on the complaint of some Dutch merchants who said he owed them money, then shipped him back to England. There the duke cashiered him for incompetence and Charles II threw him into the Tower.

But New Orange was a chimera. The Dutch were growing weary of the war—their forces had done well at sea, but French troops occupied four of their seven provinces—and defending New Netherland was certain to

require more money and resources than they could afford. (New Orange authorities had in fact warned the States-General that the colony couldn't survive without prompt and substantial help.) The States-General asked for peace and offered to return all conquered territories, including New Netherland. Charles II, himself nearly bankrupt and under intense pressure from Parliament to recover the colony, agreed. A formal treaty of peace was signed in February 1674.

When rumors of the sellout reached Manhattan several months later, the Dutch were incredulous. Some, in “a distracted rage and passion,” hurled “curses and execrations” at the States-General, demanded a chance to fight, and vowed to “slay the English Doggs”; others vowed “to fyre the Town, Pluck downe the (fortifications [and] teare out the Governours throats, who had compelled them to slave soe contrary to their priveledges.” A small number packed their belongings and struck out for Dutch Surinam, while a few went back to the Netherlands with Colve, who officially surrendered the city in October. Jeremias Van Rensselaer, always the pragmatist, resolved to make the best of it. “Well, if it has to be,” he shrugged, “we commend the matter to God, who knows what is best for us.” He added, almost as an aside: “We didn’t count on such a blow, God knows.”

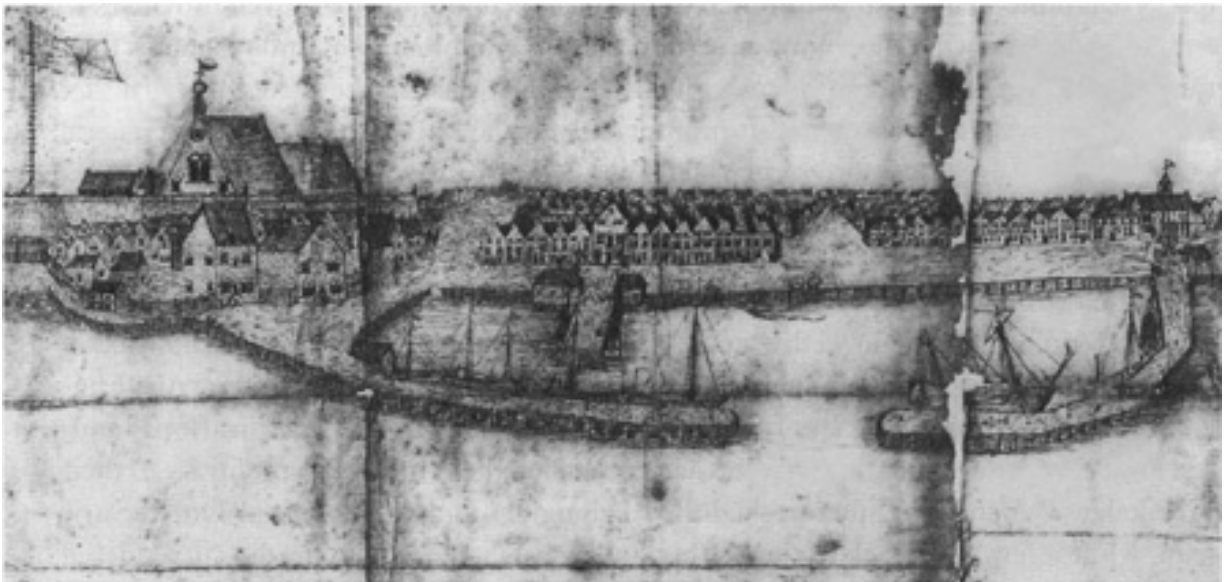

ANDROS

Although angered by their enthusiasm for New Orange, the duke of York rejected suggestions that his Dutch subjects be relocated to the Albany area or expelled altogether. He did, however, obtain a new charter that enlarged his already considerable powers as proprietor. He also dispatched a new governor in the person of Major Edmund Andros, a thirty-eight-year-old royalist soldier and aristocrat, highly regarded by the king and recommended by extensive experience in the West Indies and the Netherlands (where he had learned to speak fluent Dutch).

Andros was instructed to be firm but forgiving toward the Dutch and to reestablish the proprietary’s ties with the principal Dutch merchants, landowners, and clergymen. Accordingly, Andros promised Colve that the Dutch needn’t fear for their property, that they could continue to enjoy perfect freedom of religion, and that they would never be asked to fight against the States-General—basically the same guarantees written ten years earlier into the Articles of Capitulation.

Andros soon came to terms with the same group of collaborators that had surrounded Nicolls and Lovelace (except Cornelis Steenwyck, with whom he never got along). Frederick Philipse, Steven Van Cortlandt, William Beekman, Nicholas Bayard, Johannes de Peyster—they and a handful of other men, many already linked together by business and marriage, willingly served Andros as councillors, mayors, aldermen, and other officials. He in turn spent much of the next six years transforming New York into a more efficient and more profitable commercial emporium.

Conscious that New York's economy depended more and more on the export of foodstuffs to Barbados and other plantation colonies of the West Indies—the fur trade had by now dwindled to one-fifth of its peak in the mid-1650s—Andros took steps to protect city merchants from competition. Ignoring cries of outrage from Albany and elsewhere, he ordered that all goods imported into the colony pass through New York City. He then designated it the only place in the colony where cargoes could be loaded for export. He decreed that no one outside the city could bolt (sift) flour or pack wheat, beef, or pork for export, and he appointed a small force of inspectors to see that the city's reputation in foreign markets wouldn't be injured by inferior goods. After 1680 its merchants enjoyed a virtual stranglehold on the trade of the entire colony. Of course what was good for them tended to be good, in turn, for millers, bakers, coopers, ropemakers, sailmakers, carpenters, and smiths.

New York from Brooklyn Heights, 1679. Drawn by the Labadist missionary Jaspas Danckaerts, its most conspicuous features are the recently completed Great Dock or mole and the new stone pier. (I. N. Phelps Stokes Collection. Miriam and Ira D. Wallach Division of Art, Prints and Photographs. The New York Public Library. Astor, Lenox and Tilden Foundations)

Andros gave particular attention to improving the waterfront. In 1675 residents along the Heere Gracht were ordered to fill in the old Dutch canal level with the street and “then to pave & pitch the Same before there dores with stones.” The foul inlet, reincarnated as what is now Broad Street, was destined to be the city’s principal commercial street well into the next century. Near where the bridge had crossed the canal, Andros erected a new mercantile exchange and covered market, the city’s first. At the foot of Broad Street he built a new stone pier into the East River. On either side of the pier he constructed a massive stone and timber mole, or breakwater, that arced out in two great semicircles from the foot of Whitehall Street and City Hall. Known as the Great Dock, it provided secure anchorage for cargo ships plying the West Indian trade.

And Andros didn’t stop with the waterfront. Because the supply of water for fighting fires had been reduced by filling in the canal, he ordered the digging of six new wells (the brackish water brought up by buckets proved unfit for drinking, however). He moved malodorous tanneries and slaughterhouses to locations outside the city gates. He fixed up Fort James, ransacked by departing Dutch troops, and designated “the Plaine afore the Forte”—now Bowling Green—as the site of an annual fair for the display and sale of “all graine, Cattle, or other produce of the Country.” He made much-needed repairs to the city wall and ensured that its gates were closed every night by nine o’clock. When the city’s twenty-three coopers banded together to fix a uniform rate for casks and barrels, Andros had them prosecuted and fined for violating the law against illegal combinations. Those employed by the city were fired.

When Long Island farmers and stockmen raised the familiar complaint that they had been enslaved to the mercantile interests of the city, Andros likewise told them to pay up or leave the province. He also advised York that it might be a good idea to set up some kind of representative assembly

so they could tax themselves. And when New England governments responded sympathetically to appeals for help from the English towns on the eastern end of Long Island, as they had done so often before, Andros warned them off so convincingly that New York's jurisdiction over the entire island would never again be called into question.

It was under Andros, too, that municipal authorities forged stronger ties with local cartmen, whose one-horse wagons were the principal means of transporting commodities into and around town. In 1667 the cartmen had formed a "fellowship" or guild and contracted with the city to work at fixed rates. In return for this privilege, the magistrates required them to perform "public work as desired"—picking up rubbish from the streets, fighting fires, maintaining roads, repairing the fort, and transporting felons to the gallows. Slaves and free blacks were later prohibited from operating carts in town—a measure that gave the cartmen relief from a troublesome source of competition but also further reduced their independence and hastened their transformation into semiofficial municipal employees.

THE COVENANT CHAIN

Andros had been in New York less than a year when the Algonkian-speaking peoples of English America rose up in a last, desperate attempt to stem the advance of white settlement. Perhaps the greatest Indian war in American history, it produced political and social revolution in the Chesapeake colonies and such devastation in New England (where it was known as Metacom's or King Philip's War) that complete recovery, economic and demographic, would take a generation.

While his New England and Chesapeake counterparts dithered, Andros acted decisively. He disarmed Long Island Indians, cut off their communication with insurgents on the New England side of the Sound, drilled town militias, and saw to the construction of fortifications. He ordered Westchester Indians to move closer to the city, where they could be kept under constant observation. He summoned sachems of the Hackensacks and other New Jersey Indians to Fort James, making them swear allegiance to the crown and requiring hostages from each to guarantee their compliance.

Andros's shrewdest stroke was to open talks with the Five Nations of the Iroquois, ancient enemies of the Algonkian peoples who were embarked on a course of imperial expansion not unlike that of the English. Armed with Dutch weapons, they had previously attacked and all but annihilated their Huron rivals to the north; by the early 1660s their power stretched from the Carolinas to Hudson's Bay.

Between 1675 and 1677 Andros and the Iroquois forged the so-called Covenant Chain, an alliance of English and Iroquois ambitions that would decisively influence the future of New York City. Its terms were simple. Andros agreed to support Iroquois domination of the coastal Algonkians, while the Iroquois agreed to attack Algonkian insurgents in New England; both agreed to make common cause against the French in Canada, and both agreed to respect what would later be called spheres of influence, English to the east, Iroquois to the west.

Early in 1676 Mohawk war parties crossed over from New York to Connecticut and destroyed a major Algonkian encampment. By that summer the uprising had collapsed. The negotiations that followed, adroitly managed by Andros, brought peace to the colonies and ensured the safety of settlements all the way to the Appalachians. The duke's province came through unharmed. What was more, New York City had become one pole of an Anglo-Iroquoian axis around which the affairs of North America south of Canada and east of the Mississippi would turn for another century. A grateful Charles II rewarded Andros with a knighthood.

For the Lenapes of the lower Hudson Valley, by contrast, the Covenant Chain was a confirmation of their impotence and irrelevance. Jaspas Danckaerts, a Labadist missionary who visited New York several years later, was one of the last Europeans to study its original inhabitants in anything like their original setting, and the observations he recorded in his diary—by turns embarrassed, angry, and despondent—depict a people thoroughly ruined by contact with Europeans. So few were left, Danckaerts wrote, that they would soon “melt away and disappear” from the face of the earth. “I have heard tell by the oldest New Netherlanders,” he noted, “that there is now not i/ioth part of the Indians there once were, indeed, not 1/20th or 1/30th; and that now the Europeans are 20 and 30 times as many.” Legend has it that the last of the Lenapes—known as Jim de Wilt or Jim the Wild Man—died in Canarsie in 1803.

NEW YORK IN 1680

To a casual observer, it might have appeared that Andros had made little headway against the Dutchness of New York. By 1680 the bulk of its four-hundred-odd buildings, even the fine new residences of anglicized families like the Steenwycks, Van Cortlandts, and Philipses, were still built in the Dutch style: high stoops, stepped-gable end to the street, roofs sheathed with the same red and black tiles that graced houses in Holland. The twin peaks of the Reformed church still poked above the ramparts of the fort, Stuyvesant's former Great House (now White Hall) still commanded the East River shore, the great stone warehouse built by the West India Company still stood on Pearl Street, and the old Stadhuis still served as City Hall. Dutch was still the language of the streets and markets, and Dutch culture was still everywhere in evidence. During the winter of 1678, his first on Manhattan, the Rev. Charles Wolley marveled at the quintessentially Dutch spectacle of "Men and Women as it were flying upon their Skates from place to place, with Markets upon their Heads and Backs."

But New York was hardly the same place it had been in 1664, or even 1674. It had many more people—around three thousand of them, give or take a few hundred (another sixty-six hundred or so were scattered across Long Island and up the Hudson). The ethnic balance was shifting as well. Immigration from the Netherlands had fallen off sharply, and by 1680 about half of the Dutch inhabitants who witnessed Stuyvesant's surrender had either died or moved away. During the later 1660s and early 1670s, meanwhile, affluent English merchants had come to Manhattan in pursuit of economic opportunities. Some, like John Darvall, arrived via Boston or other North American seaports. John Lawrence moved in from Long Island, and Robert Livingston came over from Scotland. Still others came up from the West Indies, most notably a rich Barbadian planter named Lewis Morris. By 1670 or so Morris and his brother Richard had established themselves in New York as importers of sugar and flour. They began buying property in and around the city, including a town house on Bridge Street next door to their friend and sometimes business associate, former mayor Cornelis Steenwyck. Another of the colonel's purchases was the five-hundred-acre Westchester estate once owned by Jonas Bronck; he promptly renamed it Morrisania. The influx of English merchants quickened after 1674, as London mercantile houses began for the first time to take an active

interest in the New York market. By 1680, although the English still accounted for under 20 percent of New York's overall population, they represented nearly 40 percent of the town's *taxable* population. Of the forty-eight merchants with estates worth over five hundred pounds, twenty-two were English.

Thanks to these newcomers, New York's trade improved markedly. After six years in office, Andros reported that the volume of New York's shipping was "at least ten times" higher than when he arrived. Ten to fifteen vessels now came across the Atlantic every year with cargoes worth in excess of fifty thousand pounds, and by 1684 some eighty ships and boats were owned in the port itself, including three barks, three brigs, and twenty-six sloops. It exported sixty thousand bushels of wheat annually, along with furs, meats, peas, horses, lumber, and fish—more and more of it to the plantation economies of the West Indies.

This expansion meant not only that New York now had "plenty of money," as Andros put it, but that the city's merchants were getting a bigger share of its wealth. In 1664 the merchants who comprised the richest 10 percent of New York taxpayers had accounted for 26 percent of its assessed wealth. A dozen or so years later, the richest 10 percent of the city's 313 taxpayers—some thirty merchants—held 51 percent of its assessed wealth; the richest 15 percent—fewer than fifty merchants—owned fully 65 percent, the richest five individuals alone accounting for some 40 percent. At a time when a merchant worth a thousand to fifteen hundred pounds was "a good substantial merchant," according to Andros, the wealthiest of them all, Frederick Philipse (who possessed "whole hogsheads of Indian money or wampum" according to Wolley) was assessed at thirteen thousand pounds, about 14 percent of the city's total. Cornells Steenwyck, now the second-richest man in New York, was assessed at four thousand pounds.

Between 1664 and 1676, by contrast, the assessed wealth of New York's hundredodd poorest taxpayers declined from 6.6 to 5.9 percent of the total. The assessments of the hundred or so just above them plunged from 23.1 percent to 10.4 percent. Many other inhabitants of the city—casual laborers, apprentices, small craftsmen—were simply too poor to be assessed at all. Still worse off were the city's four or five hundred slaves, perhaps half again as many as had been present at the time of the English conquest, crowded into garrets, cellars, and outbuildings.

Pockets of poverty now dotted the urban landscape, throwing the prosperity and comfortable residences of the possessing classes into sharper relief. The city's predominately Dutch carters, who ranked among its poorest taxpayers, lived in shabby dwellings along a back alley called Smith's Street Lane, not far from the Dutch Reformed church. Shoemakers congregated along Broad Street until Andros banished their tanning pits to the outskirts of town, but a handful of streets crossing Broad—Beaver, Marketfield, Mill—continued to have a disproportionately large share of poor taxpayers. So did places like Smith's Valley (or Vly), which lay on the East River between Wall and Maiden Lane, and along the roads and trails that led to villages still further to the north. In 1679, when Jaspar Danckaerts visited Stuyvesant's bouwerie, he passed "many habitations of negroes, mulattoes and whites" who had simply "settled themselves down where they have thought proper" and cultivated "ground enough to live on with their families." In the following decade, however, a number of free black families would sell or abandon their Manhattan holdings and move to more secluded corners of New Jersey and Pennsylvania.

A comparable gap was opening up between the wealth of the city and that of the fishing and farming towns of the Long Island hinterland. Southampton, the most prosperous, was assessed at a total of thirteen thousand pounds—barely more than Frederick Philipse alone. The combined assessments of Brooklyn, Bushwyck, Flatbush, Flatlands, and New Utrecht—the five Dutch towns on the western end of the island—were calculated to be only half that much. Not surprisingly, the towns believed they were oppressed and exploited by the merchants on Manhattan, where the law required them to market their produce. What was more, as population growth and the practice of partible inheritance combined to reduce the size of individual farms, many of their residents were beginning to move elsewhere in search of arable land.

STANDING MORE ON NATURE THAN NAMES

These transformations sharpened the discontent of those Dutch craftsmen, farmers, and small traders who had declined to embrace English ways or ingratiate themselves with their English rulers. After the collapse of New Orange in 1674, they grew more determined than ever to maintain their

distinctiveness as a nation, for in an age of conflict and upheaval, who could say they would never again be delivered from captivity?

One index of Dutch intransigence was their low rate of intermarriage with other national groups. In New York City, only one Dutch woman in six married a man who wasn't Dutch. Dutch men almost never married non-Dutch women; those in Flatbush, for example, were known to range as far as the Dutch villages of New Jersey and the upper Hudson Valley in search of wives. With the passage of time, this pattern of behavior ensured that Dutch families and communities everywhere in New York would be closely linked by kinship networks. These guaranteed that the essentials of communal life—the preservation of order, the settlement of disputes, the care of widows and orphans and the needy—could be handled quietly and smoothly without recourse to external (that is, English) authority.

The intensity of Dutch resistance to assimilation was also demonstrated by their loyalty to Holland's Roman-Dutch legal tradition. With the resumption of proprietary authority in 1674, the use of Dutch was no longer permitted in New York courts. But Dutch New Yorkers showed little inclination to accept the English notion of a common law or to yield to the unfamiliar procedures of English courts (Dutch courts relied on arbitrators and referees rather than juries). Instead they effectively boycotted the English judicial system for the resolution of commercial as well as private disagreements, often appealing instead to the consistory of the Reformed Church. Dutch residents of New York City rarely sued one another after 1674.

Even more telling was their aversion to the patriarchalism that dominated English attitudes toward property, inheritance, and gender. English practice stressed the descent of both realty (land, buildings) as well as personalty (clothing, household goods, livestock, cash) through the male line. Only in the absence of male heirs did females inherit real property, and their rights to personalty were sharply limited. When she married, a woman became *feme covert*—legally “covered” by her husband, who thereafter represented her interests. She took his name; he took control of the real and/or personal property she possessed, subject only to the restriction that he couldn't sell or bequeath her realty. If he died before her, she was entitled as a rule to a “dower right”—the use of or rent from one-third of the real property belonging to his estate (including what she had brought to the

marriage). The balance of his estate would be divided between their children and his kin, with real property going to males whenever possible. If she died before him, on the other hand, he kept everything until his death, at which time it passed to their children.

In defiance of the conqueror's laws, Dutch women continued to use their own surnames rather than their husbands'; some went on doing business in their own names. Dutch husbands and wives still employed the Roman-Dutch mutual or joint wills that kept their common property intact if either one died. Dutch children, daughters as well as sons, still inherited equal portions of the family estate, but only after both parents had died. It "was the manner amongst them," the Rev. Charles Wolley wrote in his journal, that they preferred "standing more on Nature than Names; that as the root communicates itself to all its branches, so should the Parent to all his offspring which are the Olive branches about his Table." This proved increasingly difficult in the country villages outside New York City, where farms couldn't be subdivided indefinitely, and some rural Dutch families did attempt to keep the land in the hands of one son—on condition that he provided his brothers with property elsewhere, and his sisters with tools, animals, furniture, kitchen equipment, and the like. Often, though, it was the youngest who kept the farm, because his older brothers had already moved away. Flatbush and other Long Island towns routinely dispatched expeditions to find land for young men who needed it. In 1677, for example, several dozen residents of Flatbush obtained a patent to settle the eastern part of the town, called the New Lots; another group moved en masse to new settlements on the Raritan and Milstone rivers in New Jersey.

Not every Dutch New Yorker clung to the old ways. One who didn't was Frederick Philipse, Margaret Hardenbroeck's husband and by far the richest man in the colony. In his will he would convey his vast holdings in Westchester and New York City to his sons and their male heirs, all of whom he expressly prohibited from breaking up or selling the property. His daughters would inherit no land at all unless both of their brothers died without male issue. No olive branches about the table for Philipse, then: his was an English landlord's dream of the future—great estates handed down from first-born son to first-born son, unbroken, generation after generation.

It wasn't the Dutch who put an end to Andres's career in New York, however, but rather the town's new crop of English merchants. They

criticized his partiality toward prominent Dutch traders and accused him of one crime after another—violating the Navigation Acts, taking bribes, extortion, obstructing trade, and pocketing the colony's taxes. He in turn excluded them from public office, harassed them with legal proceedings, and threw one or two into jail without trial. In the summer of 1680, bowing to pressure from the merchants' connections in London—a clear signal of where the fulcrum of New York's destinies now stood—the duke summoned Andros home pending an investigation of the charges against him. Captain Anthony Brockholls of the Albany garrison tried to maintain order pending the arrival of a new governor, but the victorious merchants, now joined by the English towns of Long Island, declared a tax strike that made a shambles of the colony's affairs for the next year or two. Frustrated and running out of money, the duke talked of selling the place to anyone who would make him a reasonable offer. His friend William Penn, whose own colony was just getting underway on the banks of the Schuylkill, urged him to hang on a while longer.

Jacob Leisler's Rebellion

Andros was acquitted of the charges that prompted his recall, but he lost his job anyway. In 1683 the duke replaced him with Colonel Thomas Dongan, the fourth royalist veteran of the Civil Wars to be sent to govern New York. Dongan was also an Irish Catholic landlord, the younger brother of Irish peer Baron Dongan (soon to be earl of Limerick), and an experienced imperial functionary who had previously served as the military governor of Tangier. Manhattan's Anglo-Dutch oligarchs liked him at once. They admired his "knowledge, refinement, and modesty," as Dominie Selyns put it. They were also grateful that although he gave a majority of the seats on his council to prominent English residents, he had the tact and good sense to seek the advice of leading Dutch merchants like Philipse, Van Cortlandt, and Steen-wyck (the latter of whom Dongan appointed as mayor). Above all, they appreciated his readiness to give them the freedom to manage local affairs more or less as they saw fit.

THE REORGANIZATION OF GOVERNMENT

Dongan launched his administration by calling for elections to the first representative assembly in the colony's sixty-year history. The Assembly's eighteen delegates met at Fort James for three weeks in October 1683. Their main accomplishment was to draft a "Charter of Libertyes and Privileges."

The charter defined the form of government for the colony (governor, governor's council, assembly), recognized basic political and personal rights (trial by jury, no taxation without representation), and affirmed religious liberty (for Christians). It divided the colony into twelve "shires" or counties: New York (all of Manhattan), Kings (now Brooklyn, including the Dutch towns of western Long Island), Queens (the English towns of western Long Island), Richmond (Staten Island), Suffolk (the eastern remainder of Long Island), and seven others. As in England, these were to be the fundamental units of local government. Each had its justices of the peace, collectively known as the County Court, plus a county clerk, high sheriff, and militia officers—all appointed by the governor. Each was also

an election district whose freeholders were empowered to elect representatives to the Assembly (although the definition of a “freeholder” was left rather vague).

The Assembly wound up its work by awarding Dongan a “free and voluntary” cash gift for his good will. Obliging, he proclaimed the Charter of Liberties aloud at City Hall—the townspeople “having notice by sound of Trumpet”—and passed it along to York for final approval.

At the behest of Mayor Steenwyck and the aldermen, the ever cooperative Dongan then issued a new charter for the government of New York City. “Dongan’s Charter,” as it came to be known, made New York City a self-governing corporation, one of only a dozen-odd communities ever incorporated in English America. It divided the city into five inner wards (South, Dock, East, West, and North) plus an Out Ward comprising the remainder of Manhattan. Every year each ward’s “inhabitants” were to elect assessors, a constable, an alderman, and an assistant, the latter two of whom served as delegates to the Common Council. The mayor, who presided over the council, would continue to be selected by the governor, as would the recorder, sheriff, coroner, and clerk.

With Dongan wielding his appointive powers on their behalf, the Anglo-Dutch oligarchy easily gained control over both provincial and municipal governments. They lost no time deploying their new powers for a wide range of purposes—straightening out public finances, establishing courts of justice, repairing municipal facilities, fixing the qualifications of physicians and surgeons, providing relief for the poor, standardizing marriage procedures, and, not the least, regulating city land sales in their favor.

THE GATHERING STORM

Dongan’s amiable relations with the Anglo-Dutch oligarchy were clouded, however, by the baronial land grants with which he favored a select group of insiders. Seven of these grants were formally styled “manors,” over which their “lords” received quasi-feudal legal and governmental powers subject only to the authority of the governor. The biggest, Rensselaerswyck Manor (an anglicized version of the old Dutch patroonship), encompassed 850,000 acres or better than eleven hundred square miles—fifty times the area of Manhattan. The Van Rensselaers’ Lower Manor at Claverack added

another 250,000 acres. Robert Livingston, the ambitious young Scot who had worked for the Van Rensselaers and linked himself by marriage to the Schuylers and Van Cortlandts, obtained Livingston Manor, some 160,000 acres in extent. Smaller grants went to James Lloyd (Lloyd's Neck Manor), John Palmer (Cassilton Manor), Christopher Billop (Bentley Manor), and Thomas Pell (Pelham Manor). Dongan also distributed a number of substantial nonmanorial patents, among them three separate patents for Frederick Philipse (fifty thousand acres in all) and one for Stephanus Van Cortlandt of several thousand acres.

The ostensible purpose of this largesse was to improve the colony's revenue while strengthening its defenses against the French and their Huron allies. Anglo-French competition in the Mississippi Valley had heated up during the 1670s and 1680s—La Salle, Marquette, Joliet, and other French explorers were scouting the interior of North America from Wisconsin to Louisiana in these years—and the danger of an invasion from Canada couldn't be ignored. (All the more so, Dongan thought, because the Albany Dutch couldn't be trusted to support the English in the event of war.)

None of this assuaged the wounded ambitions of men the governor overlooked while making free with the proprietor's real estate. Land, not money, was still the key to power and status in the English-speaking world: a rich man without estates was a man of limited influence—which explains why rich men on both sides of the Atlantic dreamed of acquiring land and moving into the ranks of the country gentry (or better yet, the titled nobility). It was galling indeed that Dongan gave so much to so few. And galling, too, that he didn't fail to help himself along the way. On Manhattan, he used dummy partners to lop off hefty slices of real estate along both sides of the city wall and drove a new road (now Park Row) diagonally through the town common from Broadway to the Bowery, appropriating a two-acre plot for his own use (and leaving a wedge-shaped remnant now occupied by City Hall Park). On Staten Island he acquired a twenty-five-thousand-acre tract that he named Castleton Manor after his estate in Ireland (its approximate location is marked by the modern Dongan Hills).

Resentment against the Charter of Liberties was also brewing outside the oligarchy, among the colony's Dutch population. Only eight of the first Assembly's eighteen members had been Dutch, and the charter contained a string of provisions offensive to Dutch traditions and sensibilities—

allowing a widow to remain in her house for only forty days after the death of her spouse and building primogeniture into the colony's law of intestate succession, among others. In 1684, the new Assembly adopted "An Act for Quieting of mens estates" that further affronted Dutch custom by denying a married woman the right to purchase land or conduct business in her own name. As for access to public office, most of the Dutchmen who found their way by election or appointment into the new city government were the same anglicized merchants who had collaborated with provincial officials for years; what was the likelihood that ordinary Dutchmen would be appointed to the new county offices in proportion to their numbers in the colony?

Working people, regardless of ethnic origin, didn't have much to gain from the new charter, either. Among the first acts of the new colonial and municipal governments were regulations for the stricter disciplining of unruly laborers, apprentices, servants, and slaves. The cartmen, still a virtually all-Dutch trade, received special attention. Early in 1684, when numerous merchants signed a petition complaining that city cartmen were "engrossing" firewood—going out of town to buy in quantity from suppliers, then returning to sell at inflated prices—the city council prohibited the cartmen from selling firewood themselves, then made them pay for inspectors to check the length and quality of all firewood sold in the city. Another measure forced the cartmen to drop whatever other work they were doing and make themselves available at the waterfront whenever shipments of perishable foodstuffs arrived. Dongan ordered each to make 104 deliveries to the fort every year, an average of two per week, without compensation. Outraged, the cartmen began the first transport strike in the city's history. The council declared them "Suspended and Discharged," then announced that "persons within this Citty have hereby free Lyberty and Lycence to Serve for Hyre or Wages as Carmen." After a week the strikers pleaded to return, but the council refused to rehire any until they had paid a fine and taken an oath to accept the new order of things.

Two additional circumstances sharpened dissatisfactions. One was the colony's faltering trade, mainly the result of competition from Philadelphia. Founded in 1682, only a year before Dongan arrived, William Penn's City of Brotherly Love had grown with alarming speed—by 1690 its population reached four thousand, already equal to or exceeding that of

Manhattan—and its merchants were cutting deeply into New York’s business with Chesapeake tobacco planters, New Jersey farmers, and the Iroquois of the upper Susquehanna. Nobody had a remedy as yet, least of all Dongan, but everyone, merchants and tradesmen and farmers alike, was worried.

Dongan’s Catholicism rankled too. He’d come to New York in the company of several Jesuit priests and immediately celebrated Mass in Fort James, the first such occasion in the city’s history. He also named Roman Catholics to strategic positions in his administration and authorized the Jesuits to open a Roman Catholic school. New York was a comparatively tolerant place and its residents didn’t complain at first, not openly anyway. As Captain William Byrd of Virginia discovered while touring the city a couple of years later, the sheer diversity of its creeds had made the residents so forbearing that they “seem not concerned what religion their neighbor is of, or whether hee hath any or none.” According to Dongan’s own tally, there were “not many of the Church of England; few Roman Catholics; abundance of Quakers. . . Singing Quakers; Ranting Quakers; Sabbatarians; Anti-Sabbatarians, some Anabaptists, some Independents, some Jews; in short, of all sorts of opinions there are some, and the most part of none at all.”

The problem was that the duke of York too now belonged to the Roman Catholic Church—and because his brother the king had failed as yet to sire a legitimate male heir, he stood next in line to the throne. Sending Dongan to New York had been only the latest of many signals that, in the event of his accession, the duke fully intended to restore Catholics to positions of power and influence from which they had been excluded by 150 years of Protestant supremacy. Horrified by this prospect, a parliamentary faction known as the Whigs was maneuvering to exclude the duke from the succession, put a Protestant on the throne, and curb the power of the monarchy. Anti-Catholic hysteria swept the country, aided and abetted by intriguers like Titus Gates, who in 1678 claimed to have uncovered a “Popish Plot” to assassinate Charles II and hasten the duke’s accession. In the spring of 1683, just as Governor Dongan left for New York, Protestant fanatics were foiled in an attempt to murder both the king and the duke.

The failure of the so-called Rye House Plot gave the crown and its allies in Parliament, known as Tories, an excuse to crack down on the Whigs.

Two of their leaders, Lord Russell and Algernon Sidney, were executed for complicity in the scheme; a third, the earl of Shaftsbury, friend and patron of John Locke, was driven into exile in the Netherlands. At the same time, crown lawyers attacked the chartered corporations and colonies that served as bases of Whig power outside Parliament. When the duke's advisers laid the Charter of Liberties before him at the end of that same year, he had second thoughts.

Then, in February 1685, Charles II died and the duke of York became King James II. New York was now a royal colony, meaning that the governor, the council, and all other appointive officials would henceforth be named by the crown. Other changes were on the way as well. Shortly after his ascension, James II and the Lords of Trade created the Dominion of New England, a super-colony incorporating all of New England plus New York, New Jersey, and Pennsylvania. New York's Charter of Liberties was disallowed, and with it the provincial legislature. Although the city's new charter survived royal scrutiny, Manhattan's affairs and fortunes were now inextricably married to those of King James.

The king's subjects in New York were struggling to make sense of these events when they learned, only months later, that Louis XIV had revoked the Edict of Nantes and unleashed a hurricane of official brutality against French Protestants. Thousands of Huguenots, as they were known, fled the country to England, Switzerland, the Netherlands, and America. A small number of them arrived in New York as early as 1686. By 1688 there were two hundred Huguenot families in the city, and they had erected a house of worship, the Eglise du Saint Esprit (originally the Eglise des Refugies Français a la Nouvelle York), on Petticoat Lane (Marketfield Street). Its congregation included Jays, De Lanceys, Boudinots, and other well-to-do merchants and shipbuilders known for their extensive business connections throughout Europe and their visceral hatred of Roman Catholicism. Not surprisingly, on hearing that the new English king had congratulated Louis for his diligence in persecuting them, New York's Huguenots—along with the great majority of the city's other Protestants—began to see the outlines of a deep-laid conspiracy, international in scope, against everything they held dear. After 1687, when James II suspended by royal decree all anti-Catholic legislation in England, they were sure of it.

A GLORIOUS REVOLUTION

In August 1688 Sir Edmund Andros returned to New York. He was now governor of the new Dominion of New England, and for the past year or so he had been up in Boston, its capital, bringing one colony after another under its authority. Now it was New York's turn to submit. Andros removed Dongan from office, broke the provincial seal, hoisted the flag of New England over the fort, and seized all the provincial records. He then returned to Boston, taking the records with him and leaving Colonel Francis Nicholson behind as lieutenant governor. Nicholson, though not a Roman Catholic like Dongan, was no less ardently devoted to the Stuart cause. He was also a passionate admirer of French culture and French political institutions.

The succession crisis in England was meanwhile coming to a head. What had held the Whigs in check thus far was the fact that James II, having no male heir, would in time be succeeded by one or the other of his two daughters, both of whom had remained Protestants. The elder of the two, Mary, was the wife of none other than Prince William of Orange—awkward, to be sure, but preferable, the Whigs figured, to having a Roman Catholic on the throne.

But in the summer of 1688, even as Andros was preparing for his journey down to New York, the queen gave birth to a son. Now faced with the certainty of a Roman Catholic succession, the Whigs reached out to William and Mary for assistance. A Dutch army landed on the coast of England in November 1688 and marched toward London. James chose not to make a fight of it and fled to France. Early the following year William and Mary accepted the crown from a grateful—not to say relieved—Parliament.

This bloodless coup, hailed by Whig apologists as the Glorious Revolution, proved to be a turning point in Anglo-American history. It secured the Protestant succession. It laid to rest the theory of royal absolutism in England. It established the supremacy of Parliament. In time, too, as Whig propagandists like John Locke labored to justify what had taken place, it would alter, fundamentally, the structure and vocabulary of Anglo American political discourse. Natural rights, popular sovereignty, constitutionalism, the inherent tendency of power to encroach upon liberty—these and other Whig commonplaces would become the conventional

wisdom on both sides of the Atlantic, so broadly accepted as to seem self-evident and timeless, a national creed rather than sectarian dogma.

“THIS CONFUSED BUSINESSE”

Secret dispatches at the beginning of March 1689 brought the first sketchy reports of “a total Revolution att home” to Lieutenant Governor Nicholson in New York. Uncertain of his own authority and unwilling to act without further information, Nicholson sat on the story for the next six weeks. His anxiety increased toward the end of April when word came down from Boston that Governor Andros and other dominion officials were under arrest. The dominion had been extremely unpopular in New England, where attempts by Andros to reorganize local government aroused exactly the same kind of discontent that he and his predecessors in New York had stirred up on Long Island. When word of James II's abdication reached Boston, an angry mob clapped Sir Edmund and other dominion officials in jail. They were later shipped back to England in chains.

By mid-April (if not earlier) everybody in New York as well knew of the Glorious Revolution—that an English king after whom the city was named had been replaced by a Dutch prince after whom the city had previously been named (during its brief incarnation as New Orange), that Andros was finished, that the Dominion of New England had collapsed. Then came news that England had joined the League of Augsburg against Louis XIV and that a declaration of war against France could be expected momentarily. Rumors may also have reached the city around this time that Louis XIV had ordered the governor of Quebec to attack New York in the autumn of 1689 and drive out all the Protestants.

Nicholson and his council (Stephanus Van Cortlandt, Frederick Philipse, and Nicholas Bayard), together with the captains of the city's six militia companies (among them Abraham De Peyster, Nicholas Stuyvesant, and one Jacob Leisler), took steps to fortify the city and strengthen the garrison in the fort. The governor said nothing, however, to indicate that he would accept the accession of William and Mary, and more rumors now began to fly around town—that Nicholson, Irish Roman Catholics (including former governor Dongan), renegade Jacobites (supporters of the deposed king), the French, and Iroquois befriended by Andros were planning to seize the city for James II.

The English towns of Long Island responded to the alleged Catholic-Jacobite-French threat by electing new magistrates and calling out their militias to march against New York City. As the militias advanced slowly westward, Nicholson reported, they were assisted by “some ill affected and restless spiritts amongst us” who “used all imaginable meanes to stirr up the Inhabitants of this Citty to sedition and rebellion.” Nicholson, his council, and the the city’s militia captains reiterated their determination to defend New York against foreign enemies and to suppress “mutinous persons nigh us.” The Long Island militiamen went no further than Jamaica and dispersed, but apprehensive merchants, Captain Leisler among them, began withholding payment of customs duties until the legitimacy of the government had been clarified and the customs collector, a Roman Catholic, was removed from office.

Nicholson still hesitated to acknowledge the abdication of James II. When he gave refuge to some soldiers from the Boston garrison, then threatened to “pistol” a Dutch militia officer and “sett the town in fyre” rather than tolerate insubordination, his authority disintegrated. Excited city militiamen poured into the streets, beating drums and calling on Captain Leisler to lead them in preventing a papist rising. On the last day of May, led by Ensign Joost Stol of Leisler’s company, the militia swarmed into Fort James and disarmed the little garrison of regular troops. Joined by a mass of civilians, they declared all laws made under the authority of King James to be null and void and formed an “association” to hold the city for William and Mary. To all intents and purposes, the colony’s government had ceased to exist. Nicholson took the first boat back to England to get help (and in the bargain got himself appointed governor of Virginia, where he founded the College of William and Mary and laid out Williamsburg).

Toward the end of June what Nicholson called “this confused businesse” took another turn when orders at last arrived from England for all public officials to proclaim William and Mary. When Mayor Van Cortlandt and Nicholson’s council continued to stall, their authority too collapsed. Angry crowds drove them out of office, shut the courts, and closed down the customhouse. Van Cortlandt went into hiding. Bayard, having narrowly escaped an armed assault, decided to get out of town.

The insurgents immediately set up a ten-member Committee of Safety (four of whom were Huguenots) to govern both city and province. Over the

summer of 1689 the committee reopened courts, resumed the collection of duties and taxes, allocated money for the city's defenses, and dispatched an emissary to England to tell William and Mary that all was well. The committee also chose Jacob Leisler to command the fort; by mid-August, the committee had become so impressed by Leisler's zeal and popularity that they made him commander-in-chief of the entire province. When William and Mary finally sent a commission for Nicholson or "such as for the time being take care for Preserving the Peace and administering the Lawes in our said Province of New York in America," Leisler decided—not unreasonably, in light of Nicholson's hasty departure—that he should assume the office of lieutenant governor. He began to organize a government, handing out commissions to scores of militia officers, justices of the peace, tax collectors, sheriffs, and notaries throughout the colony. As the year drew to a close his control of New York seemed complete.

LEISLER AND THE LEISLERIANS

Leisler was not unprepared for the work that lay ahead. Born forty-nine years earlier in Frankfurt-am-Main, he came from an illustrious family whose members included well-known Reformed clergymen, wealthy merchants and bankers, and highly placed government officials throughout Germany and Switzerland. After graduating from a Calvinist military academy in Nuremberg, he moved to Amsterdam and got a job as a translator for Cornells Melyn. In 1660, probably with Melyn's help, he was commissioned an officer in the forces of the West India Company and led a contingent of troops over to New Amsterdam. He stayed on after the English conquest, set himself up in the fur and tobacco trade, and by the mid-1670s had become one of the half-dozen richest men in New York, owning a large town house, a farm on the present site of City Hall Park, and numerous other properties in and around the city. He became even wealthier in 1683, when the courts finally awarded him control over the vast estate of Govert Loockermans, whose stepdaughter, Altye (Elsie) Tymans, he had married some years before. Active as well as prosperous, Leisler was a deacon of the Reformed Church, captain of the militia, justice of the peace, and—thanks to close family and personal connections with the international Huguenot community—a respected figure among New York's French Protestants. It was largely through Leisler's efforts, in fact, that a settlement

of Huguenots had been started in 1687 at New Rochelle (named after La Rochelle, the epicenter of French Protestantism).

Leisler never quite made it into the innermost circle of the Anglo-Dutch oligarchy, however. One reason was a nasty, protracted dispute with the Bayards and Van Cortlandts over the estate of his wife (who was related to both families). Another was his ardent Calvinism and passionate devotion to the House of Orange, which linked him to anti-English elements in the Reformed Church. During the brief Dutch reconquest of 1673-74, moreover, Leisler had been closely identified with Governor Colve and was thereafter never entirely trusted by the English.

Leisler's goal in the summer of 1689 was to hold New York for his new sovereigns against the "Popish Doggs & Divells," foreign and domestic, who threatened it. The identity and motives of his followers cannot be summed up so neatly. Many were second-generation Dutch, born in the city around the time of the 1664 conquest. A few, like Johannes De Bruyn, Abraham Gouverneur, and Nicholas Stuyvesant, were successful merchants; others, such as Cornelius Pluvier, baker, and Johannes Van Couwenhaven, brewer, were well-to-do artisans. Gerardus Beekman, a physician, supported Leisler. So did Samuel Staats, also a physician, who had returned to the Netherlands after the English conquest "rather than endeavor to make himself an Englishman," then came back again to join Leisler. But this wasn't simply a Dutch uprising against English oppression. Some prominent Dutch merchants opposed Leisler, as did Dominie Selyns of New York and Dominie Varick of Long Island, while Leisler's most trusted lieutenants included a number of Englishmen, among them Jacob Milborne and Samuel Edsall, a New Jersey hatmaker and Indian trader. Among Leisler's followers, moreover, were the shopkeepers, craftsmen, sailors, cartmen, and laborers of every nationality who formed the bulk of the city's population. Somewhat more than half the militiamen who initially took over Fort James came from England, Scotland, Wales, Denmark, France, Germany, or other parts of North America; outside the city itself, the Stuart-hating villagers of English Long Island would prove to be among Leisler's staunchest supporters.

What united these disparate insurgents was a rhetoric of loyalty to the Protestant cause that encompassed a broad range of social and political discontents. As Leislerian pamphleteers and spokesmen told the story, they

had lived for years in “great dread” that the late King James planned “to Damn the English Nation to Popery and Slavery.” His minions in New York —“our grandees,” Leisler called them—had already made great strides in that direction, aided by Reformed clergymen who collaborated with the English. Then “the Hand of Heaven sent the glorious King William” to save the colony. When the governor and council delayed in declaring for the new government, the people rose up to defend both “the Holy Protestant Religion, and the Rights and Liberties of English men.”

Nowhere was this layering of social and religious resentment more apparent than in the case of Jacob Milborne. Eight years younger than Leisler, Milborne was the son of a tailor who had been deeply influenced by the radical Protestantism that flourished among English working people during the Civil War. Jacob’s brother William was one of the Fifth Monarchy Men who believed that Christ’s kingdom was at hand and in 1661 attempted an armed uprising to prevent the restoration of the Stuarts. He eventually settled in Boston as a Baptist preacher. Jacob, in the meantime, went to America as the apprentice of a Hartford merchant. In 1668 he came down to New York, found work as a clerk for Thomas Delavall, and then went into business for himself.

During the 1670s and early 1680s, Milborne often traveled to Europe as a factor for Delavall and other city merchants, building a modest fortune as well as contacts with powerful English Whigs like Shaftsbury. On both sides of the Atlantic, his loathing for the Stuarts and his egalitarian contempt for puffed-up authority got him into trouble on more than one occasion. He helped spread the tale of the Popish Plot and served as a spy for Samuel Pepys. He also joined Leisler in opposition to the anglicized dominies who led the Reformed Church in New York. The Glorious Revolution found him in the Netherlands on business, but rumors of a Catholic plot to deliver the colony to the French brought him hurrying back in the summer of 1689.

Like his brother, who took part in the Boston uprising that toppled Andros and the Dominion of New England, Milborne threw himself into the struggle to defend his new sovereigns against their enemies. His pronouncements on social equality and the popular basis of political authority—far more extreme than anything ever heard from Leisler himself

—soon made him one of the city’s most conspicuous and controversial figures.

As for Leisler’s “grandees,” whose version of events is more fully recorded, they knew, without a shadow of doubt, what they were up against. “Hardly one person of sens & Estate. . . do countenance any of these ill and rash proceedings,” Nicholson had said after giving up the fort, striking a note that would be played over and over again by Leisler’s opponents and victims in the months and years to follow. Thirty-six merchants, including a half-dozen deacons of the Reformed Church, sent an address to William and Mary depicting the Leislerians as “a Rable . . . who formerly were scarce thought fit to bear the meanest offices among us.” Still other “men of quality” and “Persons of Note” scoffed at Leisler’s “ignorant Mobile,” his “most abject Comon people,” his “drunken crue,” his “Olleverians” (a reference to Oliver Cromwell’s supporters). Van Cortlandt spoke grimly about the approach of “people’s Revolutions.”

To Nicholas Bayard, perhaps his most vitriolic critic, Leisler was a man of Cromwellian insolence, driven by “unsatiable Ambition,” unable to accept “the station nature had fitted him for, and placed him in, but his soaring, aspiring mind aiming at that which neither his birth nor education had ever qualified him for.” Jacob Milborne was a “dark politician” who had an “affected ambiguous way of expressing himself [which] renders him unfit for the conversation of any but the vulgar, who in this age are so apt and ready to admire and applaud that they understood not.” The rest of the insurgents, Bayard continued, were “poor ignorant innocent and senseless people who suffer them to be ruled and hectored by about twenty or thirty ill drunken sots.” (Bayard also alleged that the insurgents were egged on by a woman, Trijn Jans, and women appear to have been among Leisler’s most active and vocal supporters.)

“KILL HIM! KILL HIM!”

Something very like a “people’s Revolucion” did indeed appear to be approaching New York between the autumn of 1689 and the spring of 1691. When the Committee of Safety called for a general election of local officers in September 1689, it decided (perhaps at Milborne’s urging) to broaden the range of elective positions: justices of the peace and militia captains were to be chosen directly by voters for the first time, triggering a dramatic

shift in the distribution of political power in the city. Bakers, bricklayers, carpenters, innkeepers—workingmen heretofore thought unfit for public responsibility—captured a majority of seats on the board of aldermen. Johannes Johnson, carpenter, became sheriff, and William Churcher, bricklayer, became marshal. Peter Delanoy, a Huguenot and one of Leisler's inner circle, was elected mayor of the city. Joost Stol, the militia ensign who had led the initial takeover of the fort, accepted the crucial task of presenting the Leislerians' case in London.

Scenes of open class conflict now became commonplace in the city. Bands of Leislerian rebels waylaid grandees who ventured out of doors, ransacked their homes and stores, intercepted their mail, and hauled them off for questioning. Bayard was arrested, marched in irons around the parapets of the fort, then thrown into jail for almost a year. Arrest warrants went out for such other prominent anti-Leislerians as Van Cortlandt, Robert Livingston, and former governor Dongan—so many, in fact, that a little colony of fugitives and refugees sprang up across the Hudson in New Jersey.

In retaliation, anti-Leislerian saboteurs reportedly tried to blow up the fort, and one day in June 1690 thirty-odd anti-Leislerian merchants set upon Leisler himself, shouting "Kill him, kill him!" "I will not suffer this to happen," cried sixty-year-old John Langstraet, a prominent carter, who jumped into the fray, giving Leisler time to draw his sword and escape. While his outraged followers flooded into town to protect him against further attempts, thirteen of the plotters were arrested, including Major Thomas Willett. Inexplicably, they were all soon released. Willett returned to his home in Queens, where he raised a small body of troops and marched back toward New York. Milborne rallied the city militia and drove the Long Islanders off after a brief skirmish near Newtown. Willett escaped to New England, and Milborne's militiamen contented themselves with looting his house. Seven of his captains were subsequently convicted of treason and rebellion at a court-martial in Flatbush.

In the spring of 1690 Leisler ordered elections for a new Assembly, which proceeded to raise taxes and strike down the monopolies and trade regulations with which every governor since Nicolls had favored New York City and its merchants. At a second session in the fall of the same year, the Assembly demanded the return of all disaffected persons who had fled the

colony and provided heavy fines for those refusing civil or military employment in Leisler's government.

The striking thing, under the circumstances, was what the Assembly didn't do—how utterly it failed to address the piled-up political and social grievances that had plunged New York into near-chaos. Leisler himself bore a large share of responsibility for what happened. He never really wanted to deal with a legislature, it seems, and when talk at the first session turned to things like fundamental rights and liberties, he angrily sent the delegates home. If Leisler's rebellion was to become a revolution, he wasn't the man to lead it.

Besides which, Leisler had his hands full. To suppress the grandees' strong and active opposition, he relied more and more heavily on arbitrary arrests, oppressive taxation, and confiscations, with the result that some of his most trusted collaborators lost their nerve and began to drift away. Then, too, there loomed the problem of French Canada. In February 1690, six months after the outbreak of the War of the League of Augsburg (known as King William's War in the colonies), a mixed force of French and Indians burned Schenectady and slew some sixty of its citizens and their slaves. Leisler promptly began to organize a retaliatory strike against Montreal, but after months of time-consuming, often acrimonious preparations the attack failed to materialize. Had he not been confronted with so serious an external threat to the entire colony so early in his regime—or had he not chosen to respond with such single-mindedness—it is arguable that his fate might have been different.

“FOR THEY HAVE DEVoured JACOB”

New York's grandees had better connections at court than did Ensign Stol, the Leislerian emissary. Over the summer of 1690 they convinced King William to disavow Leisler. Colonel Henry Sloughter was commissioned governor and given a council consisting of Philipse, Van Cortlandt, Bayard, Willett, and other oligarchs. Proclaiming his intention to rid New York of Leisler and the “rabble,” Sloughter set sail for New York toward the end of 1690.

The first contingent of English troops, commanded by Richard Ingoldsby, reached the city in March 1691. With several hundred well-

armed followers, Leisler and Milborne barricaded themselves in the fort and refused to surrender until shown Slougher's commission. A tense six weeks passed, punctuated by exchanges of gunfire, as both sides waited for Slougher himself to arrive. When Slougher finally turned up, commission in hand, Leisler and Milborne had no choice but to lay down their arms. A hastily appointed court (including Ingoldsby) convicted them and six others of treason, then directed that they be "hanged by the Neck and being Alive their bodys be Cutt Downe to the Earth that their Bowells be taken out and they being Alive burnt before their faces that their heads shall be struck off and their Bodys Cutt in four parts and which shall be Desposed of as their Majesties shall Assigne."

While he waited for this grisly sentence to be approved back in London, Slougher ordered elections for a new Common Council and provincial assembly. Both bodies began at once to apply pressure on the city's working people and its large Dutch population, the two overlapping groups that had formed the mass base of the insurgency. The council imposed a licensing requirement on cartmen, made it more difficult to obtain the privileges of freemanship, and drew up the first municipal ordinances specifically regulating apprenticeship. The Assembly facilitated the suppression of future dissent with legislation providing that anyone who disturbed "the peace good and quiet of this their Majestyes Government" would be guilty of high treason. It also allocated public funds to compensate individuals for losses sustained during Leisler's regime and encouraged punitively large private damage suits against dozens of leading Leislerians.

The Assembly's most important thrust against the Leislerians, however, came in the form of the Judiciary Act of 1691. Designed to anglicize New York's legal system once and for all, the Judiciary Act set up a centralized Supreme Court of Judicature, erased the remaining traces of Roman-Dutch law in the colony, and instituted a new, uniform legal system based on the English common law. (That this was the Assembly's work underscores its vindictiveness: English courts traditionally derived their authority from the crown, not legislatures.) The act also empowered county sheriffs and justices of the peace to prosecute "moral" as well as civil and criminal offenses—a de facto license to homogenize local custom and culture. Under English law "moral offenses" were a matter for church courts. No such courts existed in New York, and by shifting their responsibilities to county

justices and sheriffs, the Assembly made those officials more powerful than their English counterparts.

In response to public appeals for clemency and to a Huguenot riot on Staten Island, Slougher paroled all the condemned rebels except Leisler and Milborne (who was now Leisler's son-in-law, having married his daughter Mary just before their arrest). Bayard talked Slougher into signing their death warrants; it was later alleged that he took advantage of the governor when he was drunk. The Assembly concurred, and on a rainy May 16, 1691, the two were taken "on a sledge" to the gallows on the eastern edge of what is now City Hall Park.

Leisler spoke briefly, begging forgiveness for the errors and excesses of his regime and insisting on the purity of his motives. "This confused City & Province," he said, needed "more wise & Cunning powerful Pilotts than either of us ever was." Milborne, always the more defiant, swore that he would have his day of reckoning with his enemies "before gods tribunal." No carpenter would provide a ladder for the scaffold, so Dominie Selyns fetched one himself, and the executions proceeded while the crowd sang the Seventy-ninth Psalm: "Pour out thy wrath upon the heathen that have not known thee, and upon the kingdoms that have not called upon thy name. For they have devoured Jacob, and laid waste his dwelling place."

One eyewitness later recalled that "Milborne was not dead when the executioner took him down from the gallows, and lifted up his arm as if to parry the blow of the axe that was to cut his head off." Another remembered that "the shrieks of the people were dreadful—especially the women—some fainted, some were taken in labor; the crowd cut off pieces of his [Leisler's] garments as precious relics; also his hair was divided out of great veneration as for a martyr." (It was also reported that the executioner cut out Leisler's heart and gave it to a lady, possibly Bayard's wife, who held it aloft, screaming, "Here is the heart of a traitor!")

Leisler and Milborne, heads sewed back on, were buried side by side on property Leisler owned not far from the place of their execution, in the area now bounded by Park Row, Spruce Street, and Frankfort Street. Legend says the latter was named after the place of Leisler's birth. If so, it is the city's only surviving monument to his memory.¹

Heats and Animosities

Leisler's death split New York like an ax. Colonel Benjamin Fletcher, who succeeded Henry Sloughter as governor in the autumn of 1692, found the hostility between Leislerians and anti-Leislerians running at such a pitch that neither faction "will be satisfied with less than the necks of Their adversaries." An Irishman, Fletcher understood how bad these "heats and animosities" could get, but he had no intention of remaining neutral. His job was to carry on the work of anglicizing the colony, and he needed the cooperation of the anti-Leislerian dominies and merchants who had, for the better part of thirty years now, cast their lot with the English.

CHURCH AND STATE

At the top of Fletcher's agenda for New York was the creation of a secure Protestant establishment—"a settled Ministry"—the one guarantee, he said, "that neither heresy, sedition, schism nor rebellion be preached amongst you, nor vice and profanity encouraged." Vice and profanity in particular were rife, observed the Rev. John Miller, newly arrived Episcopal chaplain to the fort's two companies of grenadiers. New York had become a sink of "irreligion, drunkenness, cursing and swearing, fornication and adultery, thieving, and other evils," he reported to the bishop of London. If the locals go to church at all, it is but "to find out faults in him that preacheth rather than to hear their own." Too many residents believed the "sweet and unconfined pleasures of the wandering libertines" an acceptable alternative to holy matrimony, while "ante-nuptial fornication" had become so widespread that New Yorkers often didn't marry until "a great belly" obliged them to.

In 1693 Fletcher more or less forced the Assembly to pass the Ministry Act, which provided for the public election of vestrymen and churchwardens in New York, Westchester, Queens, and Richmond counties. These county vestries (secular bodies, not to be confused with those governing individual churches) were empowered to tax all residents to pay the salaries of "good and sufficient Protestant ministers." In England, this

meant only Anglicans. Fletcher, a staunch adherent of the national church, said it meant only Anglicans in New York as well.

Anglicans were a distinct minority in New York, however. The colony's only Anglican clergyman was the chaplain attached to the garrison on Manhattan, and his congregation comprised fewer than ninety families, at best 10 percent of the city's twenty-one hundred white adults. Except for a comparative handful of Roman Catholics and Jews, the vast majority of New Yorkers were nonconformists or "dissenters"—Protestants not affiliated with the Church of England. The Act of Toleration, adopted by Parliament in 1689, guaranteed their right to public worship, as did legislation by the New York Assembly in 1691, which extended the same right to all orderly Christians other than Catholics. Even Fletcher's official instructions required him to allow "a liberty of Conscience to all persons (except Papists)." Not surprisingly, then, dissenters saw the governor's interpretation of the Ministry Act as a subterfuge for evading the law and establishing the Church of England: what good is the right of public worship, they asked, if they must pay the salaries of Anglican clergy and, worse yet, allow Anglican clergy to occupy their pulpits?

The dominies who had opposed Leisler were especially indignant, and to them the governor offered a compromise. In return for their acquiescence, the Dutch Reformed Church, representing some 650 adults in the city alone, could have a charter exempting it from any obligation to support the Church of England and granting it complete autonomy in the appointment of clergy. The dominies accepted. In 1696 they got their charter, presented the governor with a silver plate as a token of gratitude, and set aside richly appointed pews for him and his entourage in the new Dutch church on Garden Street (Exchange Place).

In 1697 Fletcher granted New York Anglicans a corporate charter of their own. A vestry of wealthy laymen began at once to organize construction of Trinity Church, the city's first Episcopal house of worship, on the west side of Broadway at Wall Street, overlooking the Hudson River. By 1698 the building was ready for services, with the Rev. William Vesey serving as first rector. Satisfied that the Church of England now had a foundation for future expansion in New York, the vestry happily declared that the days were over when "for want of a Temple for the public Worship according to the English Church, this seemed rather like a conquered

Foreign Province held by the terrour of a Garrison, than an English Colony, possessed and settled by people of our own Nation.”

Ties between the Anglican and Reformed communions remained strong, nevertheless. During Trinity’s construction, Dutch carters were paid handsomely for transporting building materials, while Dominie Henricus Selyns made the Garden Street church available for Anglican services and assisted Fletcher at Vesey’s induction on Christmas Day of 1697. For the first three months, moreover, Vesey and Selyns preached alternately at Trinity, the former officiating in English, the latter in Dutch.

Yet this unique arrangement—really a dual establishment—failed to have the calming effect that Fletcher promised. Dissenters refused to concede the Church of England’s right to public maintenance and initiated a decades-long conflict with militant Anglicans. Provincial authorities responded by leaving Trinity to fend for itself, thus ensuring the colony’s reputation for heterodoxy and toleration. Only Roman Catholics remained officially unwelcome. In 1700, when there were still fewer than a dozen Catholics in the city, the Assembly required all priests ordained by the pope to leave before the end of the year; anyone hiding a priest was subject to a fine of two hundred pounds.

Nor did the privileged status of the Reformed Church quiet the wrath that swept New York’s Dutch population following Leisler’s execution. County sheriffs and judges, linchpins of local English government outside Manhattan, reported case after case of Dutch opposition to their authority, often to the point of open violence. On one occasion, in 1696, a party of Dutchmen armed with “swords guns and Pistoles” attacked the Kings County courthouse, and Myndert Courten, a prominent Leislerian, announced that “he didn’t value the Courts order a fart for their power will not stand long.”

More odious still for truckling to the English were the Reformed dominies themselves—Selyns of Manhattan, Varick of Long Island, and Dellijs of Albany. Angry congregations tried to starve them out of office by withholding their salaries; those in Harlem, Staten Island, and New Jersey announced that they could “live well enough without ministers or sacraments” and refused to have anything to do with the three. Once the sanctuary of the Garden Street church was “attacked by violence and open force.” Thousands of men and women throughout the colony simply

abandoned the Reformed communion altogether. By the mid-nineties, according to Dr. Benjamin Bullivant, a visitor from Boston, the Dutch residents of Manhattan generally ignored the Sabbath, “some shelling peas at theyr doors children playing at theyr usuall games in the streets & ye taverns filled.” As the decade came to a close, Reformed churches everywhere in the colony complained of 80 or 90 percent declines in membership, frequently because of wholesale exoduses—“ten, twenty or more families” at a time—to the wilds of Ulster County, northern New Jersey, or Pennsylvania.

THE PIRATES OF NEW YORK

While attempting to erect an Anglo-Dutch religious establishment in New York, Fletcher also secured the fealty of the colony’s anti-Leislerian oligarchs by serving them gluttonous helpings of real estate. The most fortunate received manors over which they exercised quasi-feudal authority. Stephanus Van Cortlandt became lord of eighty-six-thousand-acre Cortlandt Manor in Westchester County and of Sagtikos Manor on Long Island’s south shore. Chief Justice William “Tangier” Smith was made lord of St. George Manor, which ran for fifty miles along the north shore of Long Island. Lewis Morris (nephew and heir of Colonel Lewis Morris of Barbados) became lord of Morrisania Manor, now encompassing some three thousand acres near the mouth of the Harlem River. Frederick Philipse became lord of ninety-two-thousand-acre Philipsburgh Manor in Westchester, while the municipal government awarded him the exclusive right to operate a toll bridge across Spuyten Duyvill Creek at the northern tip of Manhattan. (King’s Bridge, as Philipse called it, opened for business in 1693.) A host of other anti-Leislerians—Peter Schuyler, Henry Beekman, Dominie Dellijs, and a rising young merchant named Caleb Heathcote—accepted hundreds of thousands of acres without the trappings of lordship.

In addition to rewarding his friends with the crown’s territory, Fletcher gave them free rein in the piracy business. As King William’s War dragged on—it didn’t end until 1697—both Britain and France bolstered their regular navies by relying on privateers, privately owned warships empowered by “letters of marque” to despoil enemy shipping. The law required that captured ships and cargoes—known as “prizes”—be legally condemned in a proper court of law before they were disposed of.

Privateering proved so lucrative that many captains and owners dispensed with the formalities and turned to out-and-out piracy, attacking the vessels of any country, including their own. There were only two details to worry about. One was being caught and hanged. The other was disposing of loot.

Fletcher rolled out the red carpet for pirates, allowing them and their crews to enter New York without fear of arrest, dispose of their treasure, and refit for another voyage—all for a mere one hundred Spanish dollars each. Over the next four or five years he hosted a remarkable collection of villains and cutthroats. When pirate captain Thomas Tew put into port in 1694, the governor invited him to dinner, escorted him around town, and presented him with a gold watch as an inducement to return. Taken aback, the Lords of Trade in London asked for an explanation. Tew was “what they call a very pleasant man,” Fletcher answered serenely. “When the labours of my day were over it was some divertisement as well as information to me, to heare him talke. I wish’d in my mind to make him a sober man, and in particular to reclaime him from a vile habit of swearing.”

With Fletcher’s blessings, some of New York’s best-known captains hoisted the black flag and sailed off” to ply the waters between Africa and India, trailing mayhem and murder in their wake. Richard Glover, captain of the *Resolution*, seized two East India Company ships off the coast of Aden, burned their crews alive, and then blockaded the port of Calicut for ransom. Edward Coates came home with stolen goods valued at sixteen thousand pounds (including twenty-eight hundred pieces of eight) and gave Fletcher his ship, the *Jacob*, as a present. William Mason, captain of the *Charming Mary*, returned with booty worth thirty thousand pounds. Mason’s quartermaster, Samuel Burgess, subsequently went into the business on his own account and became one of the most feared pirates along the east coast of Africa.

Frederick Philipse, Nicholas Bayard, William Nicoll, Stephanus Van Cortlandt, Peter Schuyler, Thomas Willett, Tangier Smith, and other anti-Leislerian merchants financed these pirate cruises, provisioned pirate ships, and smuggled pirate contraband back into the city. They invested heavily in the illegal trade between New York and Madagascar, a notorious haven for marauders where goods of both colonial and European origin—clothing, shoes, tobacco, rum, sugar, firearms—fetched fantastic prices. A cask of wine worth nineteen pounds in New York was said to sell for three hundred

pounds on Madagascar, and local merchants sometimes made profits of ten thousand pounds on a single voyage. A few maintained their own agents on St. Mary's Island, just off the Madagascar coast, where a former New York mariner named Adam Baldrige had set up a kind of trading post for merchants and pirates.

All told, according to one report, this boodling was worth a hundred thousand pounds a year to the city. Tavern keepers, whores, retailers, and others flourished as buccaneers swaggered through the streets with purses full of hard money—Arabian dinars, Hindustani mohurs, Greek byzants, French louis d'or, Spanish doubloons. Merchants reaped huge profits (as great as “200,300, yea sometimes 400” percent, according to the Rev. John Miller) on silk carpets, muslins, ivory fans, ebony and teakwood chairs, East India cabinets, looking-glasses, vases of hammered silver and brass, and other exotic merchandise whose provenance didn't always bear close scrutiny. The most successful built fine new residences, prompting Dr. Bullivant to remark on the “multitudes of greate & Costly buildings” that went up in New York during Fletcher's administration.

Few New Yorkers did better than Fletcher himself, however. In addition to the protection money he collected from pirates, he extorted bribes from licensed Indian traders, bilked the customs service, padded military payrolls, and embezzled funds raised to pay the provincial debt. “He takes a particular delight in having presents made to him,” wrote Peter Delanoy, the former Leislerian mayor, a trait that “has found employment for our silversmiths and furnish'd his Excellency with more plate (besides variety of other things) than all our former Governours ever received.” Altogether, his profiteering reportedly netted him thirty thousand pounds. His luxuriously appointed residence in the fort, staffed by nineteen servants, was the talk of the town.

THE ANGLICIZATION OF CITY LIFE

While working to attach the anti-Leislerian dominies and oligarchs ever more firmly to his government, Fletcher accelerated the process of anglicization begun by the Judiciary and Ministry acts. In 1693 he informed New Yorkers that Long Island would henceforth be called the Island of Nassau so that the memory of William III “may live forever amongst you” (prior to the Glorious Revolution the new king's title had been Prince

William of Nassau; it survives in Long Island's Nassau County). That same year Fletcher tightened New York's connections with other English colonies by reviving regular mail service to New England. Except in the dead of winter, a post rider left New York once every week, following the Post Road through New Haven to Saybrook, where he exchanged mailbags with the Boston rider, who had come down via Providence, Stonington, and New London. Service to Philadelphia was added shortly thereafter.

On November 4, 1694, likewise at Fletcher's behest, the city celebrated the King's Birthday with a bonfire—the first instance of what soon evolved into an elaborate annual civic ritual “essential,” in the words of a later royal governor, “to preserve and keep up in the minds of the People that respect which is due to His Majesty.” One day later, another bonfire was lit to commemorate the discovery of Guy Fawkes's Gunpowder Plot of 1605, a Catholic scheme to blow up Parliament. Also called Guy Fawkes Day (or Pope Day in New England), the fifth of November was a popular English holiday marked by fireworks, anti-Catholic effigy processions, and general rowdyism. As a spur to political loyalty and patriotism its value in post-Leislerian New York was self-evident, and it too would become a key element of an ever more anglicized municipal culture. At some point early in the eighteenth century, it also became customary for the governor to host a fancy-dress ball for well-to-do New Yorkers of English descent on St. George's Day (April 23). St. George, of course, was the patron saint of England, and in time, private national societies sprang up to celebrate the feast days of St. Andrew (Scotland), St. David (Wales), St. Patrick (Ireland), and even St. Nicholas (the Netherlands) as well.

Fletcher pressed his anglicization program still further by persuading the Assembly to hire thirty-year-old William Bradford of Philadelphia as public printer. Over the summer of 1693 Bradford opened a printshop at the Sign of the Bible in Dock Street (now Pearl) and promptly ran off a glowing testimonial to Fletcher's martial exploits by Nicholas Bayard and Charles Lodwick. It may have been the first book ever printed in New York.

Because of its close association with dissent, and of the thin line that seemed to separate dissent from sedition and revolution, printing had always been closely controlled in England (as elsewhere); the duke of York, not long before ascending to the throne as James II, warned Governor Thomas Dongan to let no one operate a printing press in his province since

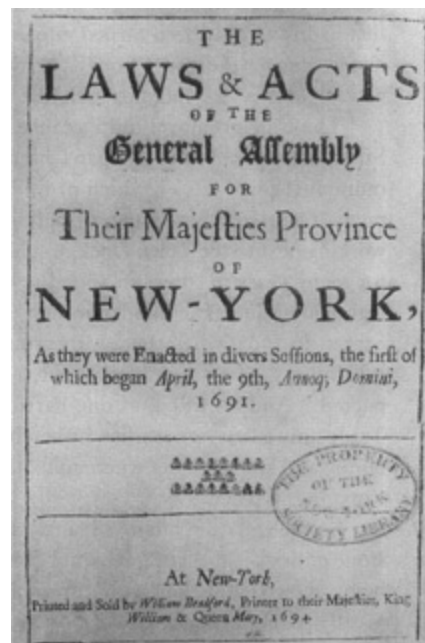

“great inconveniences may arise by the liberty of printing.” After the Glorious Revolution, though, Parliament virtually eliminated restrictions on the press and the expression of opinion. Well before the end of the century, as a result, the English-speaking world was awash in books, pamphlets, journals, magazines, and newspapers.

Bradford’s shop connected New York to this burgeoning print world, attuning its residents to every nuance of British social and political discourse (although his audience was narrow by modern standards: in 1700 no more than one out of five residents of the city could read, and by 1750 no more than two out of five). Over the next thirty or forty years, he served up a steady diet of English-language almanacs, religious tracts, courtesy books, and excerpts from English newspapers (most often the *London Gazette*). His editions of Richard Lingard’s *Letter of Advice to a Young Gentleman Leaving the University Concerning His Behavior and Conversation in the World* (1696) and Francis Daniel Pastorius’s *A New Primmer, or Methodical Directions to Attain the True Spelling, Reading & Writing of English* (1698), as well as his own *Secretary’s Guide, or, Young Man’s Companion* (1698), were obvious attempts to promulgate British standards of correct behavior. So, too, the first American edition of the Anglican Book of Common Prayer would come off Bradford’s press in 1710. In 1725 he would launch New York’s first newspaper, the weekly *Gazette*.

As the government’s mouthpiece, Bradford issued a stream of official edicts, statutes, ordinances, petitions, and notices that imparted legitimacy as well as substance to the imperial order. His annual edition of the Assembly’s journals was the first publication of its kind anywhere in the colonies, for nowhere else did government have a more urgent need to inform and instruct the literate classes. Similarly, in 1698, Bradford would issue the first locally printed account of Leisler’s Rebellion, an anonymous anti-Leislerian diatribe entitled *A Letter from a Gentleman of the City of New York to Another, Concerning the Troubles Which Happen’d in the Time of the Late Happy Revolution*. (True freedom of the press was an idea whose time hadn’t yet come, though: the Leislerian response—another anonymous polemic, entitled *Loyalty Vindicated*—had to be printed in Boston.)

In this increasingly anglicized climate the city acquired its first coffeehouse. Created by Puritans in the mid-seventeenth century, coffeehouses were now quite fashionable in London as alternatives to the taverns and gin mills frequented by the lower classes. They offered men of affairs a comfortable place to talk business, discuss current events, and peruse the latest books and newspapers. Lieutenant John Hutchins, an officer who had come over with Sloughter, decided that New York was ready for a coffeehouse of its own. In 1696 he opened for business at the sign of the King's Arms.

Standing on the west side of Broadway between Crown (Liberty) and Little Prince (Cedar), just north of Trinity Church, the King's Arms quickly became the unofficial headquarters of English New York. Municipal and provincial officials, merchants, and officers from the fort thronged the barroom, some milling about on foot, others occupying small curtained booths to sip coffee or dine in comfort and privacy. Committees of both the provincial assembly and Common Council routinely convened in its spacious upstairs meeting-rooms, whose windows and balconies afforded sweeping views of the river and harbor below. As early as 1699, Hutchins may have allowed his establishment to be used for theatrical performances, now considered very chic in London.¹

(The New York Society Library)

In these same years, the Common Council decided to replace the Dutch Stadhuis, half a century old now, with a proper City Hall at the intersection of Wall and Broad streets. (The parcel was donated by Abraham De Peyster, who had bought up many of the Dongan lots on Wall Street.) Completed in 1700 at a cost of some three thousand pounds, the new building was as much a symbol of the anglicization of New York as Trinity Church, Bradford's printshop, or the King's Arms. Facing down Broad, still the city's premier commercial thoroughfare, it held rooms for the Common Council, the Assembly, the Mayor's Court (also known as the Court of Common Pleas), the new Supreme Court of Judicature, and, in the basement, the municipal jail. After 1716 "a publick Clock" of local manufacture embellished the tower.

Yet another vestige of New Amsterdam was erased when colonial authorities demolished the old city wall, erected almost half a century earlier to keep out the English. In 1694 the Common Council had asked to have the wall removed, citing the "Incroachment of Buildings" on those parts of the palisade "Along the Wall Street" that hadn't already been turned into firewood. The last of it finally came down in 1699, just in time for the stones from its bastions to be incorporated into the foundation of the new City Hall—a symbolic touch that would have been lost on no one.

The wall's removal didn't cause an immediate surge of building north of Wall Street, however, for the Dongan Charter had given all vacant land on Manhattan to the municipal corporation, which proved quite unwilling to part with any of its endowment. The resulting shortage of building plots, along with the attractions of living and working next to the Town Dock, would keep New Yorkers tethered to lower Manhattan for many years to come. In 1695 the built-up part of town covered no more than an eighth of a square mile, and most new construction took place below what is now Fulton Street. In 1704, when there were around 750 houses for the city's five-thousand-odd inhabitants, Sarah Kemble Knight, a visitor from Boston, pronounced it "well compacted." And crowded: as one harried colonial official complained to the Board of Trade only a few years earlier, he had been unable to find a place to live. "I have eight in family and know not yet where to fix them, houses are so scarce and dear, and lodgings worst in this place."

Scarce and dear, but increasingly solid: most houses in New York were now built of stone or brick—the latter, Knight reported, “are of divers Coulers and laid in Checkers, being glazed [they] look very agreeable.” Aesthetics aside, the new building materials greatly reduced the menace of fire. So did the municipality’s relentless attention to fire prevention. In 1691 Direck Vandenburg, the mason who would direct Trinity’s construction, headed a committee that regularly examined chimneys and fireplaces; in 1697 the Common Council shifted that responsibility to inspectors in each ward who checked every house weekly. The city’s sixteen wells were put also put under ward supervision, and as many as fifteen more would be drilled in the middle of Manhattan streets by 1720, with residents covering the expense. In addition, new Common Council regulations required residents to keep fire buckets handy—compliance to be monitored by two city inspectors, assisted by constables.

The condition of the streets was another story. Dr. Bullivant agreed (in 1697) that “most of theyr new buildings are magnificent enough, ye fronts of red and yellow (or Flanders) brick looking very prettily.” But, he added caustically, “theyre streets are Nasty and unregarded, ye which they excuse at this time, saying the Multitudes of buildings now going forth are ye Occasion.” Improvements were nonetheless underway. In 1691 the Assembly resolved that, for the “Encouragement of Trade and Commerce,” streets, lanes, and alleys should “be conveniently regulated” and empowered the municipal corporation to lay out new ones. It did so in 1691, 1694, and again in 1700—mostly in the area below Wall Street, with the addition of some roads in the Out Ward after 1707.

The most important new street was built on landfill adjacent to the Town Dock. In 1686, intending to raise cash for the payment of its debts, the Common Council began the process of selling “water lots” along the East River shore to merchants who agreed to fill them in. In 1691, when the town again needed funds for a new market house and ferry house, and later in the decade, when it built the new City Hall, additional lots were sold along the waterfront between the old Stadhuis and Fulton Street. But this time the Common Council attached strings. Purchasers were required to fill in their lots and erect on each a stone- or brick-fronted building at least two stories high—after which the entire stretch of new-made land was to be designated Dock Street. By 1692 purchasers were hard at work, filling in

their lots with dirt obtained by digging and leveling as much of “the hill by Mr. Beekmans” as belonged to the city. Increasingly, the city gave preference in the sale or lease of water lots to inhabitants (usually wealthy) who owned property fronting the new lots.

Dock Street’s residents, like those along other roadways, were also required to pave the section of street in front of their house, at their own cost, with “good & sufficient pebble Stones,” and to pull up any “poysonous and Stinkcking Weeds” (Broadway residents had to plant trees as well). By 1707 most of the city’s major thoroughfares were covered with cobblestones, except in the middle, where a gutter or channel was left to funnel off rainwater. Residents of Broad Street had petitioned the city for a “Common Sewer” in 1696, but when the parsimonious Common Council discovered that a proper sewer would cost £865, they promptly dropped the matter. As a result, the channels on Broad and elsewhere were constantly clogged with dirt and refuse, much of the latter dumped there by householders themselves, in lieu of paying cartmen the prescribed fee for taking it away. Official scavengers were employed from time to time to tackle the problem, but without notable success.

The streets presented other perils—being run down by galloping horses, for example, or bowled over by the ever ubiquitous pigs (whenever they weren’t rooting about in the city graveyard). At night, footpads were so common that pedestrians were obliged to travel in pairs. Finally, in 1697, the magistrates—remarking on “the great Inconveniency that Attends this Citty, being A trading place for want of Lights”—ordered that every house have a light “hung out on a Pole” from an upper window “in the Darke time of the Moon.” When homeowners objected to the expense, the magistrates retreated to a requirement that only every seventh house need present “A Lanthorn & Candle,” and only in winter, the cost to be shared by the owners of the other six.

In 1684, moreover, the Common Council instructed the constables in each of the five wards south of the Fresh Water Pond to hire eight citizens as watchmen. This “Constables Wattch” was a more substantial force than in other colonial (or most English) towns. Besides patrolling the streets at night, staffs in hand, the watchmen were to ensure that no violations of the drinking laws occurred during Sunday worship. In 1685 the Assembly increased the fines for public drunkenness, describing that “Louthsome and

Odious sin” as “the root and foundation of many other Enormous Sinnes as bloodshed, stabbing, murther, swearing, fornication, Adultry, and such like.” That same year the Common Council outlawed “Pockett Pistols” and other concealed weapons. It was becoming somewhat more difficult, too, to open a “public house” or tavern for the sale of liquor. Municipal authorities now requested applicants for a license to present a certificate attesting they were “of good life & Conversation and fitt to keep such a house.”

“TRUMPET AND DRUMMS”

The anglicization of New York also meant the closer synchronization of provincial “heats and animosities” with the rhythms of party politics in England. Within a year of Leisler’s execution, his son, Jacob Leisler Jr., and his old friend Abraham Gouverneur were in London, lobbying members of Parliament, cabinet officers, and other highly placed government officials to clear his name. The complexion of affairs in London was changing rapidly, and powerful Whigs agreed to help.

By 1694 King William had become impatient with the Tories who remained in his cabinet after the Glorious Revolution. They criticized the war with France as excessively expensive and complained when the Whigs set up the Bank of England to stabilize government finances. Before the year was done, the king had forced them all out of office, leaving the Whigs in complete control of the machinery of state. Moving swiftly to strengthen the government’s hand abroad, the Whigs established a new Board of Trade, adopted the first comprehensive Navigation Act, announced a full-scale crackdown on piracy and illegal trade, and poured money into the Royal Navy.

For New York’s Leislerians, the Whig ascendancy was a new beginning; for Governor Fletcher, it spelled disaster. In 1695 Parliament declared that both Leisler and Milborne had been unjustly convicted. Robert Livingston, one of Fletcher’s keenest enemies, rushed to London bearing lurid testimonials, largely accurate, to Fletcher’s corruption. As the protege of certain Tories no longer in the king’s favor, Fletcher was helpless. In 1697, after a lengthy investigation that focused on his relations with pirates, the Board of Trade ordered him home.

Fletcher's successor was Richard Coote, the earl of Bellomont, a gouty Irish peer with impeccable Whig credentials. Bellomont reached New York in the spring of 1698 and found that "there are parties here as in England." The local Tories included Bayard, Philipse, and other anti-Leislerians—disgraceful "vermin," Bellomont called them, who with former governor Fletcher's backing had turned New York into "a sink of corruption." He promptly brought the leading anti-Leislerians up on charges of smuggling, graft, landgrabbing, election fraud, and piracy. He started legal action to recover the millions of acres of prime land they had obtained from Fletcher, including the property occupied by Trinity Church. He gave the job of mayor back to Peter Delanoy and ordered customs officers to enforce the new Navigation Act with utmost vigor.

With Bellomont's help, the Leislerians soon regained control of the Assembly and began to settle old scores—granting pardons to Leisler's followers, canceling punitive lawsuits, restoring illegally seized property, voiding Fletcher's most excessive land grants, and writing new legislation to protect the livelihood of city artisans. They broadened the suffrage for Assembly elections (Catholics excepted, of course). But nothing gave the Leislerians greater satisfaction than the day in October 1698 when the bodies of Leisler and Milborne were exhumed and reburied in the Dutch church on Garden Street amid the "sound of trumpet and drums." Despite a "rank storm," an estimated fifteen hundred people took part, many coming in from Long Island, New Jersey, and Pennsylvania for the occasion. Excited spectators reported seeing "Leisler's apparition in a Coach" near the church.

The anti-Leislerians were meanwhile actively scheming against Bellomont. Already, he warned the Board of Trade, they had sent a delegation to London to bring charges against him and were "cock sure of carrying the point and getting me turned out of this government." It proved to be Captain Kidd, however, who would wound Bellomont most deeply.

THE STRANGE CAREER OF CAPTAIN KIDD

A Scot by birth, William Kidd went off to sea as a young man and at length found his way to the Caribbean. There, along with thousands of other restless, ambitious seamen, he drifted from port to port looking for work, a

background that later prompted Leisler to call him, with considerable justice, a “blasphemous privateer.”

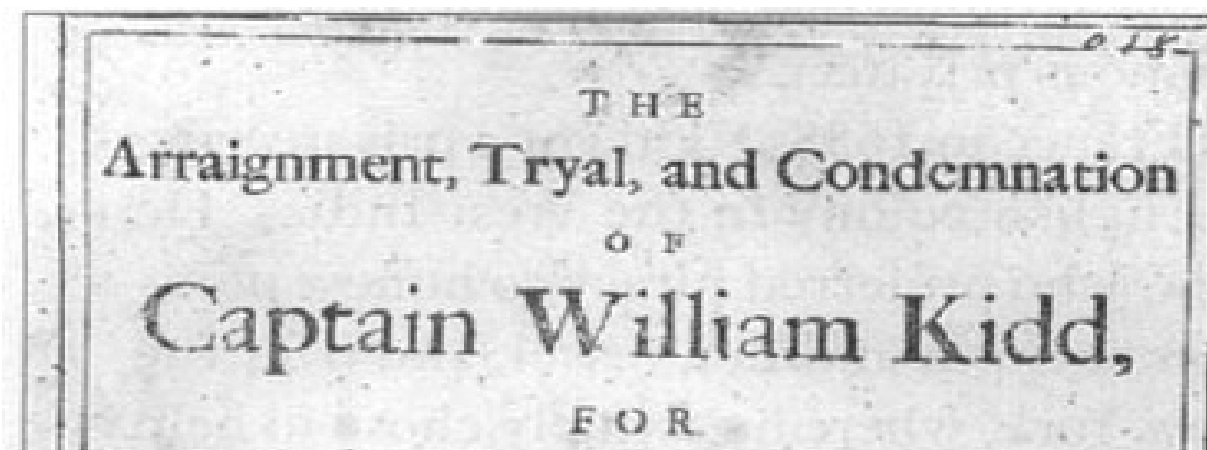

When war broke out between England and France in 1688, Kidd got a privateering commission from the governor of Nevis, an English colony in the West Indies. He attacked French ships and colonies until his crew, who preferred piracy to honest plunder, absconded with his ship. Kidd set out after them in another vessel, and over the winter of 1690-91 the chase brought him to New York, where he astutely chose to help Ingoldsby and Sloughter recapture the town from Leisler. The Assembly voted Kidd a reward of one hundred fifty pounds, and he became fast friends with Nicholas Bayard, Stephanus Van Cortlandt, Frederick Philipse, and other anti-Leislerian worthies implicated in piracy and illegal trade. On the very day of Leisler’s execution, he obtained a license to marry Sarah Bradley Cox Oort, widow of a prosperous merchant whose property included a flour warehouse, the fine home on River Road (Pearl Street) once owned by Govert Loockermans and Annetje Jans, and a capital of nineteen hundred pounds. After a few more years, Kidd had acquired fine silverware, a large plot of land north of Wall Street, and an excellent wine cellar; his wife was the proud owner of the first “Turkey worked” carpet seen in New York. When construction began on the new Trinity Church, he provided the block and tackle for hoisting the stones.

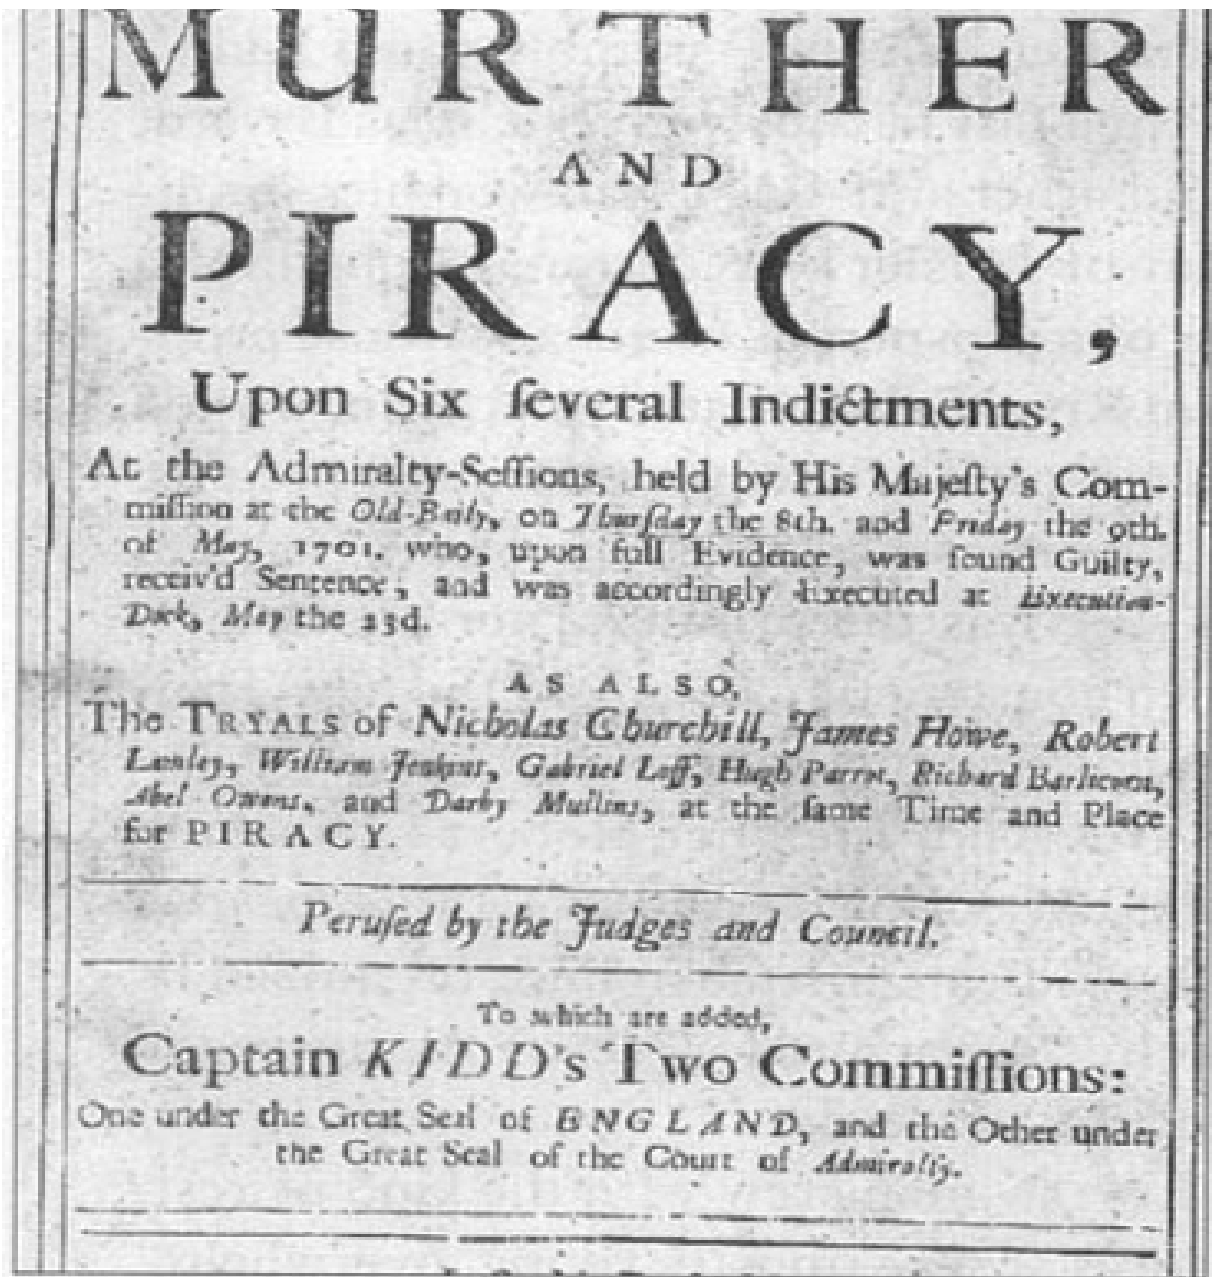

In 1695, while marshaling his case against Governor Fletcher, Robert Livingston met Kidd in London and arranged for him to take a heavily armed frigate, the *Adventure Galley*, into the Indian Ocean to hunt pirates. A syndicate of rich Whigs, organized by Bellomont and Livingston on the eve of Bellomont’s departure for New York, agreed to finance Kidd’s expedition in return for a share of the proceeds.

Kidd returned to New York and filled out his 150-man crew with the kind of restless spirits who usually signed up for risky ventures at sea—mostly young, overwhelmingly poor, and, except for a handful of experienced mariners, thoroughly weary of trying to make a living on land as farmers, laborers, carpenters, shoemakers, bakers, and the like. Two out of three were English, and one out of six was Dutch. There was one African and one Jew—Benjamin Franks, a jeweler from Jamaica who was trying to get to India, then the world’s leading supplier of precious gems.

The *Adventure Galley* set sail for Madagascar in the early autumn of 1696. Somewhere along the way Kidd decided to turn pirate and spent the next couple of years preying on trade in the Indian Ocean. When he headed back for New York in the spring of 1699, he was rumored to be carrying a treasure worth half a million pounds. His backers, though, were deserting him. He had thumbed his nose at the government, embarrassed important people, defied the navy, outraged the budding imperial bureaucracy, and done harm to the mighty East India Company. The Tory opposition was clamoring for his head, and by early 1699, even as Kidd reentered American waters, the Whigs knew they might lose control of Parliament if they didn't wash their hands of him at once.

Kidd's relationship with Governor Bellomont was a particularly sensitive issue for the Whigs. When Kidd showed up in Boston in July, Bellomont had no choice but to order his arrest—a decision probably made easier by the discovery that Kidd's loot was worth a paltry forty thousand pounds or so, far too meager to make it worth anyone's while to protect him (though rumors persist that just before his arrest he stashed a huge treasure somewhere on the forks of eastern Long Island). In May 1701, after six months of solitary confinement in Boston, followed by a year in London's infamous Newgate prison, Kidd was hanged for murder and piracy while his erstwhile Whig patrons looked on in stony silence. (Hanged twice, actually, because the first rope broke and he had to be dropped a second time, after which his body was tarred, bound in an iron cage, and left swinging alongside the Thames as a warning to sailors contemplating a pirate life.) Exactly ten years had passed since Leisler's execution, and it couldn't have been clearer that the political trail between New York and London was now shorter, and more treacherous, than ever.

Kidd's fate, like Leisler's, had been played out on the Anglo-American political stage, before an audience that was increasingly eager for printed news and information. This account appeared on the market very soon after the execution. (© National Maritime Museum, Greenwich, London)

"A VERY WELL HUMOURD AFFAHLE GENT."

Just weeks before Kidd's execution, Lord Bellomont died suddenly in New York. By the time his replacement was chosen in 1702, the Tories were back in power in Parliament and Queen Anne had taken the throne. The new royal governor was the queen's Tory cousin Edward Hyde, Viscount Cornbury. Former governor Fletcher's private secretary welcomed him as "a very well humoured Affable Gent.," and so he no doubt appeared to his political supporters—all the more so after Cornbury removed Bellomont's Leislerian appointees and resumed the practice of handing out land to backers; the largest ran to two million acres, better than half the size of Connecticut. The large number of New Yorkers belonging to Reformed and dissenting congregations, on the other hand, saw nothing affable about Cornbury or his campaign to impose the Church of England on the colony.

A zealous Anglican like Fletcher, Cornbury favored Trinity Church with a generous portion of Manhattan real estate known as the King's (or Queen's) Farm, which stretched up the island's west side as far as modern Christopher Street. He increased the salary of Trinity's rector, the Rev. William Vesey, and persuaded the Assembly to raise taxes to pay for it. He welcomed missionaries dispatched by the Church of England's new Society for the Propagation of the Gospel (SPG), chartered by King William in 1701 to invigorate the colonial church. It was, he said, his intention to promote the SPG's "good and pious designs, to the utmost of my power."

In 1707 Cornbury ordered the arrest of the Rev. Francis Makemie, one of the founders of American Presbyterianism, for preaching in the city without a license. After languishing in jail for three months, Makemie successfully defended himself under the English Toleration Act (which Cornbury said didn't apply in New York). In Jamaica, where the Presbyterians had just built a new church, Cornbury evicted the minister, William Hubbard, and replaced him with an Anglican. When the congregation rioted and retook the building, Cornbury barred Hubbard from ever preaching there again.

Cornbury bore down heavily as well on the Reformed Church, despite decades of collusion by its dominies. Claiming the authority to do so under the Ministry Act, he began to fill vacant Reformed pulpits with Anglicans—a tactic, he said, that in conjunction with English-language schooling was the best way to "make this Colony an English Colony, which I am afraid will not easily be done without it." Under his aegis, Anglicans also took over Dutch Reform missions to the Indians, and when they began to

distribute Dutch-language editions of the Anglican Book of Common Prayer—suggesting that Netherlanders were also fit objects for proselytizing—the dominies abandoned their collaborationist policy and went over into opposition.

Only a few years after he arrived in New York, Cornbury was tangled in sheets of trouble. Stories began circulating on both sides of the Atlantic about his eccentric, outlandish personal behavior. On one memorable occasion he allegedly scattered the patrons of the King's Arms by riding his horse through the front door and up to the bar. It was charged, too, that he made a habit of addressing the Assembly and strolling the fort's parapets in female attire. "His dressing himself in womens Cloths Commonly [every] morning is so unaccountable that if hundred[s] of Spectators didn't dayly see him, it would be incredible," said Robert Livingston (who in fact never actually witnessed such a scene himself and was only spreading rumors). Cornbury was a casual chiseler, on top of everything else, and soon had city merchants clamoring for him to pay off better than ten thousand pounds' worth of bills and promissory notes. Lady Cornbury was accused of swiping clothes and jewels from the town's best-dressed women; the sound of her carriage at the door, people said, was a warning to hide anything of value.

In 1708, when the Whigs won a crushing majority in Parliament, Cornbury's enemies, rallied by Lewis Morris, persuaded the government to remove him from office. Stephen De Lancey and assorted other creditors immediately had him thrown into debtor's prison. "A Porter in the streets of London is a happier man than a Governor in America," Cornbury wailed. He got out only when the timely death of his father made him the third earl of Clarendon, rendering him immune from prosecution. No one shed a tear when he left New York later that same year, except perhaps those unlucky townsfolk who were still trying to collect the money he owed them.

POLITICAL INTERESTS

Cornbury hadn't yet taken up his post in New York when, in 1702, Parliament renewed the war with France, this time to prevent the grandson of Louis XIV from inheriting the Spanish empire. The War of the Spanish Succession—"Queen Anne's War" in America—soon blossomed into a kind of national crusade for the great Whig traders and financiers of

London, who fattened their purses on military contracts, loans, and colonial commerce.

In New York, on the other hand, city merchants suddenly found themselves up against a Spanish embargo on their exports to the West Indies and mounting losses to enemy privateers. In the first two years of the war alone the French captured nearly thirty New York vessels, about one-fourth of those that worked out of the port. The economy nosedived. "Their Trade is in effect quite gon," said a contemporary report; "the produce of the Country is of little or noe value, nor is there any markt for it any where." Local shipyards eventually did some business replacing vessels taken by the enemy; some merchants traded illegally with the French West Indies; and privateering helped cushion the losses. Between 1703 and 1712, New York privateers returned with more than fifty prizes worth as much as sixty thousand pounds, but this was a trifling sum compared to the wages of piracy a decade earlier, and it cost the lives of nearly three hundred seamen, almost half the colony's total.

The end of Queen Anne's War was in sight after 1710, when the wheel of political fortune turned again and the Tories won a majority in Parliament. Viscount Bolingbroke, a Jacobite who had become the party's chief tactician, set out at once to make peace with France and restore the Stuarts to the line of succession. He achieved the former in 1713, but his plans for the latter were foiled by Queen Anne's death in 1714 and the accession of the Hanoverian George I. In desperation, Bolingbroke cast his lot with a Jacobite rising in Scotland in 1715. (For reasons of commerce as well as defense, the Whigs had engineered the unification of Scotland and England in 1707.) "The '15" ended in defeat, however, and from that point forward the Whigs had a firm grip on the government.

As the likelihood of counterrevolution receded and Parliament settled in for a long period of one-party rule, the "heats and animosities" between Leislerians and anti Leislerians slowly dissipated. Robert Hunter, governor between 1710 and 1719, hastened the process by administering timely doses of both intimidation and compromise to suppress dissent. By 1717 he could inform his superiors back home that New York seemed at peace for the first time in a generation, "a perfect harmony reigning among all parties." Among the old parties, that is, for new lines of conflict were already being

drawn as Britain's escalating rivalry with France spawned two competing cliques or "interests" within New York's propertied classes.

The "mercantile interest," headed by the De Lancey, Philipse, and Schuyler families, spoke for those residents who regarded the Anglo-French conflict as bad for business. The deep-water merchants among them were fearful of the toll an all-out war would take on international commerce; others traded regularly with French Canada. The De Lanceys, in particular, had relations with both sides. Stephen, who had helped establish New York's French Church, had prospered as a merchant (in 1719 he built the handsome mansion on Broad and Queen that would later become Fraunces Tavern). His success was due in part to adroit anglicizing, notably by marriage into the wealthy Van Cortlandt family. His son James had studied in England, where the archbishop of Canterbury had been his college tutor, and the family had impressive connections with influential men in Parliament, the cabinet, and the Anglican Church.

The rival "landed interest," dominated by the Livingstons, Beekmans, Van Rensselaers, and Morrisises, was an alliance between Hudson Valley manor lords and the assorted speculators, lawyers, and city retailers whose fortunes were tied to theirs (and leaned, as they did, toward Presbyterianism or other dissenting sects). They wanted no expense spared for the defense of the frontier, they welcomed war as a source of profit, and they dreamed of conquering Canada, not trading with it.

The landed interest was dominant in the early 1720s owing to the support of Governor William Burnet, Hunter's hand-picked successor. Bookish and courtly, Burnet liked nothing more than to sit on the porch of White Hall, Stuyvesant's old residence, gazing out over the harbor while taking his afternoon tea. On three occasions after 1720, at the instigation of Livingston, Morris, and their friends, the Assembly halted sales of "Indian goods" to the French, hoping thereby to keep the Iroquois tied to Britain while ruining Montreal. With the arrival of Governor John Montgomerie, who replaced Burnet in 1728, the mercantile interest got its turn to luxuriate in the warm embrace of official preferment, while the landed interest became increasingly identified with opposition to the colony's royal governors.

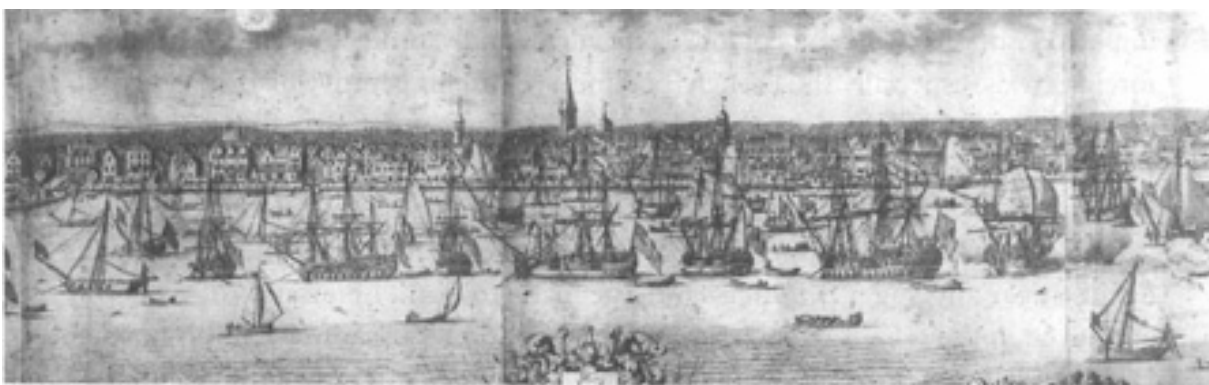

The full meaning of these factional twists and turns was not yet apparent, however, for by 1720 New York was on the upward slope of an economic

boom that would completely change the contours of public life in the city.

In the Kingdom of Sugar

Sometime over the spring or early summer of 1717, an obscure artist-engraver named William Burgis finished a six-foot-wide panoramic drawing entitled *A South Prospect of the Flourishing City of New York in the Province of New York in America*. Better known as the “Burgis View,” it depicts the East River waterfront of Manhattan from the Battery to the foot of Catherine Street (slightly north of where the Brooklyn Bridge now stands). That Burgis meant to emphasize the Britishness of the city is readily apparent. At the very center of his panorama he placed Trinity Church, topped by a steeple disproportionately taller than nearby buildings. Besides drawing attention to the privileged status of Anglicanism, this device defines a visual axis of power that runs down Wall Street, passes through the Royal Navy’s Station Ship, and terminates in the coat of arms of the royal governor, Colonel Robert Hunter. A bevy of oversized Union Jacks and Red Ensigns reiterates that the city is a British possession, while the absence of other national flags serves as a reminder that the Navigation Acts excluded vessels of foreign nations from every British port.

Equally apparent in the Burgis View is New York’s prosperity. The economy of the town had perked up since the end of Queen Anne’s War a couple of years before. Imports as well as exports were advancing vigorously, and over the next decade it was the rare year that didn’t see at least two hundred vessels clear the port. Burgis’s perspective evokes and celebrates this latest round of expansion by exaggerating the density of the built environment and depicting every structure that could be taken as evidence of municipal progress—churches, markets, substantial private residences, wharves, shipyards—each carefully rendered and identified by number. Lilliputian merchants walking to the Exchange, shipwrights at work on the hull of a new vessel, a man driving a steer along the waterfront, and other figures not only make the scene more lifelike but suggest the scope and variety of enterprise in the city as well. So does the impressive throng of merchantmen, sloops, warships, yachts, and ships’ boats on the river, perhaps celebrating a royal birthday or other special occasion (two vessels can be seen firing salutes).

The Burgis View, 1717. Visible in the lower right-hand corner is the Brooklyn ferry landing, where cattle and produce from Long Island were brought across to the growing city. Almost directly above the ferry house, on the Manhattan shore, are the shipyards that built vessels for the West Indian trade. (© Collection of The New-York Historical Society)

WHITE GOLD, BLACK SLAVES

New York was flourishing when William Burgis saw it thanks mainly to a prodigious rise in the English market for sugar. In 1660, when it was a luxury associated with social privilege, England consumed a thousand hogsheads of sugar. That figure had since increased a hundredfold while the per capita annual consumption of sugar doubled, driven up by a combination of improved purchasing power and falling prices. By 1730 sugar would be as embedded in English culture as Whig principles were in English politics. A cup of heavily sweetened chocolate or coffee—accompanied by candies, cakes, or bread slathered with molasses—was integral to the daily rituals of middle-class life and a practical way to supplement the caloric intake of poorly nourished workers.

Changes in production and exchange moved in tandem with the rise in consumption. Until 1710 or so, half of England's sugar came from the tiny (166 square miles) island of Barbados. Between 1710 and 1720, however, notwithstanding the fact that its annual output continued to rise, Barbados was eclipsed by the development of numerous new plantations on Jamaica and four of the Leeward Islands: Antigua, Nevis, St. Kitts, and Montserrat. By the 1730s their combined production accounted for fully 85 percent of the sugar exported from the British West Indies, and sugar from all sources

had emerged as the single most valuable article of British overseas trade. “White gold,” they called it.

By then, too, wealthy West Indian planters—far wealthier, as a group, than their tobacco- and rice-cultivating counterparts on the North American mainland—were leaving their affairs in the hands of agents and returning home to England, where they set themselves up on sprawling estates and elbowed their way into social prominence alongside the old landed aristocracy and commercial bourgeoisie. The most ambitious went to Parliament, where they fought tenaciously to promote what came to be known as the West Indian “interest.” Among their most notable achievements were the rum ration ordered by the Royal Navy in 1731 (half a pint per man per day) and the Molasses Act of 1733, which gave the planters a virtual monopoly of the North American market by laying prohibitively high duties on foreign (i.e., French) sugar, molasses, and rum imported into the mainland colonies. Not surprisingly, protecting the West Indies from foreign rivals, especially the French, became a central imperative of British foreign policy, a fact acknowledged by the placement of permanent British naval stations on Jamaica and Antigua.

Sugar also brought wealth to British refiners, shippers, bankers, insurers, and investors, not to mention the royal treasury, which came to depend on the taxes and duties sugar and sugar products could be made to bear. Thousands of workers were employed in the refineries and distilleries of London, Glasgow, Edinburgh, and other British ports. Their need for food and clothing and shelter created jobs, in turn, for additional thousands of laboring people and was an important reason for that great upsurge of manufacturing around the middle of eighteenth century—the industrial revolution.

No less momentous was the parallel Africanization of the West Indian populations. Between 1678 and 1745 the number of whites living on the Leeward Islands declined from 10,400 to 9,500 while the number of African slaves rose from 8,500 to 59,500. In the half century from 1651 to 1700 some 78,000 slaves had been brought to Jamaica; between 1701 and 1750 imports ballooned to 339,000. All told, between 1700 and 1775 the West Indies absorbed 1.2 *million* slaves.

After 1713, when Britain was awarded the *asiento*—the coveted exclusive right to supply Spanish America with slaves—the business was

almost entirely in British hands. When Parliament broke the Royal African Company's monopoly two years later, independent slavers raced in to open new markets as well as new sources of supply. A report of 1753 said that British captains purchased 34,250 slaves every year from Africa; a second report, fifteen years later, put the figure at 53,100.

THE WEST INDIAN CONNECTION

It became so profitable to raise sugar that West Indian planters, preferring to cover their land in cane rather than waste it growing food or raising stock, turned to New England and the Middle Colonies for essential supplies. New York merchants had traded in the islands for a long time, of course; some, like Colonel Lewis Morris, maintained extensive business and family connections there. But in the opening years of the eighteenth century the West Indian market became a cornerstone of the city's economy. By 1720 or so half the ships entering or leaving the port were on their way to or from the Caribbean; another one-quarter to one-third were on their way to or from other North American colonies, moving goods often as not destined for reexport to the Caribbean.

Outward bound, New Yorkers hauled the flour, corn, pork, beef, and naval stores (tar, pitch, turpentine, lumber, and the like) without which the West Indian plantations couldn't survive (New York flour, in particular, was regarded as the finest available). They returned with bills of exchange, bills of credit, warehouse certificates, and (infrequently) specie—plus sugar, rum, molasses, cotton, indigo, lime juice, salt, cocoa, pimento, ginger, and other tropical commodities for which there were markets in the city itself, elsewhere on the North American mainland, or in London.

It wasn't specialized work. Most merchants were jacks-of-all-trades who dealt in whatever goods came their way and almost always functioned as both wholesalers and retailers. The typical vessel was a modest, all-purpose sloop or brig with a single deck, a few hands, and multiple owners (who often as not held "eights," or one-eighth shares). Its cargo represented the combined "ventures" of several traders, including members of the crew, who trusted the ability of the master or captain (who not only ran the ship but also served as the business agent of its owners) to find the best market for their goods and return with something of value. Prevailing winds and currents dictated a standard route that looped down to Barbados, swung up

into the Leewards, crossed over to Jamaica, then pointed for home through either the Gulf Passage (between Florida and Cuba) or the Windward Passage (between Cuba and Santo Domingo). In practice, such a voyage would ordinarily be broken by frequent return visits to this port or that as the captain hunted among the islands to find the most favorable prices for his wares or to assemble a cargo for the homeward voyage.

Success was never a foregone conclusion. Pirates ceased to plague the Caribbean after a British expedition ran down Edward Teach (“Blackbeard”) in 1718. Even so, untimely gluts or shortages, bad weather, poor judgment by a master or supercargo, an unexpected outbreak of war—any one of them could doom a voyage and bring its sponsors to ruin. To minimize such dangers, the merchants of New York and other colonial ports developed networks of correspondents upon whom they could depend for credit, for the disposal of a cargo, for the collection of debts, and for reliable news about distant crops, weather, prices, and public affairs.

As they matured, these networks facilitated intricate multilateral exchanges in both commodities and commercial paper that involved other New York merchants, indirectly but no less deeply, in the West Indian trade. Around the middle of the century, for example, Gerard G. Beekman (grandson of the Leislerian Gerardus Beekman) ran a store on Beekman Street from which he presided over a remarkable variety of projects that depended in one way or another on Caribbean products and markets. He sold limes and indigo on commission for a Philadelphia merchant, bought ginger from another Philadelphia merchant and paid for it with a shipment of logwood, bought more ginger at New London, Connecticut, that a commission agent sold for him at Boston and Newport, sold rum on commission for a Rhode Island merchant, shipped bread and flour to Rhode Island for reexport to the West Indies and used the proceeds to buy molasses that he sold on his own account in New York, and invested in a large order of cocoa that he meant to sell either there or in Philadelphia, depending on the market. Beekman’s quick thinking must have saved the day more than once for his correspondents, as it did for the Rhode Islander whose shipment of cheese “Spoiling with maggets” seemed lost until Beekman hired a cartman to peddle it on the streets of New York. It was a safe bet that he would one day take advantage of a similar favor in return.

Knowing that the difference between profit and loss might well be a matter of whether or not they complied with the Navigation Acts, Beekman and his correspondents didn't scruple at evasive measures—bribing customs collectors, doctoring ships' manifests, circulating fraudulent bond certificates, and outright smuggling. After Parliament passed the Molasses Act in 1733, such conduct became almost a way of life. Planters on Guadeloupe, Martinique, and other islands of the French West Indies responded to the law by offering premium prices for North American provisions and asking less for sugar and molasses than did their British counterparts. When it became evident that customs officials were making only halfhearted attempts at enforcement, the profitability of illicit trade for North American merchants was assured. (It may have accounted for one-third of all northern commerce.) Beekman himself became so accustomed to smuggling that he would complain bitterly if circumstances compelled him to pay full duty on the rum and molasses he imported by way of Rhode Island.

What Beekman and men like him almost never did was invest their profits in plantations. Trade, not production, was the New Yorkers' forte, and they tended to think of the West Indian plutocracy as wildly dissolute and irresponsible. Nor did more than a handful of them engage in direct trade with England. Local products alone couldn't fetch high enough prices in the mother country to pay for imported manufactures. Also, because the prevailing winds blew out of the west, getting back to New York from, say, Bristol or Liverpool was a hazardous and time-consuming proposition. Ships outward bound from British ports usually took tropical routes to the New World, dropping down to Madeira to catch the Canaries Current, then winging across to the West Indies and working up the North American coast. Over time, improvements in ship rigging and design—the appearance of the gaff-rigged “schooner,” the development of jib and headsails, and the adoption of the helm wheel—gradually made it easier to sail in the teeth of the westerlies. Even then, however, the majority of New York merchants continued to concentrate on the West Indies and other North American colonies.

The net result was the economic triangulation of three strikingly different systems of production: the small-farm hinterlands of northern seaports, the slave-labor plantations of the Caribbean, and the wage-labor

workshops of early industrial England. New York now lived by feeding the slaves who made the sugar that fed the workers who made the clothes and other finished wares that New Yorkers didn't make for themselves. Along the way, they closed in on their old objective of breaking Boston's grip on the economies of southern New England. Lying a week closer to Barbados and ten days closer to Jamaica, the city enjoyed a natural advantage over Boston in competition for the lucrative West Indian markets. Inexorably, pressed by Philadelphia's domination of the mid-Atlantic region, New York merchants took control of the New England coasting trade. Commercially becalmed, Boston sank into a depression from which it wouldn't recover for years. After 1750 New York ranked second only to Philadelphia in wealth and population.

THE TOWN THAT TRADE BUILT

By 1720, if not earlier, the economy of New York advanced and receded throughout the year in a seasonal rhythm that was unmistakably West Indian in origin. Between November and January, the East River waterfront buzzed with activity as merchants and captains rushed to get down to the islands in time to take delivery of the new sugar crop, usually ready soon after the first of the year. The pace slackened in the early spring, then picked up again between April and June as the ships raced back to escape hot-weather diseases and hurricanes. Another brief lull was followed, in the high summer, by the arrival of additional vessels from other mainland ports (usually Boston) and, in the fall, from Britain.

The effects of the West Indian connection were visible as well in the expansion of commercial agriculture around the city. On innumerable small and medium-size plots, ranging from a few dozen to a few score acres in extent, the rural populations of Long Island, Staten Island, New Jersey, and Westchester—many relying heavily on slave labor—produced an ever-growing volume of foodstuffs for the Caribbean market. Bigger and richer landowners like Lewis Morris, nephew and heir of Colonel Lewis Morris, built productive complexes that combined elements of slave plantations and industrial villages. From Morrisania, his nineteen-hundred-acre estate in what is now the southwest corner of the Bronx, he and his workforce—which in 1691 included one of the area's largest concentrations of slaves (twenty-two men, eleven women, six boys, two girls)—sent corn, wheat,

barley, oats, lumber, and a variety of livestock to Manhattan for export to the West Indies. (The Morris property ran west from the Harlem River to Intervale Avenue, with the manor house near the junction of 132nd Street and Cypress Avenue, overlooking Long Island Sound.) Morris ground the grain in his own gristmill and cut the lumber in his own sawmill. He kept his own sloop, and even operated an ironworks at Tintern, New Jersey. His products—as was the case with all lumber, grain, flour, meat, and leather exported to the West Indies—were carefully scrutinized by government inspectors as to size, weight, and quality and labeled accordingly. All exported butter, for example, was packed in firkins branded “N.Y.”

Shipbuilding grew rapidly to meet the demand for the single-masted sloops and two-masted brigs needed for Caribbean and coastal commerce. In 1728, having made a fortune in the West Indies, “Boss” William Walton founded a shipyard on the East River at the foot of Catherine Street (just north of the Brooklyn Bridge, about where the Alfred E. Smith Houses now stand), and another five were soon in operation nearby. Sail lofts and ropewalks (the elongated workshops that made rigging and lines for ships) likewise enjoyed unprecedented prosperity—as did millers, cartmen, chandlers, and other trades heavily dependent on oceangoing commerce. Coopers worked hard to keep up with mounting demand for wooden firkins, casks, tubs, and vats, their livelihoods protected by duties on the importation of empty containers from other colonies.

Other New Yorkers flourished by processing imports from the West Indies, above all sugar. In 1730 Nicholas Bayard announced in the *Gazette* that he had erected, virtually next door to City Hall, a “Refining House for Refining all sorts of Sugar and Sugar Candy, and has procured from Europe an experienced artist in that Mystery.” In time, Livingstons, Roosevelts, Van Cortlandts, and Rhinelanders would follow him into the business of turning brown sugar into clean white loaves of table sugar, suitable for export to Europe or the West Indies. By the early 1720s, moreover, sixteen distillers were turning molasses into rum (much of the raw material having been smuggled in from Martinique). In addition, after 1715, New Yorkers began importing tobacco for conversion into snuff, a process that involved the grinding and flavoring of dried tobacco leaf.

The movement of these exports and imports would have been impossible without the labor of “Jack Tar,” the seafaring man who loaded, sailed, and

unloaded the city's growing merchant fleet. Mariners had been a familiar presence on Manhattan ever since the West India Company first set up shop, but never in such quantities: by the second or third decade of the eighteenth century, not counting the masses of transients who drifted from port to port in search of work on the docks or merchant vessels, perhaps one out of every four or five adult male residents of New York earned his livelihood as a mariner. It was a notoriously hard existence—periodic bouts of unemployment punctuated by long, isolating voyages on ships where the dangers, atrocious conditions, harsh discipline, strict division of labor, and exploitative wages prefigured the industrial factories of a later era. Since most men quit (or died) after fewer than ten years at sea, the average age of crews tended to fall somewhere between twenty-five and thirty. No other trade or occupation in the city developed a stronger sense of collective identity and interest, however. More than once, crowds of “Brother Tars” in their distinctive attire—baggy breeches (tarred to keep out water), checked shirts, “fearnought” jackets, Monmouth caps—swarmed out of waterfront gin mills and rookeries to confront a tyrannical captain, dishonest “crimps” (the recruiting agents who filled out crews for merchants), or a press gang from one of His Majesty's warships. Their fine disdain for thrift, sobriety, polite speech, and organized religion constituted a standing challenge to the values of respectable society. “A merry life and a short one”: that was the sailor's motto.

Because the perils of the sea threatened the owners as well as crews of ships, access to reliable marine insurance was a matter of increased importance in the city. Rather than rely solely on underwriters in London or Amsterdam, a few prominent New York merchants began to insure voyages on their own, forming consortiums of wealthy residents willing to share the risks at an attractive rate of interest. Similarly, the need for access to capital promoted the expansion of private banking. One lawyer went so far as to advertise his services as an intermediary, inasmuch as “many Persons in this Province have often Occasion to borrow Money at Interest, and others have sums of Money lying by them which they want to put out.” All transactions, he added, would be managed with the “greatest Secrecy and Integrity.”

Indeed the legal profession too was changing significantly in these years. Until quite recently, all but a few of New York's two dozen or so lawyers had been self-taught “attorneys” rather than formally trained “barristers.”

Their knowledge of the law was often rudimentary, most of their work consisted of collecting debts or making out conveyances, and even the busiest of them doubled as tavern keepers, ferry operators, and tradesmen. Now, however, the demands of an increasingly complex international economy, together with the new, anglicized legal system, gave the edge to professionals with expensive university educations. Their desire to set higher standards had already led to the formation of the city's first bar association in 1709.

With the expansion of trade, too, came more taverns and coffeeshops. Between 1694 and 1720 fifty-four tavern keepers, victuallers, and vintners were granted the "freedom" of the city. New inns and ordinaries like the Black Horse Tavern joined the old King's Arms in providing residents and travelers alike with food, lodging, and a convivial setting for business. The Exchange Coffee House, which opened in 1729 at Broad and Water, became the principal scene of real estate transactions, while the Merchants' Coffee House (originally named the Jamaica Pilot Boat) catered to merchants active in auctions and shipping.

Taverns, and the dozens of dramshops that catered to seamen and the laboring classes, were often run by widows who received free licenses from the Common Council, an inexpensive form of relief. Women were also prominent in the retail shops that boomed after the late 1720s. The Widow Lebosses carried Canary wine and olive oil in her store at Hanover Square, the city's shopping center, while the Widow Vanderspiegel and her son sold imported window glass. Mrs. Edwards started a cosmetics business in 1736, offering "An admirable Beautifying Wash, for Hands Face and Neck, it makes the Skin soft, smooth and plump, it likewise takes away Redness, Fredkles, Sun-Burnings, or Pimples." The continuing role of women in trade, English as well as Dutch, promoted a certain feistiness among their ranks that ran contrary to prescriptions for proper female behavior. In 1733 the Widow Lebosses and other "She Merchants" complained bitterly to the press that while they were "full as Entertaining" as men, and certainly as brave, the governor never invited them to dinner "at Court." As taxpayers who "in some measure contribute to the support of the government, they reasoned, "we ought to be entitled to some of the sweets of it."

The typical retail shop carried a wide range of goods. In 1733 George Talbot displayed beds, chairs, tables, chests of drawers, and andirons. In

1736 the “New Store in Hanover Square” offered haberdashery, dry goods, laces, pictures, pipes, snuff, cutlery, hardware, and glassware. Visitors to William Bradford’s printing office could buy coffee, Bohea tea, and “Very good oatmeal” in addition to books. Thomas Adams, a stationer, had also begun selling reading matter, and by 1719 there were perhaps four booksellers in town.

The diversity of imported goods in New York was matched by their costliness. Governor Hunter asserted that a 100 percent advance over London prices was “reckoned cheap” on Manhattan, where profits from the West Indian trade, swollen by indirect earnings from insurance and interest on loans, were contributing to a relentless rise in the concentration of wealth. As early as 1716 John Fontaine, a visitor from Virginia, met “many rich people” in New York; ten years later the richest 10 percent of the population—mostly merchants, with a sprinkling of lawyers and landed gentlemen who had taken up residence in town—controlled half the city’s wealth. Judging by estate inventories of upper-class households, these rich New Yorkers proceeded to accumulate luxuries—silver, fine furniture, carpets—at a significantly greater rate than their seventeenth-century forebears.

The demand for luxury goods and services in turn spurred the formation of a pool of skilled local artisans and tradespeople. By the 1720s fine work was being turned out by New York goldsmiths, silversmiths, watchmakers, potters, and jewelers. Families of means seeking self-portraits patronized a small group of local artists (known more colloquially as “phiz mongers”), including old Evert Duyckinck. “Crooked women” seeking to “appear strate” could get help at the stay shop run by James Munden and Thomas Butwell. Nichols Bailey, coachmaker, sold chaises and chairs for ladies. Barbers and periwig makers arrived to cater to their husbands.

For food and other provisions, New Yorkers shopped at the municipal markets, of which (by 1728) there were five along the East River waterfront—one at the end of each major street (Broad, Coenties Slip, Wall Street, Old Slip, and Maiden Lane). But much of what city households needed was grown and made by its women. Housewives, aided by daughters and perhaps female slaves, produced soap and candles, smoked meats, put up garden fruits and vegetables, spun flax, dyed yarn, wove cloth, and sewed clothes. Governor Cornbury observed in 1705 that New Yorkers made “very

good linen” for domestic use as well as “very good serges [and] linsey-woolseys.” Several years later, the Board of Trade was advised to make them stop, because if they began to produce cloth for the market it would be “very much to the prejudice of our manufactures at home.”

Finally, New York’s developing connection to the West Indies brought a sharply higher frequency of epidemic disease. A ship from the islands was blamed for a major outbreak of smallpox in 1690, and after the turn of the century malaria, yellow fever, and other tropical scourges became an all too familiar part of life in the city. In 1702 a visitor informed William Penn that “at York they are visited with a mortal distemper . . . which sweeps off great numbers; tis such a visitation as that place, they say, never knew before, carrying off eight, ten, or twelve in one day.” Over a three-month period, smallpox and “malignant fever” claimed 570 lives—better than 10 percent of the population. Because well-to-do residents “left their usual habitations and Retired into the Country”—Lord Cornbury retreated as far as Albany—the poorer classes suffered a disproportionate share of the fatalities and the immiseration that often followed.

New York had plenty of doctors, among them Cadwallader Golden, who graduated from the University of Edinburgh and studied medicine in London before migrating to Philadelphia. When he moved up to New York in 1718, Golden discovered to his dismay that twenty “Chirurgeons” and two “Barber-Chirurgions” had been admitted into freemanship over the previous two decades. “The practice of Physick being undervalued,” Golden found it necessary to supplement his income by wholesaling imported drugs (and stockings) to local shopkeepers and apothecaries (Mrs. Golden occasionally moved some of his merchandise at retail). Of course it wasn’t only the oversupply of doctors that caused New Yorkers to undervalue “the practice of Physick,” for the current state of medical knowledge still put great stock in such useless practices as purging and bleeding. Golden’s own contribution to the problem was to take an active part in opposing the introduction of inoculation in 1722, although his colleagues eventually accepted the idea in time to minimize fatalities in the epidemic that struck the city in 1731.

CITY OF SLAVES

Nowhere was the impact of the West Indian trade on New York more obvious than in its burgeoning population of African slaves. Stuyvesant, York, Bellomont, and others had dreamed in years past of making the city an entrepot in the slave trade or exploiting slave labor for the production of commodities. Yet despite the best efforts of the Dutch West India Company and York's Royal African Company, slavery remained a marginal feature of the municipal economy. Decade after decade, New York merchants took only a fitful interest in slaving, and the number of slaves on and around Manhattan rose more slowly than the rest of the population. When Stuyvesant surrendered in 1664, New Amsterdam counted about fifteen hundred whites, three hundred slaves (half the colony-wide total of six hundred), and seventy-five freedmen. Forty years later, the 1703 census found forty-four hundred whites and somewhere between six and seven hundred blacks in New York City alone—more than twice as many, but down from 20 percent to around 12 or 13 percent of the total (enslaved Indians, never common, were exceedingly rare after 1700).

Everything changed during the second and third decades of the eighteenth century, as the city became more closely tied to the plantation colonies of the West Indies. Their insatiable demand for servile labor and foodstuffs drew growing numbers of city merchants into the slave trade. By 1730 it had become big business in the countinghouses of Pearl Street and Hanover Square, never representing more than a minor share of the total tonnage involved in overseas commerce yet sufficiently lucrative that few merchants weren't involved at one time or another.

In the city itself, where cheap labor was always in short supply, the economic advantages of slaveowning became harder to overlook as greater availability brought down costs. By the early eighteenth century, the price of a prime slave was roughly equivalent to the annual wages of a skilled craftsman, and direct imports began to soar. In the first quarter of the eighteenth century, twenty-four hundred slaves would be legally imported into New York, with another five thousand to follow over the next fifty years (maybe six hundred or so of whom would be smuggled in): seventy-four hundred in all, greater than the entire population of the city in 1700. More blacks came involuntarily to New York in the eighteenth century, in other words, than whites came voluntarily in the seventeenth.

The proportion and distribution of slaves in the city's population increased accordingly. In 1712 nearly a thousand of New York's sixty-four hundred inhabitants—somewhat over 15 percent—were black, and better than 40 percent of its households owned a slave. By 1746 African Americans comprised about 21 percent of the city's residents—more than 2,440 in a total population of nearly 11,720. This was the highest concentration of slaves north of Virginia. At least half the city's households now contained one or more slaves.

Merchants bought slaves to fill out their crews and toil on their docks. Shipbuilders put them to work in the bustling East River yards. Coopers, butchers, carpenters, blacksmiths, tanners, and other artisans prospered by training them up in the mysteries of their crafts. In 1715 Governor Hunter remarked on the manumission of a butcher's slave, "who by his faithful and diligent service, had helpt to gain most part of his masters Wealth." Tradesmen unable to afford slaves found themselves at a competitive disadvantage, and in 1737 the provincial assembly received a report of widespread opposition to the "pernicious custom of breeding slaves to trades," which "reduced [whites] to poverty for want of employ."

Wealthy New Yorkers began to utilize slaves as domestic servants. ("Please to buy mee two negro men about eighteen years of age," Cadwallader Golden instructed his commercial agent in 1721. "I design them for Labour & would have them strong & well made. Please likewise to buy mee a negro Girl of about thirteen years old my wife has told you that she designes her Cheifly to keep the children & to sow") And if ever there wasn't enough work to do, owners could hire their slaves out at half the going rate of free labor—enough, as a rule, to bring an annual return of between 10 and 30 percent on the initial investment. This business was already so brisk by 1711 that the Common Council designated the Meal Market at the foot of Wall Street as the authorized site for the purchase, sale, and hire of slaves. From time to time the council itself appropriated funds to hire slaves for construction and cleanup projects around town.

TO be Sold, a Young Negro Woman, about 20 Year old, she dos all sortr of House work; she can Brew, Bake, boyle soaft Soap, Wash, Iron & Starch; and is a good darey Women she can Card and Spin at the great Wheel, Cotten, Lennen and Wollen, she has another good Property she neither drinks Rum nor smoaks Tobacco, and she is a strong hale healthy Wench, she can Cook pretty well for Rost and Boyld; she can speak no other Language but English; she had the small Pox in *Barbados* when a Child. Enquire of the Printer here of and know the Purchase.
N.B. She is well Clothed.

From *New York Weekly Journal*, April 15, 1784. (© Collection of The New-York Historical Society)

Across the East River, in Kings and Queens counties, slaves did almost everything. They worked for merchants, grocers, physicians, attorneys, tallow chandlers, coachmakers, ropemakers. Samuel Hallet's slave piloted ships on the river. But the bulk of rural slave labor was employed in agriculture. Bondsmen and bondswomen cut, hauled, and split firewood; carted dung, mended fences, thatched roofs, and repaired farm buildings; raised vegetables, fruits, animals; plowed fields, mowed meadow grasses, harvested potatoes, cut and husked corn; butchered hogs and salted and barreled the meat; cooked, kept house, sewed, spun, knit, repaired clothing, attended table—and in their off-moments were hired or leased to others.

The 1738 census turned up twenty-three hundred people in Kings County, of whom one in four was a slave. Brooklyn, whose 705 inhabitants made it the largest village, had 158 slaves (22 percent). Flatbush, second largest with 539 inhabitants, contained 129 slaves (24 percent). In Bushwick, population 327, there were another 78 slaves (24 percent). The 185 whites of tiny New Utrecht owned 84 slaves (an astonishing 31

percent). By contrast, the overall proportion of slaves stood at 14 percent in Queens and Suffolk counties, 18 percent in Richmond, and 13 percent in Westchester.

The highest concentrations of slaves occurred on the great Westchester and Hudson Valley estates, where slavery settled in alongside indentured servitude and tenantry. Caleb Heathcote, created lord of Scarsdale Manor in 1702, depended on dozens of slaves, indentured servants, and tenants to produce lumber, grain, cloth, and leather goods for export. By mid-century, Frederick Philipse's son Adolph had some eleven hundred tenants and two dozen slaves on Philipsburg Manor, an agricultural-industrial complex that not only produced a variety of grains for the New York market but ground and bolted (sifted) them in its own mills, packed them in its own barrels, and shipped them downriver in its own sloops.

But these high concentrations of slaves were extremely unusual, for most New York masters owned no more than two or three slaves. Their need for slaves, their ability to purchase slaves, and their capacity to house and feed slaves were on an utterly different scale from the masters of cash-crop plantations in the southern colonies. Even so, the life of a slave in a small household could be as harsh, in its own way, as in the rice and tobacco fields of Carolina or Virginia. When an SPG catechist named Elias Neau began to baptize slaves in New York, masters resisted on the grounds that conversion imposed constraints on their property rights—even after a 1706 law, supported by Neau, affirmed that it did not. It was almost impossible, moreover, for slaves to form enduring family units because masters routinely opposed slave weddings, broke up husbands and wives to raise cash, sold off infants as well as superannuated adults, and wrote wills dividing up their chattel among their heirs. In 1717 Cadwallader Golden sold a slave woman to a purchaser on Barbados precisely because he wanted to remove her from her children. “I could have sold her here to good advantage,” he admitted, “but I have several other of her Children which I value and I know if she should stay in this country she would spoil them.”

New York slaves were divided on cultural lines as well: those imported from the West Indies and thus already “seasoned” (perhaps speaking Spanish), or those—two out of every five in these years—who arrived directly from Africa. Typically, the latter had roots in the Akan-Asante society of the continent's west coast, a fact reflected in the large numbers

named, according to Akan-Asante practice, after the days on which they were born—e.g., Quashee (Sunday), Cudjo (Monday), Quaco (Wednesday), Cuffee or Cuff (Friday), and so on.

Notwithstanding such obstacles, many slaves found common ground in practicing and perpetuating African customs, both sacred and secular. Burials were a focal point of the wider slave community, a chance to engage in traditional funerary rites. The interment ground lay north of the city, in a low-lying area that ran east from Broadway toward a deep ravine that continued to the Fresh Water Pond. It may have been used by the Africans since before the English conquest, because it lay near many of the plots granted half-freed slaves. It was certainly well established by 1713, a year after blacks were denied interment in Trinity's graveyard. "They are buried in the Common," wrote the Rev. John Sharpe in 1713, "by those of their country and complexion without the office, on the contrary the Heathenish rites are performed at the grave by their countrymen." Bodies were wrapped in shrouds fastened with brass pins and placed in wooden coffins; some had coins placed over their eyes, while others were adorned with seashells, glass beads, or buttons of bone and pewter. They were laid to rest with their heads facing west, as was done in Africa.¹

These nighttime ceremonies were disturbingly outside white jurisdiction, although whites themselves habitually foreclosed other options. In 1722, for example, the Common Council passed a law requiring that "all negroes and Indian slaves dying within this corporation on the South side of the fresh water be buried by daylight at or before sunset," while three years later a Bushwick town meeting resolved that "no negro at all shall be buried in this aforesaid churchyard." Similarly, whites attempted, with at best mixed success, to prevent slaves from coming together in great and occasionally raucous gatherings, especially on the Sabbath. "On Sundays while we are at our Devotions," Elias Neau remarked in 1703, "the streets are full of Negroes, who dance and divert themselves." In 1710 they were said to "feast and Revell in the Night time."

"BONNY COUNTRY"

The same demand for labor that led New Yorkers to purchase slaves in record numbers stimulated an upsurge of immigration from Europe in the early decades of the eighteenth century. First to arrive were the Palatine

Germans. Mostly Lutherans and Calvinists, they had barely recovered from the terrible devastation of the Thirty Years War when they were overrun, again and again, by the armies of Louis XIV during Queen Anne's War. In the wake of the catastrophic epidemics and famines that followed the French invasion of the Rhineland in 1707, they appealed to the British government for help. Queen Anne, eager to rescue Protestants from the clutches of a Catholic despot, said the Palatines could take up land in British North America; Parliament, eager to populate the colonies, passed a law naturalizing foreign Protestants.

No one was prepared for the response. By the end of 1709 at least thirteen thousand German refugees had already crowded into London, and thousands more were said to be on the way. All manner of schemes were developed for putting the Palatines to work in Ireland, Wales, or one of Britain's overseas possessions. Most promising was a proposal to settle them in communities along the Hudson River in New York, "where they might be useful to this kingdom, particularly in the production of naval stores, and as a frontier against the French and their Indians." A small advance party reached New York in 1708 and began a settlement at Newburgh, fifty-five miles north of the city.

The main body of Palatines, some twenty-five hundred in all, arrived in the summer of 1710 with Governor Hunter. Flabbergasted at the sheer magnitude of this invasion, which amounted to roughly 40 percent of the city's population, and frightened by an outbreak of typhus among the exhausted and malnourished newcomers, the Common Council quarantined the Palatines on Nutten (Governors) Island. There they languished while Hunter tried to find them land and city merchants cashed in on their desperate need for food, clothing, and shelter. Several hundred Palatines died in the course of the summer and were buried in unmarked graves. Of those who survived, about eighteen hundred were subsequently transported up to several tracts of land lying along the Hudson, where they founded half a dozen small communities. The rest, around 350 individuals, settled in New York City. Forty or so were apprenticed out to local residents, including John Peter Zenger, who went to work in William Bradford's printshop. The others were probably widows and children.

Things got worse. The Palatines soon learned that they weren't to be independent proprietors but indentured servants of the crown, obliged to

work at the pleasure of the governor until the costs of transporting and relocating them had been paid off. Hunter's agents herded them into labor gangs to do the noisome, unfamiliar work of extracting turpentine, tar, and pitch from pitch pines; children orphaned by the typhus epidemic were apprenticed off in Albany and other towns. Enraged, the Palatines mutinied, and Hunter sent troops to restore order. It then became clear that the land chosen for them was poorly suited for cultivating pitch pines—whereupon Hunter turned them loose to fend for themselves. Some found their way to the Mohawk Valley. Others scattered into New Jersey and Pennsylvania. Still others returned to the city. No one could have been happy with the outcome except perhaps the merchants who, like Lewis Morris and Robert Livingston, realized tidy profits selling them spoiled food and second-rate supplies at inflated prices. Livingston also wound up with sizable numbers of Palatines as his tenants.

Close behind the Palatines came the Irish, though on their own rather than with official backing. Roughly two out of three were the so-called Ulster Scots or Scots-Irish, the descendants of hundreds of thousands of Scottish Presbyterians driven by chronic poverty and religious persecution to settle Ireland's northern counties during the seventeenth century. After 1715 a succession of blows—parliamentary suppression of the Irish woolens industry, crop failures and famine, rack-renting by absentee English land-lords—forced them to move again, first to Irish coastal ports, then to America. Between 1720 and 1730 the mainland colonies as a whole absorbed more than fifteen thousand Ulster Scots.

With them came between sixty and eighty thousand Roman Catholics (many of them possibly Gaelic-speaking) from Ireland's southern counties, driven out by legal proscription, Protestant prejudice, and the erosion of traditional communities. While cheap land on the frontier was their primary goal, a substantial though undetermined number made their way to New York City. Many arrived as indentured servants who contracted to serve an employer for a stated period of time, in exchange for passage and keep ("sufficient Meate drinke and App[arel] during his said time," as one indenture phrased it). Sometimes this was arranged in Europe, as in 1729, when tailor William Presland agreed, in the presence of the lord mayor of Dublin, to serve New York merchant John Colgan for four years. Others were advertised for sale in the *New- York Gazette* on their arrival.

(“Redemptioners” were those who agreed to pay for their passage within a stated period after arriving in America; if they failed to “redeem” this debt, the captain who brought them could sell their services to the highest bidder as indentured servants.)

When the ship *Thomas* arrived from London in October 1728, its owners invited the public to purchase the indentures of “several Men, Women and Boys, Servants, amongst whom there are several Tradesmen, as Bakers, Weavers, Bricklayers, Carpenters, Shoemakers, Glassiers, Coopers, &c.” Not infrequently, entire families were on the market. “To Be Sold,” read one advertisement at the middle of the century: “A German Servant Man, with his Wife and Son, of about Six Years old, who are to serve five Years, he is as compleat a Gardner as any in America; understands a Flower and Kitchen Gardens to Perfection.” (Only a tiny fraction of these were the convicted felons routinely sent out from the mother country as indentured servants: most such “transported” convicts wound up in the plantation colonies of the Chesapeake or the West Indies.)

What drew artisans to New York was the good pay they could expect after they had served their terms. In “York city,” James Murray wrote home in 1737, “a Wabster gets 12 Pence a Yeard, a Labourer gets 4 Shillings and 5 Pence a Day, a Lass gets 4 Shillings and 6 Pence a Week for spinning on the Wee Wheel, a Carpenter gets 6 Shillings a Day, and a Tailor gets 20 Shillings for making a Suit of deaths, a Wheel-wright gets 16 Shillings for making Lint Wheels a Piece.”

Despite Murray’s assurances to those left behind that his new homeland was a “bonny Country,” a servant’s life could be a harsh one, as attested by the mounting number of advertisements for runaways published in the *Gazette* during the 1730s. One Hugh Agen, his master advised, “wears a light coloured blew Coat” and “is an Irish man” though he “pretends to be a Doctor and to let Blood.” Nevertheless, well before the middle of the eighteenth century the Irish, Protestant and Catholic, had become the most numerous and rapidly expanding element of the city’s working population. New York’s reputation as a market for Irish servants was indeed so well established by then that Dublin could boast two inns, both named the New York and Philadelphia Arms, where shipping agencies processed prospective immigrants for the voyage over.

A D V E R T I S E M E N T S.

THe Ship *Hppy Return*, is lately arrived at the City of *New-York*, from *Dublin*, with Men and Women Servants; many of the Men are Trades-men, as Black-Smiths, Carpenters, Weavers, Taylors, Cordwainers, and other Trades. Which Servants are to be seen on board the said Vessel, lying over against Mr. Reads Wharff and to be disposed of by John & Joseph Read, on reasonable Terms.

(The New York Society Library)

Not to be confused with the Scots-Irish were immigrants from Scotland proper. Like Robert Livingston, handfuls of native Scots had found their way to New York in search of fame and fortune during the final decades of the seventeenth century. But after 1707, when the Act of Union with England opened a period of sweeping economic and social upheaval, immigration from Scotland accelerated. As in Ireland, enclosures and rack-renting displaced tens of thousands of cotters from their traditional holdings; the failure of the Jacobite rising of 1715, and of a second rising in 1745, drove away thousands more, at least some of whom were banished prisoners of war. All told, more than twenty-five thousand Scots—perhaps as many as fifty thousand—found their way to America before the end of the colonial period. Most settled in the Carolinas, New Jersey, or Pennsylvania, but there was always a regular trickle to New York, where “Presbyterians,” Scots as well as Scots-Irish, had become a force in the life of the city by the third decade of the century. In 1716, “att the desire of a few especially Scots people,” visiting minister James Anderson began preaching and was soon called to serve as pastor of the First Presbyterian Church, conducted in the manner of the Church of Scotland. The erection of its first building, on the north side of Wall Street between Broadway and Nassau streets, offered clear evidence of how much the climate had changed since Cornbury’s persecution of the Rev. Francis Makemie, an Ulster Scot.

Though at first, as Anderson reported in 1717, his church's supporters were "yet but few & none of the richest," the expanding commercial ties between New York and Scotland (which after the Union of 1707 was allowed to trade directly with the American colonies) drew a number of well-to-do merchants and professionals. So did the appointment of a string of Scotsmen—Hunter, Burnet, and Montgomerie—to serve as governor of the colony. Indeed Hunter, a Scot well known in the coffeehouses of London and boon companion of such literary luminaries as Joseph Addison, Richard Steele, and Jonathan Swift, prompted a miniature Scottish Enlightenment in the city. Described by one admiring colonist as "a gentleman of as refined a taste as any we have known or perhaps heard of in America," Hunter gathered unto himself a small group of intellectuals united in the belief that fortune had set them down in a cultural wasteland. Together they discussed books, conducted experiments with pendulums and telescopes, and collaborated on an Italian translation of Addison's play *Cato*. Hunter himself composed Latin odes and achieved a certain literary renown in 1714 with the publication of *Androboros: A Biographical Farce in Three Acts*, the first play written and printed in America.

Conspicuous in Hunter's circle were the attorney James Alexander, the physician Cadwallader Golden, and the proprietor of Morrisania, Lewis Morris. Alexander, one of the Jacobites transported to America after the 1715 rising, had an aptitude for mathematics and engineering that immediately brought him to the governor's attention; under Hunter's aegis, he embarked on a long and illustrious public career (along the way training an entire generation of New York lawyers in his office). Golden, whom Hunter appointed surveyor-general of the province, possessed one of the most original minds in the colonies. His copious writings on physics, botany, history, and ethnography (especially his *History of the Five Indian Nations*, first published by William Bradford in 1727) would earn him an international reputation—New York's answer, as it were, to Benjamin Franklin. Boasting a library of three thousand books, not much smaller than that of Harvard College, Golden was a devoted student of Cicero, Virgil, Tacitus, Shakespeare, Milton, and Addison. He composed poetry, dabbled in the natural sciences, and taught the Linnaean system of plant categorization to his daughter Jane, whose subsequent research made her something of a celebrity among botanists on both sides of the Atlantic.

The same need for mercantile and professional expertise that helped break down resistance to dissenting Protestants helped revitalize New York's Jewish community. The first generation of immigrants had moved elsewhere by the early 1660s—Asser Levy was for many years the only one remaining in town—but the 1680s brought a steady trickle of Portuguese-speaking Sephardim from the West Indies, Surinam, France, and England. Religious services had resumed in 1682, and although its appeals for formal recognition of the right to public worship were consistently rejected, the congregation wasn't molested. By the mid-eighties it had acquired a private burying ground (a corner of which still survives on St. James Place opposite Chatham Square); by the mid-nineties, if not earlier, it was openly using a house on Beaver Street as a synagogue.

Yet New York Jews faced legal hurdles to earning a livelihood in the city. The great majority weren't English citizens, and the Navigation Acts explicitly prohibited them from doing business in England or in any English colony (even the right of native-born Jews to engage in trade or own property remained less than secure). Legal naturalization didn't provide an attractive solution to the problem, since Parliament required prospective subjects to swear an Anglican oath of allegiance. The alternative was to obtain a patent of denization from the crown, allowing the recipient to settle and trade in specified parts of the realm. But this required money and political connections, and only a dozen or so Jewish residents of New York ever managed to become endenized in England. In addition, the provincial assembly, in 1683, had decreed that anyone wishing to be naturalized in New York would have to be a professing Christian.

Almost immediately, however, the potentially adverse effects of such a restriction on the city's commercial interests compelled local authorities to be more accommodating (just as they had once compelled the West India Company to make Stuyvesant accept the presence of Jews in New Amsterdam). Governor Fletcher began the practice, continued by his successors, of granting letters of endenization to Jews and other aliens, for a fee, few or no questions asked. After 1718, moreover, the Assembly routinely naturalized Jews on its own authority and permitted them to omit the phrase "on the true faith of a Christian" from the necessary oaths. The municipal corporation meanwhile quietly ignored instructions from England that the privileges and duties of freemanship be restricted to native-born,

naturalized, or endenized subjects. Even before the turn of the century, as a result, Jews were serving on juries, in the militia, and on the Common Council; many would hold the office of constable (one of whose duties was to collect taxes for the Anglican Church). Similarly, although the English Test Act of 1673 barred Jews (and Catholics) from sitting in the Assembly or holding appointive office, local custom allowed Jews to vote freely in provincial as well as municipal elections. (When this was called into question in 1737, the Assembly voted to deprive Jews of the franchise. The decision wasn't strictly enforced, though, and within a few years Jews were again going to the polls without interference.) Of equal importance, Jews inherited the economic right—for which Asser Levy had fought decades earlier in New Amsterdam—to trade in local commerce like other burghers. This right to make a living as they pleased, without constraint, wouldn't be available to them in England for another half century.

In this climate, New York Jews flourished. Nathan Simson made his mark in the West Indian trade and retired at the end of the 1720s with an estate valued at sixty thousand pounds. His son Joseph was one of several Jewish merchants who did so well marketing kosher beef in the islands and elsewhere that by the 1740s the stamp *K. Sh.I., kasher* (Congregation Shearith Israel, kosher) was recognized throughout the colonies. The marriage of Jacob Franks to Bilah Abigail Levy in 1712 not only ensured Franks's success in trade but was also the beginning of a mercantile dynasty that would be renowned in London and Philadelphia as well as in New York. Luis Moses Gomez shipped New York wheat to Lisbon, used the profits to import wine from Madeira, then expanded his operations to include furs, slaves, rum, and English manufactured wares. In addition to such families, who ranked among the city's wealthiest residents, Jews occupied positions as peddlers, candlemakers, butchers, watchmakers, goldsmiths, and shopkeepers.

The community was not without its internal divisions. The immigration of more and more German speakers in the early eighteenth century—by 1730 a majority of the 225 Jews in New York were Ashkenazim—stirred resentment among the Sephardim. Proud, socially conscious families like the Gomezes resisted intermarriage with “Tudescos” (i.e., Germans), even wealthy ones like the Franks, and tensions between the two groups were reflected in their tendency to live in different parts of town: Sephardim in

the East Ward, Ashkenazim in the Dock Ward. When the congregation decided to erect a new synagogue on Mill Street (South William) in 1728, the Sephardim made no secret of their apprehension that it would adopt Ashkenazic liturgical practices. By the midthirties, however, Ashkenazim and Sephardim came up with an arrangement that enabled them to present a more unified front to their sometimes hostile neighbors: henceforth the president of the congregation would normally be an Ashkenazi, while services continued to follow Spanish-Portuguese ritual under the leadership of a Sephardic *hazzan*. The use of Portuguese in congregational records and on tombstones nonetheless slowly but surely yielded to English; before the middle of the century it had disappeared altogether.

Bilah Abigail Franks. “Still it Gives me a Secret pleasure to Observe the faire Character Our Family has in [this] place by Jews and Christians,” she once wrote. {American Jewish Historical Society)

Despite New York’s reputation for allowing “perfect freedom of conscience for all, except Papists” (as one Dutch dominie put it in 1741), the attainment by some Jews of social and economic standing stirred resentment. On one occasion, in 1743, a mob attacked a Jewish funeral cortege, seized the corpse, and subjected it to a mock conversion. A less clear-cut case of anti-Semitic violence would occur half a dozen years later, when Oliver De Lancey organized a mob to attack the home of a recently arrived Jewish merchant. They smashed all the windows, broke down the door, wrecked the interior, and threatened to rape the man’s wife—on the grounds, De Lancey allegedly said, that she looked like the wife of Governor George Clinton, “and if he could not have her, he would have her

likeness.” Oddly, De Lancey’s own wife was Phila Franks, daughter of Jacob and Bilah.

AN EPITAPH FOR DUTCH NEW YORK

As New York grew ever more integrated into the English empire, and trade with Holland ever more attenuated, the position of the city’s Dutch declined accordingly, more so than met the eye. Well into the second decade of the eighteenth century, travelers continued to marvel at the tenacity of Dutch speech, Dutch dress, and Dutch architectural conventions in New York. Sarah Kemble Knight, in 1704, was astonished at how *different* its Dutch women looked. “The English go very fashionable in their dress,” Mrs. Knight wrote. “But the Dutch, especially the middling sort, differ from our women, in their habitt go loose, were [wear] French muches wch are like a Capp and a head band in one, leaving their ears bare, which are sett out wth Jewells of a large size and many in number. And their fingers hoop’t with Rings, some with large stones in them of many Coullers as were their pendants in their ears, which You should see very old women wear as well as Young.” A dozen years later John Fontaine remarked that most houses still went up “after the Dutch manner, with the gable-ends toward the street,” and in the Burgis View of 1717 it is indeed possible to make out, huddling along the waterfront below Wall Street, the stepped gables and sharply pitched roofs that bore silent witness to the days when New York was New Amsterdam.

Yet between 1700 and 1720 the Dutch component of the city’s white population fell below 50 percent for the first time, and its marginalization, underway for a generation, passed the point of no return. A select company of Dutch traders with good connections in London or the West Indies—Rip van Dam, Abraham De Peyster, Jacobus Van Cortlandt—prospered in the boom that followed Queen Anne’s War. As a group, however, Dutch merchants now formed a distinct minority of the city’s wealthiest inhabitants, and proportionally fewer Dutch New Yorkers owned slaves than either the English or the French. What was more, fully 80 percent of the families in the city’s poorer neighborhoods were Dutch. The Dutch had managed to carve ethnic niches in the labor force—they were disproportionately represented among the ranks of coopers, smiths, masons, cordwainers, cartmen, and other laboring people—but these niches were at

the lower end of the city's economy. The Dutch were losing ground politically too. Prior to Leisler's Rebellion, most mayors of New York had been Dutch; after Leisler, not only were most mayors English or French, but as a rule the Dutch held a third or fewer of the seats on the Common Council.

After 1720 Dutch was almost exclusively reserved for private communication or worship. Subsequent attempts to provide Dutch-language schooling for the young invariably failed, and by the early 1740s even bilingualism was a thing of the past. "The Dutch tongue Declines fast among Us Especially with the Young people," wrote a saddened Cornelius van Home, grandson of a New Amsterdam settler. "All Affairs are transacted in English and that Language prevails Generally Amongst Us."

Affirmatively Dutch communities did survive along the Hudson River, over in New Jersey, on Staten Island, or out on Long Island. Dutchess, Orange, and Ulster counties remained predominately Dutch for years; Albany was almost exclusively Dutch, and would long remain so. Overall, nevertheless, the Dutch now constituted a clearly dwindling minority of the colony's population, and Dutch settlements outside the city were becoming more clannishly isolated from the rest of the world.

Dwindling population and waning prosperity were accompanied by a pietist movement that tunneled through the Reformed Church during Queen Anne's War. The pietists' message—part denunciation of orthodox clerical authority, part attack on liturgical formalism, part summons to individual spiritual renewal—reaped bountiful harvests of souls along the rural frontiers of New York and New Jersey, home to large numbers of Leislerians who hadn't forgotten the Church's complicity in their leader's defeat and execution. When an evangelical dominie named Theodore Frelinghuysen began preaching among the villages of New Jersey's Raritan Valley in 1720, the movement erupted into an open revolt.

These afflictions, combined with the chronic shortage of Dutch-speaking dominies, the missionary efforts of the Society for the Propagation of the Gospel, and the growing social status commanded by the Church of England, helped expand Anglican congregations. Every year prominent Dutch families went over to the Church of England—Beekmans, Roosevelts, Schuylers, Stuyvesants, Van Cortlandts, Verplancks, Van Dycks. Huguenots too embraced Anglicanism, most notably Elias Neau,

who had been an influential elder in the Huguenot Church before enlisting with the SPG. By the 1730s the French Church had all but vanished.

Other institutions that had shielded the Dutch way of life in the first generation or two after the English conquest were in comparable disarray. No longer recognized in provincial courts since the Judiciary Act, the mutual will—last line of defense against British patriarchalism—virtually disappeared from use in the early eighteenth century. As among the English, married women used their husbands' names; a husband enjoyed full control of his wife's personal property (clothing, housewares, money) and had the right to administer (though not dispose of) her real estate until his death, even if she should die before him. Though some Dutch women continued to run businesses, they were now almost always widows, far outnumbered by men. (And perhaps because they had more to lose from Anglicization, Dutch women were slower than their husbands to abandon the Reformed communion. After 1700 women comprised two-thirds of the new members of the Dutch Church.)

De Lanceys, Livingstons, Schuylers, Van Rensselaers, Beekmans, Morrisses, Philipsses: New Yorkers now tended to speak of them in the plural not merely because these families spread so luxuriantly as time went on, but because in an anglicized environment it was the family name that determined social standing and political influence. Outsiders could and often did acquire money and reputation, but the price was going up all the time and more and more rich men were starting out as the sons (or sons-in-law) of other rich men.

Rich women, by the same token, were being held to new standards of purity and obedience with the expectation that they would devote themselves to childrearing, household management, and the mastery of such parlor rituals as the serving of "high tea" (now *de rigueur* among the English upper classes). "Let your Dress your Conversation & the whole Business of your life be to please your Husband & to make him happy & you need not fail of being so your self," Cadwallader Golden wrote his daughter Elizabeth De Lancey in 1737. It was advice that might well serve as the epitaph of Dutch New York.

One Body Corporate and Politic?

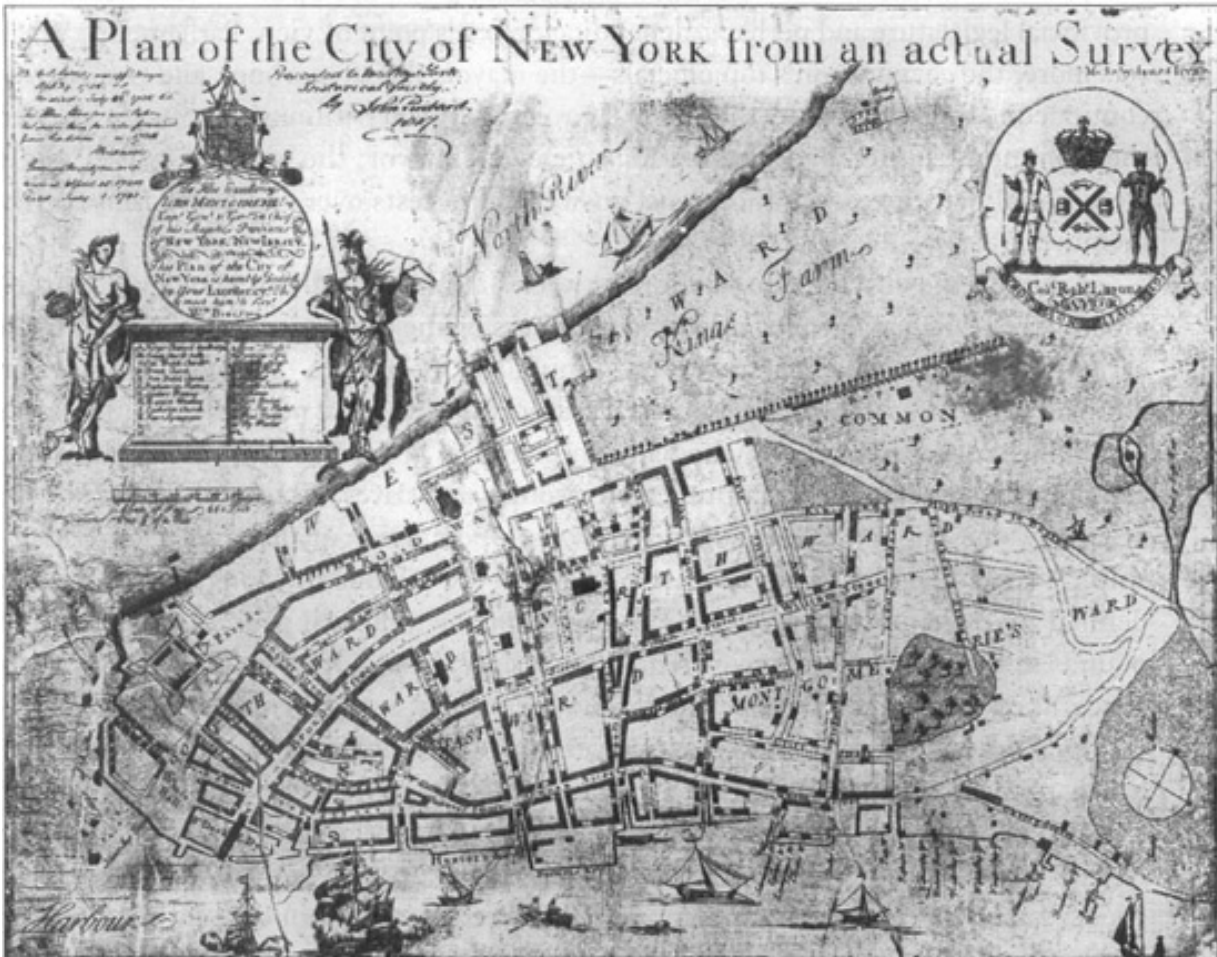

On the morning of February 1, 1731, Mayor Robert Lurting and two dozen other municipal officials gathered at City Hall to prepare for a ritual that none had ever taken part in before. At precisely ten o'clock, no doubt after some last-minute fussing with wigs and robes, they proceeded "in their formalities" down to Fort George and were escorted into the presence of Governor John Montgomerie. Montgomerie greeted them with a little speech, then handed Lurting "his Majestys Royal and most Gracious Charter to the Mayor Aldermen and Commonality of this City." The New Yorkers, who had already paid Montgomerie an £840 cash bribe to get them the charter, praised the governor for his "Just Good and wise Administration." After a round of drinks and toasts, they returned to City Hall.

Twice before, from Governor Nicolls in 1665 and from Governor Dongan in 1686, New York City had received municipal charters. Neither grant bore the royal seal, though, and doubts had arisen over the years as to their validity. In 1729, after repeated appeals to have its status clarified, the Common Council petitioned the crown for a new charter ratifying the city's "ancient Rights and Priviledges." The delivery of the "Montgomerie Charter" a year later was a happy occasion—all the more so because in the charter His Majesty praised New York for having "become a considerable seaport and exceedingly necessary and useful to our kingdom of Great Britain in supplying our governments in the West Indies with bread, flour, and other provisions."

"A FREE CITY OF ITSELF"

The Montgomerie Charter established, or confirmed the existence of, a corporation—"one body corporate and politic"—bearing the name of "the Mayor, Alderman, and Commonality of the City of New York." The charter also gave the corporation an "estate" consisting of the City Hall as well as all municipal market buildings, docks, wharves, cranes, and bridges; the "waste and common land" of Manhattan; the land surrounding Manhattan

out to the low-water mark, plus an additional four hundred feet around the southern end of the island; the waterfront of “Nassaw Island” (Long Island) “from the east side of the place called Wallabout to the west side of Red Hook”; and the exclusive right to operate ferries between Manhattan and Long Island. Like other individual property owners, the corporation could increase, improve, sell, lease, or otherwise dispose of this estate as it saw fit. It could sue and be sued.

The Lyne-Bradford Plan of 1730/1731, drawn by surveyor James Lyne and printed by William Bradford. The first map of New York to be printed in the city itself, and probably intended to accompany the Montgomerie Charter, it shows that the built-up area of town now extended almost up to what is now Fulton Street. Wall Street remains the municipal axis, running east from the “English Church” (Trinity), past the new City Hall and the Meal Market, to the Coffee House on the

corner of Water Street. The East Ward, lying east of William Street between Hanover Square and John Street, has begun to replace the Dock Ward as the city's commercial center of gravity. (© Collection of The New-York Historical Society)

Like other property owners, too, the corporation was accorded powers of selfdetermination commensurate with the size and nature of its estate. In the words of the charter, it was a "free city of itself." It could lay streets, regulate markets, license trades, and charge fees. It could make laws and promulgate ordinances not only for "the good rule and government of the body corporate" but for the "common profit, trade, and better government" of all the city's inhabitants. To enforce such laws and ordinances it could set up courts, erect jails, collect fines, confiscate goods and chattels, and administer punishments "not extending to the loss of life or limb."

The "free city of itself" was not perfectly autonomous. It had to abide by English and provincial law. It could not tax its inhabitants (that was a power reserved for the provincial legislature and perhaps, depending on one's point of view, Parliament). What was more, the corporation's top officials—the mayor, sheriff, coroner, and recorder—continued to be appointed by the colonial governor. When petitioning for a new charter the Common Council had pleaded for an elective mayor; the crown's refusal was a clear signal that the corporation must answer to interests over and above those of its members.

Likewise the charter's distinction between "freemen" and "freeholders." "Freemen" were residents enrolled as voting members of the corporation after swearing an oath of loyalty and paying a modest fee—initially £3 12s. for a "Merchant, Trader or Shopkeeper," £1 4s. for a "Handy-craft Tradesman," and mere pennies for native-born residents of the city or those who had completed an apprenticeship there (the exact amounts varied over time). Counting white women and slaves of both sexes over the age of twenty-one, about one-third of the city's adult population qualified for the freemanship. "Freeholders" (a term not used in either the Nicolls or Dongan grant) were defined by existing provincial statute as persons owning real property worth forty pounds in the ward where they voted. They needn't be residents of the ward, or even residents of the city, and were permitted to vote in every ward where they met the property qualification. Here too the

charter gave outsiders a voice in the corporation's governance; to wealthy outsiders it offered the prospect of more than one.

Freemanship conferred genuine benefits. As under the old burgher-right, only freemen could practice an "art, trade, mystery, or occupation" or sell "any manner of goods, wares, merchandises, or commodities by retail.. . within the said city." Every Michaelmas (September 29), they assembled ward by ward to elect their aldermen, assessors, collectors, and constables for the year to follow. Though bona fide headcounts are very rare, throughout the first half of the eighteenth century, probably three or four of every five adult white males in the city had the right, as freemen of the corporation, to determine by whom they would be governed. This made the freemen of New York one of the most inclusive political communities in British America.

Some freemen were affluent merchants, lawyers, landowners, and "gentlemen." The majority consisted of carpenters, bakers, bricklayers, butchers, cordwainers, cartmen, mariners, tavern keepers, weavers, tanners, laborers, and other working people of moderate means, or less. (Between 1700 and 1745 better than two thousand individuals representing ninety-one trades would be admitted to freemanship; after mid-century half the new admissions were laborers.) Rich or poor, all freemen were created equal under the charter, and the charter held them all equally responsible for the management of the corporation's business. "Ye Shall be Contributing to all Manner of Charges within this City," ran the oath to which they were required to swear, "as summons, Watches, Contributions, Taxes, Tallages, Lot and Scot, and all other Charges, bearing your Part as a Freeman Ought to do."

Freemen did not, however, enjoy access to the corporation's real estate. In many villages of England and New England, the "commons" were available to all members of the community for hunting, cutting hay and firewood, pasturing livestock, and the like. Not so in New York, where the Montgomerie Charter gave the corporation absolute ownership of its estate, unencumbered by old-fashioned "use-rights." The Common Council would in fact spend considerable time prosecuting trespassers, encroachers, poachers, and others who allegedly threatened the value of its holdings.

Suffusing the charter was the idea of a collective civic good that transcended the private interests of individual freemen. The most direct and

tangible expression of this belief was a welter of regulations (some dating back to the Dutch era) that protected all freemen from the destructive effects of economic competition, dishonest practices, and shoddy workmanship. Periodic “assizes” fixed the weight, quality, composition, and price of every essential commodity offered for public sale in the city. Other regulations prevented “forestalling,” the practice by which sellers bought up and withheld goods from the market in the hope of boosting prices. Wages too were typically set by statute, and there was close supervision of trades deemed vital to the public interest—carters, butchers, bakers, tavern keepers, gravediggers, porters, chimney sweeps, river pilots, midwives, and assorted municipal functionaries (gaugers, packers, watchmen, weighmasters, and so on).

Yet the welfare of the corporation as a whole was an ideal that could mean different things to different people. Building and repairing docks, for instance, were improvements to the municipal infrastructure that arguably benefited everybody. But how should the work be done? Municipal authorities favored a policy of selling the “water lots” that lay between high- and low-water marks along the East River. Purchasers were required to fill in the lots and construct buildings, wharves, bulkheads, and streets—which looked like a reasonable way to raise revenue while developing the port. It was also, however, a device for moving some prime urban real estate into the hands of wealthy speculators and developers. So, too, when municipal authorities refused to let the cartmen raise their rates, it was hard to avoid the conclusion that the livelihoods of working people were secondary to the interests of merchants.

DEFERENCE OR INDIFFERENCE?

Merchants and the propertied classes usually got their way, moreover, for freemen of modest means—the “middling” classes who comprised perhaps 60 percent of the city’s white population—generally failed to sustain an organized presence in either municipal or provincial politics. From time to time, small merchants, shopkeepers, and master craftsmen occupied as many as half the seats on the Common Council, while others served regularly as constables, assessors, market inspectors, and the like. Yet for several decades, elections grew duller by the year, polling was generally

slow, and incumbents were almost always returned to office without opposition.

For rich and influential New Yorkers, the kind who dominated the Assembly and Common Council, this was exactly as it should be. To their way of thinking, a politically engaged “commonality” meant instability and upheaval because men of little or no property, even freemen of the corporation, lacked the judgment and self-discipline needed for participation in public affairs. And because they depended on others for trade, patronage, and employment, such men (like women and children) could never be trusted to think or act independently: when they entered the political arena it was certain to be as mere tools of someone else. A stable, effective system of government was thus one in which the mass of citizens deferred to the leadership of their social superiors—just as they now appeared to be doing in New York.

But there were other reasons for the torpor of public life in the city. For one, except for the annual Common Council elections, the freemen had few venues for sustained political activity. All the important citywide offices were appointive, besides which Assembly elections occurred only at the discretion of the governor or on the death of the monarch (not until 1743 was legislation adopted that mandated elections at least once every seven years). All told, in the eighty-four years between 1691 and 1775 New Yorkers voted for assemblyman on only thirty-one occasions.

For another, the law required viva voce or “voice” voting in both charter and provincial elections, meaning that every voter declared his preference, openly, before election officials, candidates, and neighbors. While the chilling effect of this procedure cannot be discounted, freemen were not altogether vulnerable to the blandishments of powerful men. Master craftsmen owned their own shops and tools, determined for themselves how often and how hard they would work, and took a fierce pride in the “mysteries” and traditions of their trades; journeymen weren’t employees but prospective equals sharing similar assumptions and expectations.

New York’s political quiescence in the early eighteenth century thus had less to do with deference, as such, than with a combination of institutional constraints and popular indifference to the issues that tended to dominate public affairs. Governors fought with the Assembly for control over the public purse. Landed and mercantile interests jockeyed for advantage. But

what did any of that matter to ordinary freemen of the municipal corporation? When they needed to sit up and take notice, they would—and did.

THE MASTER'S VOICE

And what of all those residents, roughly two out of every three adults, excluded from the corporate community by reason of gender, race, or poverty? How did the freemen expect to secure *their* compliance with municipal rules and regulations?

The maintenance of law and order depended—by day—on the constables of each ward (one of whom seems to have been designated high constable). From nine o'clock at night to daybreak the following morning the night watch took over—"four good And honest Inhabitants householders," as the Common Council described them in 1698, who were paid to "go round the Citty Each Hour in the Night with a Bell and there to proclaime the season of the weather and the Hour of the Night and if they Meet in their Rounds Any people disturbing the peace or lurking about Any persons house or committing any theft they take the most prudent way they Can to Secure the said persons." Attempts were made from time to time to improve on the system, now by adding more men, now by paying the men for their efforts. The thinness of municipal police power was unmistakable, however, and it was never regarded as the city's main line of defense against the multitudes who lived beyond the pale of membership in the corporation. (The county sheriff and city marshal, as agents of the county and mayor's courts respectively, had no responsibility for routine police work in the city.)

It was no accident that the Common Council wanted "Inhabitants householders" for the night watch. The typical workplace in eighteenth-century New York was part of a private house, or something in close proximity to a private house. Merchants, lawyers, and physicians saw clients and patients in their parlors. Importers and exporters kept their "stores" in attics and back cellars. Retailers displayed their wares, and tavern keepers served their customers, in small ground-floor front rooms. Master craftsmen set up workshops in their own homes—on the first floor, in the basement, in backhouses, or in yards—while their apprentices, slaves, and indentured servants, if any, slept in garrets or nearby outbuildings. Even

sugar refineries, shipyards, ropewalks, and tanneries—trades that required heavy, bulky equipment as well as ample space—were located as close as possible to the residences of their owners.

In this domestic mode of production, the heads of households were managers of labor as well as parents. More exactly, their “families” included one or more dependents to whom they weren’t biologically related but over whom they exercised, by law as well as custom, paternal authority (“paternal” more than “parental” because after 1700 only one New York household in six was headed by a woman, typically a widow).

Other than the small handful of constables and the night watch, the freeman-pater-familias, master of his household, was the primary bulwark of public order, because throughout the eighteenth century the freemen’s apprentices ranked among the most troublesome elements of the city’s population. Mostly they were young men between the ages of ten and twenty-one (though William Reade was apprenticed to a tailor in 1701 at the age of five) or girls bound out to learn housewifery, cooking, and sewing. Most were British in origin (because the Dutch rarely made use of formal apprenticeship agreements). Their rights and responsibilities derived from the Elizabethan Statute of Artificers (1562), which was the explicit basis of regulations relating to apprenticeship in New York after 1695. Apprentices swore to serve their masters well and faithfully for a specified period of time (a 1711 ordinance required a minimum of seven years). In return, their masters promised to teach them a trade, to give them adequate room and board, and, at the end of their terms, to release them with whatever clothing, tools, or “freedom money” was required by their written deed, or indenture. Nearly all indentures, moreover, offered to provide some education. In 1693 Frances Champion was apprenticed as a house servant to Elizabeth Farmer, who agreed to “Instruct the said Frances to Reade and to teach and Instruct her in Spining, Sewing, Knitting or any other manner of housewifery.” Night schools for apprentices became popular after 1700, and indentures often included arrangements for them to attend after work.

As surrogate parents, masters also had full authority to discipline their apprentices by any means not causing death or permanent physical injury. In theory, the good behavior of apprentices was ensured by the promise of admission to a trade and automatic membership in the corporation when their terms were over. But apprentices were frequently too young, too

homesick, too restless, or (as a printer's apprentice named Benjamin Franklin said of himself) "too saucy and provoking" to heed their masters. Often they refused to work or worked indifferently. Some returned to their parents or signed up with other masters, actions that could embroil everyone in long and acrimonious litigation. So many simply took to their heels, never to be seen or heard from again, that the runaway apprentice would become a stock figure of the eighteenth-century urban scene. Nor did masters invariably live up to their part of the bargain. Abusive or negligent masters weren't hard to find, and ill-clad, ill-fed, and ill-treated apprentices were an all too common sight on city streets.

Repeatedly, the Common Council tried to bolster the authority of masters with ordinances that prohibited apprentices from loitering, gambling, bartering or selling goods, fighting, swearing, drinking in taverns after eight or nine o'clock at night, and other offenses against the peace of the city (especially on the traditional popular holidays: in 1719 the Court of General Sessions complained of the "Disorders and Other Mischiefs that Commonly happen within this City on Shrove Tuesday by Great Numbers of Youths Apprentices and Slaves that Assemble together in throwing at Cocks"). Apprentices who broke the law could be fined, whipped by the public whipper, or sentenced to longer terms of service, at the discretion of the magistrates.

Masters who failed to abide by their contractual obligations, especially those guilty of cruelty, were increasingly likely to be fined or to have their apprentices released. James Jamison's indenture to Henry Brughman was voided in 1718 when the magistrates learned that Brughman had so disfigured Jamison's face that he stood "in Danger of loosing his Eyes." In 1728 eleven-year-old Margaret Anderson won a discharge from her apprenticeship to Benjamin Blake, a cordwainer, who was found guilty of "very often Immoderately Correcting her & not allowing her reasonable time to rest several times in the Night."

Indentured servants presented the corporation with a somewhat different kind of dilemma. Although servants too were subject to the *in locoparentis* authority of masters, they were probably older than apprentices, on the whole, and doubtless included a higher percentage of women. Some already knew a trade, having gone into service for the sole purpose of obtaining passage to the colonies. They also appear to have been rather less tractable

than apprentices. Masters griped constantly about disobedient servants, larcenous servants, and idle servants. Ann Sewall savagely beat Ann Parsons and kept her “in Chains and Irons for several Weeks upon bread and water only,” explaining “she didn’t know itt was the breach of any Law her said Servant having highly offended her.” Small wonder that hardly a day seemed to go by when the sheriff and constables didn’t have to contend with servants who, like apprentices and slaves, struck back or ran off. (In 1734 maidservants formed an organization and declared that “we think it reasonable we should not be beat by our Mistrisses Husband[s], they being too strong, and perhaps may do tender women Mischief.”)

Maintaining order was complicated by the town’s so-called bawdy or disorderly houses—unlicensed grogeries and gin mills catering to boisterous crowds of apprentices, servants, free women, and even slaves. The better part of them also sheltered a brisk underground traffic in stolen goods as well as aiding and abetting prostitution; many were located in the homes of widows or unmarried women unable to support themselves by other means. In 1710 Elizabeth Green spent a week in jail because she regularly permitted “sundry Negro slaves to assemble and meet together to feast and Revell in the Night time” at her house. Such an establishment, besides endangering public safety, was an ominous inversion of the social order—a world turned upside down, an underworld beyond the authority of masters, where the conventional boundaries between races and sexes were flagrantly ignored.

THE CITY AND THE POOR

Further complicating the management of servants and apprentices was the sharply unequal distribution of wealth in the city. According to the 1730 census, New York’s population stood at 8,622: 7,045 whites and 1,577 blacks. That same year, a comprehensive property assessment revealed that the richest 10 percent of the city’s taxable population, some 140 merchants and landowners, held almost half its taxable wealth. By contrast, 49 percent of white taxables held property worth ten pounds or less—a pathetically meager sum, indicating that around one-third of all whites were more or less destitute. On the assumption that virtually all blacks were no better off, nearly three-fifths of the city’s inhabitants thus lived at or near the subsistence level. (Poverty wasn’t just an urban problem. In rural Newtown,

just across the East River, the pressure of population on the community's supply of land had begun as early as the 1720s to diminish the size of holdings and multiply the numbers of those without any land at all.)

In New Amsterdam, the care of the indigent had been left to the city's religious bodies. In New York, this approach seemed less and less satisfactory as the seventeenth century drew to a close. Not only were the numbers of poor people rising, but on both sides of the Atlantic poverty as such was increasingly regarded as an aspect of the general problem of labor discipline. In the comprehensive Settlement Act of 1662, Parliament prohibited the indigent from seeking relief outside their native parishes and drew up precise classifications of poverty to prevent the able-bodied from evading work. The New York Assembly followed Parliament's lead in 1683 with the first colony-wide measure "for Maintaining the Poor and Preventing Vagabonds." The law combined relief for needy residents of every community with provisions for the prompt eviction of newcomers who lacked visible means of support (to which end it also required ship captains to give the magistrates a list of all their passengers). Because each town and county had to maintain its own poor, governor Dongan remarked, "no vagrants, beggars, nor idle person" would be allowed in the colony.

The poor didn't go away, though. In 1685, at Dongan's urging, the Common Council ordered the aldermen of each ward to identify their "deserving poor"—established residents who had fallen on hard times through no fault of their own—and for the first time accepted the responsibility to provide "for their Reliefe out of the publique Treasury." This decision was affirmed in the Ministry Act of 1693, which created a special tax known as the "poor rate" and made the proceeds available to five "overseers of the poor" or "churchwardens" (secular officials, despite the name). So-called outdoor relief, or outrelief, the most common form of aid, involved grants of fuel, clothing, food, and even cash. Persons unable to care for themselves could be boarded with families. In New York City, the very sick and infirm were placed in an almshouse on Broad Street, the first of a succession of private residences that the corporation rented for this purpose after 1700. Denied assistance of any kind were nonresidents and all able-bodied persons judged fit to work for a living. In 1707, moreover, the Common Council told the churchwardens to "put a Badge upon the Clths of such persons as are clothed by this city with the Mark N:Y in blew or Red

Cloathh.” (Only ten years earlier Parliament had passed a similar law requiring pensioned paupers to wear the letter *P*.)

During Queen Anne’s War, warnings about the inadequacy of the poor rate became a standard feature of the annual churchwardens’ report. In 1713 the wardens said their resources had been exhausted by the many people in the city “who are in great want and a miserable condition and must inevitably perish unless some speedy method be taken for their support.” Next year the tax was raised to £438, three times the amount collected in 1697.

Relatively few New Yorkers received municipal assistance (one reason being that local congregations continued to give food, clothing, shelter, pensions, and medical care to their “own” poor, who therefore weren’t counted as public charges). Between 1721 and 1725 the names of only two-hundred-odd residents appear on the relief rolls—ninety-nine women, fifty-five men, fifty children—170 of them on outrelief, twenty in the almshouse, and fourteen as boarders. Nearly all the boarders and residents of the almshouse were men too old or sick to work; the bulk of those on outrelief, by contrast, were indigent widows with children.

Vagrants and beggars—the undeserving poor, men and women deemed unwilling to work by the authorities—got no pity. In 1699 Governor Bellomont proposed the construction of a workhouse to “employ the poor and also vagabonds,” but the Assembly rejected the idea. “They smiled at it because indeed there is no such thing as a beggar in this town or country,” Bellomont wrote. Just one year later, the Common Council nevertheless adopted legislation for removing the “Vagabonds & Idle Persons that are a Nuisance & Common Grievance of the Inhabitants.” (Perhaps two dozen individuals and their families were actually expelled from Manhattan in the first half of the century.) For those worthy of sterner treatment, “a Cage, Whipping post, pillory and Stocks” were erected in front of the new City Hall on Broad Street. Subsequent legislation authorized thirty-five lashes for anyone returning to town after deportation and required all citizens to report the presence of strangers to the authorities.

“A TERROR TO OTHERS”

When the Montgomerie Charter went into effect, some sixteen hundred of the city's residents, roughly 18 percent of the total population, were black slaves. Prominent officials were beginning to wonder if the presence of so many slaves didn't discourage white immigration, and working people had already complained on numerous occasions that the increasing employment of blacks in the trades was costing them jobs. None doubted, though, that preserving order among this large servile labor force had become one of the corporation's most pressing challenges.

Legally, there was no longer any doubt as to the subordinate and dependent status of blacks. By the beginning of the eighteenth century, the comparatively broad rights enjoyed by slaves under Dutch rule—to hold property, to carry a weapon, to serve in the militia, to sue in court, to obtain half-freedom—had all been whittled down or stripped away. New York's first comprehensive slave code, adopted in 1702, underscored the association of slavery with black skin by banning the enslavement of Indians and defining indentured servitude as a condition for whites only. It granted masters nearly unlimited powers of correction, set up special tribunals to try slaves accused of crimes, and authorized a Common Whipper for the city. Subsequent enactments by either the legislature or Common Council confirmed that slavery was heritable through the female line, prohibited more than three slaves gathering together at a time (twelve for funerals), restricted the movement of slaves after nightfall, banned slaves from selling food or other goods in the streets (a practice known as "huckstering"), and eliminated conversion to Christianity as grounds for manumission. Innkeepers couldn't sell liquor to slaves, and severe penalties were decreed for whites who helped slaves break the law or failed to take appropriate action when they did. In 1738 Elizabeth Martin was "Reputed a Common Whore as with Negro Slaves as to others and a great Disturber of the Peace." Declared a "very Low Notorious Wicked Woman," she was ordered out of city. When she refused to go, she received thirty-one lashes and was chased out.

It proved next to impossible to enforce such laws. Slaves moved about the city almost at will in the course of their work and were often unsupervised by their masters for extended periods of time, even at night. Despite the profusion of statutes, therefore, municipal authorities were inundated year after year with demands to stop slaves from illegally

congregating, brawling, breaking curfew, playing in the streets on Sundays, and drinking at “bawdy houses” whose white proprietors were suspected of keeping prostitutes and fencing stolen goods. Their brazen defiance of whites was notorious. In 1696 Mayor William Merritt ordered a group of noisy slaves to disperse and got punched in the face; half a dozen years later Governor Cornbury expressed alarm at the “great insolency” of slaves in the city. Everybody complained about runaways, especially as it became known that fugitives could find refuge with the Seneca, Onondaga, and other Indian tribes to the north, or the Montauks, Shinnecocks, Massapeguas, and others of eastern Long Island.

R U N A W A Y

T H E 18th Instant at Night
 from the Subscriber, in the City of New-York, four Negro Men, Viz. LESTER, about 40 Years of Age, had on a white Flannel Jacket and Drawers, Duck Trowsers and Home-spun Shirt. CÆSAR, about 18 Years of Age, clothed in the same Manner. ISAAC, aged 17 Years clothed in the same Manner, except that his Breeches were Leather; and MINGO, 15 Years of Age, with the the same Clothing as the 2 first, all of them of a middling Size, Whoever delivers either of the said Negroes to the Subscriber, shall receive **TWENTY SHILLINGS** Reward for each beside all reasonable Charges. If any person can give Intelligence of their being harbour'd, a reward of **TEN POUNDS** will be paid upon conviction of the Offender. All Masters of Vessels and others are forewarn'd not to Transport them from the City, as I am resolv'd to prosecute as far as the Law will allow.

WILLIAM BULL,

N. B. If the Negroes return, they shall be pardon'd.

 Notices such as this, common in colonial newspapers, typically provided as much detail as possible about the

fugitives and their destinations. (© Collection of The New-York Historical Society)

A mere hint of restiveness among black New Yorkers could throw whites into a near panic. And not without justification. New York slaveowners knew full well that the price of slavery in the West Indies had been a long ordeal of racial violence and bloodshed. Between the 1670s and the 1730s half a dozen major slave insurrections and numerous small revolts took place on Barbados and Antigua alone; on Jamaica, armed bands of escaped slaves known as Maroons kept the authorities at bay for decades. New Yorkers knew, too, that slaves convicted of serious crimes in the West Indies—even arson and murder—were frequently sold to unsuspecting buyers on the mainland. Beginning in 1702 the Assembly tried to deter nonresident merchants from dumping these “refuse Negroes” on the colony by permitting local merchants to pay much lower tariffs on slaves imported directly from Africa. How many veteran insurrectionaries had ended up in New York? No one knew for sure. Everyone feared, however, that a mere handful could do terrible damage to the city and neighboring communities.

Could it happen in New York? A gang of runaway slaves allegedly robbed and terrorized Dutch farmers in Harlem in 1690. In 1706 Governor Cornbury learned that “several N’s in Kings County (Brooklyn) have assembled themselves in a riotous manner, which if not prevented may prove of ill consequence.” To make certain the turmoil didn’t spread, he ordered the arrest of “all such Negroes as shall be found to be assembled— & if any of them refuse to submit, then fire upon them, kill or destroy them, if they cannot otherwise be taken.”

Two years later, Queens County was thrown into an uproar by the slaying of William Hallett Jr., a prominent landowner and self-styled “gentleman” whose plantation bordered Hallett’s Cove in present-day Astoria. Hallett, it seems, had tried to stop his slaves “from going abroad on the Sabbath days.” In retaliation, an Indian slave named Sam and his African wife murdered Hallett, Hallett’s wife, and their five children. The culprits were quickly seized, convicted, and executed on the plains east of Jamaica. Sam was impaled and hung in chains. His wife was burned alive. Two other black men were executed as accessories. A witness reported the four “were put to all the torment possible for a terror to others.”

The city got its first taste of servile rebellion in 1712—less than a year after the municipal slave market opened for business. One night in early April, two dozen slaves who, Governor Hunter reported, “had resolved to revenge themselves, for some hard usage, they apprehended to have received from their masters,” gathered in an orchard of Mr. Crook, “in the middle of the town.” According to John Sharpe, the Anglican chaplain, the majority were unchristianized Kormantines and Pawpaws from the Akan-Asante society of the Gold Coast—probably imported within the previous year or two (so much for the assumption that newcomers from Africa were more docile). They had pledged themselves to secrecy “by Sucking ye blood of each Others hands” and attempted to make themselves invulnerable by rubbing their clothes with a powder supplied by one Peter the Doctor, “a free negroe who pretends Sorcery.” Arming themselves from a secret cache of stolen muskets, swords, knives, and hatchets, the conspirators set fire to a nearby building and ambushed residents who rushed to put out the flames. Nine whites were shot or slashed to death before Governor Hunter raised the garrison and marched against them, but the rebels “made their retreat into the woods, by the favour of the night.” The next day, Hunter sealed off “the most proper places on the Island to prevent their escape,” then dispatched militia to “drive the island.” Hunted down, six of the conspirators cut their own throats (one man killing his wife and himself) rather than be captured. Seventy others were arrested and brought back for trial before a special court convened by the governor. Twenty-three were convicted of murder, two others of attempted murder. Twenty were hanged outright. Three were burned to death—among them Tom, a bondsman of Nicholas Roosevelt, who was condemned to roast over a slow fire “in Torment for Eight or ten hours & Continue burning in the said fire untill he be dead and Consumed to Ashes.” Another, named Robin, was sentenced “to be hung up in chains alive and so to continue without any sustenance untill he be dead.” Still another, named Clause, was “broke alive upon a wheel.” Spread-eagled and fastened face upward on a wheel, he was laid flat on the ground in front of City Hall. A Dutch sailor (who said he’d seen the thing done in Rotterdam and knew how to go about it) then took a crowbar and over a period of many hours smashed the bones in Clause’s body, one by one, stopping now and again for refreshment at Jan Peterson’s Broad Street tavern. Clause finally expired at two o’clock the next morning, having suffered, as had the others, what Hunter assured the

Lords of Trade were “the most exemplary punishments that could be possibly thought of.”

In the wake of the trials the Common Council ordered that no slave could travel about the city after dark without a lantern. (Elias Neau, the SPG catechist, was widely blamed for sowing discontent among the city’s slaves; the new lantern law was in part an attempt to cut attendance at his school, which held classes only at night.) The Assembly drafted a tough new slave code. Among other things, the law made manumission almost prohibitively expensive for masters and stipulated that no freed slave could henceforth own a house or land in the colony. But this merely codified the status quo. By the early eighteenth century very few free blacks remained on Manhattan; most of them lived on the fringes of the city on land granted them or their forebears by the Dutch West India Company.

The real legacy of the 1712 uprising was a new era of routinized brutality and official cynicism toward slaves. Crowds of townsfolk often gathered now to watch slaves hanged or burned to death for one offense or another. A slave girl named Rose was arrested “foar Damning the White Peoples Throats and Yours too (Speaking to a White Woman) and divers other Vile Expressions against the White People”; the magistrates gave her nine lashes at the whipping post, had her tied to a cart and dragged around town, gave her thirty-nine more lashes for good measure “on the Naked Back,” and then transported her to another colony. And when John van Zandt horsewhipped his slave to death in 1735 for being on the streets at night, an all-white coroner’s jury found that the “Correction given by the Master was not the Cause of his Death, but that it was by the Visitation of God.”

Recession, Revival, and Rebellion

By 1730, even as municipal officials prepared to receive the new city charter, New York was sliding into a deep recession. Part of the problem was that cheap flour from Pennsylvania had cut into New York's share of the West Indian trade. Merchants and farmers, now heavily reliant on wheat production, responded by cutting prices—then expanded output in order to maintain their profits, glutting the market and driving prices still lower. At the same time, climaxing years of overproduction on West Indian plantations, the price of brown sugar at the London Custom House fell off sharply. Pressed by their creditors, numerous planters failed, and those who didn't fail retrenched. Trade between the islands and the mainland colonies slumped for the first time in nearly two decades, then sagged further still when the Molasses Act of 1733 took effect. Being part of an international commercial network, it was clear, could bring severe dislocations as well as create opportunities. An alarmed Lieutenant Governor George Clarke advised New Yorkers to consider manufactures as the solution to their dilemma. "The markets for your flour, the present staple of the Province, are already so much overdone by the great importations that are made of them from this and the other northern colonies," he warned, that unless New York could begin to produce goods "that are wanted in Great Britain" (and didn't interfere with British manufactures), then soon "there will be no way to employ the people to any advantage."

In New York, the ramifications of the recession were multiplying quickly by the mid-1730s and continued for the remainder of the decade. The city offered "nothing but the melancholy Scene of little Business, and less Money," it was reported in 1732. Shipyards languished; by 1734 only one or two vessels were under construction, and the governor was seeking ways to "give life to the expiring hopes of ship carpenters." Indeed everyone whose livelihood depended on overseas trade was in trouble. "The Baker, the Brewer, the Smith, the Carpenter, the Ship-Wright, the Boat-Man, the Farmer, and the Shopkeeper"—all were suffering, "John Scheme" wrote to the *New-York Weekly journal* in 1734. Many residents had been forced "to seek Other Habitations so that in these three Years there has been above 300

Persons who have left New York.” Sailors were hit hard as the town’s merchant fleet, 124 ships strong in 1700, shrank to fifty in 1734. Residents wondered how the prosperity of the previous decade could have ended so quickly. As one poetically inclined writer asked in the pages of the *New-York Gazette* in 1733: “Pray tell me the cause of trade so dead, / Why shops are shut up, goods and owners fled, / And industrious families cannot get bread?”

Disease made matters worse. Epidemics of measles and smallpox claimed 549 victims, some 6 percent of the population, before running their course at the end of 1732. “Many Children dye . . . and the Country People are afraid to come to Town which makes Markets thin, Provisions dear, and deadens all Trade, and it goes very hard with the Poor.” Between 1731 and 1735, almost four hundred people required public assistance—twice as many as a decade earlier—while the poor rate soared to £649 (although the churchwardens and vestrymen were unwilling to raise taxes to support able-bodied artisans out of work). Prosecutions for larceny, fencing stolen goods, and prostitution rose swiftly, accompanied by a skittish clamor for a new jail and a better watch. Courts imposed increasingly severe exemplary punishments, and the municipal gallows were moved up to the Common to accommodate larger crowds.

Hard times increased racial animosities. In 1737 Lieutenant Governor Clarke received petitions from skilled craftsmen who “complain with too much reason of the pernicious custom of breeding slaves to trades. The honest and industrious tradesmen are reduced to poverty for want of employ” and must “seek their living in other countries.” For this too Clarke had a solution. New York, he said, needed to be “replenished with white people” and made an all-white city. But white outmigration continued, the flow of white immigrants fell off, and the city—its economy and society now hooked on slavery—continued to import African slaves. By 1741 nearly one in five New Yorkers would be black.

THE PARTY OF THE PEOPLE

In the summer of 1731 Governor John Montgomerie died unexpectedly. His replacement was William Cosby, formerly governor of Minorca, who regarded his appointment as an invitation to gorge at the public table. No sooner had he reached New York in 1732 than he forced the Assembly to

give him a “present” of a thousand pounds and sued Rip Van Dam, president of the council, for half the salary that Van Dam had collected as acting governor in the months since Montgomerie’s death. Van Dam’s lawyers, William Smith and James Alexander, persuaded Chief Justice Lewis Morris to throw out the governor’s suit, over the objections of Associate Justices James De Lancey and Frederick Philipse. Cosby, in a rage, kicked Morris off the bench and named De Lancey to be chief justice instead.

This was no routine dispute over political spoils. Nor was it the usual dispute over who should pay the bulk of the tax burden—the gentlemen of New York’s mercantile interest (who advocated a tax on land and were now in favor) or those of the landed interest (who championed a tax on imports and were now out). Cosby was a protege of the duke of Newcastle, a great Whig nobleman, secretary of state, and staunch ally of Robert Walpole—the canniest and most controversial politician of the era.

During the 1720s, as lord of the treasury and chancellor of the exchequer, Walpole had acquired such influence over both cabinet and Parliament that he became known as the “prime” minister, Britain’s first. He also earned the implacable hatred of “country party” Tories and old-fashioned True Whig “commonwealthmen.” Despite their differences, they were unanimous in the belief that Walpole’s lavish use of patronage had corrupted Parliament, the last bastion of English liberty, and infected the nation with avarice, speculation, luxury, and sloth.

By 1730 attacks on Walpole permeated British literature and public discourse. John Trenchard and Thomas Gordon, two radical libertarians, won renown for their savaging of Walpole in *The Independent Whig* (1720) and *Cato’s Letters*, a series of essays that first appeared in the *London Journal* (1720-22) and were widely reprinted in the colonies. At the other extreme of the political spectrum stood the *Craftsman* (1726-76), in which Bolingbroke, William Pulteney, and other Tories flayed Walpole as the “man of craft” who had driven the country to the brink of moral and political ruin. When Walpole proposed a new excise on wine and tobacco in 1733, angry crowds thronged the streets of London chanting “No slavery, no excise!” and— *The Craftsman’s* motto—“King George, Liberty, and Law!”

The gentlemen of the landed interest in New York, who knew all about the ties between Walpole, Newcastle, and Cosby, decided that Cosby's venality possessed a deeper, more sinister meaning than first met the eye—that its real purpose was to accelerate the subversion of English liberty by exporting ministerial corruption to America. Their response was to reach out for public support, drawing upon the full range of anti Walpole “opposition” rhetoric. By the spring of 1733, against a background of epidemic disease and the most serious economic depression in the town's history, the stage was set for New York's first broad-based political confrontation in decades.

The struggle began in Westchester County, where Morris mounted a campaign against the Philipses for possession of a vacant Assembly seat. When the polls opened in the village of Eastchester on the appointed day in October, hundreds of Morris's supporters, many on horseback, converged on the village green behind “two Trumpeters and 3 Violines” and a banner emblazoned with the motto of the *Craftsman*: KING GEORGE on one side, LIBERTY & LAW on the other. After circling the green three times, they retired for refreshments supplied by Morris and his friends. Morris's rival, a schoolmaster appointed by the Society for the Propagation of the Gospel, then made his appearance, escorted by Frederick Philipse, James De Lancey, and nearly two hundred horsemen. They paraded twice around the green and likewise trooped off for refreshment. The high sheriff, “finely mounted” in the scarlet and silver regalia of his office, then summoned the electors back to the green and began to record their votes.

Morris won handily and returned to New York City, where his supporters had just arranged for William Bradford's former apprentice, John Peter Zenger, to launch a new newspaper in opposition to Bradford's semiofficial *Gazette*. The Morrisites hoped to crack the government's virtual monopoly on the dissemination of information and to create a means for mobilizing the city's artisans, shopkeepers, and laborers.

Zenger's *Weekly Journal* proceeded to belabor Governor Cosby and his circle for “tyrannically flouting the laws of England and New York and . . . setting up personal henchmen with unlawful powers to control the judicial system of New York.” Over the next year the Morrisites, billing themselves as “the party of the people,” widened their popular appeal by calling for the adoption of electoral procedures already in place in Boston and

Philadelphia: annual or triennial Assembly elections, the reapportionment of that body to reflect population growth, and adoption of the secret ballot (which would allow ordinary people to vote “for the Man they Love, and not for the haughty Tyrant they fear, and consequently hate”). They further proposed that mayors, sheriffs, and other officials be popularly elected and that judges be appointed during good behavior, protecting them from gubernatorial whim. They promised the city’s artisans to build a permanent almshouse (a project that would promote employment). They also pledged to issue paper money for the construction of fortifications (yet another public works project that would have the additional benefit of easing credit, bringing down interest rates, and affording relief to debtors).

The Morrisites swept the hotly contested municipal elections of September 1734, capturing control of the Common Council. Laboring New Yorkers voted for the upperclass candidates who most convincingly claimed to be favorable to their interest. But they elected men of their own kind as well. Among the popular party’s councilmen that year were a painter, three bakers, a bricklayer, and a bolter—“the meanest labourers, tradesmen and Artificers” in town, Cosby sniffed. At no time since the suppression of the Leislerians a generation earlier had working people been so actively engaged in city politics, or so successful.

THE CASE OF THE POOR PRINTER

Nor had political rhetoric been more strident. Week after week, Zenger’s *Weekly Journal* lashed Cosby for incompetence, influence peddling, corruption, collusion with the French, election fraud, and tyranny. His confederates were sycophantic politicians, rich merchants, “people in Exalted Stations,” and haughty “courtiers” who regarded their opponents as “*Canaille* or Dregs of the People.” By contrast, the “industrious poor” who backed Morris were truly “the support of any country.” Writers named “Timothy Wheelwright” and “John Chisel” urged honest working men—men like “Shuttle” the weaver, “Plane” the joiner, “Drive” the carter, “Mortar” the mason, and “Tar” the mariner—to defend their “rights and liberties” from “Gripe” the merchant, “Squeeze” the shopkeeper, and “Spintext and Quible” the lawyers. To be sure that his readers would see all this in its wider, British frame of reference, Zenger also reprinted essays from the *Craftsman* as well as lengthy excerpts from *Cato’s Letters*.

Stylistically, too, the *Journal* imitated the *Craftsman* by treating its readers to the same outrageous lampoons, brutal caricatures, mocking ballads, and double-entendre advertisements that had delighted the denizens of London's coffeehouses year after year.

The *Gazette* labored to respond in kind. It attributed the *Weekly Journal* to "a parcel of griping lawyers" who had failed to receive the patronage they hoped for from the governor. It reprinted selections from the standard English defenses of the established order and itemized the *journal's* not infrequent errors of omission and commission. Others in the gubernatorial party issued pamphlets denouncing Morrisite appeals to "unthinking" people who were "of no Credit or Reputation, rak'd out of Bawdy-Houses and Kennels."

Soon, however, Cosby and De Lancey tired of bandying words and resolved to silence the *Journal* by force. De Lancey asked a grand jury to indict Zenger for two "scandalous" songs published after the "popular" party's victory in the 1734 elections. The jurors balked, claiming they couldn't confirm the printer's identity. Cosby then ordered the sheriff to arrest Zenger for "seditious libel" and burn four especially offensive issues of his paper. Both the Assembly and Common Council objected, to no avail. Zenger went to jail in mid-November 1734. De Lancey set his bail at a preposterously high four hundred pounds, which not only ensured that the printer would remain behind bars until the end of his trial, eight months later, but also enabled the Morrisites to portray him as a martyr to the cause of liberty. James Alexander and William Smith (both of whom bore some responsibility for getting Zenger into trouble in the first place) began to prepare his defense.

In April 1735, Smith and Alexander made their first move on Zenger's behalf by challenging the legality of Cosby's commissions to De Lancey and Philipse. De Lancey found them in contempt, ordered them disbarred, and assigned John Chambers, a skilled attorney but one of Cosby's men, to represent Zenger instead. Shrewdly, Alexander then enlisted the help of Andrew Hamilton of Philadelphia—the best trial attorney in the colonies. Hamilton's decision to participate in Zenger's defense changed everything.

Zenger's trial began in August 1735. Hamilton's strategy, from a strictly legal point of view, was extremely risky. As the English common law then stood, "seditious libel" meant simply the publication of any material

undermining the authority of government. The truth or falsity of such material was irrelevant; juries were to determine only whether, as charged, it had been made public and referred to the persons or institutions in question. Hamilton conceded that Zenger's articles were malicious, seditious, and scandalous—which should have ended the matter then and there. But in a dazzling appeal to “reason” and “natural rights,” Hamilton argued that truth must be accepted as a defense against the charge of libel. What was at stake, he told the jury, was nothing less than the right of a free people to criticize their rulers. “It is not the cause of a poor printer, nor of New York alone, which you are now trying. No! It may in its consequences affect every freeman that lives under a British government on the main of America. It is the best cause. It is the cause of liberty.”

The New-York Weekly Journal, December 17, 1783. Ten months after it appeared, this issue was burned by order of

Cosby and the provincial council. (© Collection of The New-York Historical Society)

Hamilton's oratory carried the day. Despite De Lancey's insistence that they stick to the law, the jurors took only minutes to acquit Zenger of all the charges against him. The crowded courtroom burst into cheers, and the jubilant Morrisites marched the Philadelphia lawyer off to the Black Horse Tavern (at what is now the corner of William Street and Exchange Place) for a feast. Shortly thereafter, the Common Council hailed Hamilton for "his learned and generous defense of the rights of mankind, and the liberty of the press" and made him a freeman of the corporation. Additional plaudits followed as word of the verdict percolated throughout the Anglo-American world, moved along by James Alexander's *Brief Narrative of the Case and Trial of John Peter Zenger*, which came off Zenger's press in 1736. Often reprinted on both sides of the Atlantic, it was probably the most famous book yet published in America.

No one imagined that Zenger's acquittal set a legal precedent for the elimination of restrictions on the press—it was an instance of jury nullification, not a judicial opinion—and indeed decades would pass before printers in either America or Great Britain were safe from official scrutiny. What made the case so significant to contemporaries, rather, was that it sent a clear warning to judges and prosecutors that the law of libel was out of step with popular sentiment and that they could no longer rely on juries to shield government from public censure. In doing so, moreover, the Zenger verdict endorsed assumptions about relations between "the people" and their rulers long familiar to readers of *Cato's Letters* or the *Craftsman*—that executive power tends to expand at the expense of liberty, and that to protect themselves, freemen must be able to speak their minds without fear of official retribution.

"SUCH A STRUGLE I NEVER SAW"

Although the Morrisites had won an important skirmish, the war still raged. Governor Cosby died of tuberculosis in 1736, and George Clarke, one of the richest men in New York, was installed as acting lieutenant governor. Clarke dissolved the Assembly, issuing writs for new elections in 1737, and the Morrisites embarked on what Cadwallader Golden remembered as one of the city's wildest campaigns on record. On election day, "the sick, the

lame, and the blind were all carried to vote,” Golden said. “Such a struggle I never saw and such a hurraing that above one half of the men in town are so hoarse that they cannot speak.” Morris and the popular party won handily. Lewis Morris Jr., who with his father swept to victory in Westchester, was chosen speaker of the new Assembly. John Peter Zenger got the nod as official printer.

Clarke now discovered, however, that if the Morrisites couldn’t be beaten, their leaders could be bought off. He won over Smith and Alexander by having them reinstated to the bar, he endorsed a few Morrisite reforms (including a one-year revenue bill and a triennial election act), and he appointed key Morrisites to public offices in Westchester and other counties. Morris himself accepted an offer from Newcastle to become the royal governor of New Jersey and promptly turned into an advocate of executive authority—which only proved, as Walpole liked to say, that every man has his price. Abandoned by its founders, the “popular party” fell into disarray, and when prosperity returned, it disappeared altogether.

The Morrisites had nonetheless opened the door to a new and potentially more turbulent political environment in the city. The freemen had returned to politics, books and newspapers were full of talk about threats to “liberty,” and gentlemen—as one assemblyman put it—increasingly had to think of public office as “a fine laced Livery coat of which the vain Lacquey may be stript at the pleasure of his proud Master [i.e., the electorate] & may be kikt out of Doors naked.”

What was more, the Morrisites had actually delivered on some campaign promises, establishing yet another precedent. To alleviate the shortage of specie and attendant high interest rates, they issued twelve thousand pounds of paper money in 1734 and added another £48,350 three years later, to repair “the Decay of Trade & other Difficulties which this Colony has the Misfortune to have Laboured Under.” In 1737 the first Assembly elected in the colony in a decade remodeled the militia, agreed to hold triennial elections, and reduced the legal interest rate.

The Morrisites also made good on their promise to construct New York’s first permanent almshouse. Completed in 1736, the two-story stone and brick building stood on the Common at the very outskirts of town (the northern end of what is now City Hall Park). Although a boon to its contractors, it was greeted with considerably less joy by those for whom it

was intended. Really three institutions under one roof—a Poorhouse, a Workhouse, and a House of Correction—its inmates were a cross-section of the city’s lower classes, ranging from “Poor Needy Persons and Idle Wandering Vagabonds” to “Sturdy Beggars,” petty criminals, rogues, and “parents of Bastard Children.” All inhabitants of the city had “free Liberty and Lycence to send to the said House all unruly and ungovernable Servants and Slaves there to be kept at hard labour.” Despite rudimentary attempts to separate them—one basement room was reserved for the inmates at forced labor, another for those considered “unruly”—the vestrymen were soon expressing concern at mixing the elderly sick with incorrigible rogues.

Whatever the reasons for their confinement, all inmates were held, insofar as possible, to a strict daily regimen calculated to teach them self-discipline, industry, and deference. Inmates were supplied clothing “marked with the first letters of their names,” deprived of meals if they refused to attend prayer sessions, and set to work carding wool, shredding old rope for reuse, or raising garden crops. The idea, according to the Common Council, was that “such Poor as are able to work, may not Eat the Bread of Sloth & Idleness, and be a Burthen to the Publick.” Inmates who learned “decorum” and exhibited a “bashful, modest, humble, and patient temper” would be “encouraged and comforted”; “troublesome and discontented” inmates would get a “moderate whipping.”

The rigid order imposed on inmates of the almshouse was quite different from what the poor experienced when they were lodged in rented private dwellings. This might explain why the new institution drew only nineteen people its first year (twelve adults and seven children) and why some inmates, though prohibited from leaving without permission, fled at the return of clement weather—only to come back “almost naked,” as the Common Council complained in 1738, when winter again approached.

Once the almshouse was in operation, moreover, the city drastically slashed outdoor relief—the traditional system of granting aid to the poor in their own homes. By 1747 it had been all but eliminated, and the gulf between those who enjoyed the privileges of membership in the municipal corporation and those who didn’t was wider than ever.

“GETHSEMANE! GETHSEMANE!”

The transformation of public life in New York received further impetus during the depression from that outpouring of piety known as the Great Awakening. Linkages between politics and evangelical religion were nothing new. Nearly two decades had now passed since Theodore Frelinghuysen began drawing on the pools of Leislerian resentment that still lay under the Dutch churches in the Raritan Valley. In the mid-1720s William Smith (Zenger's sometime attorney) and Gilbert Livingston led a faction within the New York Presbyterian Church that struggled against clerical orthodoxy and managed the installation of the Rev. Ebenezer Pemberton as pastor.

After 1710, moreover, Baptists began gaining ground among the city's laboring population when the Rev. Valentine Wightman came down from Groton, Connecticut, to preach. Wightman kept a low profile, speaking only at private homes and performing baptisms by night, until several converts, disdaining further subterfuge, demanded daylight baptism. Governor Hunter offered his protection and even went to the waterfront to watch, accompanied by other gentlemen. By 1715 Baptists in the city were meeting at the Broad Street home of a brewer named Nicholas Eyres. In 1724 the Baptist Church was formally organized and moved into a new building atop Golden Hill, along what is now Cliff Street (near John).

Enter now George Whitefield, a young preacher from Oxford University who had been closely associated with Charles and John Wesley in the budding Methodist movement. Whitefield was an unusually talented orator and within a few years after his graduation in 1736 became renowned in England for his attacks on clerical laxity as well as for his ability to awaken the slumbering religious fervor of popular audiences. So large were the crowds that flocked to hear him—and so hostile were the established clergy to his speaking in their churches—that Whitefield took to preaching outdoors, a practice that soon became his trademark.

In the summer of 1739, aware that many of his printed sermons had already aroused great interest in America, Whitefield crossed the Atlantic for a tour of the colonies. His first stop was Philadelphia, where he spoke to excited multitudes of as many as six thousand people. In mid-November he went up to New York, staying at the home of William Smith, the prominent Presbyterian layman. Seeking a pulpit from which to speak, Whitefield approached the Rev. William Vesey, now in his forty-fifth year as rector of

Trinity and more doggedly conservative than ever. Vesey refused the use of his church, charging Whitefield with various violations of canon law (to which Whitefield replied that the aging cleric spent too much time in the taverns). Faithful to the arrangement struck years before with the Anglicans, Dominie Henricus Boel likewise refused to let Whitefield speak in the Dutch Reformed church. Whitefield had his sympathizers, however, and when the Rev. Ebenezer Pemberton granted him permission to use the Presbyterian church, everything was in place for a dramatic confrontation between the Awakeners and their critics.

On the afternoon of November 15, Whitefield launched his New York tour with an open-air prayer meeting in the Common. His theme was the need for a “New Birth”—a reawakening of the faith without which there can be no salvation. According to a newspaper account probably written by Pemberton, “many Hundreds of People” turned out to hear him. Most were “very serious and attentive,” but a fair number of hecklers also gathered on the fringes of the crowd, “Giggling, Scoffing, Talking and Laughing.” Whitefield faced them down, delivered a blistering attack on “the boldness and Zeal with which the Devil’s Vassals serve him,” and left the entire crowd “hush’d and still,” their faces glowing with “solemn Awe and Reverence.”

Pemberton was hard-pressed for words to describe what had taken place. “A mighty Energy attended the Word,” he said. “I heard and felt something astonishing and surprizing.” So, evidently, had many others. Over two thousand people jammed into the Presbyterian church that evening, during which an awed Pemberton reported, “The Peoples Eyes and Ears hung on his Lips. They greedily devour’d every Word. I came Home astonished!”

Whitefield continued for four days, speaking at least twice a day, afternoons in the Common and evenings in the Presbyterian church. Despite chilly weather, the crowds grew ever larger and more emotional. People who couldn’t find a seat or get close enough to hear him wept openly with disappointment. One member of the audience, finding himself seated next to a lady who sobbed loudly through the entire service, later asked “which part of the sermon had most particularly affected her.” “Oh! Sir,” she told him, “it was when he said *Gethsemane! Gethsemane!*” Whitefield himself wrote in his journal that “the people seemed exceedingly attentive, and I have not felt greater freedom in preaching, and more power in prayer, since

I came to America, than I have had here in New York. I find that little of the work of God has been seen in it for many years.”

It was the same story when he returned the following year, once in the spring and again in the autumn. Five, six, and seven thousand people at a time allegedly thronged the Common to hear him speak, now from a specially constructed scaffold. New York—polyglot, urbane, skeptical New York—appeared to be in the throes of a full-scale religious revival.

Whitefield was probably tapping the same vein of popular restiveness mined by the Morrisites just a few years earlier. His chief targets—complacent and even corrupt leaders, a loss of old-time zeal, indifference to basic principles, the advent of a heartless, legalistic formalism—echoed almost exactly, albeit with a religious rather than political vocabulary, the opposition to Cosby. If there was a difference it lay in the breadth of Whitefield’s audience/The crowds that flocked to hear him in 1739-40 included numerous representatives of the city’s lower classes—apprentices and laborers, the poor and the enslaved—whose exclusion from the municipal corporation rendered them invisible to the Morrisites. During his 1740 tour, indeed, Whitefield had called openly for the humane treatment of slaves and for instructing them in the Christian religion, issues that had never troubled Morris (one of the city’s leading slaveowners) or his followers.

Leaders of New York’s Anglican-Reformed establishment were horrified. As one conservative Dutch dominie declared in 1741, Whitefield’s attacks on the sincerity of the orthodox clergy struck at the authority of all organized religion. A “spirit of confusion is ever blazing up more and more,” he wrote. Many went further and insisted that the revivalists had called into question the authority of all institutions—a not unreasonable fear, it turned out, for only months after Whitefield’s last visit, it appeared that scores of slaves and poor whites had banded together in a frightful plot to burn the city.

“G—D D——N ALL THE WHITE PEOPLE”

On March 18, 1741, the soldiers of Fort George—Irish and non-Irish alike—were recuperating in the barracks from their hearty celebration of the Feast of St. Patrick the day before. The garrison was undermanned as well

as under the weather, for the Empire was at war again. In the autumn of 1739, after years of heavy losses to Spanish privateers, West Indian planters demanded action from London. Walpole wanted to avoid costly foreign conflicts, but Pulteney roused Parliament to a declaration of war by waving around the pickled ear of one Captain Robert Jenkins—cut off, it was said, by an arrogant Spaniard who told him to give it to King George as a warning. The so-called War of Jenkins' Ear reached New York during the summer of 1740, when an expedition of six hundred troops left the city for an assault on Cuba. Now, six months later, only a relative handful remained on Manhattan.

Shortly after noon on the eighteenth, smoke and flames poured from the governor's house; soon the adjoining chapel was ablaze as well. A bucket brigade and the town's recently purchased hand-pump fire engines failed to control the wind-whipped flames, and by late afternoon the Fort's buildings were in cinders. Precisely a week later, on March 25, another fire broke out, at the home of Captain Peter Warren, brother-in-law of Chief Justice De Lancey, but this one was successfully contained. Another week passed, and then another fire incinerated Winant van Zant's warehouse near the East River docks on April 1; astonishingly, given its contents of hay, fir, and pine, this conflagration too was kept from spreading farther. Three days later fire flared again, this time at a Maiden Lane cow stable filled with dried fodder. On the following day a passerby sniffed smoke and discovered coals burning at the base of a haystack in attorney Joseph Murray's stables on lower Broadway, just in time to prevent the wealthy neighborhood from going up in flames.

Fires were common in the mid-eighteenth century, so the first catastrophe had aroused few suspicions. But as the number of incidents mounted, so did the conviction that they were the product not of accident but of arson. Perhaps (one council member hypothesized) "a combination of villains" was creating diversions, under cover of which they could make "a prey of their neighbor's goods." Most white residents suspected the slaves, however. All New York had heard about the massive uprising that had rocked Stono, South Carolina, in September 1739 and of the ongoing disturbances in that colony that culminated, in November 1740, in an apparent attempt to destroy Charleston by fire.

Then *another* round of fires broke out on April 6—four in one day. A black man was spotted near one of them, running. A white tried to catch him, yelling, “A negro, a negro.” The cry, swiftly taken up, soon turned into terrified screams of “The negroes are rising”! The man seen running—Adolph Philipse’s slave Cuffee—was quickly captured and incarcerated. This did nothing to quiet the hysteria. Crowds of white vigilantes rounded up more blacks and threw them in jail with Cuffee.

Although the City Council launched an intensive investigation, two weeks of examining the blacks in custody and searching for evidence of arson yielded nothing except increased anxiety among the white townspeople. The council now turned the inquiry over to Daniel Horsmanden. Horsmanden was the city’s recorder as well as a justice on the supreme court of the province (a position he had gained through loyalty to the late Governor Cosby). Horsmanden, who had long believed that New York was far too lax in its handling of slaves, set out to track down the conspirators he was sure were behind the fires.

A special grand jury was convened and directed to investigate whites who sold liquor to blacks—men like tavern keeper John Hughson. A poor and illiterate cobbler from Yonkers, Hughson had come down to New York in the mid-1730s with his wife, Sarah, his daughter, and his mother-in-law. Unable to find employment, he opened a tavern on the East River waterfront that “very much offended his neighbors” by catering to a disreputable clientele. This was at the height of the Morris-Cosby struggle, and according to a number of witnesses, Hughson soon became convinced that “the country was not good,” that there were “too many gentlemen” in the city, that they “made negroes work hard.” Some even said he had urged slaves to burn the town and kill their masters.

In 1738 Hughson opened a new tavern on the Hudson River waterfront, not far from the Trinity churchyard. This establishment, like its predecessor, acquired immediate notoriety as a rendezvous for slaves, free blacks, poor whites, soldiers from the nearby fort, and even (as rumor had it) the occasional “young gentleman” inclined to after-hours carousing and gaming. (In the winter of 1740–41, after constables raided his tavern, Hughson had been convicted of illegally “entertaining Negro slaves” but let off as a first offender.) Hughson’s also became the residence of one “Margaret Sorubiero, alias Salingburgh, alias Kerry, commonly called

Peggy, or the Newfoundland Irish beauty,” said to be a prostitute “of the worst sort, a prostitute to negroes.” Her room and board was paid by a slave of baker John Vaarck, named Caesar, by whom Peggy had recently had a child.

Hughson also fenced stolen property. He got to be so well known in this line of work that city slaves laughingly referred to his place as “Oswego,” after the Indian trading post on Lake Ontario. Although the constables had their eye on him, they had as yet failed to catch him red-handed. Nor had they caught John Romme, a publican-shoemaker and friend of Hughson’s whose tavern stood on the Battery near Fort George. Like Hughson, Romme trafficked in stolen goods—protected, perhaps, by his kinship with a member of the Common Council and connections in the right places. Yet he too had been heard to speak bitterly of “how well the rich people at this place lived” and likewise advised slaves to “burn the houses of them that have the most money, and kill them all, as the negroes would have done their masters and mistresses formerly”—an obvious allusion to the abortive 1712 uprising.

Two weeks before the fire in the fort, Hughson had been arrested for receiving goods stolen by Caesar and Prince (slave of merchant John Auboyneau) from Rebecca Hogg’s general store on Broad Street. The crime came unraveled when on March 3 the Hughsons’ sixteen-year-old indentured servant, Mary Burton, had been enticed to give evidence against John, Sarah, and Peggy by a promise to free her from her indenture.

Caesar and Prince were arrested—and not for the first time. The two, along with Cuffee, had been caught stealing barrels of Geneva (Dutch gin) back in 1736 and denounced as “the ringleaders of a confederacy of negroes who robbed, pilfered and stole whenever they had opportunity.” Caesar and Prince had faced the death penalty then—burglary committed by slaves was a capital crime—but had been let off with a public whipping. They had carried on, however, boldly assuming the name “Geneva Club.” (According to one observer they had even had the “impudence to assume the style and title of Free Masons, in imitation of a society here: which was looked upon to be a gross affront to the provincial grand master and gentlemen of the fraternity. . . and was very ill accepted.”) Caesar languished in jail; the Hughsons and Prince were freed on bail; and all were awaiting trial on burglary-related charges when the fires started.

Horsmanden's grand jury now called Mary Burton to testify. She confirmed her earlier account of the Hogg burglary but refused to talk about the fires. When ordered jailed for contempt, however, she quickly agreed to cooperate and proceeded to describe what she said was a conspiracy between slaves and poor whites to burn the city. To Horsmanden's delight, Burton declared that the three Geneva Club members had met frequently at Hughson's, that they had often talked of burning the fort and town, and that the Hughsons had agreed to help. Though Burton's testimony didn't prove that a crime had actually been committed, it did constitute evidence of criminal conspiracy. Seeking additional corroboration, the Common Council posted rewards for anyone coming forward with information about the fires—one hundred pounds to whites (an amount equal to at least five years' wages for anyone lucky enough to be working steadily during the hard times), forty-five pounds to a free black or Indian, and, for a slave, twenty pounds plus freedom.

On May 1 the court found Caesar and Prince guilty of burglary and condemned them to death. The next day, just across the river in Hackensack, New Jersey, seven barns were set ablaze; two blacks were caught and immediately burned at the stake. On May 6 the Hughsons and Peggy were found guilty of receiving stolen goods, and Peggy, in fear of her life, decided to talk. So did some of the blacks crammed in the dungeons below City Hall. Two who didn't confess to anything were Caesar and Prince: on May 11 they were hanged for burglary. Caesar's corpse was then dangled from a platform near the city's powder house, on the little island between the two arms of the Fresh Water Pond.

Now, "witnesses" in hand and with the backing of the mayor, governor, and Common Council, Horsmanden proceeded to trial against Cuffee and Quack, a slave belonging to butcher John Roosevelt. He summoned all the town's lawyers and got each of them, including William Smith and James Alexander, to agree to assist Attorney General Richard Bradley with the prosecution. Eleven witnesses were called for the prosecution. They reported on conversations they'd overheard, such as the time Cuffee declared "that a great many people had too much, and others too little, that his old master"—Adolph Philipse, wealthy merchant, speaker of the Assembly, and prominent supporter of Governor Cosby—"had a great deal of money, but that, in a short time, he should have less." The defendants,

who had no legal counsel, called witnesses, including their owners, who offered at best limited support to avoid rousing the wrath of their neighbors. The jury returned a guilty verdict in minutes, and Horsmanden instantly pronounced sentence—death by fire the following day. Chained to the stake, faggots piled at their feet, Cuffee and Quack both confessed to burning the fort. They also began naming names, eventually accusing some fifty others of complicity. Horsmanden, thrilled, considered saving them as future witnesses. But the crowd was howling, and the sheriff said it would be unwise to stop. So, as Horsmanden later recounted, “the executions proceeded.” The two screaming men, having bought but a few extra hours of life, were soon engulfed in flames.

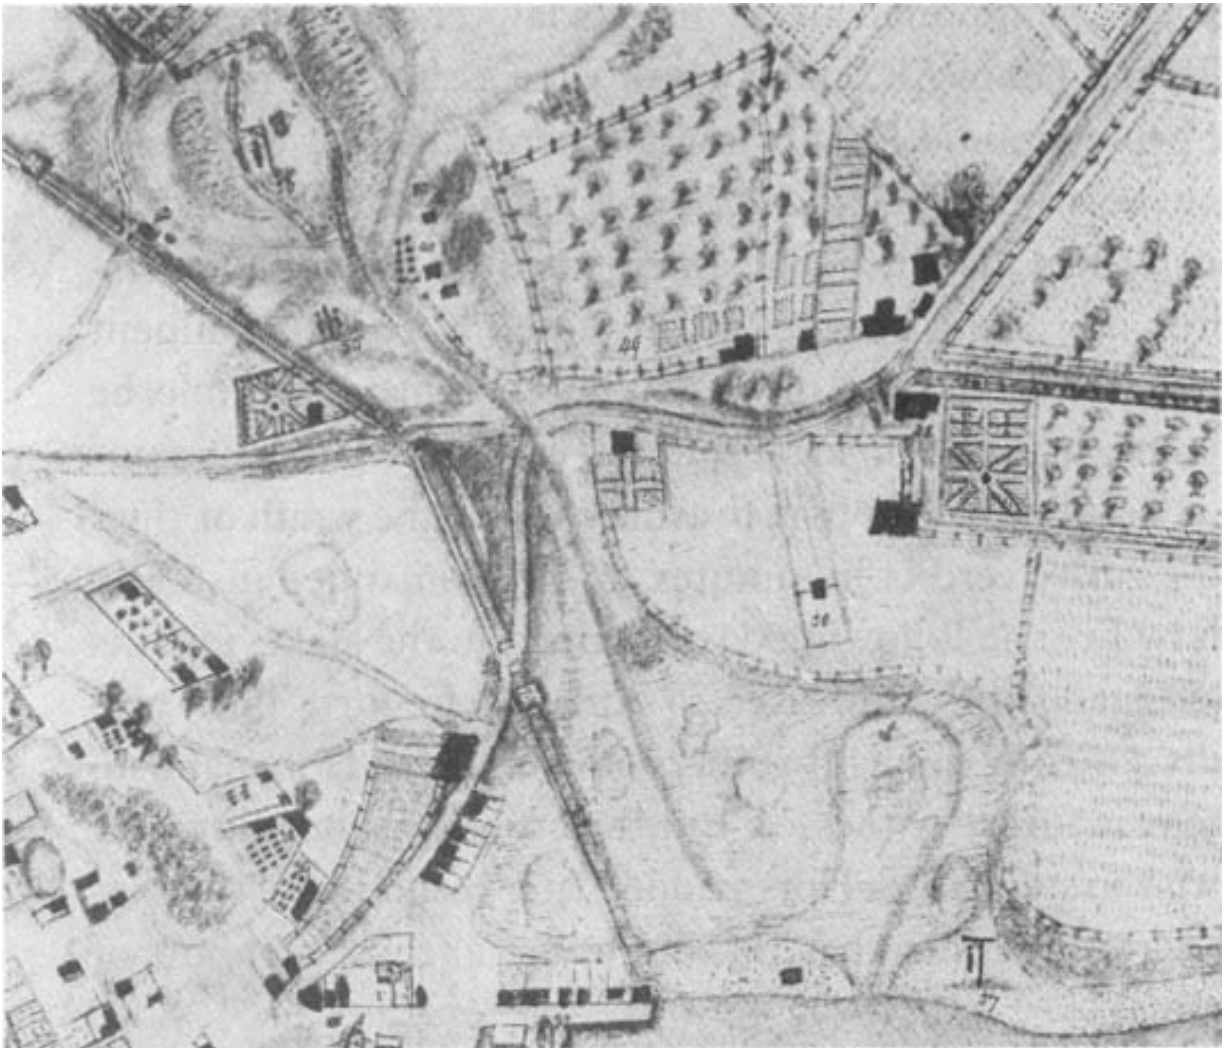

Trials followed quickly now. The Hughsons and Peggy were sentenced to hang, with John Hughson’s body to be suspended in chains next to Caesar’s rotting corpse. More verdicts, more burnings, more confessions, more verdicts. At the height of the hysteria, nearly half the city’s male slaves over sixteen years of age were in jail.

From Horsmanden’s point of view, however, something was still lacking: a white mastermind who could be held accountable for the whole diabolical conspiracy (given that Africans, in his view, clearly lacked the intelligence for such a scheme, and the illiterate Hughson didn’t quite fit the bill). As candidate for head conspirator, Horsmanden nominated John Ury. Only recently arrived in town, Ury had been working as a private tutor and schoolmaster. Because his expertise in Latin made him conspicuous around town, he now found himself under arrest on the suspicion of being a Roman Catholic priest and a secret agent of the Spanish. Arrested with Ury were several soldiers from the garrison—among them Peter Connolly, Edward Kelly, Edward Murphy, and Andrew Ryan—who were also suspected of being Catholics and conspirators. The everobliging Mary Burton now remembered that Ury, too, had been among the plotters at Hughson’s; William Kane, another of the soldiers, offered a corroborative confession.

Ury’s grand scheme, the prosecution now proposed, had been to have Hughson purchase arms and organize all participating slaves into two companies, the Long Bridge Boys and the Smith’s Fly Boys, who would set fire to the fort, slay their masters, and burn their homes. Led by Hughson and Caesar—the former as king, the latter as governor—they would hold the city until the arrival of Ury’s Catholic masters, the Spanish or French.

After that, the conspirators would divide up their booty and make their way to freedom.

During the unfortunate Ury's trial, a hysterical warning arrived from Governor Oglethorpe of Georgia, saying that Spanish agents were "preparing to burn all the magazines and considerable towns in the English North America" and that some were priests "who pretended to be physicians, dancing masters, and other such kinds of occupations." That sealed Ury's fate, and he too was dispatched to the gallows at the end of August.

Gallows of the 1741 conspirators. Note also the stake with flames on it. Detail of a map drawn from memory by David

Grim in 1813. (© Collection of The New-York Historical Society)

By then, all told, some 160 blacks and twenty-one whites had been arrested. Four whites—John Hughson, Sarah Hughson, Peggy Kerry, and John Ury—were hanged, as were seventeen blacks; one white, sentenced to be hanged, escaped. Thirteen Africans were burned at the stake. Seventy-two were subsequently banished from the colony, twenty-seven to the Portuguese island of Madeira, and most of the rest to colonies in the West Indies.

But had there in fact been a conspiracy? Certainly the autumn and winter of 1740-41, the time when Hughson, Romme, and the Geneva Club allegedly began planning a rebellion, had been a miserable period in the city. To the effects of years of depression were added dwindling supplies of fuel and food, the result of record snowfalls and the lowest temperatures in memory. By February 1741 the Hudson was a solid mass of ice all the way up to Poughkeepsie, and huge drifts blanketed the smaller houses and shacks that were home to New York's poorest inhabitants. Funds for the relief of the needy had already run out, and many were in imminent danger of freezing or starving to death. City bakers had gone on strike to protest what they considered the unfairly low price of bread set by the city. Zenger's *Weekly Journal* reported that their refusal to bake caused "some Disturbance, and reduced some, notwithstanding their Riches, to a sudden want of Bread." (Similar shortages had also led to rioting in Wales and England, the paper reported.)

Certainly the slaves were angry enough, particularly those forced to live apart from their spouses. Quack resented Lieutenant Governor Clarke for prohibiting him from visiting his wife, the governor's cook, and he had had several fights with the fort's sentry during repeated attempts to visit her. Quack might well have fired the governor's house, as he confessed to doing. And the sailors and soldiers in town, particularly the Irish, had grievances of their own. Private Edward Murphy reportedly said, "Damn me if I won't lend a hand to the fires as soon as anybody." Moreover, this milling, interracial discontent might well have been brought into sharp focus by the recent outbreak of war. By 1741 so few troops remained in Fort George, one slave reportedly said, that only "an hundred and fifty men

might take this city.” If the Spanish or French did come to their aid, they stood a reasonable chance of getting away with it.

The actual evidence, however, is less than convincing. John Hughson, Hughson’s wife, John Romme, and more than a few of the most important blacks denied to the very end that a conspiracy existed. Key witnesses against them—Mary Burton, Peggy Kerry, Hughson’s daughter, Sarah, an indentured servant named Arthur Price, the soldier William Kane—gave confused, frequently contradictory, and invariably self-serving testimony. Equally suspect were the sixty-odd “confessions” wrung out of terrorized slaves. Much of the trial testimony vital to the official conspiracy theory is likewise tainted. The presiding judges—Horsmanden, De Lancey, and Frederick Philipse—took pains to follow accepted rules of evidence and procedure. Yet none of the accused, slave or free, had legal representation. As a result, key witnesses weren’t cross-examined, obvious exculpatory evidence was ignored, and no alternative explanation of events was ever presented to the juries. Only Ury, the suspected Catholic priest, mounted anything like an informed and organized defense, explaining that he was just a dissenter from the Church of England and had no knowledge whatever of any conspiracy. Bradley and his assistants got a conviction by haranguing the jury on the dangers of Catholicism—a “hocus pocus, bloody religion,” cried Bradley—but Ury’s calm eloquence, first in the courtroom and then on the gallows, threw a shadow of doubt across the entire business.

So, in the end, did Mary Burton herself, by hinting that the conspiracy had involved “some people *in ruffles* (a phrase as was understood to mean persons of better fashion than ordinary).” Incredulous, the court demanded names, whereupon “she named several persons which she said she had seen at Hughson’s amongst the conspirators, talking of the conspiracy, who were engaged in it; amongst whom she mentioned several of known credit, fortunes and reputations, and of religious principles superior to a suspicion of being concerned in such detestable practices.” Knowing that the veracity of its star witness would crumble if Burton kept talking, the prosecution began to wrap up the proceedings soon after Ury’s execution. One who escaped the hangman as a result was Hughson’s friend John Romme. “The devil couldn’t hurt me,” he had boasted, “for I’ve a great many friends in town, and the best in the place’ll stand by me.” Although he was arrested in

New Jersey after fleeing to escape prosecution, the New York authorities made no attempt to bring him back.

If the official conspiracy theory cannot be taken at face value, that doesn't rule out the possibility of some less widespread or well-organized coup—by slaves against their masters, by the poor against the rich, or a combination of both. It's quite likely that Hughson and a number of slaves often speculated casually about their chances of getting away with some such project. Alternatively, Hughson and perhaps another half-dozen or so whites and blacks may have planned the rash of fires in February and March to cover up multiple burglaries.

Whether or not they had really planned an uprising, the mass of casual, incidental evidence—corroborative detail supplied in page after page of depositions, confessions, and trial testimony—makes it apparent that by 1741 New York's two-thousand-odd slaves had the organizational ingenuity and the political sophistication to do so. Over and over again, witnesses testified to the inability or unwillingness of their masters to keep them under close supervision. They regularly held clandestine meetings, passed long hours drinking, gaming, and dancing together away from the prying eyes of whites, easily got away with petty larceny and the small-scale destruction of property, and even managed to own weapons.

Conspiracy or no, moreover, the Geneva Club and its mock-Masonic rituals had been real enough. The existence of two paramilitary companies said to have been formed by the conspirators—the Long Bridge Boys and the Smith's Fly Boys—undoubtedly made perfect sense to prosecutors because they corresponded to groups or affiliations or divisions within slave society. Judging by reactions to the departure of the expedition to Cuba and the hopes of a Spanish or French attack, at least some slaves knew a good deal about international events and their ramifications for the city. Many clearly remembered or knew of the 1712 revolt, how it had been organized, and what came of it. A few had participated in revolts elsewhere; one was a veteran of risings on both St. John's and Antigua. No doubt some of them were ready for a revolt in New York too, despite the tremendous odds against success. "G—d d———n all the white people," one was said to have cried, "if he had it in his power, he would set them all on fire."

Prosecution of the alleged conspirators also disclosed the numerous points of contact and mutuality between the city's slaves and its burgeoning

population of poor whites. Witness after witness reported blacks and whites as partners in crime, partners in drink, partners in bed, partners in survival, partners in their contempt of the rich and well-born few who dressed in ruffles and ran the town—a vast, restless, interracial underworld.

One response by municipal authorities to these discoveries was to demand increased vigilance on the part of slaveowners. Another was to insist on closing down the sleazy disorderly houses whose owners, like Hughson, observed the “most wicked and pernicious practice . . . of entertaining negroes, and the scum and dregs of white people in conjunction.” Yet another was to accuse “Suspicious, Vagrant, Strolling Preachers” of stirring up the lower classes, especially “Youths and Negroes.” George Whitefield’s tumultuous revivals in 1739 and 1740 drew particular criticism in this regard. As one SPG missionary put it, Whitefield’s “impudence and indiscretion” in advocating the conversion of blacks to Christianity—still a very unpopular idea among slaveowners—gave “great countenance” to the plot. Even Ury was said to have blamed “all the disturbances” on “the great encouragement the negroes had received from Mr. Whitefield.”

But the ultimate response, one on which prosecutors often fell back in their final summations, was to drown out the noise of class conflict by beating the drums of racial hatred. Bradley berated city slaves as “silly unthinking creatures.” Horsmanden called them “cannibals.” Not only did they dare to think of killing white men, Smith ranted, but they intended to make white women the victims of their “rapacious lust” as well. “The monstrous ingratitude of this black tribe is what exceedingly aggravates their guilt,” he added. As for Hughson, he “could not be content to live by the gains of honest industry, but must be rich at the expense of the blood and ruin of his fellow citizens! miserable wretch!” His crimes “have made him blacker than a negro.”

It was indeed mysterious, Horsmanden reported, that the rotting cadavers of Hughson and Caesar, after hanging on the gibbet in the summer sun for several weeks, had changed color—the former becoming “a deep shining black, rather blacker than the negro placed by him, who was one of the darkest hue of his kind,” while the latter “somewhat bleached or turned whitish.” Crowds gathered to ponder the meaning of these “wonderous

phenomenons,” and “many of the spectators were ready to resolve them into miracles.”

Mindful that many slaves implicated in the “conspiracy” had come by way of the West Indies, white New Yorkers concluded they would be safer with chattel imported directly from Africa, a decision that in time would significantly alter the composition of the city’s servile population. The mass deportation of male slaves also helped transform the city’s gender balance. During the depression the outmigration of unemployed artisans and seamen had changed the sex ratio from 117 white men for every 100 white women in 1731 to 91:100 in 1731, then to 89:100 in 1741—producing a substantial excess of white women. At the same time, male-heavy slave imports had continued. While in 1731 there had been 99 black men for every 100 black women, by 1737 the ratio was 111:100, and by 1741 it was 119:100—a substantial excess of black men. Demographics like these, together with well-known sexual alliances between black men and white women, like that of Caesar and Peggy, had given rise during the hysteria to lurid fantasies of bondsmen seizing white mistresses. The post-hysteria shift in slaveholders’ preferences from males to females, together with the opposition of white male artisans to the use of skilled black labor, had by 1746 diminished black males to under 47 percent of the African population.

New York didn’t soon forget the “Great Negro Plot” of 1741. A printed version of Ury’s last words from the gallows was a standing reminder of the panic that had gripped the city, and it was rumored for years that Hughson’s ghost haunted his place of execution. When renewed political squabbling began to dissolve the united front forged by racial and religious fear, critics of the governor’s party hinted that Horsmanden had imagined the whole conspiracy and committed judicial murder. Stung by such rumors, he defended himself by writing a book. It appeared in 1744 bearing the unwieldy if accurate title of *A Journal of the Proceedings in the Detection of the Conspiracy Formed by Some White People, in Conjunction with Negro and other Slaves, for Burning the City of New-York in America, and Murdering the Inhabitants*.

War and Wealth

While New York recovered from the “Great Negro Plot,” the Anglo-Spanish war that began in 1739 grew wider. By 1743 both Prussia and France were fighting alongside Spain, and virtually all Europe and America had plunged into a conflict, at once dynastic and imperial, known to His Majesty’s American subjects as King George’s War. Peace returned in 1748, without a clear-cut victory for either side, and hostilities soon resumed.

In 1754 a detachment of Virginia troops under young Colonel George Washington surrendered to French forces on the frontier near what is now Pittsburgh. When General Edward Braddock’s attempt to repulse the French ended in a humiliating disaster, Britain declared war—this time with the intention of driving France out of North America once and for all. The war went badly, however, until George II brought in William Pitt, arguably the most brilliant wartime leader in British history. Between 1757 and 1761 the French were expelled from India and Canada, a French invasion fleet was smashed in the English Channel, and choice sugar islands in the French West Indies passed into British hands. Pitt might have achieved even more, but George II died in 1760. His twenty-two-year-old grandson, George III, was eager for peace and forced Pitt’s resignation in 1761. Two years later, the fighting was ended by the Treaty of Paris. To Europeans, it would be remembered as the Seven Years War. Americans called it the French and Indian War.

Throughout these twenty-odd years of conflict, New York’s strategic proximity to Canada—Montreal lay only three hundred miles to the north along the Hudson-Champlain corridor—kept the city in a state of almost constant alert. French raiding parties struck as far south as Saratoga and Albany during King George’s War, and during the French and Indian War heavy fighting erupted around Lakes George and Champlain as well as on the shores of Lake Ontario. Often (as in 1741) New Yorkers believed themselves in imminent danger of attack. Militia companies camped on the Common, drilling incessantly, and in 1745 municipal authorities took the precaution of erecting a palisade along the northern perimeter of the town (raising the necessary funds by a public lottery). Made of fourteen-foot-long

cedar logs set in a three-foot-deep trench, the barrier zigzagged from Cherry Street and James Slip on the East River to present-day Chambers Street on the Hudson, broken by only four gates and guarded by six blockhouses. This second city wall, like the first a century earlier, was a grim reminder that New York's fortunes often hinged on events unfolding oceans away from Manhattan.

SPOILS OF WAR

Even gentlemen of the mercantile "interest," always leery of getting entangled in imperial conflicts to the detriment of trade, conceded that both King George's War and the French and Indian War were good for business. ("War is declared in England—Universal joy among the merchants," William Smith wrote in his diary in 1756.) Legislative bodies in New York and other colonies spent unprecedented amounts of money on military operations, while the British government poured troops into the colonies in numbers that staggered contemporary imaginations. The first contingent arrived in 1756, when a thousand soldiers set up winter camp in the city after losing to the French at Oswego. When the barracks in the fort proved inadequate, the earl of Loudon, commander-in-chief of His Majesty's armed forces in America, billeted soldiers in private homes. This practice brought so many complaints from residents that the Common Council authorized construction of additional barracks up on the Common. And none too soon, for by 1758 some twenty-five thousand soldiers and a vast fleet manned by fourteen thousand mariners would be stationed in America—most of them in either New York or Boston.

Provisioning His Majesty's forces required gargantuan quantities of food, clothing, shoes, alcohol, horses, wagons, and other materiel, and in 1755 New York was made the "general Magazine of Arms and Military Stores" as well as a station for military and naval forces. (That same year, the British government inaugurated monthly fast-sailing packets from Falmouth to Manhattan, underscoring its selection of New York as its link with the colonies.) Contracts to deliver any of those items to royal or provincial commissaries made fortunes for well-connected New York merchants like Hayman Levy, Peter Van Brugh Livingston, James Alexander, William Bayard, Gerard G. Beekman, Oliver De Lancey, and John Watts. None did better than the firm of De Lancey and Watts, which

by virtue of Oliver De Lancey's marriage to Phila Franks enjoyed close ties to her brother Moses, chief purveyor to His Majesty's troops in America after 1760. Yet there was plenty of room for newcomers as well. Young Uriah Hendricks, representing one of London's best-known Jewish firms, settled in the city in 1755 and was soon doing a substantial business supplying the sutlers, mostly Jews, who set up store wherever the military made camp. By 1756 an envious Benjamin Franklin observed "that New York is growing immensely rich, by Money brought into it from all Quarters for the Pay and Subsistence of the Troops."

Provisioning His Majesty's enemies was another lucrative wartime preoccupation. "Scarce a Week passes without an illicit Trader's going out or coming into this Port," one New Yorker remarked in 1748, "who are continually supplying and supporting our most avowed Enemies [the French]." In the French and Indian War, Manhattan merchants who traded with the French islands offloaded their cargoes beyond Sandy Hook and proceeded to port while their illicit goods were smuggled in by wagon. When increased fighting in the Caribbean made such expeditions too risky, one annoyed merchant crankily informed a correspondent that "I am now about trying a Voyage to our own Islands, since Trading with the Enemy has turn'd out so very ill."

Still another way to get rich in wartime, especially for merchants without friends in high places, was that old standby, privateering. During King George's War, about three dozen New York privateers prowled the Caribbean, taking several hundred French and Spanish prizes, worth some £618,000 to their investors. One ship, the *Royal Hester*, seized forty prizes, generating £63,800 for a dozen backers, among them men with such names as Aspinwall, Beekman, Cuyler, and Livingston. Seven other privateers cleared over forty thousand pounds for their investors, and Captain Peter Warren sailed into port in the summer of 1744 with a single French merchantman carrying nine thousand pounds' worth of sugar and indigo. Such exploits won "the general acclamation of the Public," and when Captain John Burgess's *Royal Catherine* took *Le Mars*, after only three broadsides off Sandy Hook, the corporation presented him with a gold box and freedom of the city.

In the next war, seventy-odd privateers operated out of New York—now the greatest such fleet by far in the colonies, and fabulously successful to

boot, capturing more than six hundred prizes worth at least 1.4 million pounds to 150-odd investors. Between September 1756 and May 1757 alone, according to an official report, prizes worth two hundred thousand pounds arrived in the city. Their cargoes included coffee, cotton, sugar, wine, dry goods, pottery, indigo, ironware, lumber, bricks, and “live wares” (slaves), not to mention strongboxes of specie—gold doubloons, louis d’or, pieces of eight. Again the champion privateer proved to be the *Royal Hester*, which brought its fourteen owners a total of twenty-five prizes worth £115,000. “Such a Spirit of Privateering prevails here,” trumpeted the *Post-Boy* in December 1756, “that by the most Judicious account, no Colony has exceeded it since the Discovery of North America.”

All told, between 1739 and 1763 legalized plunder poured something like two million pounds into the pockets of two hundred or so investors—an immense accession of wealth at a time when, as Gerard G. Beekman observed, an income of three hundred pounds a year was sufficient to live “Like a Gentleman” in New York. Not all of this was profit, of course. As a rule, the crew of a privateer signed on for 60 percent of the value of prizes taken. An experienced captain received an extra two to three hundred pounds for a voyage of nine or twelve months. There were also multitudes of contractors, suppliers, and lawyers to be paid, not to mention the costs to be absorbed when a ship returned empty-handed, or didn’t return at all. Inevitably, some shareholders in privateers lost everything, while still others barely covered expenses.

As a group, however, they did well enough that the average investor could expect to double or even triple his money in less than a year. Christopher Bancker refitted one of his merchantmen as a privateer in 1744 at a cost of twelve hundred pounds. He then sold shares to seven other merchants and captains, probably at a small profit to himself. Three cruises resulted in the capture of prizes worth £42,400. After the crew received its share, and after all other expenses were paid, each investor realized a profit of eighteen hundred pounds—a return of around 140 percent on the initial investment, perhaps more for shares that had changed hands at a discount.

More than a few found ways to multiply their winnings. They speculated in shares in privateering expeditions, creating a rudimentary futures market. They invested in city real estate, as land appreciated steadily in response to the pressures of population and economic growth, provided a hedge against

recession, and could be mortgaged to obtain credit. They also loaned out their funds to friends and business associates at 6 or 7 percent interest, creating a system of private credit that partially compensated for the absence of banks.

INDUSTRY AND EMPIRE

A second source of New York's prosperity during the 1740s and 1750s was that great transformation of the British economy known as the industrial revolution. Its essential components were many and varied: the application of water and steam power to textile production, a burst of road- and canal-building, a new flowering of banks and insurance companies, improved agricultural output, accelerated demographic expansion, and urbanization. The population of London, largest city in the Western world, climbed from 676,000 to 900,000 between 1750 and 1800.

For British America, these changes spelled enhanced importance both as a market for cheap manufactured goods and as a source of raw materials and foodstuffs. By midcentury roughly half of all British shipping was engaged in trade with the American colonies, and the colonies were buying nine hundred thousand pounds' worth of British products annually—around 25 percent of all Britain's exports and 50 percent of all manufactures other than woolens. By the early 1760s that figure had soared to over two million pounds. (Because the Navigation Acts prohibited direct imports from other European countries, 80 percent of the finished wares shipped to New York from British ports were of British origin.)

Colonial exports rose almost as rapidly, from seven hundred thousand pounds at mid-century to some £1.5 million in the early 1760s. For New York and other northern ports, the mainspring of this business remained the British craving for sugar, which in the 1740s and 1750s triggered a new round of expansion in the West Indies. The demand for North American lumber and foodstuffs drove the prices of those commodities to new heights. By the early 1760s New York merchants were shipping over four hundred thousand pounds' worth of bread, flour, wheat, and livestock to the islands every year. Their ships returned with valuable cargoes of mahogany, slaves, raw sugar, rum, molasses, and, perhaps most important, bills of exchange that helped finance imports of manufactured goods from Great Britain. Direct sales to the mother country remained relatively rare: between

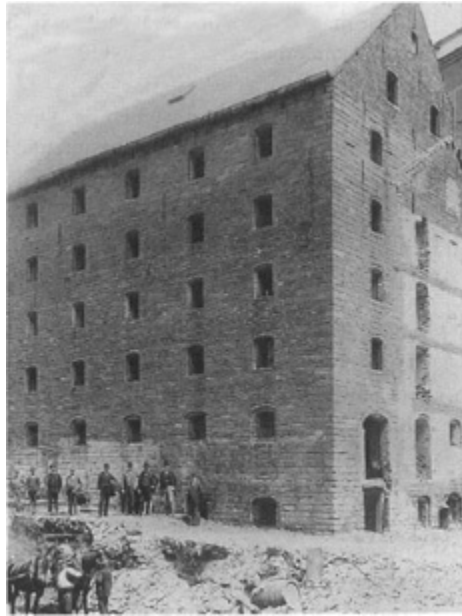

1751 and 1765 the *total* value of New York exports to Great Britain came to a mere £559,000.

Because the prices of imported British manufactures rose more slowly than the value of agricultural exports, the purchasing power of colonial Americans climbed throughout the later 1740s and 1750s, pushing their overall standard of living higher and higher. British exporters encouraged the trend by allowing colonial merchants, vendue houses, and even individuals to buy on credit. Merchants, in turn, extended credit to shopkeepers, who passed it on to artisans and farmers, drawing them as well into the international web of money and commerce. By 1760 or so the mainland colonies had run up some two million pounds in debts to English creditors; in another dozen years they would owe more than four million pounds. The residents of New York, meanwhile, became the leading American consumers of British wares.

Along with easy credit came restrictions aimed at protecting British merchants and manufacturers from colonial competition. In 1732 Parliament outlawed the exportation of American-made hats, and the Molasses Act of 1733 effectively prevented colonial merchants from trading with the French West Indies. In 1750 Parliament likewise prohibited the manufacture of iron products and certain classes of textiles in the colonies. Enforcement of these laws was lax, however, and many otherwise law-abiding colonial businessmen simply ignored them, even—perhaps especially—in time of war.

By 1750 New York was thriving again. The stores and countinghouses of Hanover Square, still the retail center, were stuffed with imported hardware, glassware, furniture, books, and clothing. Along Queen, Dock, Smith (William), Wall, Broad, Duke (Stone), and other nearby streets the houses of leading mercantile families—De Peysters, Beekmans, Livingstons, Philipses, Verplancks, Roosevelts, Crugers—presided over a lively hodgepodge of shops, taverns, and public markets. The Customs House showed 157 vessels registered out of the port, with a combined burden of sixty-four hundred tons; something on the order of twenty-five thousand tons of shipping entered and cleared it every year. A dozen years later, in 1762, the fleet consisted of 477 vessels with a combined burden of 19,500 tons, a threefold increase. Some 33,700 tons of shipping were by then

passing through the port, providing employment for some thirty-six hundred seamen, nearly five times the number only fifteen years earlier.

The Rhineland Sugar House, constructed 1768, photographed c. 1890. This massive stone building on the corner of Rose and Duane streets was one of the largest structures in the pre Revolutionary city and a tangible symbol of its prosperity after 1760. Like other New York “sugar houses,” it was used to refine the sugar produced by West Indian slave labor into the loaves and other products that were in high demand throughout the colonies as well as England.

Overall, the city’s population had now swelled to nearly eighteen thousand—almost twice what it had been in the 1740s. Philadelphia remained the largest North American city, with a population of 23,750. Boston, which actually lost population between 1740 and 1760, had slipped from second to third place with a population of 15,600.

REFINEMENT

When Dr. Alexander Hamilton of Philadelphia came up to New York in 1744, he often dined with the members of the Hungarian Club at Robert Todd’s tavern on Broad Street. It wasn’t, he reported, an easy thing to do.

His companions seemed to think that “a man could not have a more sociable quality or enduement than to be able to pour down seas of liquor and remain unconquered while others sank under the table.. . . To drink stoutly with the Hungarian Club, who are all bumper men, is the readiest way for a stranger to recommend himself.” Crude puns and dirty jokes were their idea of wit. Their arguments were “incoherent,” their table manners execrable.

The good doctor’s revulsion honored a code of taste and conduct known as “refinement.” Detailed in countless British magazines, novels, and “courtesy books” over the previous half century, “refinement” was what distinguished people of quality from the vulgar masses—not just money, that is, but an inner discipline of body and spirit, a natural smoothness, for which money was a necessary though far from sufficient precondition.

“Refined” men and women had a poised yet complaisant manner. They avoided coarse speech, gross or lewd behavior, uncouth gestures, and sharp displays of emotion. They could make their way through a roomful of strangers without embarrassment, and at table they didn’t give offense by using improper utensils or chewing with their mouths open. They conversed easily on history, literature, music, science, and other basic subjects. They read a little Greek and Latin and spoke at least one modern language besides English—hopefully French. For recreation, gentlemen rode and hunted while their ladies did needlework; both danced gracefully and played cards competently. Both, too, paid close attention to appearances: they kept their bodies clean, they wore fresh and fashionable clothing, they lived in commodious and agreeably furnished houses.

Notwithstanding Dr. Hamilton’s verdict on the Hungarian Club, there had always been handfuls of ladies and gentlemen in New York who qualified as “refined.” Earlier in the century they gathered round Governor Hunter, sipping Madeira, discussing Shakespeare, and peering through telescopes. In the early 1730s they patronized what may have been the city’s first regular playhouse: the New Theater, located in the loft of a Nassau Street warehouse owned by Rip van Dam. When it closed after a season or two, genteel audiences contented themselves with puppet shows, pantomimes, and assemblies in the “long Room” of dancing master Henry Holt. Only after 1750, however, did refinement become *de rigueur* among the Manhattan gentry. By then, wartime affluence and buy-now-pay-later

offers from British exporters finally afforded them access to the full range of goods and services that signaled a refined way of life.

Evident almost at once was a new opulence and complexity in upper-class attire. Guided by the life-size fashion dolls with which Britain's garment manufacturers advertised in distant markets, wealthy New York women began to accumulate closetfuls of "smart" clothes and accessories—girdles, hooped petticoats, gowns, cloaks, hoods, bonnets, pocketbooks, muffs—preferably constructed out of such exotic materials as India damask, China "taffety," Irish and Venetian poplin, Turkey Tabby, German serge, or Genoa velvet. They teased their hair into "towers," slathered their faces with fancy creams and pastes and powders, and splashed their bodies with costly oils and scented waters. Upper-class men developed comparable collections of "gallant" wigs, toupees, hats, shirts, waistcoats, cloaks, cravats, breeches, shoes, stockings, buttons, pocket watches, silk handkerchiefs, ribbons, snuffboxes, swords, walking sticks, and toothpick cases.

For Gerard B. Beekman, as for other wealthy New Yorkers, the wish to appear refined required a conscious adaptation to higher standards. Beekman resolved to wear stockings of the "best Silk" instead of plain linen. He sent to London for "a good fashionable Shass [sash]" of the sort favored by officers, plus "a fashionable Silver Mounted Sword . . . with a sword knot." He also vowed to take up the "Glorious sport" of hunting and sent away, again to London, for a "Genteel fowling Piece." One morning on Long Island, seated in his carriage, he experienced the sublime pleasure of shooting fifteen brace of plovers. The fact that he had a carriage to sit in wasn't unimportant either. Before 1740 only a handful of New Yorkers owned carriages, and the town had no resident coachmaker. Over the next twenty-odd years, though, carriages became securely linked to gentility and thirteen coachmakers set up shop to meet the demand.

Jane Beekman (1760-1841), by John Durand, c. 1768. Miss Beekman's genteel upbringing is apparent not only from her fashionable clothing but the book she holds, open to a page in Latin from Erasmus. (© Collection of The New-York Historical Society) By the mid-1770s there were eighty-five coaches, chaises, and phaetons in New York, and the sixty-nine families to whom they belonged ranked among the city's richest and most powerful.

But stylish clothes and carriages alone weren't enough. Refinement also demanded superior diction, posture, and gesture—knowing which, the gentry flocked to elocutionists, music teachers, singing masters, dancing masters, and dentists. Gentlemen practiced the lazy nasal drawl and elaborate slang of London bluebloods. “Split me, Madam,” they declared. “By Gad.” “Dam me.” Ladies learned to blush at such talk and studied the techniques of genteel correspondence.

Ultimately, the only way to assess one's own progress toward refinement was by comparison with other aspirants in a suitable setting. New York's biggest social event—the occasion when pretensions to refinement came under the keenest scrutiny—was still the Governor's Ball, which took place every year at the fort following public celebrations of the King's Birthday. During the 1750s and 1760s formal dancing assemblies, a fixture of polite

society in Britain, became very influential in New York as well. Like the Governor's Ball, they were selective. Admission was by invitation only, and the "managers" of an affair bore the solemn responsibility of ensuring that only the right kind of people got in.

"Turtle-feasts" were much in vogue too. "There are several houses, pleasantly situated on the East River, where it is common to have turtle-feasts," one visitor reported. "These happen once or twice in a week. Thirty or forty gentlemen and ladies meet and dine together, drink tea in the afternoon, fish and amuse themselves till evening, and then return home in Italian chaises . . . a gentleman and a lady in each chaise."

Intimate card parties became quite fashionable, whist and backgammon being all the rage at court. Private eating and drinking clubs remained a fixture of city taverns, though literary and scientific "societies," which multiplied rapidly after mid-century, were considered more respectable. The New York Harmonic Society sponsored musical recitals and benefit concerts featuring the works of Handel, Bach, Corelli, Haydn, and other fashionable composers. Even the besotted members of the Hungarian Club were capable of a "great deal of talk about attraction, condensation, gravitation, rarification [and] the mathematical and astronomical problems of the illustrious Newton," Dr. Hamilton admitted. "I was tired of nothing here but their excessive drinking, for in this place you may have the best of company and conversation as well as at Philadelphia."

Chaperoned "routs" and "frolics" not only allowed young men and women of genteel families to socialize among their own kind but helped inculcate appropriate rules of courtship and marriage. Refined young bachelors learned to expect sexual favors only from serving girls or prostitutes (though that too was frowned on in some quarters). Without a chaste reputation, conversely, young women of quality couldn't hope to find acceptable husbands.

Even at their funerals, refined New Yorkers knew, they would be on trial. Lest they appear stingy or unsociable, they took care to set aside enough money to provide mourners with an abundance of food, drink, and tobacco. In time, gifts of gold rings, silk scarves, silver spoons, and gloves for pallbearers and other important guests became practically mandatory; private family vaults created an especially favorable impression. As a result, funerals costing a hundred pounds or more weren't unusual after the

middle of the century—an amount equal to or exceeding the annual wages of a skilled craftsman and sufficient to support three or four laborers and their families for an entire year.

Probably the most challenging environment for the observation and exercise of gentility was the theater. Beginning in the early 1750s a succession of theatrical companies occupied the New Theater on Nassau Street, abandoned fifteen years earlier, where they indulged enthusiastic audiences with performances of *The Recruiting Officer*, *Richard III*, *The Beggar's Opera*, *Beau in the Suds*, *The Intriguing Chambermaid*, and other favorites of the contemporary London stage. The renowned Lewis Hallam, a Covent Garden veteran, brought his London Company of Comedians to Manhattan in 1753 and erected a new New Theater on the same site as the first, only bigger, and with more attractive accommodations for the gentry. The gentry turned out in force—"a player is a new thing under the sun in our good province," explained the young Philip Schuyler—even though they didn't have the players to themselves. Occupants of the cheaper gallery seats frequently interrupted performances by talking, singing, fighting, and hurling eggs at the well-dressed boxholders below. The experience wasn't lost on David Douglass, Hallam's successor as manager of the London Company: when he put up a new playhouse on the corner of Nassau and Chapel (now Beekman) streets in 1761, he wisely added partitions to the boxes for the protection of "select Companies."

GENTEEL RESORTS

To partisans of refinement everywhere in the Anglo-American world, the noise, squalor, and capricious intimacy of city life—the unpredictable, unintended encounters with people beneath one's station—were sources of constant irritation. Country estates afforded occasional relief, above all in the summer, but year-round rural isolation had obvious disadvantages. A more practical solution was to define places within cities where polite people could promenade, ride carriages, converse, and socialize among themselves without having to take notice of their inferiors. Prototypes of such "resorts" already existed. The Mall in London's St. James Park and the Tuilleries in Paris, for example, were restricted to the refined classes. London also had its "pleasure gardens" like Vauxhall and Ranelagh, ornate

sanctuaries where properly dressed and well-behaved visitors could stroll, take refreshments, attend musical concerts, and the like.

In 1732 the Common Council of New York leased a portion of the large open space fronting the fort to three prominent citizens—John Chambers, Peter Bayard, and Peter Jay—who agreed to lay out and maintain a “Bowling-Green” on the site, with “Walks therein.” The little park was intended for “the delight of the inhabitants of this city,” the council said, besides which it would enhance the “Beauty & Ornament” of lower Broadway. Abigail Franks, wife of the wealthy Jewish merchant Lewis Franks, affirmed a couple of years later that Bowling Green’s “handsome Walk of trees” and neatly painted fence did indeed make a “very Pretty” retreat from the hustle and bustle of the waterfront.

By the 1760s some of the city’s most fashionable residences could be found in the immediate vicinity of Bowling Green, including those of the Van Cortlandts, Livingstons, De Lanceys, Morrisises, Bayards, and De Peysters. Since the governor’s mansion stood there as well, some residents referred to this as the “court” end of town. Yet Bowling Green was neither large enough nor exclusive enough to function as a truly genteel resort.

Because few private residences had rooms of sufficient size for entertaining on a grand scale, committees of leading citizens in towns all over England and America organized the construction of special assembly rooms. As early as 1751 “several gentlemen” of New York hit upon a plan to replace the tottering eighty-year-old market house on Broad Street with a structure that could serve both commerce and genteel society. They had no trouble raising the necessary funds—the Common Council alone contributed twelve hundred pounds—and work proceeded so swiftly that the new building was ready the following year. Known as the Royal Exchange, it had an arcaded ground floor suitable for an open-air marketplace. Upstairs was a large hall with twenty-foot ceilings, ideal for balls, dinners, and concerts. Several smaller adjacent rooms provided space for more intimate gatherings or meetings. One would sometimes be used by the Common Council; another would be leased for use as the Exchange Coffee House, which was for many years the best place in town to get news of distant ports and the preferred location for privateers to auction off prizes.

Taverns often had plenty of space, but their association with drunkenness, cursing, fighting, and other plebeian vices disqualified them as milieus for polite recreations. Alert tavern keepers responded with inducements calculated to attract a wealthier, more decorous clientele. They cleaned up, laid on decent food, improved service, and even relocated in better neighborhoods; more and more of them advertised “long rooms” decorated like genteel parlors, only spacious enough for an assembly or recital of music. Samuel Fraunces, a West Indian of mixed French and African descent, had opened his first New York tavern, the Mason’s Arms, on upper Broadway near the almshouse—not a name or a location with which an ambitious man could rest content. In 1763 Fraunces moved down to the old De Lancey mansion on the corner of Broad and Pearl, still one of the handsomest buildings in town and the perfect location for a tavern where ladies and gentlemen would feel at ease. Its very name was a step up: the Queen’s Head, presumably in honor of Charlotte, wife of King George III. For two decades the Queen’s Head would be recognized as the premier establishment of its kind in the city.

The enterprising Fraunces also had a hand in bringing “pleasure gardens” to New York. Several had opened during the 1740s and 1750s, though only two remained: Spring Garden, situated at the northeast corner of Broadway and Ann Street, and Catiemuts Garden, located on the brow of a small hill of the same name about where the Boston Post Road (Park Row) now crosses Chambers Street—the same hill, some residents remembered, where the “Negroes were Burnt.” In 1765 Fraunces opened Vauxhall Garden on a prominence overlooking the Hudson near the present junction of Greenwich and Warren streets. Its attractions included a wax museum, Italian fireworks, and afternoon teas. That same year, a rival opened Ranelagh near the corner of Church and Thomas streets, advertising band concerts on Tuesdays and Thursdays.

No public space in New York attracted higher concentrations of the refined, however, than Trinity Church. Of all the city’s religious bodies, Judge Thomas Jones later recalled, Trinity enjoyed “the most influence, and greatest opulence. To this Church, the Governor, the Lieutenant-Governor, most of his Majesty’s Council, many members of the General Assembly, all the officers of Government, with a numerous train of rich and affluent merchants, [and] landholders, belonged.” During the 1740s and 1750s its

parishioners began renovations to Trinity's now cramped and aging building (including the purchase of its first organ) that were aimed at creating an environment more hospitable to their genteel brand of Christianity. What they had in mind reflected the legacy of the renowned Christopher Wren and his students, who had utilized principles and themes of classical Roman architecture—strict symmetry, geometric proportions, temple-front porticos—to create buildings perfectly attuned to the ambitions and self-confidence of the propertied classes in Georgian Britain (whence the term “Georgian” architecture). Trinity paid homage to the link between this neoclassicism and gentility as early as 1752, when it erected St. George's Chapel on Chapel (Beekman) Street for the convenience of members living on the east side of town. St. George's columned portico, balustrades, gracefully arched windows, and hexagonal steeple wouldn't have been out of place in a fancy London suburb.

St. George's was soon eclipsed by Trinity's second chapel, St. Paul's, erected between 1764 and 1766 on the corner of Broadway and Fulton streets. Its builder, Thomas McBean, studied under the London architect James Gibbs, arguably Wren's most eminent disciple. St. Paul's closely resembles Gibbs's elegant St. Martin's-in-the Fields Church in London. Its dominant features—temple-front portico, giant Ionic columns, massive pediment, and elaborately decorated tower—gave visible expression to the desire for order, balance, and harmony that denoted the genteel way of life. (A second Wren-Gibbs-style building, the North Dutch Church on William Street, went up in 1769 to accommodate members of the Reformed faith who wanted Englishlanguage services.)

St. Paul's domestic counterparts were the fashionable residences built by well-to-do New Yorkers in imitation of the Georgian-style mansions already ubiquitous in Britain. The most famous of the city's “Spacious Genteel Houses” (as one visitor called them) was erected in 1752 by William Walton, son of the “Boss,” on the east side of Queen (today Pearl) Street between Peck Slip and Dover Street—not far from the Walton shipyards on the East River. Three stories high, fifty feet wide, and built of costly, yellow-hued “Holland” brick, Walton's house was a manifesto of Georgian refinement. The details of its facade—including a majestic front door framed with fluted classical columns and topped by a broken pediment with the Walton coat of arms—conveyed not only wealth but good taste, social

confidence, and family dignity. The same effect was achieved inside by oak-paneled halls, marble floors, gilt mirrors, silk damask curtains, and drawing rooms wainscoted in black walnut and hung with crystal chandeliers. An ornately carved mahogany staircase led to the second floor, one corner of which was devoted to a ballroom. Outside, to the rear of the house, lay carefully groomed grounds that sloped down past flower gardens and grape arbors to the grassy banks of the East River, where the family had a summer cottage and boathouse.

Nothing like it had ever been seen in New York, and for decades it was considered one of the finest private residences in North America. When Walton threw a victory party for British officers after their conquest of Canada in 1759, the splendor of his home made such an impression that it would be offered to Parliament as proof of the colonies' ability to pay their fair share of imperial expenses (and of the need to boost the compensation of royal governors and other imperial functionaries, who were finding it more and more difficult to keep up).

As the interior of the Walton house demonstrated, refined standards of sociability necessitated newer, more complex approaches to the organization and furnishing of domestic space. Well-to-do New York families had long since replaced the clunky Dutch-style furniture of the William and Mary period: first with the more graceful walnut pieces in the newer Queen Anne style; then with the self-consciously classical style popularized by the London cabinetmaker Thomas Chippendale after 1750; and then again, in the 1760s, with the more ornate classicism advocated by Scottish designer Robert Adam. Out, as well, went the plain, old-fashioned, often home-made canvas floor-cloths once favored by the rich as well as middling classes; in came expensive, imported "Turkey fashion" carpets, no two exactly alike.

Each room now served a specific public or private function, identified by specialized furniture, distinctive imported wallpaper, and suitable pictures. Nothing graced a drawing room or parlor more than a family portrait by Benjamin West or John Singleton Copley, whose blunt materialism appealed to the gentry's pride in its power and possessions. The hallmarks of a genteel dining room, by contrast, were a sideboard stuffed with Wedgwood china and an abundance of specialized silver, pewter, and crystal implements, many of them associated with the serving and

consumption of tea. Afternoon tea had now become a vital upper-class ritual on both sides of the Atlantic, presided over by ladies equipped with a fantastic technology of kettles, lamps, stands, urns, strainers, trays, and canisters of fine imported teas.

New rural “seats” and country houses enabled the gentry to pursue refinement outside the city as well as in. The trendsetter here was Peter Warren, whose fame as commander of the fleet that took Louisbourg in 1745 had won him a promotion to viceadmiral, a knighthood, and a seat in Parliament. Sir Peter acquired several hundred acres of land at Greenwich, a mile or so above the city, and built a comfortable Georgian country house to which he and his family could flee during the hot, pestilential months of summer.

The Warrens soon had company. In 1750 Captain Thomas Clarke acquired a tract between what are now Eighth and Tenth Avenues, running north from 14th Street to roughly 29th Street. He called it Chelsea, after the London borough, and just below the present intersection of Ninth Avenue and 23rd Street he too built a fine Georgian home. In 1760 Abraham Mortier, commissary to His Majesty’s forces, leased an estate from Trinity Church called Richmond Hill—a promontory between the present King, Varick, Charlton, and MacDougal streets—where he wine and dined a host of dignitaries, including Lord Jeffrey Amherst, who until 1763 served as supreme British commander in America. Other gentlemen, too, developed a taste for refined country life—William Bayard, James Jauncy, and John Morin Scott among them—enough that by the mid-1760s there was an almost unbroken line of great estates up the west side of Manhattan.

Much the same thing occurred on the east side. South of the present Seward Park, just below the intersection of Division and Rutgers streets, lay the hundred-acre estate of the wealthy Rutgers family, whose money came from trade and brewing. Chief Justice and later Lieutenant Governor James De Lancey occupied 340 acres on what is today 120 blocks of the Lower East Side, running from the Bowery to the East River, and north from Division Street (so named because it separated his property from that of the Rutgers family), across Delancey, to Stanton. (Orchard Street was cut through the governor’s fine stand of fruit trees.) The Stuyvesants still held Director Pieter’s original estate, encompassing most of the land west of Fourth Avenue from 5th to roughly 20th streets. Gerardus Stuyvesant (the

Director's grandson) still lived in the old family house, while his two sons, Petrus and Nicholas, occupied more up-to-date mansions nearby; Petrus dubbed his Petersfield, and Nicholas's was known as the Bowery.

Above the Stuyvesants lay John Watts's Rose Hill (now 29th Street and Park Avenue) and, still further north, Inclenberg, the estate of John Murray, whose mansion stood on what is now Park Avenue between 36th and 37th streets (an area known today as Murray Hill). In the early 1760s James Beekman (cousin of Gerard G. Beekman and son of William) built Mount Pleasant, an elegant villa overlooking Turtle Bay on the East River, near the foot of what is now 50th Street. Further upriver lay the mansions of Schermerhorns, Rhinelanders, Lawrences, and others. On Harlem Heights, Colonel Roger Morris and his wife, Mary Philipse, were building Mount Morris, a beautiful Georgian showplace commanding a view down the length of Manhattan. Some gentlemen preferred the comparative isolation of Westchester or Long Island. Frederick Van Cortlandt built a substantial mansion in the Bronx in 1748. Cadwallader Golden located his country seat in Flushing. Philip Livingston erected his in Brooklyn Heights, while William Axtell went all the way out to Flatbush to build his Melrose Hall.

Although some of these estates grew crops for profit, their primary purpose—besides providing refuge from epidemics—was to serve as theaters of refinement. Many New York gentlemen, inspired by the rage for gardening and landscaping among English estate owners, surrounded their country homes with vast lawns and flowerbeds, orchards, greenhouses, conservatories, fish ponds, and fanciful grottos. The great demand for flowers, shrubs, and trees prompted William Prince to found a nursery in Flushing, later called the Linnean Botanic Gardens, famous throughout the colonies.

Such embellishments conveyed an appreciation of order and harmony, paid lip service to scientific agriculture and horticulture, and provided a setting for such recreations as golf, tennis, cricket, hunting, and horse racing. Some estates boasted deer parks and game preserves—Governor Cosby may have set the local precedent when he designated Governors Island as his private game preserve—and the De Lancey estate even had its own race course just off the Bowery Road, between the present 1st and 2nd streets.

POLITICS AMONG GENTLEMEN

One thing the spread of refinement didn't do was improve the tone of New York politics. During King George's War, the Morris-Livingston "landed interest" and the De Lancey-led "mercantile interest" waged increasingly rancorous public battles around the problem of Canada. With the help of Governor George Clinton, who replaced George Clarke in 1743, the landed interest clamored for wider military operations against the French. The mercantile interest resisted the idea, fearing a disruption of the Albany trade and new taxes that would jeopardize New York's reviving commerce. When the two factions turned to voters for support, they hurled pamphlets, broadsides, and newspapers at one another with furious abandon—without, however, eliciting much of a response among the freemen of the city, who remained content to leave politics to gentlemen. The merchant interest was thus able to get a firm grip on the provincial assembly, and when Clinton's successor, Sir Danvers Osborne, committed suicide shortly after his arrival in 1753, it was James De Lancey who took control of the government as lieutenant governor.

By then, too, religion had again become an ingredient in the colony's factional strife. The gentlemen of the landed interest had always leaned toward Presbyterianism or one of the other dissenting sects, while those of the mercantile interest mostly identified with the Anglican establishment. At mid-century this line was drawn more sharply by a trio of young men connected with the landed interest: William Livingston, John Morin Scott, and William Smith Jr., often referred to as the "Triumvirate." Each was a recent Yale graduate. Each had read law in the office of Smith's father, William Smith Sr., who had defended Zenger and helped prosecute the 1741 "conspirators." And each was (or would be) a member of the Presbyterian Church (the elder Smith had been a leading Presbyterian layman).

In 1752 Livingston and his friends launched the *Independent Reflector*, a political journal that combined the oppositional intensity of Trenchard and Gordon's *Independent Whig* with the didacticism of the *Reflector*, a contemporary British literary magazine in the style of Addison and Steele. One of their primary concerns was the adverse impact of prosperity on the manners and morals in New York. Dedicated to "correcting the taste and improving the Minds of our fellow Citizens," the *Independent Reflector* ridiculed the grasping, pretentious people "who call themselves the Polite

and Wellbred.” “Our extraordinary success during the late War has given Rise to a method of living unknown to our frugal Ancestors,” Livingston wrote scoldingly. The journal ceased publication at the end of 1753—done in, Livingston wrote, by “the fears of my enemies and the spite of malignants.” But like Zenger’s *Weekly Journal*, with which it shared a common intellectual ancestry, the *Independent Reflector*’s influence would resonate long after it had disappeared. When William Smith Jr. published the first volume of his *History of the Province of New York* (1757), sharply critical of the De Lanceys, he too mocked the sudden concern for refinement among well-to-do residents of the city. “Our affluence during the late war introduced a degree of luxury in tables, dress, and furniture, with which we were before unacquainted,” Smith wrote.

Yet nothing gave the Triumvirate greater cause for concern than De Lancey’s effort to make New York’s first publicly supported college an Anglican institution. Back in 1746 the Assembly had approved a lottery to raise money for a college, and when a board of trustees was finally appointed in 1751, seven of its ten members were Anglicans. They decided to build on a thirty-acre portion of the King’s (formerly Queen’s) Farm on the west side of Manhattan, donated by Trinity Church on condition that the school’s presidents belong to the Church of England and that it use the Anglican liturgy in religious services. The board then invited Samuel Johnson, the Anglican rector at Stamford, Connecticut, to lead the new institution.

William Livingston, one of the three non-Anglicans on the board, was apoplectic. He revered higher learning as a beacon of enlightenment in a crassly materialistic age and believed that a college would do much to improve New York’s reputation (there were, after all, only four other such institutions in all of British North America: Harvard, William and Mary, Yale, and the College of New Jersey, now Princeton). “Our Neighbours have told us in an insulting Tone, that the Art of getting Money, is the highest Improvement we can pretend to,” he had written in the *Independent Reflector*. In the spring of 1753, accordingly, Livingston, Smith, Scott, and Alexander launched an all-out attack on the Anglican plan.

Their contention, in Livingston’s words, was that the Anglican scheme would make the college “a contracted Receptacle of Bigotry” and was part of an SPG conspiracy—“so perilous, so detestable a plot”—to impose

religious conformity on the colony. The stakes were thus political as well as religious. Inasmuch as the Ministry Act of 1693 hadn't actually established the Anglican Church, use of the Anglican liturgy in college services constituted an invasion of hard-won legislative prerogatives. Natural rights, constitutional liberty, rational toleration, freedom of thought, diversity of opinion, separation of church and state—those were the real issues, Livingston declared. “The Absurdity of a Religion, supported and inforced by the Terrors of the Law, is too apparent to need much farther Display.”

These Whiggish accusations made the proposed New York college a transatlantic cause celebre by tying it, like the Zenger affair fifteen years earlier, to issues and ideas deeply imbedded in Anglo-American political experience. Thomas Bradbury Chandler, Samuel Seabury Sr., Samuel Auchmuty (rector of Trinity), and other Anglican spokesmen fought back in a succession of pamphlets and newspaper essays. (Belfast-born Hugh Gainé's *New-York Mercury*, published at the sign of the Bible and Crown on Hanover Square, was their favorite outlet; the Livingston forces labeled it a “priestly Newspaper.”) Inequality, hierarchy, monarchy, patriarchy, obedience to authority, and an established church—these were the true principles of social organization, the Anglicans declared. Religious toleration was one thing, the anarchy of complete religious freedom quite another. The Church of England symbolized and served the British people as a whole; its clergy acted as custodians of British values, tradition, and culture; its preeminence was as vital in the colonies as in the mother country. Opposition to the proposed college wasn't merely ignorant: it smacked of treason and rebellion as well.

In 1754, to no one's surprise, Governor De Lancey granted a charter for King's College. By July of that year the new institution had opened in the vestry room of Trinity Church with Samuel Johnson as president. Later that year Livingston and his friends founded the New York Society Library. Their intent was not only to serve the city's inhabitants generally but to maintain some influence over the new college by establishing a collection of books for the use of its students.

Wrangling continued over whether the Assembly would allow public money to be spent for the college. The arrival of Osborne's replacement, Sir Charles Hardy, cleared the way for a compromise in 1756. The Assembly agreed to give half the lottery money to the college and the other half to the

city for a new municipal jail and pesthouse (a quarantine hospital for the victims of contagious diseases). Construction of a proper academic building began at once on the plot now bounded by Murray, Barclay, West Broadway, and Church streets; Bedloe's Island in the Upper Bay—which the city purchased in 1758—was chosen as the site for the pesthouse, completed by 1760. Compromise or no, Livingston and company continued for years to view King's College with deep suspicion.

WAGES OF WAR

Throughout the King's College controversy, the Livingstons, unlike their predecessors in the "popular party" of the 1730s, made no real attempt to mobilize a broad following. Freemen continued to pay little attention to local elections, and the numbers of small shopkeepers and artisans on the Common Council fell to levels not seen in forty years. Nor was there much popular interest in official ceremonies, as the traveler Peter Kalm discovered. "The King of England's Birthday was celebrated in town to-day," Kalm wrote in November 1749, "but the people didn't make a great fuss over it. A cannon was fired at noon and the warships were decorated with many flags. In the evening there were candles in some windows and a ball at the governor's. Some drank until they became intoxicated, and that was all."

When the occasion seemed to warrant it, however, the common people didn't hesitate to defend their interests—in the streets rather than at the polls. Over the winter of 1753-54, for example, a self-appointed committee of merchants agreed that by devaluing copper pennies in relation to the shilling they could improve the colony's balance of payments with the mother country. Outraged that devaluation would also raise the price of bread and depress wages, laboring people "armed with Clubs and Staves" took to the streets to protest, though without success.

Trouble could erupt, too, over the tendency of soldiers stationed in town to supplement their meager pay by moonlighting as tradesmen or laborers. As their numbers increased, their competition with native working people became the subject of more than a few dockside rows and tavern brawls. What really riled townspeople, however, was raids by naval press gangs. One spring morning in 1756 marines armed with clubs and pistols came ashore at Murray's Wharf, hurried through the Fly Market, and, ignoring

orders to seize “only such as had the appearance of seafaring or labouring men,” entered houses and grabbed people indiscriminately. One man was chased down Wall Street, beaten unconscious, and dragged off. The following spring, when Lord Loudoun’s expeditionary fleet was delayed from sailing against Louisbourg by a scarcity of hands, he had three thousand men cordon off the city at two o’clock in the morning, then sent press gangs to search “the Taverns and other houses, where sailors usually resorted.” By dawn, they had hauled in eight hundred people, including “All kinds of Tradesmen and Negroes”—a number equal to more than a quarter of New York’s adult male population. Even after half had been released, the four hundred or so “retained in the service” were more than enough to meet Loudon’s needs. In 1760, when the fiftygun HMS *Winchester* fired a shot over the bow of the privateer *Sampson* and dispatched a party to board it, the *Sampson*’s crew locked the captain in the cabin, then blasted the press gang with a volley of musketry, killing or wounding several. The mariners then took refuge in the town, where sympathetic citizens helped them escape the clutches of the sheriff.

Despite such incidents, seamen were doing well in the war years; indeed the navy’s resort to impressment was a consequence of the mariners’ prosperity. New York seamen had been swept by “almost a kind of madness to go a-privateering,” Lieutenant Governor De Lancey noted in 1758. They had been quickly joined by farmers, laborers—and deserters from the Royal Navy. In 1759 alone, forty-eight ships were commissioned out of New York as privateers manned by 5,670 seamen.

Reality rarely lived up to expectations. The crew of a privateer that returned to port with thirty-five thousand pounds or more in prizes would have £12,600 to divide among themselves (subtracting court costs and the shares for the owners, captain, and mates). On a typical ship of around seventy-five or so hands, that could mean £168 per man—a lot of money at a time when common laborers earned thirty pounds a year. Most privateers came home empty-handed, however, and in nearly two decades of war the average tar probably received no more than eleven pounds for his troubles. Assuming he came home at all, that is: one out of every two or three was killed, captured by the enemy, or injured.

So many common seamen continued nonetheless to sign up with privateers that New York shipowners were obliged to offer five shillings per

day for regular voyages (over three times the peacetime rate), while the government had to offer five pounds a month to recruit sailors for service on troop transports (a master's rate in peacetime). That was good news for the three thousand or so seamen working on New York vessels by 1762.

The town's artisans flourished as well. The East River shipyards, stretching up the waterfront toward Corlear's Hook, did a booming business refitting merchantmen with the cannon and extra sail required for a Caribbean expedition and repairing those that returned to port with damages. Ropemakers, sailmakers, coopers, chandlers—all had steady employment now for the first time in recent memory. Cordwainers struggled to keep up with huge military orders for boots and shoes, a boon also for the city's tanners, whose operations had been moved from Beekman's Swamp to the Fresh Water Pond, where they were allowed to dig their tanning pits and draw water. British troops needed hats too, so officials winked at violations of the 1732 parliamentary law that limited colonial hatmaking. In 1755 New York's bakers, on hearing that the army would need fifty thousand pounds of bread, jacked up their prices a hefty 14 percent. His Majesty's forces likewise paid good money to cartmen for hauling supplies and gunpowder. Merchants, too, needed cartmen more than ever, and Mayor John Cruger, himself a powerful merchant, began to expand their ranks in 1756. Over his nine-year term Cruger licensed 386 new carters, a nearly tenfold increase. (Cartmen remained tightly regulated, though. The Common Council set standard rates on over a hundred commodities and listed them in chapbooks distributed throughout the city. Violators could be tracked down easily as each cartman had to put his number, using red paint, on his wagon.)

The presence of hundreds of military and naval officers, together with surging civilian demand, caused a burst of new construction that raised the number of houses in New York from 1,991 in 1753 to nearly twenty-six hundred by 1760. Housewrights, bricklayers, stonemasons, glaziers, plasterers, painters, and carvers commanded wages about 25 percent higher than prewar levels, and the demand for building materials led the city to allow manufacturers to set up brick kilns on the Common or on leased land farther north. Similarly, the influx of officers created a rich new market for the luxury goods produced by local carvers and gilders, watchmakers, furniture makers, painters, pewterers and potters, silversmiths, perfumers,

glovers, seamstresses, hoopmakers, and mantua makers. During the war years, forty-one wigmakers and hairdressers found employment in New York, providing men with perukes and ladies with fashionable towers. Shoemakers offered goods “equal if not superior to any made in London,” and as word of the provincial demand for finery crossed the Atlantic, milliners and staymakers began arriving from London and Bath with the latest fashions.

Specialty shops around Hanover Square thrived on the demand for wines, tobacco, china, glassware, stationery, and teas. Much of this retailing continued to be done by women—widows as well as the wives of merchants and sea captains—who tended to specialize in dry goods and millinery. Some did so well as the city’s economy charged forward that they crossed the line separating shopkeepers from she-merchants. Martha Carrick ran an ordinary “shop” until 1761, when she moved into the “store” (short for “storehouse”) of a former merchant and began selling only at wholesale. Frances Willett in Wall Street sold sugar and rum by the hogshead, which she fetched from St. Kitts on her own two ships, a schooner and a snow.

The most successful wartime retailers were the tavern owners who sold food and drink to the thousands of seamen and soldiers passing through town every year. New York, in fact, could boast of more licensed public houses than any other colonial city—334 by 1752, up from 166 only eight years earlier. Local merchants who had once imported rum now began making their own: of the ten rum distilleries in 1753, the leading “works” were those of Livingston and Lefferts, erected “at great expence” just behind Trinity Church. After 1760 Pierre Lorillard did his best to keep the city’s nicotine output on par with its alcohol production. Having served an apprenticeship as a snuffmaker, Lorillard opened his own “manufactory” in a small rented house on Chatham Street. Here he packed snuff into animal bladders, which had first been dried and tanned, then sold it to wholesalers, thereby launching Manhattan’s tobacco industry.

The pursuit of refinement by war contractors and others provided work for a small army of gardeners, coachmen, butlers, footmen, and maids, although many domestic servants remained unpaid slaves. In 1756 New York counted 695 female slaves over the age of sixteen and another 443 under it, constituting a pool of over a thousand black women to serve a

population of almost 10,800 whites. Black men continued to do much of the town's heavy labor, as well as to be used by their owners as fishermen, coopers, barbers, or boatmen. At the same time, the institution of slavery was gradually coming under more severe criticism throughout the English-speaking world, and white New Yorkers were exposed to a growing number of books, pamphlets, and newspapers that argued for abolition on economic as well as religious grounds. One essayist, after a careful statistical analysis, pronounced "the labor of freemen to be much more productive than of slaves" and concluded "that slavery is impolitic as well as unjust."

MUNICIPAL IMPROVEMENTS

Although years of war boosted the city's income from licensing fees, rents, fines, and other charges, both the mayor and the Common Council proved reluctant to spend money on municipal improvements. They made little effort, for example, to upgrade harbor facilities in response to the upsurge in waterfront traffic and made only occasional repairs to the municipally owned Great Dock, now used mainly for fishing boats, market boats, and other small craft. Rather, the magistrates continued the old practice of granting water lots, often to one another, for the building of quays (wharves that paralleled the shore) rather than substantial piers. Similarly, despite the expansion of overland traffic between Westchester and Manhattan, the city built no new bridges over the Harlem River. King's Bridge, erected by Frederick Philipse in 1693, was still the only crossing, and still charged exorbitant tolls. Its monopoly was finally broken by private entrepreneurs in 1759, when Benjamin Palmer and Jacob Dyckman—blacksmith, tavern keeper, and the owner of a riverfront farm—constructed their Freebridge.

The Common Council was diligent, to be sure, about keeping streets and roads in good repair, inasmuch as they were vital to the local economy. Maintaining the upisland Kingsbridge and Bloomingdale roads cost little or nothing because the law required all inhabitants to do roadwork two days a year, using their own spades and pickaxes, or pay a large fine (wealthy residents routinely paid). Not until 1764 would the council create the first rudimentary highway department, hiring laborers and surveyors whose wages were paid out of a general tax levy. Around the same time, recognizing the need for better roads within the city itself, the council ordered boatloads of cobblestones from Westchester to pave streets near

public buildings—the fort, Bowling Green, City Hall, and the Old Slip Market. It also enforced street-cleaning laws rigorously, though packs of feral swine and dogs continued to roam about with impunity.

The council proved much less attentive to the sanitation problems created by steady population growth and overcrowding. After ten P.M., householders and servants were allowed to empty ordure tubs of human waste into the rivers, where it coated the wharves and quays with a fecal slime. A storm sewer under Broad Street, reinforced with stone in 1747, was designed to drain into the East River, but even with the addition of trunk lines in Wall Street and elsewhere, it never functioned properly, and pools of rank, debris-filled water were a frequent challenge to pedestrians. Although residents complained loudly about the appalling stench and clouds of flies that blanketed the city as a result—*a* hot day in summer could be almost unbearable—the Common Council seemed unwilling or unable to act.

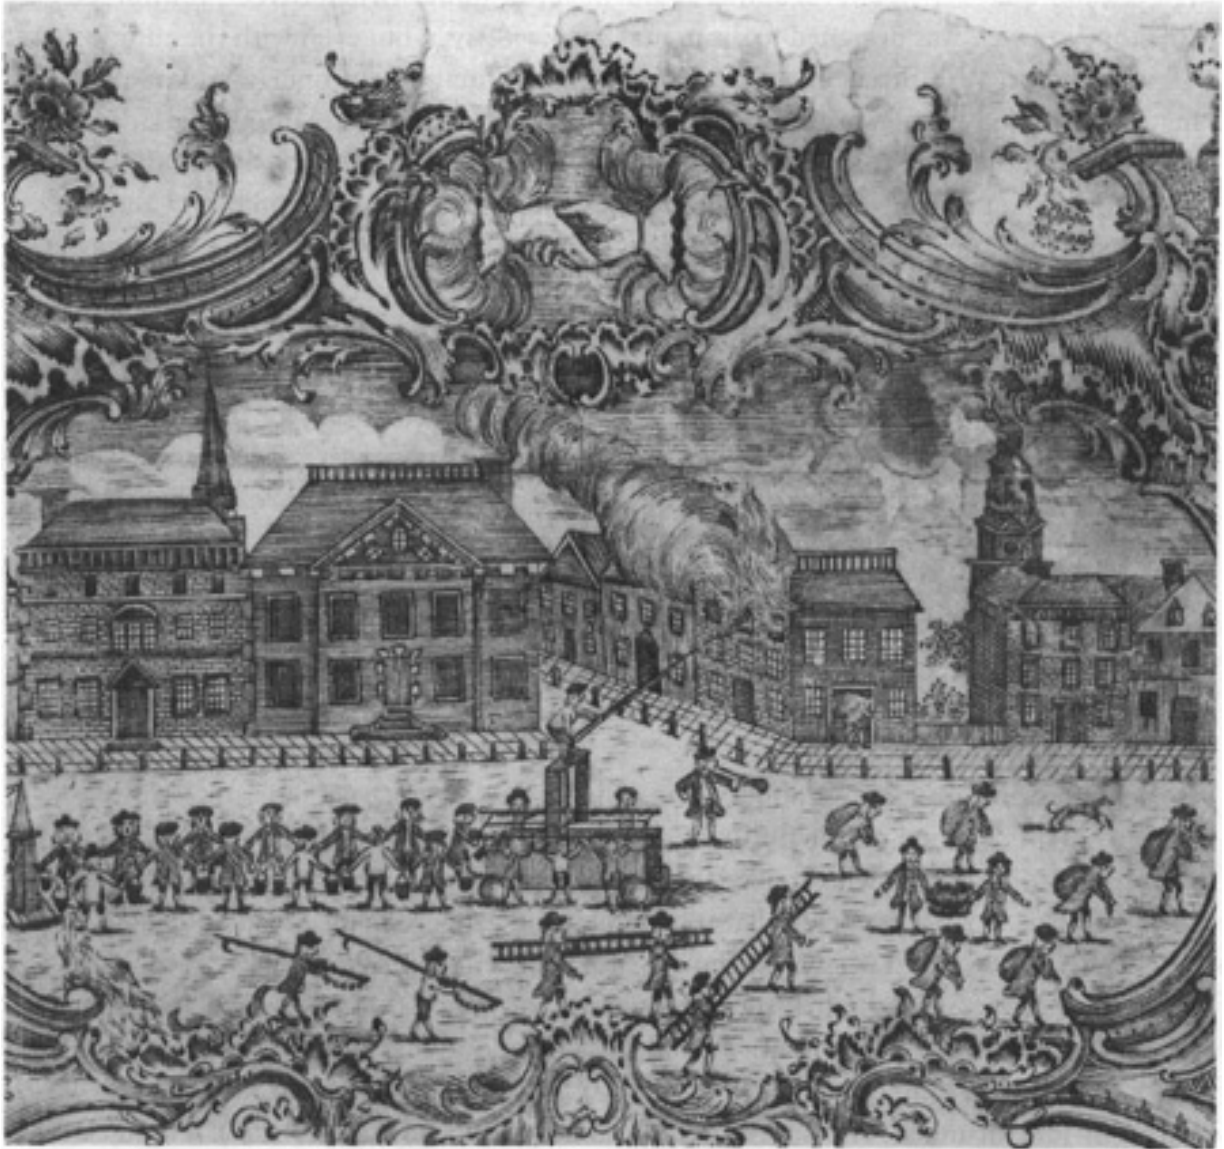

Nor did it cope effectively with the increase of crime that accompanied the city's new prosperity after 1750. Prostitution, for example, had been relatively unobtrusive in New York as late as 1744, when Dr. Hamilton learned that an after-dusk stroll on the Battery “was a good way for a stranger to fit himself with a courtesan; for that place was the generall rendezvous of the fair sex of that profession after sunset.” The mass arrival of troops and privateers prompted more aggressive and organized approaches to commercial sex—bolder women venturing out to board ships at anchor in the harbor, others setting up “Houses of 111 Repute” in town. Raids on these establishments in July 1753 netted twenty-two “ladies of Pleasure,” five of whom received fifteen lashes before “a vast Number of Spectators” and were then banished. These measures were utterly ineffectual, though, and prostitution became a more and more conspicuous element of the city scene in the years that followed.

So did assault, mugging, robbery, and other crimes against persons and property, which residents blamed on the influx of disreputable outsiders like the “Gang of Fellows of no good Aspect” who arrived one day on the stage from Philadelphia. As early as 1749 one local paper reported that it had “become dangerous for the good People of this City, to be out late at Nights, without being sufficiently strong or well armed,” and half a dozen years later the printer Hugh Gaine estimated that at least one house in New

York was burgled every night. The unpaid citizen watch, consisting chiefly of residents who couldn't afford to buy their way out of obligatory service, was useless—a “Parcel of idle, drunken, vigilant Snorers, who never quelled any nocturnal Tumult in their lives,” the *Gazette* scoffed in 1757, “but would, perhaps, be as ready to join in a Burglary as any Thief in Christendom.” Equally ineffective as a deterrent were the public floggings and other forms of corporal punishment ordered by the courts. Mary Anderson, “a loose and profligate Wretch,” was given thirty-nine lashes for theft in 1754, and “she afforded some Diversion while at the Post to the Mob, as she was very obstinate and resisting.”

In 1759 the Common Council responded to the rising clamor for action by erecting a new city jail in the Common (at the northeast corner of today's City Hall Park). The New Gaol was quickly filled with French and Indian prisoners of war, however, and the council had to begin making plans for a second structure. Three years later the council took the further step of creating a paid watch to patrol the streets at night. It decided, too, to begin installing whale-oil lamps around town and hired municipal lamplighters to keep them lit.

Besides crime, the council had to contend with the ever-present danger of fire, magnified now by the great stockpiles of pitch, tar, resin, turpentine, and gunpowder that His Majesty's armed forces had located in and around town. New regulations were adopted for the storage of flammable materials, and official inspectors were appointed to secure compliance. Because the new density of buildings in lower Manhattan heightened the risk of a major conflagration, the provincial assembly ordered, in 1761, that all new buildings erected after 1766 south of the Fresh Water Pond be roofed with slate or tile rather than the highly combustible white fir or cedar shingles (then delayed implementation of the law for an additional ten years after residents objected to the expense).

One of the city's first fire engines, detail from a notice of the Hand-in-Hand Fire Company. (I. N. Phelps Stokes Collection. Miriam and Ira D. Wallach Division of Art, Prints and Photographs. The New York Public Library. Astor, Lenox and Tilden Foundations)

Back in 1731 the council had ordered two firepumps of the very latest design from London. Because they required teams of men to operate—some for the bucket brigades that kept the reservoirs supplied with water, others to work the levers that forced water out through a hose—the council appointed thirty “Strong able Discreet honest and Sober Men” to run “the

said ffire Engines” (in lieu of wages they were exempted from serving as constables, highway laborers, or jurymen). When this force proved deficient in dealing with the blazes of 1741, the city immediately bought a hundred new buckets (marked “City of N.Y.”), purchased two more London engines, and expanded the force to forty-four men. Additional engines arrived in 1758, at which time the magistrates ordered construction of sheds to house them—at least one in each ward, with the largest at Hanover Square.

If its interest in civic improvements thus seemed haphazard—driven as much by a concern to protect the estate of the municipal corporation as by a sense of duty to an abstract public interest—the Common Council must have taken considerable satisfaction from the stream of visitors who praised the city’s busy, well-regulated appearance. As one of His Majesty’s naval officers admitted in 1756, it caught Europeans off guard. “The nobleness of the town surprised me more than the fertile appearance of the country,” he remarked. “I had no idea of finding a place in America, consisting of near 2,000 houses, elegantly built of brick, raised on an eminence and the streets paved and spacious, furnished with commodious keys and warehouses, and employing some hundreds of vessels in its foreign trade and fisheries—but such is this city that very few in England can rival it in its show.”

ARTISANAL WARDS

City authorities also spruced up the municipal almshouse in the 1740s and 1750s, for despite the general prosperity of the war years, poverty remained a problem. Some inmates were casualties of combat, others of inflated currency, others of the death of a provider. One widow told a local newspaper in 1752 that her husband’s death had left her “in the greatest poverty,” with only her eldest boy, twelve years old, able to support the family selling oysters. Oysters, in fact, were the mainstay of the poor. As Peter Kalm observed, many “lived all year long upon nothing but oysters and a little bread.”

Other working people had better luck. A few butchers, innkeepers, and sugar boilers got rich during the war years; blacksmith Matthew Buys, cordwainer John Sickles, and baker John Orchard did well enough to purchase estates of over 150 acres.

The bulk of New York's laboring population happily settled for reaping the rewards of constant employment at high wages. Many saved enough to buy a piece of property on which to set up a house and shop—though not in the dock area, where competition between merchants, retailers, and real estate investors had driven the price of land near Hanover Square and Bowling Green beyond the reach of any but the most prosperous craftsmen. A standard lot there, measuring twenty-five by a hundred feet, could rent for as much as twenty pounds a year for the land alone (the “ground rent”), exclusive of improvements. A house in the Dock Ward or East Ward might rent for as much as two hundred pounds a year. It wasn't any easier finding cheap land outside of town, where thousands of acres had long since been engrossed by the country estates of Stuyvesants, Bayards, Warrens, Rutgers, and other prominent families.

Virtually the only place open to residents of modest means was the hundred-acre tract owned by Trinity Church on Manhattan's west side. Known familiarly as the Church Farm, it lay in the West and Out wards between what are now Cortlandt and Christopher streets. In 1762, hoping to generate additional income, Trinity's vestry had the property surveyed and mapped into rectilinear blocks. It then offered to lease two hundred lots, most of them measuring twenty by a hundred feet, for periods of twenty-one, forty-two, or sixty-three years and for attractively low ground rents—two pounds per year for the first seven years, three pounds per year for the next seven, and four pounds per year for the remainder of the lease—on the assumption that land values would double over time. Artisans and laborers realized that for the same money it would cost to rent near the wharves they could erect their own wooden houses on the Church Farm (improvements remained their own property).

The largest single group of working people to settle this part of town were the cartmen, whose numbers and incomes had swollen during the war. They built homes and stables and declared their presence by planting cart-and-horse signs in front of their houses. (Because Trinity permitted subletting, some leased two or three lots for purposes of speculation.) Second in numbers to the carters were bricklayers, masons, house carpenters, stonecutters, and other representatives of the flourishing construction trades. Like cartmen, many of them worked not in their own homes but at job sites around town. Some artisans (cabinetmakers, for

example) and retailers moved west to set up combined work-and-living households, from which they could practice their trades. There were virtually no merchants or professionals (or blacks, who had been legally barred from owning property since 1712).

This proto-working-class neighborhood was set off by more than distance from the wealthier East River wards. The discrepancy between the Georgian grandeur of upperclass brick residences and the rough-and-ready wooden housing of artisans was readily apparent—inside as well as out. One knowledgeable observer calculated that while New York’s finest private homes averaged seven hundred pounds’ worth of “Plate and furniture,” and those of the “Middling” class some two hundred pounds, the contents of “lower Class” houses averaged a mere forty pounds, and many fell below twenty pounds. Then, too, the cobblestoned solidity of Hanover and Broad streets stood in marked contrast to the west side’s raw, unpaved roads, which frequently became quagmires of mud, garbage, and manure.

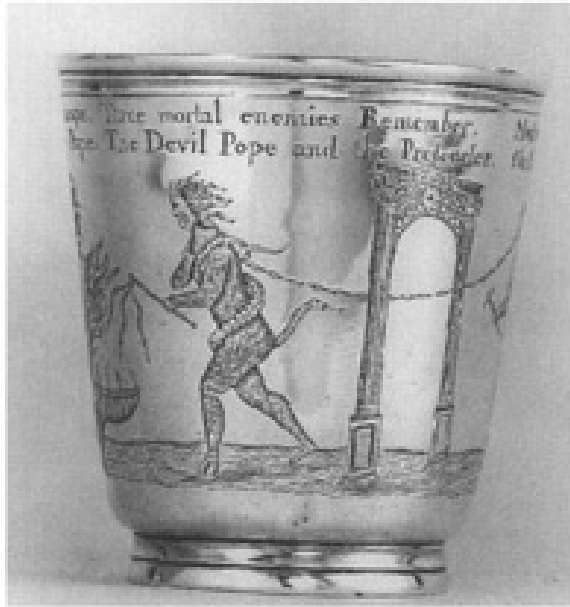

It was a comfortable quarter nonetheless, not too far from the city’s commercial district and anchored by institutions like Abraham Montayne’s tavern on Broadway, just across from the Common. Montayne’s became an informal neighborhood headquarters, a place to read a newspaper and talk over the latest news, a rendezvous for personal or public celebrations, a magnet for canny politicians who appeared on election day to buy a round for the voters. Its clientele could play at dice and cards (ignoring the provincial law that promised to fine innkeepers who let youths, apprentices, journeymen, servants, or common sailors gamble). They might also take a chance, between beers, on one of the “private Lotteries” that were springing up (also illegal because they encouraged “Labouring People to Assemble together at Taverns where Such Lotteries are usually Set on Foort & Drawn”). From time to time, as well, they could take in the display of a live leopard, a waxworks show, a bullbaiting, and other entertainments hosted by the proprietor.

Montayne’s was far from the only such establishment in New York. Dozens of waterfront dives like the Pine Apple, the Dish of Fry’d Oysters, or the Dog’s Head in the Porridge served similar functions for seamen and shipyard workers. Out-of-town drovers and city butchers congregated in the smoky, low-ceilinged rooms of the Bull’s Head Tavern, which stood just below modern Canal Street amid a jumble of stables, cattle pens, and

slaughterhouses. Increasingly, moreover, the sweaty, wood-and-pewter camaraderie of these workingmen's hangouts was shunned by persons of fastidious sensibility, who preferred the more genteel ambience of the King's Arms or the Queen's Head.

And if gentlemen still rubbed elbows with workingmen at cockfights, horse races, and the theater, the widening cultural distance between them was readily apparent now in the contrast between the fancy wig-and-powder fashions of the upper classes and the practical costumes of ordinary craftsmen or the hand-me-down garb of the poor. Nowhere, indeed, did the splendor of a refined gentleman in full regalia shine more brilliantly than in the light of advertisements for runaway servants during the 1750s. These often noted in detail what New York's poorest inhabitants wore from one day to the next: "a coarse Linnen Jacket"—"a Half worn blue Broadcloth Coat"—"half worn Shoes, with plain Brass Buckles in them"—"homespun Cloth Colour'd Jacket"—"blue Plush Breeches pieced behind with Buck-Skin, an old Felt Hat, blue Stockings, old ribbed leggings over them"—"old Leather Breeches patched before, a half worn Wool Hat, coarse light coloured ribbed Stockings, old Shoes"—"blue homespun coat and jacket, greasy leather breeches, old grey stockings."

Plebeians as well as patricians remarked on the new, increasingly visible distances between the classes. Some working people began to use terms like "silk-stocking" or "big-wig" as an epithet. In 1761 a certain "Sally Tippet" wrote sarcastically that many women still adhered to "home-bred fashions and complements," adding that "I believe the one-half have neither milliners, dolls, dressing-maids, dancing-masters, nor indeed pier-glasses."

Silver beaker, engraved by Joseph Leddel of New York in 1760 with scenes of the devil leading the Pope and Pretender into the mouth of Hell. The full inscription reads: "Three mortal enemies Remember. The Devil Pope and the Pretender./ Most wicked damnable and evil. The Pope Pretender and the Devil./ I wish they were all hang'd in a rope. The Pretender Devil and the Pope." These figures were no doubt very similar to the effigies carried in the city's

annual Pope Day celebrations. (© Museum of the City of New York)

This same trend can be traced in the emergence of Pope Day as a distinctively popular festival. The fifth of November, nominally a patriotic holiday commemorating the failed plot of Guy Fawkes to blow up Parliament, had had a kind of semiofficial standing in New York since the British conquest. It was an opportunity for the governor to make a speech, for gentlemen to toast the health of the monarch, for the artillerymen of the garrison to fire their cannon, for right-thinking inhabitants to illuminate their houses with candles in every window. Beginning in the later 1740s, however, the city's working people appropriated the day's festivities for their own purposes. Speeches by persons in authority gave way to raucous, torch-lit parades by tradesmen, sailors, apprentices, laborers, boys, and slaves that culminated with the marchers throwing effigies of the pope, the Pretender, and the devil into a roaring bonfire.

13

Crises

In September 1760 His Majesty's troops captured Montreal, completing the conquest of French Canada. The focus of the war now shifted from the North American mainland to the Caribbean, where British forces were preparing to assault France's island possessions. When the Spanish government appeared ready to assist France, Britain declared war on Spain as well. For New York, this turn of events proved disastrous.

Once-lucrative war contracts evaporated almost immediately, and in May 1761 the East River shipyards fitted the last fleet for an expedition against French Martinique and Dominica—both of which fell to Britain the next year, followed shortly thereafter by the capitulation of Havana. Privateering, vital to the well-being of every American port since the early 1740s, fell off sharply as the Royal Navy harried French and Spanish forces out of the Caribbean. The navy also shut down the clandestine traffic in molasses and sugar from the French West Indies on which many colonial merchants had depended, while an invigorated British customs service cracked down on American smugglers. The departure of British troops from Manhattan meanwhile constricted the flow of coins into the tills of local retailers and tavern keepers. As the merchant John Watts observed sadly: "The Tipling Soldiery that use to help us out at a dead lift, are gone to drink it in a warmer Region, the place of its production."

The 1763 Treaty of Paris confirmed Britain's triumph. France ceded the whole of Canada, abandoned its claims to land east of the Mississippi (except New Orleans), and withdrew from India. Spain had suffered losses in the Americas from which it would never recover, British merchants stood poised to take over the lucrative European trade with Africa and Asia, and London was positioned to become the financial axis of the world market. New York, though, sank into a depression worse than that of the 1730s.

British mercantile houses, reacting as well to a recession at home, cut back on credit and pressed merchants in New York and other colonial ports to settle outstanding accounts. Some firms abandoned long-established relationships to deal with newer, smaller importers and exporters in the

colonies—aggressive upstarts ready to trade on the narrowest of margins—or with public auctioneers, known as vendue masters, who could dispose quickly of great quantities of goods at sharply reduced prices. Others sent out their own agents to bargain directly with local shopkeepers and suppliers. “The weak must go to the wall,” warned one New York merchant, and for craftsmen engaged in the production of finished goods for the local market—ironware, furniture, shoes, hats, and the like—the influx of cheap imports from Britain’s overstocked mills and factories looked similarly ominous.

Hard-pressed merchants called in debts from shopkeepers and tradesmen—who then bore down on artisans, farmers, and country storekeepers. Hard money, of which there was never enough, virtually disappeared. The exchange rate soared, in effect siphoning the profits of recent years back to the mother country as importers scrambled to stay solvent. Domestic consumption fell off, markets languished, inventories of unsold goods mounted. Overextended merchants went bankrupt. Stores and shops stood empty. Journeymen, apprentices, and laborers found themselves out of work for the first time in years. “Our business of all kinds is stopped,” declared the *Post Boy* in December 1765. “Great numbers of our poor people and seamen without employment and without support. . . many families which used to live in comfortable plenty daily falling to decay for want of business.” In effect, one merchant declared, “Trade in this part of the world is come to so wretched a pass that you would imagine the plague had been here.” Before 1760 there had never been more than sixteen actions against debtors in any given year; by 1763 there were forty-six; by 1766, eighty. So many debtors were locked up in the recently completed New Gaol (conveniently located in the Common next to the almshouse) that it was already being called the debtors’ prison.

The crisis was exacerbated by relentless increases in the cost of living, which had already doubled during the war and now continued to rise as Britain’s burgeoning demand for colonial grain helped push prices higher still. Small houses renting for ten or fifteen pounds were in such short supply that families of modest means were beginning to double up. Food was more expensive than ever, and during the winter of 1760-61, with unemployment spreading, the cost of firewood rose drastically. Taxes, chiefly regressive imposts and excises, mounted sharply. Even steadily

employed craftsmen and established shopkeepers found themselves badly squeezed. As one artisan wrote in 1762 to the *New-York Gazette*, “the Expençe of living in the most frugal Way has increased so exorbitantly, that I find it beyond my ability to support my Family with my utmost Industry—I am growing every Day more and more behind hand, tho’ my Family can scarcely appear with Decency, or have necessaries to subsist.” This, he insisted, “is really the Case with many of the Inhabitants of this City.” Things remained equally grim five years later according to a “tradesman” writing in the *New York Journal*: “What a dismal Prospect is before us! A long Whiter, and no Work; many unprovided with Fire-wood, or Money to buy it; House-rent and taxes high; our Neighbors daily breaking; their Furniture at Vendue at every Corner.”

The times were even harder for widows, transients, former indentured servants, British deserters, ex-privateers, recent immigrants—people with the smallest savings, who spent most of their scarce resources on the hard-to-trim items like food, rent, clothing, and fuel. Worst off were the aged or infirm slaves whose owners set them free to save money, a practice so widespread by 1773 that in order to keep down the cost of relief, the legislature imposed a fine of twenty pounds on the last owner of any freedman found begging in the city.

To make matters worse, working people faced competition for jobs, food, and firewood from the numerous military personnel who remained in the city. By law, off-duty sailors and soldiers could take odd jobs or even practice trades to supplement their normally low wages. It was notorious that they would work for next to nothing. The anger this generated was intensified by the Royal Navy’s ongoing attempts to fill out crews by impressing seamen from town. When four fisherman were taken from their boat and carried to a nearby man-of-war in July 1764, an infuriated crowd dragged the ship’s barge to the front of City Hall, burned it, then forced municipal officials to negotiate for the release of the captives.

Spiraling municipal expenditures for relief bear witness to the spread of poverty. Between 1740 and 1760 the city’s average annual expenditure for poor relief was £667 (some £39 per 1,000 population), but between 1761 and 1770 the annual average soared to £1,667 (£92 per 1,000). In 1765 the churchwardens informed the Common Council that money raised for the relief of the indigent “had been “Long Since Expended,” yet the “distresses

of the Poor” had become “so Extremely Great” that many “must unavoidably perish” without additional assistance for food and firewood.

Private charity, churches, and national groups like the St. George’s Society and the St. Andrew’s Society shouldered much of the burden, as always. In 1767 some Irish officers in the British army formed the Ancient and Most Benevolent Order of the Friendly Brothers of St. Patrick in the Sixteenth Regiment of Foot; by 1769 its sixty members included civilians as well, and in 1771 they relieved some of their countrymen languishing in the debtors’ prison. Such efforts weren’t nearly enough, and the Common Council discussed various schemes for simply removing the poor from the city, often to places like Staten Island.

Not everyone suffered. Wealthy merchants, lawyers, crown officials, and naval officers lived no less comfortably than they had at the peak of wartime prosperity. The annual cycle of musical recitals, masquerades, balls, and routs went on as before. Performances continued at the Chapel Street Theater. Better shops continued to stock a full range of imported luxuries, and, as one New Yorker informed a London newspaper, “notwithstanding the great complaints of the distressing times, we have here no less than four coaches which were brought hither from London in the last ship.” By 1770, according to one count, a mere sixty-two people owned all the city’s eighty-five fashionable “equipages”—twenty-six coaches, thirty-three chariots, and twenty-six phaetons.

In 1764 a party of rich young aristocrats organized a “macaroni table” at London’s fashionable Almack Club. Their foppish, devil-may-care manner of dressing—short waistcoats, huge wigs, small cocked hats, tasseled walking sticks—represented the height of Italianate fashion. Hard times or no, the so-called macaroni style was at once picked up in New York, which boasted a Macaroni Club of its own at least by the autumn of 1764. That same year the club proclaimed its indifference to the city’s straitened circumstances by offering purses of £100 and £150 for the fastest horses at the Hempstead races.

These excesses attracted a good deal of unfavorable attention around town, and local newspapers soon began to carry letters from indignant residents that had a distinctly radical edge. “Some Individuals,” one writer told the *New-York Gazette* in 1765, “by the Smiles of Providence or some other Means, are enabled to roll in their four wheel’d Carriages, and can

support the expense of good Houses, rich Furniture, and Luxurious Living. But is it equitable that 99, rather 999, should suffer for the Extravagance or Grandeur of one? Especially when it is considered that Men frequently owe their Wealth to the impoverishment of their Neighbors?”

NEWCOMERS

Faltering trade, unemployment, inflation, poverty—to this litany of trouble was added another: a sudden rise in the city’s population. In 1760 New York had roughly eighteen thousand inhabitants. Over the next ten years or so, the city’s population jumped by four thousand—a 20 percent increase. By 1775 it stood between twenty-two and twenty-five thousand. Only Philadelphia, with forty thousand inhabitants, was larger; Boston now trailed far behind, having barely reached sixteen thousand.

Behind this demographic expansion lay an unprecedented surge in transatlantic migration. Between 1760 and 1775 better than 137,000 Europeans poured into the thirteen colonies—roughly fifteen thousand people every year, three times the average rate before 1760. The great bulk of them—125,000 or so—came from the British Isles, some fifty-five thousand from Ireland (predominately but not exclusively Protestant), another forty thousand from Scotland, and the remaining thirty thousand from London and Yorkshire. Of those whose occupations are known, most were trained artisans and craftsmen, directly or closely tied to the beleaguered textile industry, which was going through a period of massive unemployment. About two-thirds of the Irish and English emigrants, generally young men and women on their own, came as indentured servants. Fewer than one-fifth of the Scots did so, presumably because they were somewhat older, included a higher proportion of laborers, and traveled as families, sometimes entire communities.

Land was the goal of the overwhelming majority of these immigrants, and they headed as quickly as possible for the rapidly expanding colonial frontier. No one kept count of how many went to the province of New York, but estimates place the figure at roughly twenty-five thousand. Most were recruited by local merchants to settle and develop property they had purchased far to the north and west, so only a small minority of these new arrivals, probably fewer than one out of every six or seven, actually took up residence in town. (That was enough, however, to make a noticeable

difference in its racial balance, for while the absolute number of slaves in New York rose from 2,278 in 1756 to 3,137 in 1771—a growth of 38 percent—the proportion of Africans in the population fell from 18 percent to 14 percent because the number of whites grew even more rapidly.)

For the permanent residents of New York as well as for transients, the hubbub on waterfront wharves and piers—the confusion of accents, the clattering, milling congestion of it all—was something to behold. Between 1773 and 1775 alone, forty-odd vessels disgorged as many as thirty-three hundred men, women, and children in the city, equivalent to 15 percent of its population.

The newcomers brought additional competition for scarce jobs and resources. They also brought new voices of protest, for they included some of Britain's most militantly disaffected urban craftsmen and rural laborers—unemployed journeyman weavers from the Spitalfields district of London who tried to storm Parliament in 1765 and followed George III about with black flags; shipwrights recently discharged from the royal naval yards after striking for higher wages; and some of the bands of Whiteboys, Oakboys, and Steelboys who were now throwing down fences and mobbing landlords in Ireland. Their anger against the British government, and the experience they had gained while fighting it, ensured that the postwar political climate of New York would become increasingly volatile.

POLICY

Even before the war with France was over, young George III began fiddling with the political system in England. It now appeared that his break with Pitt was only the beginning of a campaign to reassert the power of the monarchy by arranging a permanent majority for it in Parliament. Year after year, more and more impatient with long-established alliances, the king shuffled ministers, shifted policies, and shoveled out patronage on a scale that would have made Walpole himself cringe.

Also on the royal agenda was a new get-tough attitude toward the colonies. Like a good many people, the king no longer believed that America could be controlled, as in the past, by the easygoing, solicitous policy that Edmund Burke famously defined as “salutary neglect.” Uncooperative colonial courts and legislatures had repeatedly obstructed

the recent war effort, or so it was said; now, without the threat of French Canada hanging over their heads, there was every reason to expect the colonies would become more rather than less difficult to manage in the future. Besides, customs fraud, smuggling, and illicit manufacturing had flourished so extravagantly during the war that respect for imperial regulations seemed to have sunk to an all-time low, even among the richest and most respectable elements of colonial society.

The crux of the matter was money. Given that customs duties accounted for well over a third of the crown's income, how was the government to finance the defense of Britain's vast new conquests, much less pay off the nation's sky-high war debt, if the colonies continued to flout the law? Increased domestic taxation was next to impossible: the landowning classes refused to accept a higher land tax, while stiffer excises looked very risky in light of widespread industrial and agrarian unrest. Considering how much the mother country had already done for the colonies, let alone the precarious state of her finances, surely the time had come for them to bear their fair share of imperial expenses. What were colonies for, after all?

In that frame of mind the king and his ministers began to tighten the administrative screws of the Empire. As early as 1761 customs officials were authorized to use writs of assistance, a kind of search warrant, to ensure compliance with the Navigation Acts. In 1763, in addition to banning further settlement across the Appalachians, the government announced it would station ten thousand British regulars in America to make certain that His Majesty's subjects did as they were told.

The following year, Chancellor of the Exchequer George Grenville won parliamentary approval for a sweeping American Revenue Act. Popularly called the Sugar Act, it raised duties on a variety of items imported into the colonies, provided more efficient collection of duties on sugar and molasses imported from the foreign West Indies, required all duties to be paid in silver, and lengthened the list of colonial products that could be shipped only to Britain. A companion bill gave the customs service broad new powers to catch and prosecute merchants who violated trade regulations. Still another measure, the Currency Act, prohibited colonial governments from issuing paper money to meet the need for specie. If necessary, Grenville said, he would also ask Parliament to raise a revenue in the colonies by means of a stamp tax.

In New York, Grenville's program looked all the more threatening thanks to the dour, petty, self-righteous, and dogmatic Cadwallader Golden. For nearly half a century now, ever since Governor Burnet put him on the council, Golden had complained to anyone who would listen that the crown's interests were being thwarted by the venality of New York's great landlords and merchant princes—to say nothing of the lawyers who trailed behind them (Golden's contempt for lawyers knew no bounds). They in turn cordially despised him. Even the Livingstons, perhaps more sympathetic than any other of the colony's great families, felt uneasy about the man.

When Lieutenant Governor De Lancey died unexpectedly at the end of July 1760, Golden, senior member of the council at the age of seventy-two, became acting governor. True to form, Golden promptly threw himself into a series of amazingly ill timed and provocative reforms that made him a target for the wrath of both the Livingston and De Lancey factions. He infuriated New York's powerful legal community by undermining the finality of jury verdicts and insisting that judges in the colony served at the pleasure of the crown (one of his few backers on the bench was Chief Justice Daniel Horsmanden, recently restored to official favor). He angered merchants and artisans alike by making a special effort to prevent any revival of illegal trade with the French West Indies. He enraged the great landholders by trying to annul some of the largest land patents in the colony. The furor died down when Robert Monckton arrived to take over as imperial governor—then resumed with even greater ferocity when Monckton returned home in the summer of 1763, having spent only eighteen months on the job, and Golden was once again in charge of the colony.

RESISTANCE

Alarmed by the altered tenor of affairs at home and abroad, New York's merchants spent much of 1764 drawing up petitions—to the Assembly, to the House of Commons, to the House of Lords, to the king himself. The basic message was always the same: don't try to squeeze more revenue out of the colonies, don't saddle the West Indian trade with additional duties, don't prohibit paper money, don't meddle with the system of trial by jury, don't tax the inhabitants of America without their consent. Over the winter of 1764-65 the Common Council took the additional step of declining to

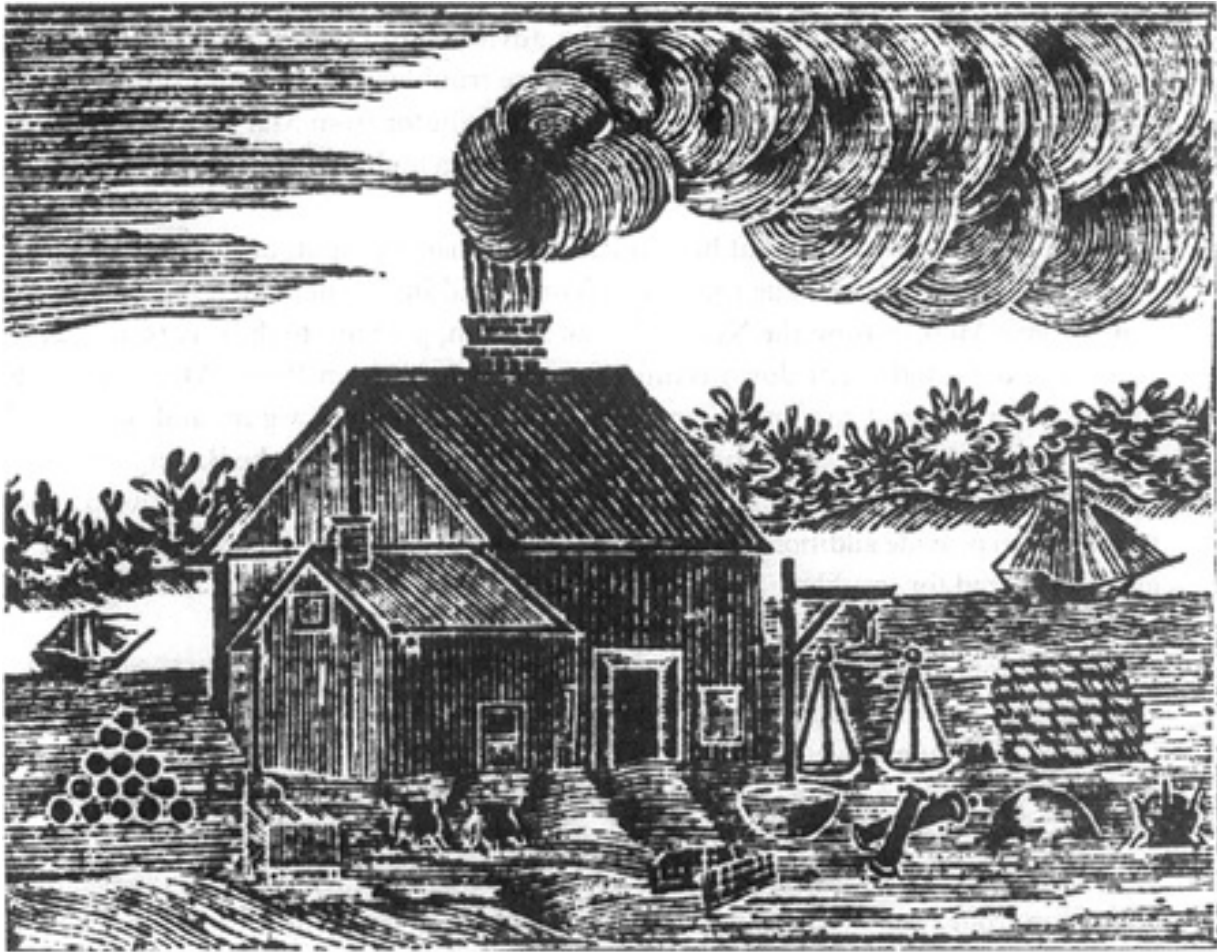

provide firewood for regular troops quartered in the New Barracks above the Common. It had always done so in the past. But this year, Mayor John Cruger informed Major General Thomas Gage, the new commander-in-chief of British forces in America, the city simply didn't have the money.

One group of wealthy New Yorkers applied pressure from a different direction. In the autumn of 1764 they set up the Society for the Encouragement of Arts, Agriculture, and Economy to promote the domestic production of manufactured goods hitherto imported from Britain, above all linen cloth. The loss of American markets would send an important message to Parliament, the society's backers theorized. What was more, domestic manufacturing would slow the drain of specie to the mother country and create work for the city's growing numbers of jobless poor. By teaching frugality and self-reliance, it would counteract the enervating effects of "the vast Luxury introduced during the late war." It looked like a good investment too.

Within months, prompted by the society's offer of cash bounties for the purchase of equipment, a linen factory with fourteen looms opened on Mulberry Street, near the Fresh Water Pond. Several spinning schools for the children of paupers were set up as well, and a new municipal market was designated for the sale of flax and yarn. Before failing a year or so later, the enterprise would employ some three hundred people, mostly poor women. It also accorded a certain legitimacy to an upsurge of popular resentment against the ostentatiousness that had so greatly altered the city over the previous two decades. "All pride in Dress seems to be laid aside," Robert R. Livingston observed, "and he that does not appear in a Homespun or at least a Turned Coat is looked on with an Evil Eye." Well-to-do women resolved that they would "let a horrid homespun covering (which can become none but a country wench) take the place of the rich brocade and graceful satin." Even Governor Golden and members of his council were seen in homespun coats.

Parliament took no notice and in the spring of 1765 made good its threat to pass a Stamp Act. The measure taxed a broad range of paper and paper products sold in the colonies, and the revenues raised were to be paid into the royal treasury for the maintenance of British troops stationed in America—meaning, of course, a proportionate reduction in the flow of

military appropriations from Britain that had boosted the colonial standard of living in the 1740s and 1750s.

The drive to reduce American dependence on British imports prompted Peter Curtenius and Company to build this iron foundry on the Hudson River in 1767. It produced kettles, pots, plows, and other items for the local market. In 1776 Curtenius contracted to make bayonets and muskets for local patriots. (© Collection of The New-York Historical Society)

More important, the Stamp Act put at risk the power and authority of every colonial political establishment by violating the old assumption that the inhabitants of America could be taxed only by representatives of their own choosing. Partly in response to Gage's prompting, Parliament also adopted a Quartering Act that required civil authorities in the colonies to provide shelter and supplies for British troops. Never before had Parliament

attempted to tax the colonies directly; never before had it ordered them to help pay imperial bills. To many colonists this was tantamount to slavery. Britain “will make Negroes of us all,” cried Robert R. Livingston.

By the summer of 1765 urban America was in an uproar. In New York, the Assembly agreed to host an emergency Stamp Act Congress in October for the purpose of coordinating colonial opposition. There was talk of refusing compliance with the Quartering Act on the grounds that it, like the Stamp Act, violated the ancient principle of no taxation without representation. What, after all, was the difference between a tax levied directly by Parliament and a parliamentary order that a colonial legislature spend money for one purpose or another?

RIOTOUS PROCEEDINGS

Mid-August brought word from Boston of a violent disturbance that forced the stamp distributor there to resign in fear of his life. James McEvers, a rich merchant who had accepted appointment as New York’s distributor, announced that he too would resign to avoid “the like treatment.” “My House would have been Pillag’d, my Person Abused and His Majestys Revenue Impair’d,” he advised Governor Colden. McEvers’s announcement was followed by reports of more trouble in Boston and the spread of rioting to Newport, Rhode Island. The stamp distributor from Maryland appeared at the gates of Fort George to tell how he had fled from a mob in that colony with just the clothes on his back.

Colden, now grasping what he and Parliament had wrought, began to prepare for the worst. He informed Gage that Fort George couldn’t be defended “in its present state, from a Mob, or from the Negroes”—an allusion, perhaps, to the events of 1741—and Gage obligingly sent down reinforcements from Crown Point. Major Thomas James, commander of the Fort George artillery, wheeled up new guns and positioned them on the walls to enfilade Broadway. Colden had the cannon on the Battery spiked to prevent their being turned against the fort, strengthened its gates, and had two frigates moved up to provide additional firepower if necessary. The more the truculent old governor prepared for trouble, however, the more it was said around town that he wanted trouble—and would get it if he tried to enforce the Stamp Act.

On October 7, 1765, twenty-seven delegates from nine colonies assembled at the City Hall for the long-awaited meeting of the Stamp Act Congress. Over the next eighteen days the Congress adopted declarations and petitions that denied Parliament's authority to tax the colonies and cautioned that its attempts to do so "have a manifest Tendency to subvert the Rights and Liberties of the Colonists."

On the evening of October 23, just as the Congress finished its work, the booming of cannon from a man-of-war in the harbor signaled the arrival of the stamps. The following day, as an angry crowd of two thousand gathered on the Battery, the *Edward*, escorted by two warships, dropped anchor under Fort George's ninety-two guns and awaited orders concerning the disposition of more than two tons of stamped paper, parchment, and vellum in its hold. Handbills circulated in the streets threatening violence against anyone assisting in their distribution ("the first Man that either distributes or makes use of Stampt Paper let him take Care of his House, Person, and Effects"). Ships in the harbor flew their flags at half-staff "to signify Mourning, Lamentation, and Woe." Golden had marines bring the stamps into the fort under cover of darkness, temporarily averting a confrontation.

One week later, two hundred of New York's "principal merchants" gathered at the City Arms Tavern on Broadway to sign a nonimportation agreement. It was the first pact of its kind anywhere in the colonies.

No British goods would be bought or sold in the city, vowed the merchants, until Parliament repealed the Stamp Act and removed the objectionable parts of the Revenue and Currency acts. They assumed that British exporters would pressure Parliament to act quickly, and in the meantime nonimportation would give local importers a chance to dispose of swollen inventories. It would stimulate the local production needed to pay for imports in the future. It would also toughen a people overly fond of foreign luxuries. Although this all went well beyond what the Assembly had been prepared to do, a crowd of artisans, mariners, and laborers had gathered outside the Coffee House in the expectation of still stronger measures. Disappointed, they staged a mock funeral for "liberty," then roamed the streets "in a mobbish manner," breaking lamps and windows and threatening to pull down houses.

On November 1, 1765, the day the Stamp Act took effect, business in the city came to a halt. An eerie calm descended over the usually busy

waterfront. Little or no traffic moved in the streets. Toward sundown, a crowd began to assemble in the Common, eventually some two thousand strong. Witnesses reported that it consisted of numerous sailors, youths, artisans, laborers, and blacks, along with many “country people” who had flocked to town from nearby farms and villages. With the upcoming Pope Day celebrations clearly in mind as a model, the crowd hoisted a scaffold from which hung an elaborate effigy of Governor Golden. One hand held stamped paper and a boot (symbol for the unpopular earl of Bute, the king’s current minister). The effigy’s other hand held a drum (recalling Colden’s service as a drummer boy in the Jacobite rising of 1715). Beside him sat the devil, whispering instructions in his ear.

A second column of demonstrators appeared, dragging Colden’s private coach and another effigy of the unpopular governor. “With the grossest ribaldry,” according to one witness, the two groups marched with gallows, coach, and effigy down Broadway to the fort, their way lit by candles and torches. They hurled bricks and stones at the walls and challenged the garrison to open fire; according to the chief engineer of His Majesty’s forces, “300 Carpenters belonging to the mob were collected & prepared to cut down the Fort Gate on the first Shot fired from thence.” Although Golden wouldn’t give the order to fire, a letter was nailed on the gate warning him that if he used force to uphold the Stamp Act, “you’ll die a Martyr to your own Villainy, and be Hang’d like Porteis, upon a Signpost, as a Momento to all wicked Governors, and that every Man, that assists you, Shall be, surely, put to Death.” The crowd then dragged his private coach over to Bowling Green and burned it along with the effigies.

From Bowling Green some “Volunteers” proceeded back uptown to Vauxhall, where they sacked the home of Major James, the fort’s artillery commander, who had incautiously sworn to “cram the Stamps down their Throats with the End of my Sword.” “Looking Glasses Mehogany Tables Silk Curtains A Libiry of Books all the China and furniture”—anything, in short, that bore witness to the refinement of its owner—was thrown into the street and smashed. The major’s private papers and personal effects were destroyed; his wine cellar was broken open and its contents consumed or destroyed; his garden was torn up. (The Assembly later awarded the major £1,745 to cover the damage, a generous sum. Golden put his losses at around £195. The Assembly gave him nothing.)

Men of property and reputation in the city, even those who had been outspoken in opposition to the Stamp Act, floundered in disbelief at what was happening. The governor's council believed New York to be in a state of "perfect anarchy." Robert R. Livingston, proprietor of Clermont and a Dutchess County assemblyman, found the mayor and his advisers "extremely dejected" and paralyzed with "despondency and irresolution." Crowds, including armed newcomers from Connecticut and New Jersey, milled about the streets waiting for something to happen. Rumors flew of an impending attack on the Fort on November 5 (Pope or Guy Fawkes Day), of attempts on the lives of officials, and, worse, of "an open Rebellion" by a "secret party, who called themselves *Vox Populi*." Golden, who believed that "a great part of the Mob consists of Men who have been Privateers and disbanded Soldiers whose view is to plunder the Town," fled with his family to the warship *Coventry* for protection. An apprehensive group of merchants associated with the Livingston faction met at the Merchants' Coffee House to discuss ways of preventing "all riotous proceedings," but broke up in confusion.

Tensions eased when Golden, fearing "the Effusion of blood and the Calamities of a Civil Warr," turned the stamps over to municipal officials, who carried them off for safekeeping in City Hall. A huge throng of five thousand lined the streets to watch. Everyone breathed a little easier, too, when a new royal governor, Sir Henry Moore, arrived on November 13 to relieve Golden. Moore's appointment was his reward for brutally crushing a Jamaican slave revolt, but he had no intention of using force to make New York accept the stamps. Instead, on the theory that a few months of economic stagnation would bring the colonists to their senses, the governor simply refused to permit any business to be conducted that would require the use of stamped paper. "All their commerce must inevitably be ruined if they persevere in their obstinacy," he explained smugly.

SONS OF LIBERTY

New York's obstinacy, as Governor Moore called it, reflected the rising influence in municipal affairs of persons and groups that spoke for the city's middling and laboring classes. One, as Livingston reported, went by the name of *Vox Populi*. Another was known as the Sons of Neptune, yet another as the Free Sons of New York. Most famous was the Sons of

Liberty, which seems to have been formed in late October or early November 1765, just prior to Governor Moore's arrival.

The Sons of Liberty was the creation of Alexander McDougall, Isaac Sears, John Lamb, Hugh Hughes, Marinus Willett, and others—plain-spoken, self-taught, self-made men, the kind who had carried little weight in municipal affairs since at least the end of the last century, if ever. McDougall's family had emigrated from Scotland when he was a boy, and his father operated a profitable dairy farm on the outskirts of town. At the age of fourteen, McDougall left the farm and went to sea. Diligent and reliable, he worked his way up to become a highly successful captain of privateers during the Seven Years War. With the end of the war, still in his early thirties, he came back to New York and set himself up in the West Indian trade. He prospered, bought a lot of land up in Albany County, and scandalized the refined classes with his flamboyant manner and flashy taste in clothes. Through the Presbyterian Church he also became a disciple of the Whig Triumvirate—William Livingston, John Morin Scott, and William Smith Jr.—under whose influence he read everything from *Cato's Letters* to nonconformist religious tracts.

Like McDougall, Isaac Sears was an immigrant to New York—from Norwalk, Connecticut, where his family had lived modestly for many years, and from where he also had gone off to sea. Like McDougall, he made his way up through the ranks and by his early twenties was a captain in the West Indian trade regularly employed by prominent New York merchants. Like McDougall, too, Sears turned privateer during the Seven Years War, won a reputation for heroism under fire, and made himself a small fortune, some of it in clandestine trade with the French. After the war, Sears established himself as a West Indian merchant in New York, where by his mid-thirties he was living like a gentleman—though everyone could tell by his quarterdeck manners that he wasn't one.

John Lamb's father had been convicted of burglary in his native England and transported to New York, where he found work making optical instruments. His son made mathematical instruments. Marinus Willett, whose early history is almost as vague as Lamb's, was a successful master cabinetmaker still in his mid-twenties when the Stamp Act crisis erupted. The dominant influence on his life seems to have been the evangelical Protestantism that periodically swept through the city beginning in the early

1740s. He moved restlessly through a succession of sects, unable to find one that quite suited his temperament, and played a leading part in the city's annual Pope Day celebrations.

What made the likes of McDougall, Sears, Lamb, and Willett so formidable was the fierce loyalty they inspired among New York's artisans, apprentices, seamen, and laborers. They were easy men to respect and good men to follow. They had come up in the world, but without the advantages of inherited wealth, fancy educations, or powerful connections—and without forgetting where they came from. They were still, unmistakably, workingmen themselves. They talked like workingmen—McDougall's Scottish burr and Sears's Yankee twang were nothing like the flat, nasal English of the upper classes—and they could still make the rounds of crowded workingmen's taverns and coffeehouses, pumping hands and slapping backs, with a straightforward, natural confidence. Willett's father, in fact, operated the Province Arms, while Sears's father-in-law owned Drake's alehouse on Water Street near Beekman's Slip, very popular among the Sons; at one time McDougall may even have owned a sailor's "slop shop." It was precisely this common touch that enabled them to link popular social and political grievances to the formal constitutional issues raised by British policy.

"OUR PORT IS SHUT UP"

Toward the end of November 1765 the Sons of Liberty posted notices around New York headed LIBERTY, PROPERTY, AND NO STAMPS and calling for a meeting at Burns's Coffee House. Enfranchised freemen or not, all residents were invited to take part. On the agenda were radical proposals that the provincial assembly "repeal" the Stamp Act and that merchants resume trade in defiance of Governor Moore's prohibition. Alarmed by this bold attempt to take charge of New York's resistance movement—let alone the extremism of the Sons' proposed remedies—the Livingston and De Lancey factions first tried to prevent the meeting, then, when that failed, determined to prevent it from getting out of hand. They succeeded, barely. A slate of moderate resolutions was adopted and forwarded to the Assembly, which used them as the basis for yet another petition to Parliament.

From the early winter of 1765 through the spring of 1766, the Livingstons and De Lanceys, jointly or at cross-purposes with one another, continued their efforts to tame the Sons of Liberty. Governor Golden, General Gage, and other officials always took it for granted that the Sons couldn't be acting independently of either one or the other faction—mostly on the grounds that common people couldn't act in concert unless led by gentlemen. “The Plan of the People of Property has been to raise the lower Class to prevent the Execution of the Law,” Gage wrote. “The whole Body of Merchants in general, Assembly Men, Magistrates, &c. have been united in this Plan of Riots, and without the Influence and Instigation of these the inferior People would have been quiet.”

In truth, the New York Sons of Liberty followed no one's direction but their own. Just a few days before Christmas they formed a Committee of Correspondence and charged it with the task of seeking a military alliance or union with their comrades elsewhere in the colonies; their idea, which owed nothing to either the Livingston or De Lancey faction, was to be ready to go “to the extremity with lives and fortunes” to prevent enforcement of the Stamp Act. The committee's efforts were successful. By the following spring the New York plan for a “Union of the Colonies” had been greeted with enthusiasm from Massachusetts to South Carolina—except, of course, by crown officials and handfuls of ministerial sympathizers who understandably viewed it as out-and-out treason. Even when word began to get around that Parliament would soon repeal the Stamp Act, the New York Sons continued to emphasize that the liberties of America couldn't be preserved without vigilance and organization.

On their own authority, too, the Sons took to the streets of New York so often over the winter and spring of 1766 that, as Governor Moore told Lord Dartmouth in January, the magistrates were terrified of displeasing them. They had “Children nightly trampouze the Streets with lanthorns upon Poles & hallowing.” They led noisy crowds around town with effigies of Golden, Grenville, and other unpopular officials; once they depicted Golden “mounted on a Cannon drilling the vent”—a ribald commentary on his orders to spike the fort's cannon. Tongues in cheek, they warned that all persons caught selling or eating lamb in New York would have their houses pulled down.

Early in May, a party of Sons interrupted the opening performance of the Chapel Street Theater. It was “highly improper that such Entertainments should be exhibited at this Time of public distress, when great numbers of poor people can scarce find subsistence,” they announced. Shouting, “Liberty, Liberty,” they then drove the audience out in a shower of “Brick Bats, sticks and Bottles and Glasses,” stripping many along the way of “their Caps, Hats, Wigs, Cardinals, and Cloak Tails”—all symbols of wealth and disdain for a virtuous frugality. The crowd then reduced the building to kindling and carted it off to a giant bonfire in the Common.

In the meantime Sears and troops of Liberty Boys brought pressure to bear on merchants who broke the nonimportation agreement, routinely inspecting papers, confiscating goods, and forcing offenders to recant in public. So effective were these measures that when spring arrived the Sons virtually controlled business in the city. “The people of this province seem to have such an aversion to taking the stamp papers, that they will sooner die than take them,” declared one resident. “Our port is shut up, no vessel cleared out, no law, and no money circulating.”

The radicalism of New York’s Liberty Boys had its limits, though, as events in the countryside soon demonstrated. Early in 1766 word began to reach the city that tenant farmers in the Hudson Valley had risen against their landlords. First in Dutchess, then in Westchester and Albany counties—on the vast estates of the Philippses, Van Rensselaers, Livingstons, Beekmans, Van Cortlandts, and other great proprietary families—disciplined bands of rebels, some said to number in the thousands, were shutting down courts, throwing open jails, and fighting pitched battles with hastily organized posses. Most sought only more secure leases and lower rents; others wanted to buy their land outright and pay no rent at all. A few at least professed to be “levelers” and looked to the day when the land would be divided equally among those who worked it. All were keenly aware that among their landlords were men who had lately been talking a great deal about liberty and freedom.

In April 1766 as many as two thousand insurgents massed at King’s Bridge, which linked northern Manhattan and Westchester. Calling themselves true “Sons of Liberty,” they made ready to march into New York City, join forces with “the poor people there,” and pull down the town houses of big landowners. If anyone got in the way, they warned, they

would “kick their Arses as long as we think fit.” Even the king would get such treatment, declared William Prendergast, one of their leaders, “for Kings had been bro’t to by Mobs before now.”

But the city’s poor didn’t respond as hoped. Nor did the Sons of Liberty, who, after some initial stirrings of sympathy, recoiled from the farmers’ more radical egalitarianism. Governor Moore called out the militia and drove them away without bloodshed.

REPEAL

Grenville had meanwhile quarreled with the king, who replaced him with the marquis of Rockingham. Rockingham, eager to disentangle his new government from Grenville’s controversial policies, promptly abandoned the Stamp Act. Parliament passed a repeal bill in March 1766, and George III signed it into law a month later.

When word of the repeal reached New York on May 20, the town went berserk with joy. Crowds of merrymakers surged through the streets, roaring out their approval against a background of clanging church bells, exploding firecrackers, and sporadic musket fire. The Common Council added its voice to the festivities by appropriating funds to erect a statue of George III in Bowling Green.

Grander festivities followed on June 4, the king’s official birthday. A throng of thousands gathered in the Common to devour, at public expense, two barbecued oxen, twenty-five barrels of “strong Beer,” and a hogshead of rum. While a band played “God Save the King,” a flagstaff was erected with the standard of George III and a banner with the word **LIBERTY** in large letters. Near the flagstaff went up a liberty pole—ancient symbol of popular defiance to tyranny—with a dozen tar and pitch barrels suspended from the top. A “Grand illumination throughout the city” followed in the evening, after which the day “ended in Drunkenness, throwing of Squibbs, Crackers, firing of muskets and pistols, breaking some windows and forcing off the Knockers off the Doors.”

Royal Navy transports arrived in June with two regiments—three or four thousand men in all—to reinforce the British garrison, and General Gage promptly dispatched one of the two to mop up what remained of the tenant insurgency. His redcoats arrested scores of rebels, dispersed them at

gunpoint, and caused considerable property damage in the process. A special court—consisting of Chief Justice Daniel Horsmanden and seven associate justices, including Oliver De Lancey, assisted by lawyers John Morin Scott and William Smith Jr.—met in July 1766 to hear the cases of some seventy men charged with riotous assault. Most received stiff fines and jail terms. William Prendergast, denied counsel, was found guilty of high treason and sentenced to death. The king pardoned him six months later, but the court's harshness wasn't forgotten. Scott's role in it remained a sore point with the insurgents for years.

After much discussion about forming a permanent political club, the Sons of Liberty decided to suspend operations until such time as the rights of America were again in danger. That time was nearer than most realized. For even as it repealed the Stamp Act, Parliament had also passed a little-noticed Declaratory Act, reaffirming its right to tax the colonies "in all cases whatsoever."

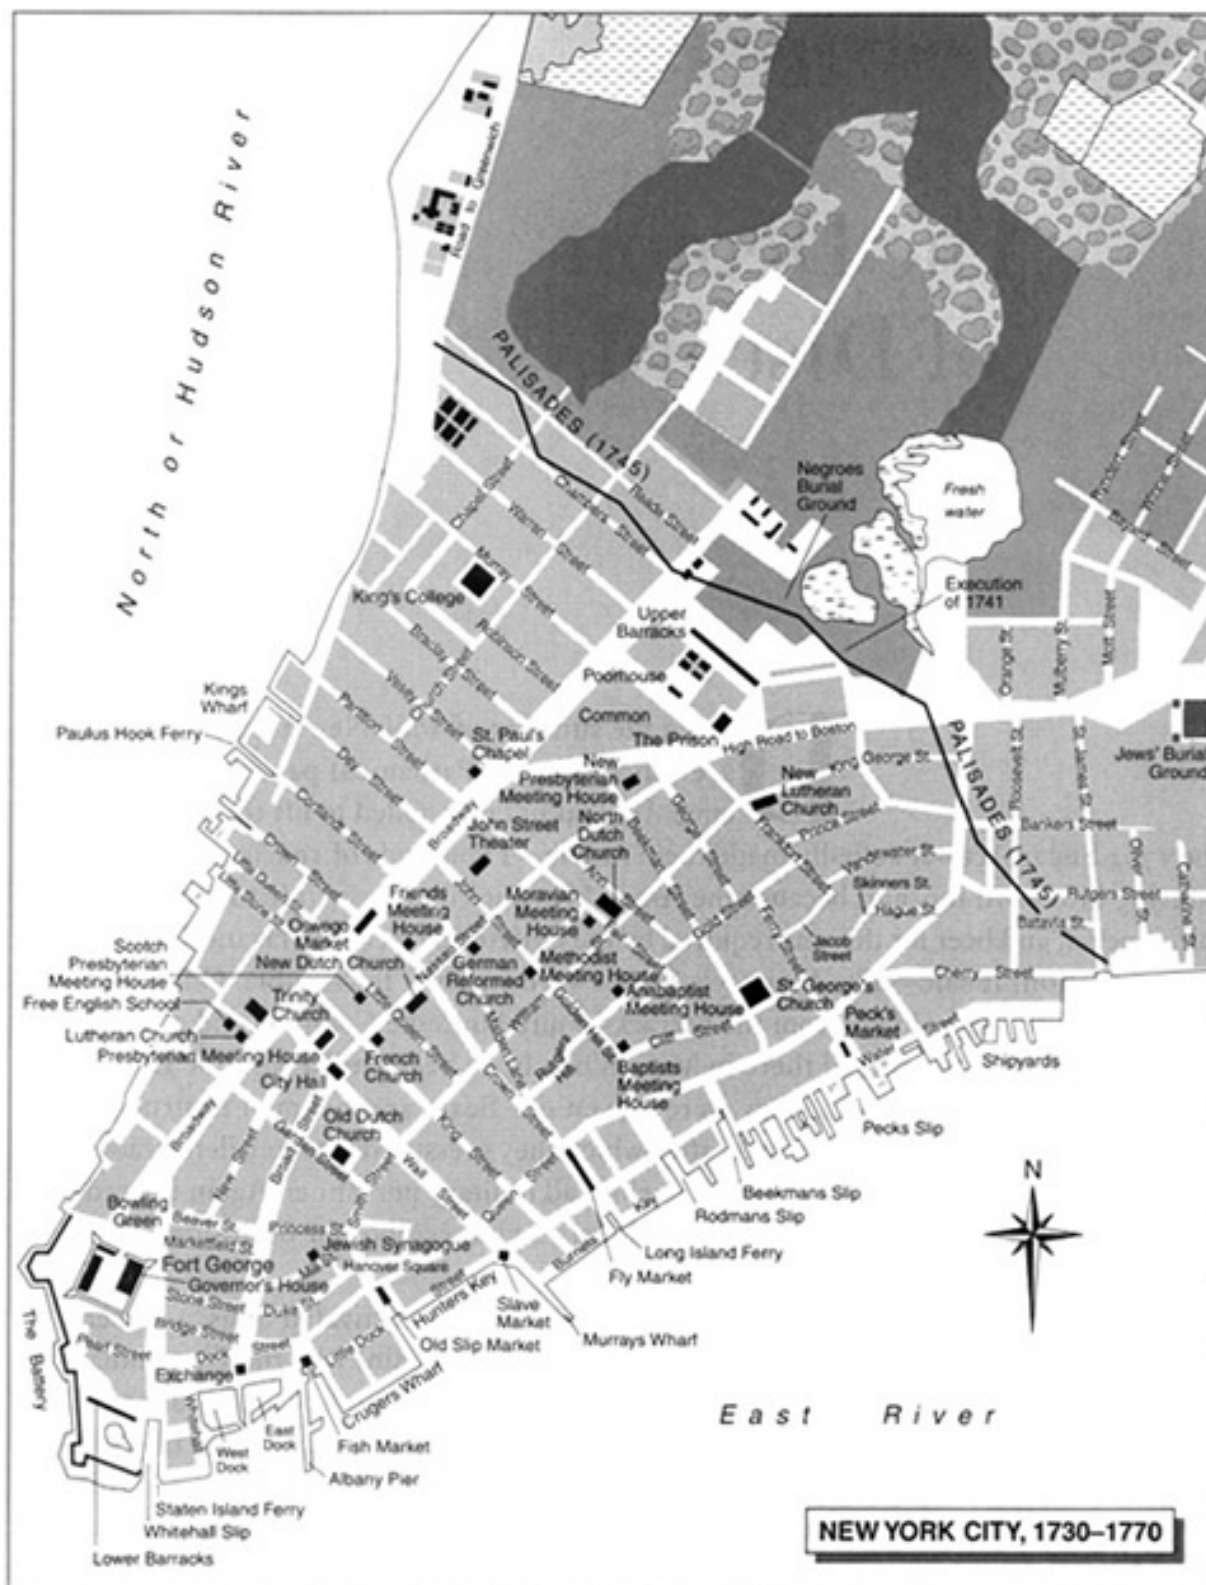

Nothing, in short, had been settled.

The Demon of Discord

During the summer of 1766 New York's prospects grew more dismal. Parliament passed a new Revenue Act that not only failed to lift the burdens of the 1764 Sugar Act but actually made them heavier. Thousands of redcoats were now pouring into town too, and because the Assembly refused on principle to requisition salt, vinegar, and beer for them as required by the Quartering Act—no taxation without representation, it said—His Majesty's forces were spoiling for trouble. One day in August 1766 fed-up soldiers from the barracks poured into the Common and chopped down the liberty pole erected there in May. When Isaac Sears and a party of Liberty Boys tried to put it up again, they were driven off. Sears and his men returned in strength to raise an even grander pole, after which they pressured local retailers, tradesmen, tavern keepers, and householders to shun all military personnel. Again the redcoats destroyed the liberty pole—now obviously a vital symbol for both sides—and again Sears and company replaced it.

Toward the end of November 1766, summoned by the reactivated Sons, 240 merchants signed a lengthy petition to Parliament explaining (again) why the West Indian trade was vital to the city's long-term prosperity and should not be sacrificed for the short-term purposes of raising revenue. Arriving at the same time as news that the New York Assembly still refused to comply with the Quartering Act, the petition was ill received in London. "Highly improper," harrumphed Prime Minister Chatham, "most absurd. . . most excessive. . . most grossly fallacious and offensive. What demon of discord blows the coals in that devoted province I know not."

Charles Townshend, the new chancellor of the exchequer, asked Parliament to suspend the New York Assembly. Because the Lords and Commons had recently slashed the land tax, throwing the government further into the red, Townshend also urged Parliament to create a new Board of Customs Commissioners to stiffen enforcement of the Navigation Acts and improve the collection of revenues from the colonies. Finally, he proposed the imposition of new taxes on paper, lead, glass, ink, paints, and tea imported into the colonies. By June 1767 his program had become law.

THE TRANSFORMATION OF POLITICS

Boston, roused over the late summer and early autumn by the oratory and organizational skills of James Otis and Samuel Adams, led the opposition to Townshend. Its merchants drew up the first in a new series of colonial nonimportation agreements, and early in 1768 the Massachusetts House of Representatives adopted a Circular Letter, inviting coordinated American protest against the Townshend program. Unwilling to back down a second time, Parliament and ministry responded with a show of force. The Massachusetts legislature was summarily dissolved—the second such body in as many years to fall before imperial wrath—and troops were dispatched to Boston as well to quell what was being referred to in London as a virtual insurrection.

For New York, the events of 1767 and 1768, though less dramatic than what took place in Boston, were no less tumultuous. In December 1767, at one of many protest meetings, residents chose a committee to devise yet another plan for promoting local manufactures, employing the poor, and encouraging frugality. The following April, the city's merchants organized its first Chamber of Commerce and agreed to join the nonimportation movement providing their counterparts in Philadelphia did likewise. In late August 1768 "Nearly all the Merchants and Traders in town" signed an agreement to begin nonimportation on November 1. Artisans and tradesmen, rallied by the Sons of Liberty, pledged to support the agreement and to use "every lawful Means in our Power" to see that everyone else did too. By the end of the year business in the city had once again come to a halt.

Two back-to-back elections for the provincial assembly had meanwhile strained long-established political practices and institutions to the breaking point. Although it escaped dissolution by Parliament on a technicality, Governor Moore dissolved the provincial assembly for objecting to the Townshend Duties, which led to an election in March 1768. Then he dissolved it again, for endorsing the Massachusetts Circular Letter and issuing a bold "Declaration of Rights," and another election followed, in March 1769. Sears and the Liberty Boys, who thought the Livingston-dominated Assembly hadn't done enough, threw their support to the De Lanceys, who won back much of the ground they had lost over the previous decade. Never before had the outcome of a faction fight between gentlemen been so influenced by men who weren't gentlemen.

Neither had gentlemen ever before faced such insistent popular demands for changes in the political process: open sessions of the Assembly, secret ballots, and strict adherence to the principle that legislators should do what they were instructed to do by their constituents rather than what they thought best for them. In response, the Assembly opened its doors to the public for the first time in early 1769. In municipal elections, too, more and more working people were involving themselves in the political process. Local elections brought steady increases in the numbers of artisans winning seats on the Common Council, and three out of five constables, collectors, and assessors were artisans.

The 1769 election even brought a hint of organized ethnic involvement in politics, when it was alleged that in the previous year's contest lawyer Thomas Smith, of the Livingston faction, had said "that the Irish were poor beggars, and had come over here upon a bunch of straw." The whole body of Irishmen, it was observed, "immediately joined and appeared with straws in their hats." Fearful that Irish voters would desert en masse to the De Lancey side, the Livingstons hastened to publish a broadside utterly denying that Smith had been involved in "abusing or reflecting upon the *Irish People*" and asserting that indeed he had "expressed his Disapprobation of such Conduct."

A CITY "ALIVE TO GOD"

Dissatisfaction with established hierarchies was heightened by a new eruption of evangelical Protestantism in the city. George Whitefield, who had an instinct for showing up at key moments in the Anglo-American crisis, swung through town in 1763—65 and again in 1769—70 to remind his vast audiences of the difference between an authentic "religion of the heart" and the sterile "legal Christianity" of an unregenerate clergy. The thousands of working-class immigrants descending on New York from England, Scotland, and Ireland also proved fertile ground for the exertions of Methodists like Philip Embury, a Palatine German carpenter who had been preaching Methodism in Ireland and came to New York in 1760. At the instigation of his cousin Barbara Heck, who had been upset to find her brother playing cards in a hayloft in John Street, Embury began preaching to a small group in his home in 1766. A Methodist organization was formed, led by Embury and Captain Thomas Webb, a British army officer

who had been conducting interracial services in Brooklyn. The fledgling Manhattan congregation met in a sail loft on William Street until Wesley Chapel was completed in 1768, fittingly enough on John Street.

New York's tiny Baptist congregation flourished as well. While its old church on Golden Hill hadn't survived the 1730s, the denomination had been revitalized in the 1740s by shipbuilder Jeremiah Dodge, who held prayer meetings at his house. Now, in the early 1760s, the First Baptist Church moved into a stone meetinghouse on Gold Street, just south of Fulton, and by 1763 had forty members.

Against this background, the city's principal dissenting sects set out to incorporate themselves as had Trinity many years earlier (incorporation permitted them to receive bequests, acquire and convey property, and the like). In March 1766, with the Stamp Act controversy raging around them, John Morin Scott, Peter R. Livingston, and other trustees of the First Presbyterian Church had petitioned the crown for a charter of incorporation. They were turned down on the grounds that the king had a duty to uphold the exclusive rights of the Church of England. The bishop of London and other imperial officials had also strongly advised against such a charter, fearing that it would encourage discord and undermine the dignity of His Majesty's government. It was a severe but revealing disappointment. When petitions from the Lutherans, Huguenots, and Reformed churches likewise failed, the established order, especially the Anglican Church, gathered a harvest of bitterness.

In May 1766 more than eighty Presbyterian and Reformed clergymen and deacons from around the colonies assembled in New York to voice their opposition to the appointment of an Anglican bishop for America. Arguments for such an appointment, though not new, had recently been revived by Samuel Johnson, president of King's College, and the Rev. Thomas Bradbury Chandler; they would be heard again the following year, with still greater force, when John Ewer, the bishop of Landaff, denounced the colonists as "infidels and barbarians" in an address to the Society for the Preservation of the Gospel, and the society began an all-out push for the creation of an Anglican episcopate in America. Read in light of Townshend's simultaneous attempt to tax the colonies, news of the SPG offensive was received by dissenters as well as secular radicals with indignation and apprehension. Their objection, as John Adams later

explained, wasn't just to the office of bishop as such "but to the authority of parliament, on which it must be founded."

In New York, William Livingston, probably with the help of William Smith and John Morin Scott, entered the fray with a series of essays entitled "The American Whig." Running in the *New-York Gazette* from March 1768 to July 1769—thus overlapping the spirited Assembly campaigns of those years, the failure of dissenting congregations to secure charters of incorporation, and the new upsurge of evangelical fervor—Livingston's "American Whig" assailed the proposal for an American episcopate with arguments and a fervor reminiscent of the Triumvirate's attacks on King's College a decade earlier.

Evidence of Livingston's effectiveness came early in 1769, when New York's leading Baptists and Presbyterians—Alexander McDougall, William Livingston, John Morin Scott, David Van Home, and several members of the Livingston clan, among others—formed the Society of Dissenters to fight episcopacy. One of the society's first recommendations was to urge the public to support dissenters rather than Anglicans in that year's Assembly elections. It subsequently advocated legislation relieving dissenters of the duty to pay taxes for the upkeep of Anglican clergy in the colony and, in 1770, got a bill through the Assembly repealing the Ministry Act of 1693. The bill died in the heavily Anglican council, however, and several years later Governor William Tryon would rule that the Anglican Church in New York was in fact legally established and immune from legislative interference. The whole experience confirmed that the line between religion and politics in New York had grown exceedingly fine indeed.

By the end of the decade, as one Methodist preacher reported to John Wesley in May 1770, the "religion of Jesus" had become a "favorite topic in New York." Even the city's "gay and polite" inhabitants were now "alive to God." "A person who could not speak about the grace of God and the new birth was esteemed unfit for genteel company," testified another observer. Thirteen of eighteen Protestant congregations in Manhattan had already gone over to pietism, while Trinity, that citadel of Anglicanism in New York, harbored a budding minority of evangelicals. (There was also a burst of church building and renovation. Between 1750 and 1776 half of the city's twenty-two religious houses were built or substantially refurbished.)

Religious orthodoxy and denominationalism had always been vital to the order of things in British New York. Their precipitous retreat during the 1760s not only made the rehabilitation of imperial power next to impossible but threw into question the authority of all social and political institutions as well. What was more, the corresponding advance of pluralism, individualism, and antiauthoritarianism—habits of mind whose meanings are as much religious as secular—increased the willingness of evangelicals to associate and cooperate with one another regardless of the doctrinal formalities that nominally divided them. Out of their concerted assaults on the religious establishment would come an organizational sophistication that mirrored—perhaps indeed helped lay the foundations for—the emergence of new secular political associations.

THE WILKES OF AMERICA

Opposition to the Townshend program was now at the end of its second year. In March 1769 New York merchants assembled at Bolton and Sigel's tavern near the Exchange (formerly the Queen's Head) to set up a Committee of Inspection for enforcing their nonimportation agreement. Headed by the indefatigable Sears, and widely believed to be an arm of the Sons of Liberty, the committee patrolled the waterfront, checked papers, and searched warehouses in search of violators. The best measure of its success was that imports from Britain fell to a mere seventy-six thousand pounds by the end of 1769, an 85 percent decline from the £491,000 reported just the year before, steeper than in any other colony.

In September 1769 Governor Henry Moore died, setting in motion an extraordinary train of events. Taking over again as acting governor was none other than Cadwallader Golden, now eighty-one (he "fairly lives himself into office," grumbled the merchant John Watts). Golden, who saw this (as his last chance to score points with the ministry and snare an appointment as governor in his own right, negotiated an alliance of convenience with the De Lancey forces. Early in December, as part of their deal, the De Lancey-led Assembly—though it had just endorsed the Virginia Resolves of May denying Parliament's right to tax the colonies—abruptly chose to comply with the Quartering Act by appropriating two thousand pounds to provision His Majesty's troops stationed in New York. It was a spectacular blunder.

On December 16 an anonymous broadside entitled *To the Betrayed Inhabitants of the City and Colony of New York* appeared on the streets. Signed only by “A Son of Liberty,” it attacked Golden and the Assembly as corrupt minions of British tyranny. It also recommended that the friends of liberty in New York, and indeed throughout America, “Imitate the noble example of the friends of Liberty in England; who, rather than be enslaved, contend for their right with k——g, lords, and commons.”

This was an unmistakable reference to the controversy then boiling around John Wilkes, a radical member of Parliament who had been imprisoned in 1763 for his part in the publication of an allegedly libelous political pamphlet, *The North Briton*, no. 45. In 1768, a hard year for England’s laboring classes, Wilkes won reelection to Parliament from Middlesex County and got himself thrown into jail again on the old charge of seditious libel. Crying, “Wilkes and Liberty!”—“Wilkes and No King!”—his indignant supporters, primarily small property owners and working people, paralyzed London with strikes, rallies, marches, and riots. On May 10, the day Parliament opened, as many as forty thousand demonstrators in St. George’s Fields (a crowd exceeding the population of New York City) was fired on by troops, with considerable loss of life.

Amid spreading disorder, Parliament refused to let Wilkes take his seat. Three times more the Middlesex electors sent him back; three times more Parliament turned Wilkes away. By mid- 1769 the government had more or less lost control of London to an array of spontaneously organized radical clubs and popular associations—among them the famous Society of Supporters of the Bill of Rights—for whom Wilkes’s ordeal now symbolized the need for massive reform, even revolution. To suggest, as had the author of *To the Betrayed Inhabitants*, that New York needed a dose of the same thing was a provocation of the first rank.

While the De Lancey-led Assembly labored to uncover the identity of “A Son of Liberty,” ill will between soldiers and civilians escalated sharply. The liberty pole in the Common was the scene of frequent mass meetings at which John Lamb and other popular orators assailed the Assembly’s decision to provision the troops both because it violated the sacred rights of Englishmen and because it imposed new hardships on the city’s working people as well. On the night of January 13, 1770, a Saturday, soldiers of the Sixteenth Regiment swarmed out of the barracks and again attempted to

blow up the liberty pole with a charge of gunpowder. When the pole didn't fall, the soldiers trashed Montayne's Tavern, the westside cartmen's hangout that had become the headquarters of the Liberty Boys. Monday night the soldiers tried a second time to topple the pole, and a second time they failed. Tuesday night they finally succeeded, leaving sawed-up pieces of the pole in a pile by Montayne's front door.

The denouement came on Friday, January 19. Led by Isaac Sears, a crowd of angry seamen and workingmen armed with cutlasses and clubs brawled with bayonet-wielding soldiers on Golden Hill, a former wheatfield at the crest of John Street (near William). That the Sixteenth had just completed a tour of duty in Ireland must have been an inspiration to those of Sears's followers who had so recently escaped that island. The ensuing Battle of Golden Hill—perhaps the first head-on clash between colonists and redcoats of the American Revolution—resulted in numerous injuries and one fatality, a seaman who was run through by a bayonet. It ended when officers ordered the soldiers back to their barracks, but scattered confrontations between civilians and troops took place the following day as well. The biggest took place in Nassau Street, when a large party of seamen, fed up with the loss of jobs to moonlighting military personnel and vowing to revenge the death of a fellow Jack Tar the day before, came to blows with some soldiers. Timely intervention by the mayor and members of the City Council quelled the disturbance before anyone had been seriously injured. Word of the clashes in New York roused the ire of British troops in Boston, however, and six weeks later the colonies would be horrified by news of the Boston Massacre.

Well before then, a committee chaired by Sears and McDougall had arranged for the erection of a new liberty pole. On February 6, escorted by flag-bearers and a marching band, a team of six horses drew a huge eighty-foot pine mast up from the East River shipyards to a site just across from the Common on private land. Several thousand onlookers cheered as the mast was then sunk in a hole twelve feet deep, girded with iron bars and hoops, crossed by a twenty-two-foot topmast—the influence of sailors on its design and construction couldn't have been plainer—and capped off with a gilt weather vane inscribed with the word LIBERTY. There it stood for the next half-dozen years, virtually impregnable. Weary of seeing his establishment used as a battleground, publican Montayne refused to host the

Sons' annual celebration of the repeal of the Stamp Act. Sears, Scott, McDougall, and eight others quickly put up the money to purchase a nearby tavern for the Sons, which they promptly christened Hampden Hall in memory of John Hampden, who had given his life to the struggle against arbitrary taxation a century earlier.

One day after the new pole went up, McDougall was identified as the author of *To the Betrayed Inhabitants* and arrested for seditious libel. Chief Justice Daniel Horsmanden, now seventy-six years old, set bail at two thousand pounds—a prohibitive figure—and McDougall was hustled off to prison to await formal indictment. New York's Sons of Liberty promptly hailed him as the "American Wilkes." The allusion was astute. By linking McDougall to Wilkes, the Sons made McDougall's arrest and imprisonment common knowledge everywhere in America. Prominent visitors from other colonies came for interviews and returned home with reports of McDougall's selfless struggle against corruption and tyranny. In the city itself, crowds gathered outside his cell window to hear him speak while his friends ingeniously employed the Wilkseite number "45" to emphasize the political nature of his arrest. On the fourteenth of February, the forty-fifth day of the year, forty-five gentlemen dined with McDougall in his cell, consuming forty-five pounds of steak from a steer forty-five months old. Forty-five "virgins of this city went in procession to pay their respects," ending their visit with a rendition of the Forty-fifth Psalm. Dinners held in McDougall's honor were concluded with forty-five toasts to him and other heroes of English freedom.

At the end of April, after nearly three months of this, the grand jury finally met to hear the case against McDougall. His lawyer, John Morin Scott, argued that the acquittal of John Peter Zenger in 1735 had established truth as a sufficient defense against the charge of seditious libel. But Horsmanden would have none of it, besides which the sheriff had carefully packed the jury with friends, relatives, and business associates of both De Lancey and Golden. McDougall was indicted for publishing a "wicked, false, seditious, scandalous, malicious, and infamous libel." After posting a reduced bail, he was released to await trial. Unlike Zenger, though, he never got his day in court. The case against him collapsed after the death of the government's key witness, the printer.

NONIMPORTATION DEFEATED

In April 1770 Parliament at long last succumbed to the pressure of nonimportation. All the Townshend Duties were withdrawn except the one on tea—a reminder, said the new prime minister, Lord Frederick North, that Parliament still claimed the right to tax the colonies at its pleasure. The Sons of Liberty, more than two hundred of them, drafted a petition urging that nonimportation continue until the tea tax as well had been removed (many could sign only with a mark).

But after two years of little or no business, finishing off a decade-long economic slump, the pressures for a resumption of trade were formidable. Although a few “rich merchants” were holding their own, observed General Thomas Gage, “traders in general are greatly hurt. Many testify to their dissatisfaction, and the country people begin to complain of the dearth of the commodities they stand in need of.” Also complaining were a sizable number of the craftsmen and seamen and laborers who depended on the merchants for work. In 1768 and 1769 journeyman tailors, waterfront stevedores, and workers in the building trades struck for higher wages. A newly organized Friendly Society of Tradesmen House Carpenters had begun dispensing sick benefits and funeral expenses for its members, obligations previously assumed by the municipal government or religious bodies.

Through the spring and early summer of 1770, the Sons of Liberty tried to keep nonimportation alive, but house-to-house polls in New York suggested that a three-to-one majority of the inhabitants also favored the resumption of trade. By mid-July New York’s nonimportation movement had collapsed. The following month, entertained by brass bands, roaring cannon, and a military parade, a festive crowd converged on Bowling Green for the unveiling of the new equestrian statue of George III, commissioned four years earlier after repeal of the Stamp Act. A statue of William Pitt was subsequently erected in Wall Street, also at public expense.

Yet all the king’s horses and all the king’s men couldn’t repair the damage done to the traditional order of things in New York. The Assembly had capitulated to the ministry and betrayed the cause of American liberty. Merchants, slow to endorse nonimportation and quick to abandon it, had punctured any illusion that men of wealth could be trusted to subordinate their private interests to the good of the whole community. Working people, drawing on the antiauthoritarianism of evangelical Protestantism as well as

on a long tradition of robust plebeian communalism, had rallied behind leaders of their own making and in pursuit of their own interests, outside existing institutions. The De Lancey and Livingston factions, latest (and last) representatives of the old political order, responded accordingly, the former heading off in the direction of Golden and the ministry, the latter moving carefully toward the Sons of Liberty headquartered in Hampden Hall. As William Smith later wrote, for “both the Assembly and People without Doors . . . the old Despotism was broke.”

The Empire, however, was not. In October 1770 London dispatched to New York a new royal governor in the person of John Murray, the earl of Dunmore, an alcoholic and corrupt Scottish nobleman whom the ministry soon sent away to take over as governor of Virginia. He took the news badly, wandering drunkenly through the streets roaring: “Damn Virginia. . . I ask’d for New York—New York I took, and they have robbed me of it without my consent.” Dunmore’s successor, William Tryon, arrived in July 1771. Tryon was another military man, well connected at court, and famous for his recent suppression of the Regulators in North Carolina, whose residents remembered him as “the Butcher.”

“A NEW FLAME KINDLING IN AMERICA”

Fleeting, for a year or two after the end of nonimportation, New York’s economy seemed to be on the mend. But in June 1772 the British credit system collapsed, dashing hopes of an early recovery. More merchants in the city went under, more tradesmen closed their shops, more mechanics sought work. And more Scots, Irish, and English immigrants arrived, full of bitterness toward the landlords, employers, and politicians who had driven them out of their homelands.

During and after the winter of 1772-73 (so cold the East River froze over and people walked to Brooklyn), the condition of the city’s poor again became desperate. Over four hundred men, women, and children jammed the old municipal poorhouse while the Common Council made more and more frequent appropriations for apprehending and transporting vagrants beyond the city limits. The council’s yearly appropriations for outdoor relief climbed swiftly toward the twenty-eight-hundred-pound mark—better than four times what the city spent in 1760 and almost eight times what it spent in the 1730s. By 1773 the spread of sickness and disease had so severely

strained the old municipal hospital that the council was obliged to order the construction of a new hospital near Broadway and Duane streets, on the outskirts of town. General Gage, serenely oblivious, praised New York's "domestic tranquility."

Crime too was on the rise again, a problem the council addressed by spending more money than ever for street lamps and the watch. By 1773 it had sixteen paid watchmen on duty every night and was placing "Centinal Boxes" at strategic locations around town (not enough, however, to protect James De Lancey Jr., son of the former governor and New York's best-known politician, who was mugged by a pair of footpads the very next year). So many convicted felons were being packed into the New Gaol, erected only a dozen-odd years before, that the council decided, also in 1773, to confine them in a proper "Bridewell" (named after London's notorious Bridewell House of Correction, which ever since the seventeenth century had been used to confine runaway apprentices, vagrants, prostitutes, and debtors). Completed two years later near the New Barracks at the north end of the Common, the Bridewell's two stories and gray stone walls made it New York's most impressive public building.

Given that hard times always bore down hardest on widows and unmarried women, it wasn't surprising that more women turned to crime—as did Mary Daily and Margaret Siggins, who were hanged as pickpockets in 1771—and prostitution. Just west of the Bridewell, a red-light district had recently sprung up on land belonging to St. Paul's. Residents called it the "Holy Ground." Patrick McRobert, a Scot who visited New York in the summer of 1774, reported that "above 500 ladies of pleasure" kept lodgings in the "Holy Ground." They included "many fine well dressed women, and it is remarkable that they live in much greater cordiality one with another than any nests of that kind do in Britain or Ireland. . . . One circumstance I think is a little unlucky," McRobert added primly, "is that the entrance to [King's College] is thro' one of the streets where the most noted prostitutes live." The *New-York Gazette* went farther still, urging municipal authorities to wipe out these "nests of villainy" that catered to soldiers of the king.

Relations between the colonies and the mother country went from bad to worse after passage of the Tea Act of May 1773. Ostensibly, Parliament wanted nothing more than to revive the fortunes of the ailing British East India Company, bulwark of British influence in India, by allowing it to sell

tea directly in America. It was bad enough that this would cut out colonial middlemen, but Americans also suspected that Parliament really wanted the company to grab control of the colonial tea market in order to collect the duty on tea held over from the Townshend program—a devious ploy to make the colonists swallow the principle of parliamentary taxation.

By September 1773 half a million pounds of East India Company tea were on their way to selected consignees in the major American ports. For the next two months, as everyone awaited the arrival of the tea, another wave of defiance rolled through the colonies. Perhaps the first public demonstration of opposition anywhere occurred in New York, where, in mid-October, Sears and McDougall formed a Committee of Vigilance to plan a course of action and congratulate ship captains refusing to handle cargoes of dutied tea. McDougall launched a series of inflammatory essays called *The Alarm*. “A New Flame is apparently kindling in America,” William Smith wrote in his diary.

Summoned by the Committee of Vigilance, a huge crowd assembled on November 5 (Guy Fawkes Day) outside the Coffee House. After denouncing Parliament and East India Company agents, they hanged in effigy one local merchant who had advised the company to ship to New York. Later that same month the Sons of Liberty formed an association to defeat the Tea Act. Anyone who stood against them, they declared, would be treated as “an enemy to the liberties of America.” Governor Tryon ruefully admitted that this resolution was “universally approved by all the better sort of the Inhabitants.”

No doubt remembering the fate of stamp distributors eight years earlier, the East India Company’s agents hastily resigned. Sears and McDougall began to talk of shutting down the port altogether to prevent the landing of tea. McDougall went even further: “What if we prevent the Landing,” he asked a horrified William Smith, “and kill [the] Gov[ernor] and all the Council?” On December 17, 1773, as many as three thousand of the city’s inhabitants gathered at City Hall to protest the Tea Act. They pledged to use force, if necessary, to resist the unloading of East India tea and elected a Committee of Correspondence, consisting of Sears, Lamb, McDougall, and several other Liberty Boys, to reopen communications with patriots in other colonies. Not until Paul Revere brought the news to town four days later did anyone know that on December 16 patriots disguised as Mohawk Indians

had dumped several hundred chests of East India tea into Boston harbor. Word soon arrived that Philadelphia too had turned back a tea ship. Two ships were reported on their way to New York.

Sears and McDougall had ample time to prepare. Hampered by bad weather, New York's tea ships didn't arrive until mid-April 1774. The captain of one, told by "sundry gentlemen" on a Committee of Inspection that "the sense of the citizens" wouldn't permit him to land his cargo, quietly turned around and sailed for home. He was seen off by the greatest crowd "ever known in this city" and a "band of music" playing "God Save the King." The captain of the other (already notorious for having brought the hated tax stamps to New York in 1765) failed to bluff his way past the inspection committee and was forced to apologize before a public meeting at Fraunces Tavern. A party of "Mohawks" dumped his cargo into the harbor, "and it was not without some risk of his life that he escaped." Lieutenant Governor Colden—now eighty-seven and once again in charge of the colony because Tryon had gone back to England for a year-long leave of absence—didn't intervene, on the grounds that no one had asked him to.

Outraged by the Boston Tea Party, the government in London had meanwhile resolved to make an example of Massachusetts. From its point of view, it could do no less. Ten years of American defiance had upset a trading empire worth thirty million pounds a year in combined imports and exports. Besides, when perhaps only one in thirty Englishmen could vote, and at a time of ballooning internal disorder, American theories of representation struck at the very heart of Britain's political and social order. As George III himself declared: "The colonists must be reduced to absolute obedience, if need be, by the ruthless use of force." (Otherwise, he would later say, India, Ireland, and the rest of England's possessions would go their own way as well, and "this Island, reduced to itself, would be a poor Island indeed.") The upshot, in April 1774, was a series of so-called Coercive Acts—soon referred to throughout America as the "Intolerable Acts"—by which Parliament shut the port of Boston, reorganized the colony's courts to facilitate the prosecution of political troublemakers, and sharply restricted the power of the colony's legislature and town meetings. Commander-in-Chief Thomas Gage was named governor and sent up from New York with additional troops to help him enforce the law.

THE "NEW ARCADIA" OF LIBERTY

Initial reports of the Intolerable Acts began to arrive in New York in mid-May. "This intelligence was received with Great abhorrence & indignation," McDougall noted in his diary. The Sons of Liberty and the Livingston faction immediately moved to organize "an impartial spirited Committee of Correspondence" for the purpose of drawing up new nonexportation as well as nonimportation agreements and reviving the idea of a continental congress. They were only partially successful. At a turbulent mass meeting at the Exchange on May 16, moderate merchants rallied by the De Lancey faction voted to postpone a decision on nonimportation and nominated a fifty-member committee with only a dozen-odd seats reserved for the Sons.

The very next day, however, Paul Revere returned to town with the Boston Circular Letter, which advocated an immediate embargo on trade with Britain until Parliament repealed the Intolerable Acts. Heartened by this evidence of patriotic zeal elsewhere, and ready now to act independently of the merchants, a group of the city's mechanics nominated a Committee of Correspondence having only twenty-five members, mostly Sons of Liberty and Livingston adherents. Revere was sent off with letters for the patriots in Philadelphia and Boston, explaining the confusion in New York and stressing the need for a general congress.

The showdown occurred at a tumultuous public meeting in the Coffee House on May 19. At issue was the size and composition of the Committee of Correspondence: fifty, as the moderates wanted, or twenty-five, as the new Mechanics Committee had proposed. Equally difficult was the question of who in the city had a right to vote on the matter: "none but the Freeholders & Freemen," as one of the moderates argued, or "every man whose Liberties were concerned," as Sears maintained. On both points the moderates again carried the day. All fifty moderate nominees won election, with the addition, as a conciliatory gesture, of one radical. A compromise plan for a house-to-house canvass of the city broke down when the details couldn't be worked out. The following day Sears and McDougall reluctantly persuaded the Mechanics Committee to accept what was now the Committee of Fifty-one on the understanding they would be removed "if they misbehaved."

Although the moderates gained the upper hand, the appearance of the Mechanics Committee was a milestone in the political history of New York City. A plebeian counterpart to the merchants' Chamber of Commerce, it

confirmed the growing political sophistication of the city's working people and their ability and willingness to act without the prompting even of men like Sears, Lamb, and McDougall. Its leaders over the next few years—Jonathan Blake, Daniel Dunscomb (a cooper), Nathan Tylee, Christopher Duyckinck (a sailmaker), Lewis Thibou, and Malcolm McEwen—had hitherto been on the fringes of municipal affairs. Now they were at the very center.

Joining them there were the many women who played an increasingly visible role in mobilizing resistance to British policy, above all by vesting ordinary domestic decisions with political significance. As shoppers, retailers, and housewives, they refused to buy or sell British goods, made clothes of homespun, and served coffee instead of tea. Some called themselves Daughters of Liberty, and their patriotic fervor suffused the letters that a New York teenager named Charity Clark sent to a cousin in England. She and other young women of the city had begun to knit “stockens,” she wrote, dreaming of the day when “a fighting army of amazones . . . armed with spinning wheels” would free America from its dependence on British imports and thus put it beyond the reach of “arbitrary power.” Do not underestimate us, she warned her distant correspondent: “Though this body is not clad with silken garments, these limbs are armed with strength, the Soul is fortified by Virtue, and the Love of Liberty is cherished within this bosom.”

THE CONTINENTAL ASSOCIATION

For the next six weeks, according to one observer, New York was “as full of uproar as if it was besieged by a Foreign force.” City papers reported a succession of raucous meetings, rallies, demonstrations, and fistfights. Isaac Sears received a “drubbing” on one occasion from a British officer stationed in the city.

Despite pressure from its more radical members, the Committee of Fifty-one managed to sidestep a commitment to nonimportation by insisting that it should be proposed first by a “Congress of Deputies from all the Colonies in general”—although the committee's moderate majority didn't much like the idea of such a meeting, either, given its radical origins.

By early July it had become certain that a congress would convene in Philadelphia in September. The Fifty-one grudgingly nominated five delegates to attend for New York City: Isaac Low, John Jay, Philip Livingston, John Alsop, and James Duane. Dismayed that no one to their liking had been included, and conscious that events had begun to turn in their favor, the Mechanics Committee met at Bardin's Tavern (the former Hampden Hall) to draw up its own slate of candidates: Low, Livingston, Jay, Leonard Lispenard, and Alexander McDougall. Called by the Sons of Liberty, a public meeting in the Fields on July 6 approved the mechanics' slate, along with resolutions instructing the five, if elected, to support a nonimportation agreement. It took three weeks of tense, byzantine maneuvering to work out a compromise: the Mechanics Committee agreed to support the original nominees of the Fifty-one, while the Fifty-one in turn assured the mechanics it would wholeheartedly support a nonimportation agreement if one were adopted by the upcoming congress.

Several weeks later John Adams and other New England delegates passed through New York en route to Philadelphia. With McDougall as their semiofficial host, they toured the city and spent hours in deep conversation with patriots. The starched Adams was less than impressed. "At their entertainments there is no conversation that is agreeable," he noted in his diary. "They talk very loud, very fast, and altogether." (They did know how to eat, however: invited to John Morin Scott's "elegant Seat" overlooking the Hudson, Adams was taken aback by the profusion of silverware and abundant food.)

Adams tore himself away, and New York's delegates embarked for Philadelphia on September 1, "with Colours flying, Music playing, and loud Huzzas at the End of each Street." Four days later the Continental Congress, attended by fifty-six delegates from twelve colonies, got down to business. To the delight of radical patriots everywhere, it advised the people of Massachusetts to form a new government and take up arms. It rejected a conciliatory Plan of Union with Great Britain and adopted resolutions attacking the entire course of British policy toward the colonies since 1763. In mid-October it created the Continental Association, a "nonimportation, nonconsumption, and nonexportation agreement" to be enforced by Committees of Inspection in every county, town, and city in America—a

clear usurpation of the authority of legal governments throughout the colonies.

To the PUBLICK.

NEW-YORK, OCTOBER 5, 1774.

BY Mr. Rivere, who left Boston on Friday last, and arrived here last night, in his way to the General Congress, we have certain intelligence that the Carpenters and Masons who had inadvertently undertaken to erect barracks for the soldiers in that town, upon being informed that it was contrary to the sentiments of their countrymen, unanimously broke up, and returned to their respective homes, on the 26th of last month; which, it is hoped, will convince the Mechanicks of this city, how disagreeable it will be to the inhabitants of that place, for them to afford any manner of assistance to those, who are made subservient to the destruction of our American brethren.

Paul Revere was an important conduit of information between radical artisans in New York and Boston. This broadside announces one of his several appearances in the city. (© Collection of The New-York Historical Society)

In New York, one immediate casualty of the Association was David Douglass's theatrical troupe. Douglass had returned to the city in 1767 and enjoyed a string of profitable seasons in a spacious new playhouse on John Street. But he had also drawn heavy abuse—from radical Whigs, who saw theatergoing as a manifestation of genteel self-indulgence (it was said that the price of a season's subscription had risen to an amazing fifty pounds), as well as from evangelicals, who believed that theaters promoted idleness,

debauchery, and blasphemy. Douglass now learned that the Association agreement had committed all patriotic Americans to “discountenance and discourage every species of extravagance and dissipation, especially all horse-racing, and all kinds of gaming, cock-fighting, exhibition of shews, plays, and other expensive diversions and entertainments.” Fearing the worst—he could hardly have forgotten the violent destruction of his old playhouse on Chapel Street a decade earlier—Douglass promptly closed his doors and took his actors to Jamaica, expecting no trouble from “the Ladies and Gentlemen of that polite and opulent island.”

The moderate Committee of Fifty-one tried to preserve its control over the course of events by proposing that it supervise enforcement of the Association through teams of inspectors chosen by the electors in each ward. But the Mechanics Committee demanded instead dissolution of the Fifty-one and enforcement of the Association by a new sixty-member Committee of Observation on which popular leaders would have half the seats. Bolstered by the success of radical patriots in other colonies, the mechanics had little trouble getting the Fifty-one to cooperate. Nominations for the new committee were published in the papers and confirmed without incident at a public rally on November 22.

WHIGS OF THE OLD STAMP

From the very beginning of the struggle with Great Britain, New York had been regarded on both sides of the Atlantic as a nursery of loyalty to the mother country. Nowhere else in the colonies, after all, did the ground lie quite so thick with royal functionaries, generals, admirals, Anglican churchmen, big landowners, and merchant princes. They were rich men, on the whole, well born, well educated, well married, and well connected—precisely the kind of men on whom the Empire had relied, for more than a century, to govern its American provinces. Few approved the idea of taxing the colonies, but they were obstinate in their devotion to British institutions and knew what they stood to lose if the Empire failed to keep a firm grip on America. By 1773 or 1774 many had already cast their lot with king and Parliament, and the potential scope of their influence troubled patriots everywhere.

Not until Congress set up the Association, though, would a concerted, broadly based loyalism begin to emerge in New York (or indeed anywhere else). For as the Committee of Sixty and other such extralegal bodies plunged into their work over the winter and spring of 1774-75—chasing down rumors of violations, examining backsliders and the contrary-minded, confiscating property, prescribing what good patriots should buy and sell and wear, often indeed administering oaths of support for the Association—substantial numbers of New Yorkers finally decided that matters had got out of hand. Hundreds of shopkeepers, tradesmen, and farmers joined loyalist associations to affirm their loyalty to the crown and the old order; many talked of forming loyalist militia companies. Jacob Walton, a careful man, built a secret escape tunnel from his country house at Hell Gate to the East River shore (workmen uncovered portions of it in Carl Schurz Park in 1913).

Hardcore loyalists were a distinct minority in the province, never amounting to more than 15 percent of the colony's 168,000-odd inhabitants. (Some 60 percent of the population, by contrast, supported the patriots; the rest were fence-straddlers and switch-hitters.) Queens, Kings, and Richmond counties—the agrarian periphery of New York City—proved

notably cool to the patriot cause. Staunch patriots comprised only 12 percent of the nearly eleven thousand residents of Queens County (which then included what is now Nassau County). With loyalists often outnumbering patriots by better than two to one, a succession of Queens communities—Jamaica, Newtown, Oyster Bay, Flushing, Hempstead—openly defied Congress and issued protests condemning the Association. Indecisiveness seemed epidemic among the thirty-six hundred inhabitants of Kings County. A mere 6 percent have been counted as hardcore patriots, but they outnumbered hardcore loyalists, and the half-dozen towns of Kings County silently ignored the Association. The Flatbush Reformed Church hedged its bets by having services conducted by two ministers, one patriot, the other loyalist.

The strength of loyalism in these counties reflected a long-standing dependence on the export markets of New York City and, through them, on the entire system of international exchange protected by British imperial power. In parts of Kings and Queens counties, if not Richmond, loyalism drew as well on local traditions of hostility to New England-style radicalism dating back to the mid-seventeenth century (neighboring Suffolk County, still closely tied to New England, was overwhelmingly patriot). Also to be reckoned with was the role of religious, cultural, and ethnic heterodoxy: the *least* “English” areas of Long Island were most heavily loyalist, presumably because they had flourished under British rule and would have the most to lose in a new, majoritarian social and political order.

Nowhere, however, was loyalism rooted in formal ideological differences with the patriots. A shower of Tory placards, handbills, broadsides, pamphlets, and newspaper essays fell on New York in 1774 and 1775—many appearing courtesy of James Rivington’s printshop, source of the *New-York Gazetteer*, the single most important loyalist journal in the colonies. The bulk of this literature appealed to essentially the same Whiggish fears about tyranny, corruption, and conspiracy that shaped patriot thought. Many Tories, in fact, waited until the very last moment to decide which side they were on, for they saw Congress, not Parliament, as the immediate danger. Parliament may well have acted unwisely or unjustly, loyalist writers conceded. But Congress was an illegal and unconstitutional body, controlled by unscrupulous men whose secret objective was to gain wealth and power for themselves. They would stop at nothing until they had

destroyed every remnant of British authority—and with it the prosperity, stability, and security the colonies had enjoyed for generations.

Still, there was something fundamentally elitist, even aristocratic, about loyalism. New York's leading Tories—John Watts, Isaac Low, Cruger, Thomas Jones, William Smith, Peter Van Schaack, William Johnson, James and Oliver De Lancey, Frederick Philipse, William Bayard—were all men of wealth and power, long identified with British high culture. A large majority of the hundred members of the Chamber of Commerce sided with the crown, as did, overall, half of the city's merchants, who as a group tended to be wealthier than their patriot counterparts. Religion too set New York Tories apart. Anglican clergy and their congregations by and large opposed independence, while dissenters favored it. Only one of the city's Presbyterian ministers became a loyalist, and many rebel leaders, like John Lamb and Isaac Sears, had evangelical connections. Thirty-seven of forty-four Dutch Reformed ministers in the colony backed independence; the four exceptions were conservatives with a record of opposition to the church's evangelical wing.

The most energetic and compelling loyalist propaganda in the middle colonies emanated from a circle of learned, profoundly conservative Anglican clerics: the Rev. Thomas Bradbury Chandler of New Jersey; the Rev. Charles Inglis, assistant rector of Trinity Church; the Rev. Myles Cooper, president of King's College; the Rev. John Vardill, a sometime professor at King's College moonlighting as a British spy; and the Rev. Samuel Seabury of Westchester County. To their way of thinking, constitutional liberty could be maintained only by the better sort of people—people of rank and distinction in society—because they alone possessed the capacity for reason and disinterested virtue. Common folk, ruled by base passions, always looked first to their own selfinterest and could not therefore be trusted with power. No wonder, then, that law and order had broken down: all those congresses, committees, and conventions now oppressing the colonies were the handiwork of vulgar upstarts, men ill equipped to govern themselves, much less others. A sad spectacle indeed, declared Cooper: "I feel indignation and shame mingling in my Bosom, when I reflect that a few men (whom only the political storm could cast up from the bottom into notice) have presumed to act in the character of *representatives and substitutes of the Province*." That one Tory pamphlet

after another would be consigned to the flames on the day of their publication by cheering crowds merely underscored the oppressive nature of mob rule. And it made perfect sense to Anglican loyalists that men who resorted to such desperate, illiberal measures frequently proved to be religious dissenters.

“THE MOB BEGIN TO THINK AND REASON”

Often only the finest of lines divided Tories from moderate or conservative patriots. For young Gouverneur Morris, a Whig like his grandfather Lewis but no admirer of the lower classes, these were gloomy and troubling days. “The mob begin to think and reason,” he declared after watching the mass meeting of May 19, 1774, in the Coffee House. “Poor reptiles! It is with them a vernal morning; they are struggling to cast off their winter’s slough, they bask in the sunshine, and ere noon they will bite, depend upon it. The gentry begin to fear this.” If this quarrel with Britain continues, Morris added dramatically, “we shall be under the worst of all possible dominions; we shall be under the domination of a riotous mob.” Yet Morris’s fears didn’t, in the end, fix his course. For whatever reason—the stirrings of national pride, a revival of confidence that the upper classes could maintain control, a sense of obligation to the Whiggism of his ancestors—he cast his lot with the patriots and supported independence.

So did James Duane, the city-born son of a well-to-do Irish immigrant merchant and landowner. After studying law in the offices of James Alexander, Duane built a practice of his own that by the early 1770s, just as he turned forty, was earning a handsome fourteen hundred pounds a year. Marriages to Maria Livingston and, after her death, to Gertrude Schuyler cemented Duane’s position in society. He became a vestryman of Trinity and a trustee of King’s College. He maintained a fashionable town house, a country seat, and a thirty-six-thousand-acre estate west of Schenectady where he managed 235 tenants and engaged in potash-making and milling.

It would hardly have been surprising if Duane, like so many other men of his class and connections, had drifted into loyalism by 1774 or 1775. He didn’t think highly of the intelligence or intentions of ordinary people and helped prosecute Alexander McDougall. He worried about the advent of mob rule and warned Robert Livingston, his father-in-law, about the dangers of “a great and respectable Family becoming obnoxious to

Government” by even appearing to associate with the Sons of Liberty. Though deploring Parliament’s attempts to tax the colonies, he revered the British constitution, regretted the absence of an American peerage, and abhorred republicanism. “God forbid that we should ever be so miserable as to sink into a Republick!” he exclaimed.

Yet Duane remained a patriot. In the First Continental Congress, he fought for a cautious statement of American rights, conceding almost everything but the right of the colonies to tax themselves. He returned home and plunged into the work of enforcing the Association and preparing the colony for armed conflict. While men no more conservative than he were turning their backs on colonial resistance, he attended the provincial convention and was named a delegate to the Second Continental Congress. In 1775 he moved that each inhabitant of the city take up arms and prepare for war.

John Jay was another unlikely rebel. Grandson of the Huguenot refugee Augustus Jay, he was reputed one of the most promising young attorneys in New York by the early 1770s. Besides a quick mind and natural eloquence, he possessed impeccable social credentials and was related to the Bayards, Stuyvesants, Van Cortlandts, and De Lanceys. Robert Livingston Jr. was for a time his law partner, and in 1774, not yet thirty years old, Jay married William Livingston’s daughter Sally. There was talk that year of getting him a royal judgeship.

As conservative as Gouverneur Morris and James Duane—“those who own the country ought to govern it,” he liked to say—Jay too found himself drawn step by step into revolution. His election to the Committee of Fifty-one marked his entrance into the struggle. Sent down to the Congress in Philadelphia, he signed the Association and drafted an *Address to the People of Great Britain* that was widely applauded for its ringing defense of American rights (“we will never submit to be hewers of wood or drawers of water for any ministry or nation in the world”). By the time he returned to New York, even radicals like Sears and McDougall were hailing Jay’s accomplishments.

Some of his friends worried that “to please the Populace he must have thrown aside his *old Principles*” but events proved them wrong. The more prominent Jay became, the more certain he was that men of property ought never yield to force from above or pressure from below. He became a

revolutionary, in the end, because he couldn't see an honorable way out of a predicament created by obstinate, venal politicians in London. "It has always been and still is my opinion and belief," he said many years later, "that our country was prompted and impelled to independence by necessity and not by choice."

15 Revolution

In February 1775, when the Assembly refused to choose delegates for a Second Continental Congress, the authority of New York's legal government collapsed. The Committee of Sixty, assuming quasi-governmental power, called for a public meeting at the Exchange in early March to devise a plan for choosing a congressional delegation. To ensure a strong patriot turnout, the Sons of Liberty rallied at the liberty pole on the appointed day, then marched downtown in force, "round all the docks and wharves, with trumpets blowing, fifes playing, drums beating, and colours flying." The excited crowd that followed them to the Exchange endorsed the Sixty's proposal that the selection of delegates be entrusted to a special provincial convention of representatives from every county in the colony, to convene at the Exchange six weeks later. Governor Colden talked about preventing the meeting by proclamation, but neither he nor the Assembly had the nerve to do so—which made the royal government look even more ineffectual. New York's Provincial Convention met on April 20 and put together a congressional delegation. The old Assembly adjourned, never to meet again.

Three days later the city learned that Gage's redcoats had been bested by mere militia at Lexington and Concord. Isaac Sears, John Lamb, and Marinus Willett quickly gathered a crowd and headed for the East River docks, where they emptied two ships of provisions intended for the British forces. Willett then led a second raid on the City Hall arsenal, removing nearly six hundred muskets, bayonets, and cartridge boxes for distribution among the patriots. Next day, April 24, a crowd of some eight thousand people—roughly a third of New York's population—assembled in front of City Hall to hear from the Committee of Sixty. Crossing the line between resistance and revolution, the Sixty proposed that all New York patriots subscribe to a General Association, that a Provincial Congress assume control of the colony, that government of the city be turned over to a new Committee of One Hundred, and that immediate steps be taken to defend the city from a British attack—a distinct possibility, given that Gage's

position in Boston was clearly untenable. “People here are perfectly fearless,” Robert R. Livingston told his wife, Mary.

Nominations and elections for the Committee of One Hundred took place within a few days. Though dominated by moderates, its members included such radicals as Daniel Dunscomb, chairman of the Mechanics Committee, whose presence helped push the committee to widen its authority. At a mass meeting of city residents on April 29, the One Hundred promulgated Articles of Association drafted by James Duane and John Jay. Those who signed pledged “never to become Slaves” and to obey the measures of the Continental Congress, the Provincial Congress, and their local committees.

Three hundred and sixty armed men, led by Isaac Sears, meanwhile seized the keys of customs collector Andrew Elliot. Sears declared the port of New York closed until further notice. For another week or two, Sears’s house on Queen Street seemed to be the effective seat of government and headquarters for the company of militia that nightly patrolled the city. William Smith Jr. could hardly believe what was happening. “It is impossible,” he wrote on April 29, “fully to describe the agitated State of the Town since last Sunday, when the News first arrived of the Skirmish between Concord and Boston. At all corners People inquisitive for News. Tales of all kinds invented believed, denied, discredited. . . . The Taverns filled with Publicans at Night. Little Business done in the Day. . . . The Merchants are amazed and yet so humbled as only to sigh or complain in whispers. They now dread Sears’s Train of armed Men.”

This was revolution—“total revolution,” in the words of one Tory. Even if Great Britain and the colonies did manage to compose their differences—the Continental Congress continued to insist that the colonies weren’t seeking independence—the legitimacy of colonial political institutions had boiled away. Governmental power was passing to a network of committees that responded to, and included representatives of, what another Tory called “the lower class of people.” The city is now ruled, said yet another, “by Isaac Sears & a parcel of the meanest people, Children & Negroes.”

Isaac Low, Abraham Walton, and a handful of other prominent Tories, still clinging to the hope of a peaceful solution, remained in New York to take part in the Provincial Congress. Most took flight. James De Lancey, merchant John Watts, and Colonel Roger Morris scrambled to get on the

May 4 packet to England. Printer James Rivington fled to the protection of a British warship in the harbor. Governor Golden retreated to his Flushing estate, writing to Lord Dartmouth that “Congresses and committees are now established in this Province and are acting with all the confidence and authority of a legal Government.”

President Myles Cooper of King’s College left town as well, chased from his bed one night in May by “a murderous band.” A student named Alexander Hamilton is said to have helped Cooper escape by delaying his pursuers with a lengthy “harangue” on Cooper’s front porch. Hamilton, who had come up to New York from the West Indian island of Nevis only two years earlier, was already the author of two highly regarded pamphlets supporting the Continental Congress; like other conservative patriots, however, he detested mobs.

“GOOD AND WELL-ORDERED GOVERNMENTS”

The New York Provincial Congress took over the vacant Assembly chamber in City Hall on May 23 and moved quickly to consolidate its authority. It called for the creation, where they didn’t already exist, of “county committees, and also sub-committees . . . to carry into execution the resolutions of the Continental and this Provincial Congress.” It instructed Queens and Richmond counties to send delegates at once. It warned everyone who hadn’t yet subscribed to the General Association to do so by July 15 or suffer the consequences. It also stepped up the pace of military preparations by creating a Military Association—in effect, a revolutionary militia—and launching a campaign to recruit five regiments. Alexander McDougall, the Wilkes of America, personally took charge of raising a regiment from the city; the First New York, as it would be known, consisted largely of workingmen.

Association militia were soon drilling in the Fields and patrolling the streets while gangs of laborers erected barricades, dug trenches, and threw up breastworks. The Committee of One Hundred, assuming the duties of municipal government, meanwhile began to grapple with such familiar problems as regulating wages and prices and providing relief for the poor.

The speed with which both the One Hundred and the Provincial Congress got to work reflected not only the quickening pace of events but

also the continued concern among more cautious patriots that popular enthusiasm not be allowed to get out of control. “Good and well-ordered governments in all the colonies,” explained John Jay, would “exclude that anarchy which already too much prevails.” James Duane, who admitted that “licentiousness is the natural effect of a civil discord,” felt “it can only be guarded against by placing the command of the troops in the hands of men of property and rank.” Easier said than done, Gouverneur Morris reflected, inasmuch as “the soldiers from this Town [are] not the Cream of the Earth but the Scum” and are “officered by the vulgar.” Even Alexander McDougall felt apprehensive. “I fear liberty is in danger from the licentiousness of the people,” he confessed.

For many moderates, these fears were underscored on June 6, when the last of the Fort George garrison, a hundred or so soldiers from the Royal Irish Regiment, were withdrawn from the city to the sixty-four-gun warship *Asia* (in part, according to one source, because too many of them had deserted to the patriots). Led by Marinus Willett, some Liberty Boys intercepted the column as it marched down Broad Street, commandeering its muskets, ammunition, and baggage. Escorts provided by the Provincial Congress and Committee of One Hundred endeavored to stop the outrage, without success. Shortly thereafter, a party of Liberty Boys raided a royal storehouse at Turtle Bay, likewise over the objections of representatives from the Provincial Congress. Knowing that a failure to respond might well explode its authority, the Congress ordered Willett to return everything he and his men had made off with. Independent “attempts to raise tumults, riots, or mobs” couldn’t be tolerated, it said sternly.

Willett backed down, but no one expected that to end the matter. When a crowd burned a supply barge from *the Asia* in July, the embarrassed Congress built a replacement; when that too was destroyed, Congress again condemned unauthorized attacks on persons and property and ordered the construction of another replacement, this time dispatching militia to guard it.

The rapidly escalating crisis between Britain and the colonies made it all the more difficult for the Provincial Congress to stay on top of the situation in New York. On June 25, 1775, General George Washington passed through town on his way to take command of the troops besieging Gage in Boston. Cheering crowds lined the streets and church bells pealed as a

battalion of militia and members of the Provincial Congress escorted him down Broadway to Hull's Tavern, where he would spend the night.

Later that same day, Governor Tryon returned to resume his duties after a fourteen-month absence. A smaller and much more restrained crowd greeted the governor at the foot of Broad Street and walked with him over to Hugh Wallace's town house on Bowling Green, where he had lodgings for the night. It was the first of many hard lessons, he said, in the "impotence of His Matys Officers and Ministers of Justice in this Province," and it now seemed "very probable I may be taken Prisoner, as a state Hostage, or obliged to retire on board one of His Majestys Ships of War to avoid the insolence of an inflamed Mob."

It came to that more quickly than the governor might have imagined. Only a week before he and Washington reached New York, a second clash between colonial forces and Gage's redcoats took place at Bunker Hill. Then, over the summer of 1775, Congress rejected a conciliatory plan proposed by Lord North. It offered instead the so-called Olive Branch Petition, pleading with the king to cease hostilities. It also drew up a "Declaration of the Causes and Necessity of Taking Up Arms," explaining that the colonists had acted only in self-defense and were "with one mind resolved to die freemen, rather than to live slaves." In August Congress launched an invasion of Canada to prevent its use as a base of operations against the colonies. "The Americans from Politicians are now becoming Soldiers," Tryon reported to the home government.

YANKEE DOODLE COMES TO TOWN

On the night of August 23 John Lamb's artillery company undertook to remove two dozen cannon from the Grand Battery at the southern tip of Manhattan. While they were at it, they exchanged fire with a boatload of soldiers from the *Asia*, lying in the East River just off the foot of Wall Street. In retaliation, the commander of the *Asia* ordered a full thirty-two-gun broadside of solid shot into the sleeping town. Apart from a hole in the roof of Fraunces Tavern, no great damage was done. But for the thousands of halfdressed, panic-stricken residents who tumbled out of their beds into the streets, it was an effective reminder of the city's vulnerability to naval bombardment. Many made plans to leave.

Isaac Sears soon left town too, albeit for reasons of another kind. In October 1775 the Continental Congress recommended the arrest of all royal officials remaining in the colonies; not only did the New York Provincial Congress seem reluctant to take so decisive a step, but when soldiers pilfered a royal store, the Congress ordered everything returned rather than risk another bombardment from the Asia. Incensed by this timidity, Sears sold his house, moved to Connecticut, and proceeded to organize an armed troop made of sterner stuff. "There are many Enemies to the cause of Freedom" in New York, he declared. Governor Tryon, suspecting that Sears had set his sights on him in particular, slipped off to William Axtell's Flatbush estate; from there he made his way to a merchant ship, the *Duchess of Gordon*, anchored safely under the guns of the fleet in the harbor.

The winter of 1775-76 brought a steady stream of news confirming that Tryon would never again set foot in the city without a fight. Parliament rejected the Olive Branch Petition. The king formally proclaimed the colonies to be in a state of rebellion and closed them to all trade. General Gage had been replaced by General Sir William Howe, and a punitive expedition force under General Henry Clinton, General Charles Cornwallis, and Admiral Peter Parker was expected to descend on North Carolina sometime in January.

Throughout the colonies, the reaction to these developments was an eruption of popular resentment against the monarchy that killed the chances of a reconciliation with the mother country. Americans now began to talk openly of independence; the case for it was clinched in January 1776 by Tom Paine's *Common Sense*, which denounced "the Royal Brute of Great-Britain" and catalogued all the reasons why the colonies would be better off on their own.

Tryon's departure left New York's Tories both demoralized and defenseless. During the late summer of 1775 the pressure on them became intolerable. A series of resolves by the Provincial Congress provided that anyone aiding the enemies of America, or even denying the authority of congresses and committees, could be disarmed, fined, imprisoned, and banished. To Isaac Sears, this was the long-overdue summons to action. He galloped down from Connecticut with one hundred men and smashed up James Rivington's printshop. After announcing that they acted

independently of all congresses and committees, Sears and his band galloped away again singing “Yankee Doodle.” (Who, it will be recalled, stuck a feather in his cap and called it “macaroni”—a deft little dig at the flamboyant style of the same name associated with the upper classes on both sides of the Atlantic.)

Printer Samuel Loudon came in for similar treatment the following March when he printed *The Deceiver Unmasked*, an attack on Paine from the pen of the Rev. Charles Inglis. Led by Sears, Lamb, and McDougall, a band of Liberty Boys raided Loudon’s shop, destroyed his press, and burned every one of Inglis’s pamphlets.

Lukewarm patriots as well as Tories fled New York in droves. By the end of 1775 more than ten thousand of the city’s twenty-five thousand inhabitants had gone; thousands more would go in the months that followed. By July 1776 only five thousand or so remained. “To see the vast number of houses shut up, one would think the city almost evacuated,” wrote one departing Tory. “Women and children are scarcely to be seen in the streets. Troops are daily coming in; they break open and quarter themselves in the houses they find shut up. Necessity knows no law.”

Outside the city, however, the Tory problem proved harder to resolve. Opposition to the Association ran so high in Kings County that in August 1775 the Provincial Congress dispatched a committee to rally the fainthearted and disarm enemies to the cause. General Nathaniel Woodhull was likewise ordered to secure Queens County, but the task there was so difficult that the Provincial Congress finally appealed to the Continental Congress for help. Congress answered by sending Colonel Nathaniel Heard of New Jersey. Heard marched through Queens in January 1776 with twelve hundred militia and a list of “inimicals” who had refused to sign the Association. Nearly a thousand Tories or suspected Tories were rounded up and disarmed; nineteen were taken away to Philadelphia for questioning. Heard made a similar sweep of Staten Island a month later.

No sooner had Colonel Heard departed than General Charles Lee arrived in New York with two regiments of New England militia. A strange and moody man who surrounded himself with dogs, Lee was already something of a sensation among the patriots. His soldiers adored him, Washington depended on him, and the Continental Congress seemed to think he could do no wrong. For one thing, Lee was a retired British officer with more

impressive military experience than anyone else on the American side, experience that had proved vital during the siege of Boston in the summer and fall of 1775. He was also an out-and-out radical who detested monarchy, spoke admiringly of democracy, and advocated immediate independence for the colonies.

To Lee's way of thinking, the struggle against Great Britain was an authentic popular uprising, which required the kind of grass-roots mobilization that French revolutionaries would later call a *levée en masse*. If the war continued, he argued, it could be won only by citizen-soldiers who made up the rules as they went along, not by professional troops employing the aristocratic "Hyde Park" tactics of conventional European armies. True to his principles, he made his headquarters at Montayne's tavern on Broadway, just across from the Fields and once the principal meeting place for radical patriots. It isn't hard to see why the New England troops and the city's mechanics loved him—or why he made the Provincial Congress extremely nervous. Paine thought him a marvel well before they met.

Congress wanted Lee in New York partly to keep up the pressure on local Tories (Lee relished that kind of assignment) but mostly because a British attack on the city was becoming more likely every day. The American invasion of Canada had just ended in disaster: General Montgomery was dead, and the First New York had suffered heavy casualties (one of McDougall's sons had been killed, the other taken prisoner). General Howe was meanwhile preparing to leave Boston, most likely for New York.

Until General Gage had left to occupy Boston in 1768, after all, New York had served as the headquarters for British forces in North America. It was familiar territory, socially and politically as well as militarily. Its central location and unsurpassed harbor and port facilities made it the logical staging area for further operations against the rebels, while control of the Hudson-Lake Champlain axis would isolate rebellious New England from the rest of the colonies. The many Tories in and around the city would surely give His Majesty's forces a warmer welcome than they had received in Boston; their presence would, of course, eliminate an important center of political and social radicalism and boost the morale of Tories throughout the colonies. Taking New York would be an easy matter, in any case: as Peter

Stuyvesant had learned a century before, New York couldn't be defended without a navy, and Congress had no navy to speak of. "I feel for you and my other New York friends," said an Englishman sympathetic to the American cause, "for I expect your city will be laid in ashes."

Lee knew full well that New York couldn't be held against an all-out assault by an enemy army and fleet; he also knew that handing it over without a fight would give the enemy a dangerous military and psychological advantage. The only course, he reasoned, was to put up a stout resistance and extract as high a price for the city as possible.

As the spring of 1776 approached, Lee threw himself into the business of preparing New York for invasion. To prevent hostile warships from entering the East River, he ordered construction of thirteen forts and batteries on Manhattan and Long Island. To forestall an attack by land, he barricaded the city's major streets and placed an additional half-dozen forts and batteries at strategic points between the city and King's Bridge at the northern end of Manhattan; one, near what is now the intersection of Grand and Center streets, was nicknamed "Bunker Hill." To keep an enemy from taking Brooklyn Heights, the high ground that commanded the city from across the East River, Lee strung a chain of forts, redoubts, breastworks, and trenches between Gowanus Creek and Wallabout Bay (built, for the most part, by levies of Kings County slaves.) He sent Isaac Sears with an armed party over to Long Island to keep the Tories there in line. He also issued manifestos to inspire the citizenry and hosted a dinner party for Tom Paine, who came up from Philadelphia.

After little more than a month of this feverish activity, Lee moved on to organize the defenses of Charleston, leaving General William Alexander in command of the city. He'd done his work well: New York wasn't safe, but it was getting ready.

"PEOPLE TREADING ON THEIR LEADERS' HEELS"

In mid-March, as expected, Howe finally pulled out of Boston and headed for Halifax, there to prepare for the move against New York. At once Washington began shifting Continental troops down to the city, then came down himself in mid-April to oversee military preparations. Every able-

bodied man in the city, including servants and slaves, was pressed into work on fortifications.

New batteries were built on Red Hook, Governors Island, Paulus Hook, and elsewhere, bringing the total to fourteen, with 120-odd cannon. To prevent enemy ships from entering the Hudson, construction began on a pair of forts that straddled the river between upper Manhattan and New Jersey—one dubbed Fort Washington, the other Fort Lee.

By the beginning of the summer of 1776, the arrival of better than ten thousand troops had transformed the city into an armed camp, and (Washington hoped) more were on the way. Military authorities established two huge bivouacs, one just north of town near present-day Canal Street, the other across the East River on the slopes above the Brooklyn ferry landing, and many other pieces of open ground were crammed with tents, huts, shacks, wagons, and piles of supplies. To build barricades and meet the demand for firewood, work parties ripped up fences and cut down the many trees for which the city had been famous. Warehouses and loft buildings, especially those belonging to departed Tories, were commandeered for military purposes, as were the new city hospital and the classrooms of King's College.

Town houses and country retreats belonging to the Apthorp, Bayard, Watts, Stuyvesant, Walton, and Morris families—every one a talisman of the old order in the city—were turned over to soldiers who draped their feet on the furniture, tore up the parquet floors for fuel, threw garbage out the windows, and corralled their horses in the gardens. Washington himself settled the army's general headquarters on Richmond Hill, the country estate of Abraham Mortier. Protests were pointless; indeed protesting seemed only to make matters worse. Oliver De Lancey, brother of the late governor and uncle of Captain James De Lancey, ordered army woodcutters off his estate on the west side of Manhattan at 23rd Street. Once they might have retreated before the wrath of so great a personage; now, fired with a new egalitarian zeal, they brushed him aside and set upon his prized orchards with a vengeance. By June, De Lancey too had fled to the *Duchess of Gordon*.

Everybody complained about price-gouging by shopkeepers, tradesmen, and ferryboat operators. Nobody knew what to do about waste disposal and sanitation, which—along with the inadequate supply of potable water,

always a problem—constituted an open invitation to epidemic disease. The provost marshal imposed a curfew on the troops and struggled to control the sale of alcohol, but drunkenness and rowdiness were a source of constant concern. So was the “Holy Ground” district west of Broadway, where (as one American officer wrote his wife) “bitchfoxy jades, jills, hags, strums, [and] prostitutes” flourished as never before. At Washington’s request, the authorities removed the four hundred indigent residents of the almshouse and ordered that the “women, children, and infirm persons in the City of New York be immediately removed from the said City” to nearby rural counties.

Despite the best efforts of military and civilian officials, the city and its environs were still crawling with Tory spies and sympathizers, many in positions of considerable importance. Throughout the spring and early summer, rumors flew that Tories in New York and New Jersey were recruiting soldiers, stockpiling weapons, and sabotaging military equipment and installations on the assumption that the redcoats would show up any day. Tensions ran especially high on Long Island, where patriot troops didn’t get along with rural villagers and Tory “skulkers” hid out in the Rockaway marshes.

The New York Provincial Congress hadn’t been much help. Since the previous summer—specifically, some said, after the *Asia* cannonaded the city in August—that body seemed to have come down with a bad case of the jitters. It agonized about prohibiting local merchants and farmers from selling supplies to British warships still in the harbor. It agonized about raising money. It agonized about spending money. It agonized about the havoc wrought by ten or twenty thousand young men under arms (especially Lee’s New Englanders, some of whom were allegedly talking about burning the city if all else failed). After agonizing, too, about the Tories, it created a special Committee for the Detection of Conspiracies to chase them down, but without much success. Washington thought the Provincial Congress was a pack of dithering nincompoops and quarreled with it about almost everything. Patriots elsewhere spoke of New York as the weakest link in the chain.

In New York City, as opposed to the colony as a whole, the revolutionary movement actually gained momentum after mid-1776. The final disintegration of royal authority, the flight of thousands of Tories, the

impending attack by His Majesty's forces, and the presence of a revolutionary army had completed the shift to radical rule. There, in the words of Hugh Hughes, "the people are constantly treading on their leaders' heels, and, in a hundred cases, have taken the lead of them." Suspected Tories were forced to recant in public, then tarred and feathered, ridden through town on rails, or forced to parade the streets holding candles.

The well-organized and militant Mechanics Committee (soon referring to itself as the Mechanics Union) had now become the dominant voice in municipal affairs. It carefully watched—and criticized, when necessary—every move of the Committee of One Hundred. When a local printer advertised a pamphlet attacking *Common Sense*, the mechanics urged him not to sell it; when he refused, they confiscated and burned all the copies. When it seemed the Conspiracy Committee wasn't moving fast enough, the mechanics ran suspected Tories out of town. When elections were held for a new Provincial Congress in April, the mechanics refused to endorse McDougall because he had stayed in town when his regiment marched off to Canada; McDougall lost. All spring, while the Provincial Congress hemmed and hawed about a final break from Great Britain, the mechanics stressed the essential connection between revolution and independence: revolution needn't have led to independence, nor independence to revolution, but neither could get very far without the other.

"I THOUGHT ALL LONDON WAS AFLOAT"

At the end of May, prodded by the Continental Congress in Philadelphia, the Provincial Congress recommended new elections so that New Yorkers could vote on the issue of forming a new state government. The result was an exhilarating, free-wheeling debate over fundamental political principles, in which the city's mechanics advocated ideas that not too many years earlier would have landed them in jail: republicanism, constitutionalism, unicameral legislatures, limited executive power, annual elections, the secret ballot, universal manhood suffrage, rotation of office, equal apportionment, the popular election of all local officials, religious toleration, and even the abolition of slavery. The Mechanics Union also declared that no frame of government should be adopted for the state without having first been ratified by the people.

When the new Provincial Congress assembled in mid-June, a number of the most conservative delegates had been unseated by men whose views were decidedly more radical—among them Daniel Dunscomb, a former chairman of the Mechanics Committee—and there now appeared to be a slim majority in favor of national independence.

Under the leadership of John Jay, moreover, the Conspiracy Committee finally began to show some initiative in dealing with the Tory problem. Its biggest discovery was that one of Washington's own bodyguards, a certain Thomas Hickey, had conspired with several others, probably including Mayor David Mathews, to kidnap or assassinate the American general. Hickey was court-martialed and hanged near the Fields in the presence of a huge throng of soldiers and civilians. Matthews was seized at his Flatbush residence and taken to prison in Connecticut.

On June 29, the day after Mickey's execution, lookouts saw the long-awaited fleet from Halifax streaming past Sandy Hook toward the Narrows between Staten Island and Long Island—better than a hundred vessels in all, bearing thousands of regular troops. To one amazed American rifleman, the harbor resembled “a wood of pine trees.” “I could not believe my eyes,” he recalled. “I declare that I thought all London was afloat.” Within a day or so nine thousand redcoats had been landed on Staten Island and set to work building fortifications.

Washington meanwhile exhorted his soldiers to be ready to fight to the last, convinced that the city was defensible. He wasn't alone. Colonel Henry Knox, a self-taught artilleryman from Massachusetts, assured Washington that the cannon emplacements now ringing the city would deter a British attack. The Provincial Congress, more cautious, thought it best to move up to White Plains.

The British fleet anchored off Staten Island, 1776. Sketch by Archibald Robertson. (Spenser Collection. The New York Public Library. Astor, Lenox and Tilden Foundations)

On July 2, 1776, Congress voted in favor of independence; two days later it adopted Jefferson's Declaration. New York's Provincial Congress gave its assent on July 9. At six P.M. that same day, the Declaration was read to Washington's troops mustered in the Common. A rowdy crowd of soldiers and civilians ("no decent people" were present, one witness said later) then marched down Broadway to Bowling Green, where they toppled the statue of George III erected in 1770. The head was put on a spike at the Blue Bell Tavern near Fort Washington at present-day Broadway and 181st Street; the rest of the statue, some four thousand pounds of lead, was hauled off to Connecticut. There it will "be run up into musket balls for the use of the Yankees," declared one soldier, "It is hoped that the emanations from the leaden George will make . . . deep impressions in the bodies of some of his red-coated and Tory subjects."

Within a week the King's Arms on City Hall had likewise come down, along with other trappings of monarchy adorning Trinity and St. Paul's. "Every Vistage of Royalty, as far as been in the power of the Rebels, [is]

done away,” said Tryon glumly. Reported another observer: “The Episcopal Churches in New York are all shut up, the prayer books burned, and the Ministers scattered abroad. . . . It is now the Puritan’s high holiday season and they enjoy it with rapture.”

SUCH UNSOLDIERLY CONDUCT

His Majesty’s army was ready for a fight too, convinced it would make short work of the rebels defending New York. Despite the recent unpleasantness in Boston, its officers still believed that Washington’s so-called army was a mere republican rabble, without the training or leadership necessary to hold off seasoned veterans. This unshakable class contempt was reinforced by the knowledge that large numbers of recent immigrants had thrown in with the patriots. “The chief strength of the Rebel Army at present consists of Natives of Europe, particularly Irishmen,” observed Captain Frederick Mackenzie of the Royal Welsh Fusiliers.

patriots pulling down the statue of George **III**. Legend has it that the head was later rescued by a British officer and shipped back to England. (© Museum of the City of New York)

General Howe, though, didn't want an all-out fight for New York. It wasn't a question of winning but of how much it would cost to win. He couldn't forget the carnage at Bunker Hill, where a frontal assault against entrenched American positions had cost him 40 percent of the men under his command in a single afternoon, and it was clear that Washington expected him to try the same thing again. Howe knew, too, that if Washington fought well the city could easily be left unfit as a base for further military operations.

As always, there were also political considerations. Sympathy for the American cause had widened steadily among the British middle and laboring classes, who linked it to demands for domestic political reform. London voters chose two Americans as sheriffs in 1773. John Wilkes, installed as mayor of London in 1775, was pressuring the crown to remove ministers hostile to American rights. A new generation of radical Whig pamphleteers—Catharine Macaulay, Major John Cartwright, Granville Sharp, James Burgh, Richard Price, Joseph Priestly—were all the while bombarding the reading public with warnings that liberty was in mortal peril on both sides of the Atlantic. New York readers paid careful attention. Local papers reprinted long extracts from parliamentary debates, British journals, and private correspondence. Local bookstores stocked a full range of controversial books and pamphlets, including Price's famous *Observations on the Nature of Civil Liberty, and the Justice and Policy of the War with America* (1776).

Aware that further conflict with America would require expenditures of blood and money that the government could ill afford—resistance to domestic recruiting had already obliged it to hire soldiers from the Landgrave of Hesse in Germany—even moderate Whigs like Edmund Burke were urging Lord North to go easy. General Howe's brother, Admiral Lord Richard "Black Dick" Howe, was in fact already on his way to the colonies at the head of a commission authorized by the king, reluctantly, to negotiate with Congress.

Both the Howe brothers felt personally well disposed toward the colonies. Both remembered with gratitude that the Massachusetts legislature

had erected a monument in Westminster Abbey to the memory of an older brother killed at Ticonderoga during the Seven Years War. Both believed, vaguely, that the Americans had some cause for complaint. Both continued to believe in the possibility of a peaceful reconciliation. Both sensed that the annihilation of Washington's army in New York would make reconciliation impossible and doom Britain to resolve the American crisis by force of arms alone—an unhappy prospect even for men who made a profession of war.

The course that both preferred, all things considered, was to make the colonies realize the danger they faced without closing the door to negotiations. Confronted with the combined might of His Majesty's army and navy, Washington and the Congress (so the theory went) would come to their senses and return to the fold. A case could be made, in fact, that General Howe's arrival off Staten Island was already having the desired effect. Virtually the entire Staten Island militia had joined the British army, and every day, from New Jersey, from Long Island, and even from Manhattan, scores of Tories were slipping through rebel lines to join the fleet. At a moment's notice, they said, thousands more were ready to rise against the tyranny of Congress; Washington's army, they said, was disintegrating.

Howe's first move, accordingly, was a modest but revealing probe of the American defenses. On July 12 a pair of British warships, the gunship *Phoenix* (forty-four guns) and the frigate *Rose* (twenty-eight guns), detached themselves from the fleet anchored off Staten Island and crossed the upper bay toward the mouth of the Hudson. American cannon blazed away from Red Hook, Governors Island, Paulus Hook (New Jersey), and Manhattan, but to no effect. While the captain of the *Rose* and his officers sipped claret on the quarterdeck, the two sailed serenely into the Hudson, past the city, and all the way up river to Tarrytown, some thirty miles to the north.

Washington was appalled. His artillery did more harm to themselves than to the enemy—the only casualties of the day occurred when an ill-trained gun crew on the Battery blew themselves up—while many of his men and officers abandoned their positions to gawk at the spectacle. “Such unsoldierly conduct,” he explained to the Provincial Congress, would “give the enemy a *mean* opinion of the army.”

Just as unfortunate, casual return fire from the British warships, though doing no great damage, caused pandemonium among the civilian population. A few of Washington's staff were convinced by what had happened that this was the wrong place and the wrong time for a head-on battle with the British. Washington, however, remained obstinate in his determination to fight for the city. Admiral Lord Howe and his fellow commissioners, who had by coincidence arrived on the evening of the twelfth (along with 150 ships and fifteen thousand more troops), got nowhere with the American commander in the days that followed. He firmly refused to see them; negotiation was a matter for Congress, he explained, besides which Howe had made the mistake of writing to "Mr. George Washington" rather than "General George Washington."

Two weeks passed. Generals Henry Clinton and Lord Charles Cornwallis, having failed to capture Charleston, came up through the Narrows on August 1 with eight regiments of veterans and several men-of-war. (For Clinton this was a homecoming of sorts: the son of Admiral George Clinton, royal governor of New York from 1743 to 1753, he had spent much of his boyhood in the city.) Several days behind Clinton and Cornwallis came a convoy of twenty-two ships with additional regiments from England and Scotland. On August 12 a fleet of over a hundred vessels crossed the bar at Sandy Hook, bringing in nearly nine thousand Hessian mercenaries under General Philip von Heister. To Ambrose Serle, Lord Howe's secretary, it was a scene never to be forgotten. "So large a fleet made a fine appearance upon entering the harbor, with the sails crowded, colors flying, guns saluting and the soldiers . . . continually shouting." In New York, "the tops of the houses were covered with gazers," the wharves were "lined with spectators," and apprehension mounted as "ship after ship came floating up" to drop anchor off Staten Island in the distance. Hundreds more residents gathered their belongings and fled. Within days, as Pastor Schaukirk of the Moravian Church described the scene, the city looked "in some streets as if the Plague had been in it, so many houses being shut up."

General Howe now had at his disposal two men-of-war and two dozen frigates mounting a combined twelve hundred cannon, plus four hundred transports, some thirty-two thousand disciplined and well-equipped troops in twenty-seven regiments, and thirteen thousand seamen. It was the largest force ever assembled in the colonies and the largest British expeditionary

force in history thus far, marshaling better than 40 percent of all men and ships on active duty in the Royal Navy. Already the cost exceeded £850,000—a breathtaking sum for the time. Washington, by contrast, had no ships to speak of and probably fewer than twenty-three thousand men under his command, mostly raw militia without adequate equipment, training, or experience. About half of them weren't fit for duty thanks to an epidemic of camp fever (dysentery) that had broken out in the overcrowded town across the bay.

But still Washington didn't waver, not even when the fever laid up Nathanael Greene, his best general and the commander of the all-important Brooklyn Heights defenses. Instead, to replace Greene, Washington turned to John Sullivan of New Hampshire. Sullivan not only lacked Greene's ability, he knew nothing about the terrain on which he was supposed to fight.

By this time six weeks had passed since General Howe's arrival on Staten Island, and it was clear that he was going to have to do something fairly soon. On August 17 Washington ordered warnings posted throughout the city that an attack was near and urged all civilians to get out immediately. Next day the *Phoenix* and the *Rose* dropped back down the Hudson from Tarrytown. Again the American batteries thundered away at them, again with no effect.

THE BATTLE OF BROOKLYN

On August 22 the British finally made their move. Under the cover of six warships, scores of flatboats, longboats, and bateaux ferried fifteen thousand redcoats across the Narrows to what is now Dyker Park on the Gravesend shore of Long Island. Set against "the Green Hills and Meadows after the Rain and the calm surface of the water," Ambrose Serle observed, the landing made "one of the most picturesque Scenes that the Imagination can fancy or the Eye behold." Similarly impressed, a light guard of two hundred Pennsylvania riflemen stationed near the beachhead withdrew without offering any opposition. More redcoats and five thousand Hessians followed on the twenty-third and twenty-fourth, bringing the total enemy force to around twenty-one thousand.

As the British settled in, their positions stretched in a four-mile arc from the village of New Utrecht on the west (site of Howe's temporary headquarters) through Gravesend to Flatbush (where the Hessians were billeted) and Flatlands (the main British camp, at the intersection of what is now Flatbush Avenue and Kings Highway). Governor Tryon appeared on the scene and called out the local militia, some six hundred men in all, to aid the regulars. Joined by two Tory regiments raised among refugees from New York, they imparted to this invasion the tensions of civil war. Eight hundred slaves had fled to the British as well and were being organized into a labor regiment.

Howe and his officers professed to be delighted by their reception on Long Island. "The Inhabitants receiv'd our people with the Utmost Joy, having been long oppress'd for their Attachment to Government," said one. "They sell their things to the Soldiers at the most Reasonable Terms & they kept up their stock in spite of the Rebels." In Flatbush and other Kings County hamlets, however, fear and confusion reigned. Many years later, the elderly mother of Gertrude Lefferts Vanderbilt still remembered when a "rumor reached us that the soldiers were rapidly approaching. The whole village was in commotion. . . . Women and children were running hither and thither. Men on horseback were riding about in all directions."

On the twenty-third Washington sent reinforcements to Sullivan and went over from New York to study the situation personally. On the twenty-fourth he dispatched more reinforcements under General Alexander, bringing the American total to around seven thousand. He also ordered General Israel Putnam of Connecticut to go over and see what he could do. "Old Put" was a capable veteran of the French and Indian War who had faced Howe at Bunker Hill. "Don't fire until you see the whites of their eyes," he is supposed to have said. "Then, fire low."

Putnam took charge of the Brooklyn Heights defenses, leaving Sullivan with around twenty-eight hundred men to cover the outer line along the Heights of Guan, the rocky, heavily wooded ridge of the glacial moraine that ran down the middle of Long Island. Only four roads traversed this barrier—at Gowanus, Flatbush, Bedford, and Jamaica—and even a relatively small force should have been able to defend it against an army advancing north toward Brooklyn Heights.¹

Someone, however, had neglected to place troops at the Jamaica Pass, on the far left of the American line. A civilian spy (probably one of many Kings County Tories who attached themselves to the British army) soon brought word to General Clinton of the gap, and Clinton persuaded Howe to attack it in strength. Just after sundown on the twenty-sixth, a Monday, Howe, Clinton, and Cornwallis led better than ten thousand regulars in a two-mile-long column out of Flatlands toward New Lots in the east; with them went two companies of Long Island Tories under Oliver De Lancey. To deceive any watching Americans, they moved quietly and left their campfires burning. At New Lots they turned north to Jamaica; at about three A.M. on the twenty-seventh, they marched through the Jamaica Pass without opposition. They then turned west along the Jamaica Road toward the village of Bedford—today the intersection of Nostrand Avenue and Fulton Street in Bedford-Stuyvesant—where they arrived around 8:30 A.M. and fired two signal guns to alert the rest of the army.

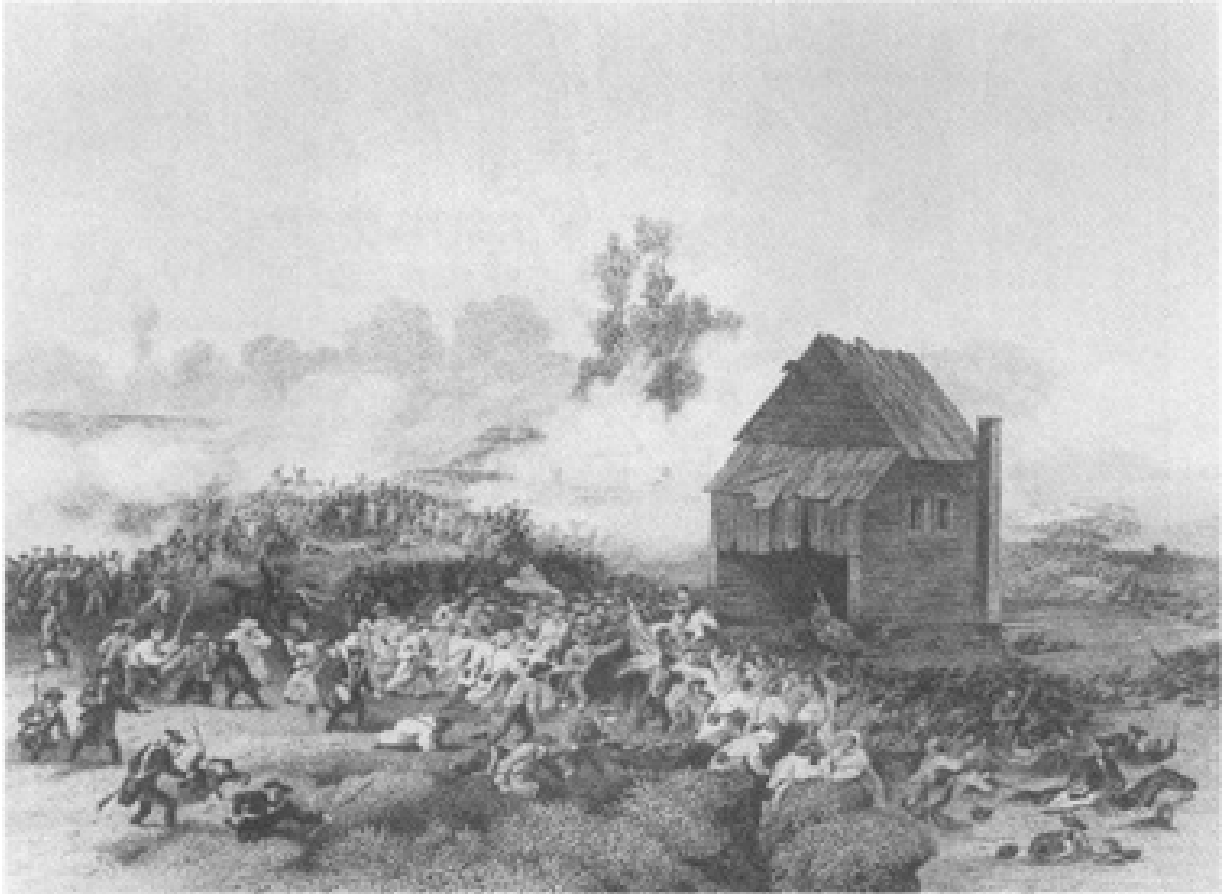

Two smaller enemy forces now swung into action. At the Flatbush Pass in the center of the American line, five thousand Hessians attacked eight hundred Americans under General Sullivan. Realizing from the signal gun that Howe had somehow worked his way around him, Sullivan tried to fall back but couldn't. Trapped between Howe's light infantry coming down from Bedford and bayonet-wielding Hessians pouring up from Flatbush, his men broke and were slaughtered. "The greater part of the riflemen," reported one German officer, "were pierced with the bayonet to trees." A jubilant British officer gloated: "It was a fine sight to see with what alacrity they dispatched the Rebels with their bayonets after we had surrounded them so they could not resist." Hundreds of Americans threw down their weapons and raced to reach safety behind the lines in Brooklyn Heights. Sullivan himself was captured in a cornfield near what is now Battle Pass in Prospect Park. It was over before noon. Although most of the American dead were buried on the grounds of the Flatbush Reformed Dutch Church, area farmers were still turning up bones in their fields well into the next century.

At Gowanus, on the far right of the American line, General James Grant had meanwhile thrown seven thousand redcoats and two thousand Royal Marines, supported by two companies of Long Island Tories, against two thousand troops from Maryland, Pennsylvania, and Delaware commanded

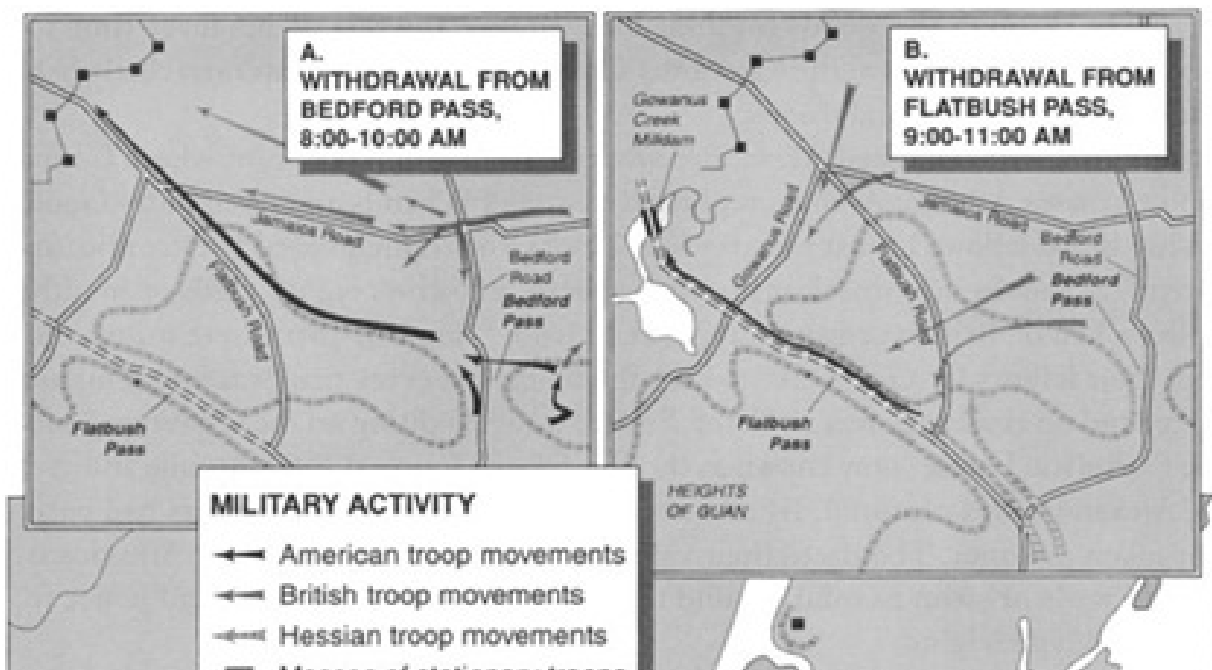

by General Alexander. Alexander's men fought gamely to keep control of the high ground—now called Battle Hill in Green Wood Cemetery—until the collapse of the American center at Flatbush made their position hopeless. Redcoats from Bedford were closing in behind them, while Hessians were crashing through the woods on their left. To give the rest of his force time to escape across the tidal flats along Gowanus Creek, Alexander counterattacked with barely four hundred Maryland troops.

Washington, who watched Alexander advance from a vantage point where Court Street now crosses Atlantic Avenue, reportedly wrung his hands and cried out: “Good God! What brave fellows I must this day lose!” Survivors remembered the “confusion and horror” as the fleeing Americans tried desperately to cross eighty yards of muddy flats under a hail of British canister, grape, and chain. “Some of them were mired and crying to their fellows for God’s sake to help them out; but every man was intent on his own safety and no assistance was rendered.” After savage fighting on the Gowanus Road near the Cortelyou House (now known as the Old Stone House, at Fifth Avenue and 3rd Street), Alexander was captured. By two P.M. all but nine of the Marylanders had been killed or taken prisoner. Thanks to their valor, however, hundreds of other Americans managed to wade or swim to solid ground on the other side of the creek, and hence to safety in Brooklyn Heights.

Had Howe kept up the chase, it is likely that the demoralized remnants of Washington’s army would have been driven into the East River. In only a few hours of fighting roughly twelve hundred Americans had died, and another fifteen hundred were wounded, captured, or missing—among them three generals and ninety-odd junior officers. The British, by contrast, reported only sixty dead and three hundred wounded or missing.

recalled. “All orders were given from officer to officer, and communicated to the men in whispers.” At water’s edge, a regiment of fishermen from Salem and Marblehead with commandeered rowboats, barges, sloops, skiffs, and canoes waited to ferry the army across to New York. Working silently, hour after hour, they rowed back and forth, under the cover of a thick fog that concealed the maneuver from enemy sentries. The last of ninety-five hundred men—Washington’s entire force—reached Manhattan just as dawn broke on Friday. Not until 8:30 would a chagrined Howe learn that the Americans had slipped his grasp.

Even though everyone knew that Washington’s audacity had saved the Revolution, there was no celebrating in New York. Pastor Schaukirk, roused out of bed to watch the soldiers straggle into town, saw only shock and exhaustion on their faces. “The merry tones on drums and fifes had ceased,” he reported. “It seemed a general damp had spread, and the sight of the scattered people up and down the streets was indeed moving. Many looked sickly, emaciated, cast down, etc.; the wet clothes, tents—as many as they had brought away—and other things were lying about before the houses and in the streets to dry.”

Washington's escape from Brooklyn Heights, by J. C.
Armytage. (© Collection of The New-York Historical Society)

THE FALL OF NEW YORK

On September 11 Lord Howe met with a congressional delegation consisting of Benjamin Franklin, John Adams, and Edmund Rutledge at the stone manor house Captain Christopher Billopp had built around 1680 in Tottenville, Staten Island. If Congress would revoke the Declaration of Independence, Howe repeated, the British would pardon all who had taken up arms against the king (essentially the same offer they had made to Washington a month before). Independence isn't negotiable, replied the American delegates—with which the so-called conference came to an end.

Now even Washington could see that his days in New York were numbered. His dispirited army was falling apart—in one week six thousand of eight thousand Connecticut militia simply picked up and went home—and the longer he stayed in the city, the greater the danger he would be encircled and destroyed. At a war council on September 12, Washington accepted the advice of his officers to abandon all of Manhattan to the enemy except for Fort Washington at the northern end of the island. Greene (supported by John Jay, among others) argued strongly that New York should be burned as well as abandoned. ("That cursed town from first to last has been ruinous to the common cause," exclaimed one officer.) Congress firmly rejected the idea. Two days later, leaving Putnam and five thousand men behind to cover his rear, Washington shifted his headquarters ten miles out of town to the home of Roger Morris on Harlem Heights (now the Morris-Jumel Mansion on 162nd Street).

On October fifteenth, the Howe brothers finally roused themselves for another move against Washington. That morning, Connecticut militiamen crouched in trenches a few miles above the city at Kip's Bay (34th Street) observed so many flatboats of redcoats massing just across the East River at the mouth of Newtown Creek that it looked "like a large clover field in full bloom." As they pushed off, five warships anchored nearby poured barrage after barrage into the American positions—"so terrible and so incessant a Roar of Guns few even in the Army & Navy had ever heard before," declared Lord Howe's secretary, Ambrose Serle. Awestruck spectators on the shore at Bushwick watched as four thousand British troops swarmed

toward Manhattan to “the strains of exciting music, and the peals of thundering guns, the tall ships vomiting flames and murderous shot” under “rolling volleys of smoke.” The militia ran off in fear, and the British waded ashore without opposition. “The rogues have not learnt manners yet,” scoffed one of His Majesty’s officers; “they cannot look gentlemen in the face.” By early afternoon the British had taken possession of the Robert Murray farm—atop what is now Murray Hill—and were prepared to descend on the city below.

Washington, racing down from Harlem Heights, found his troops in complete disarray, “flying in every direction and in the greatest confusion.” He tried to rally them in a cornfield north of what is now 42nd Street, near where the Public Library now stands, but the sight of advancing redcoats sent them running again up the Bloomingdale Road (Broadway). At this, witnesses recall, Washington went berserk with rage. “The General was so exasperated,” a Virginia officer reported, “that he struck several officers in their flight, three times dashed his hat on the ground, and at last exclaimed, ‘Good God! Have I got such troops as those?’” Aides led him away, fearful he would be captured. The disgraceful rout became a more orderly retreat only after his panic-stricken soldiers reached McGowan’s Pass at the south end of Harlem Plains.

In the meantime, Howe arrived at the Murray farm and stopped to wait for reinforcements—or perhaps, according to legend, to have some cake and wine with Mrs. Murray, who saw a chance to distract him from the business at hand. Howe’s dallying gave Putnam and the rest of the army, guided by Lieutenant Aaron Burr, time to slip out of New York along the Greenwich Road and reach Harlem Heights before the redcoats crossed Manhattan to cut them off. They left behind about half of the army’s heavy guns and what Greene called “a prodigious deal of baggage and stores.”

The city itself was in a state of utter chaos as thousands of civilians, including the last remaining members of the Mechanics Committee, scrambled to get out as well. Only a few thousand remained when some officers from the fleet rowed ashore that evening to announce that New York was again in British hands. A small but delirious crowd of Tories paraded them “upon their shoulders about the streets and behaved in all respects, women as well as men, like overjoyed Bedlamites,” Ambrose Serle reported. “One thing is worth remarking,” he added: “A woman

pulled down the rebel standard upon the fort, and a woman hoisted up in its stead His Majesty's flag after trampling the other under foot with the most contemptuous indignation."

The next day, September 16, a reconnaissance party of Connecticut rangers tangled with an advance column of several hundred redcoats on a farm near present-day 106th Street and West End Avenue. As the rangers pulled back toward the Hollow Way, a ravine where West 125th Street now meets the Hudson River, enemy buglers taunted them with the same call that traditionally ended a successful fox-hunt. "I never felt such a sensation before," wrote Washington's adjutant, Joseph Reed, who witnessed the retreat. "It seemed to crown our disgrace." Perhaps even more sharply stung—no one appreciated better than Virginians the upper-class associations of fox-hunting—Washington ordered up reinforcements and counterattacked, driving the redcoats back through a buckwheat field in the vicinity of 120th Street and Broadway before breaking off the engagement two hours later. About thirty Americans and fourteen British had been killed. This "brisk little skirmish," as Washington called it, was the first time soldiers under his command had bested the British in a stand-up fight; it did much to lift their flagging spirits.

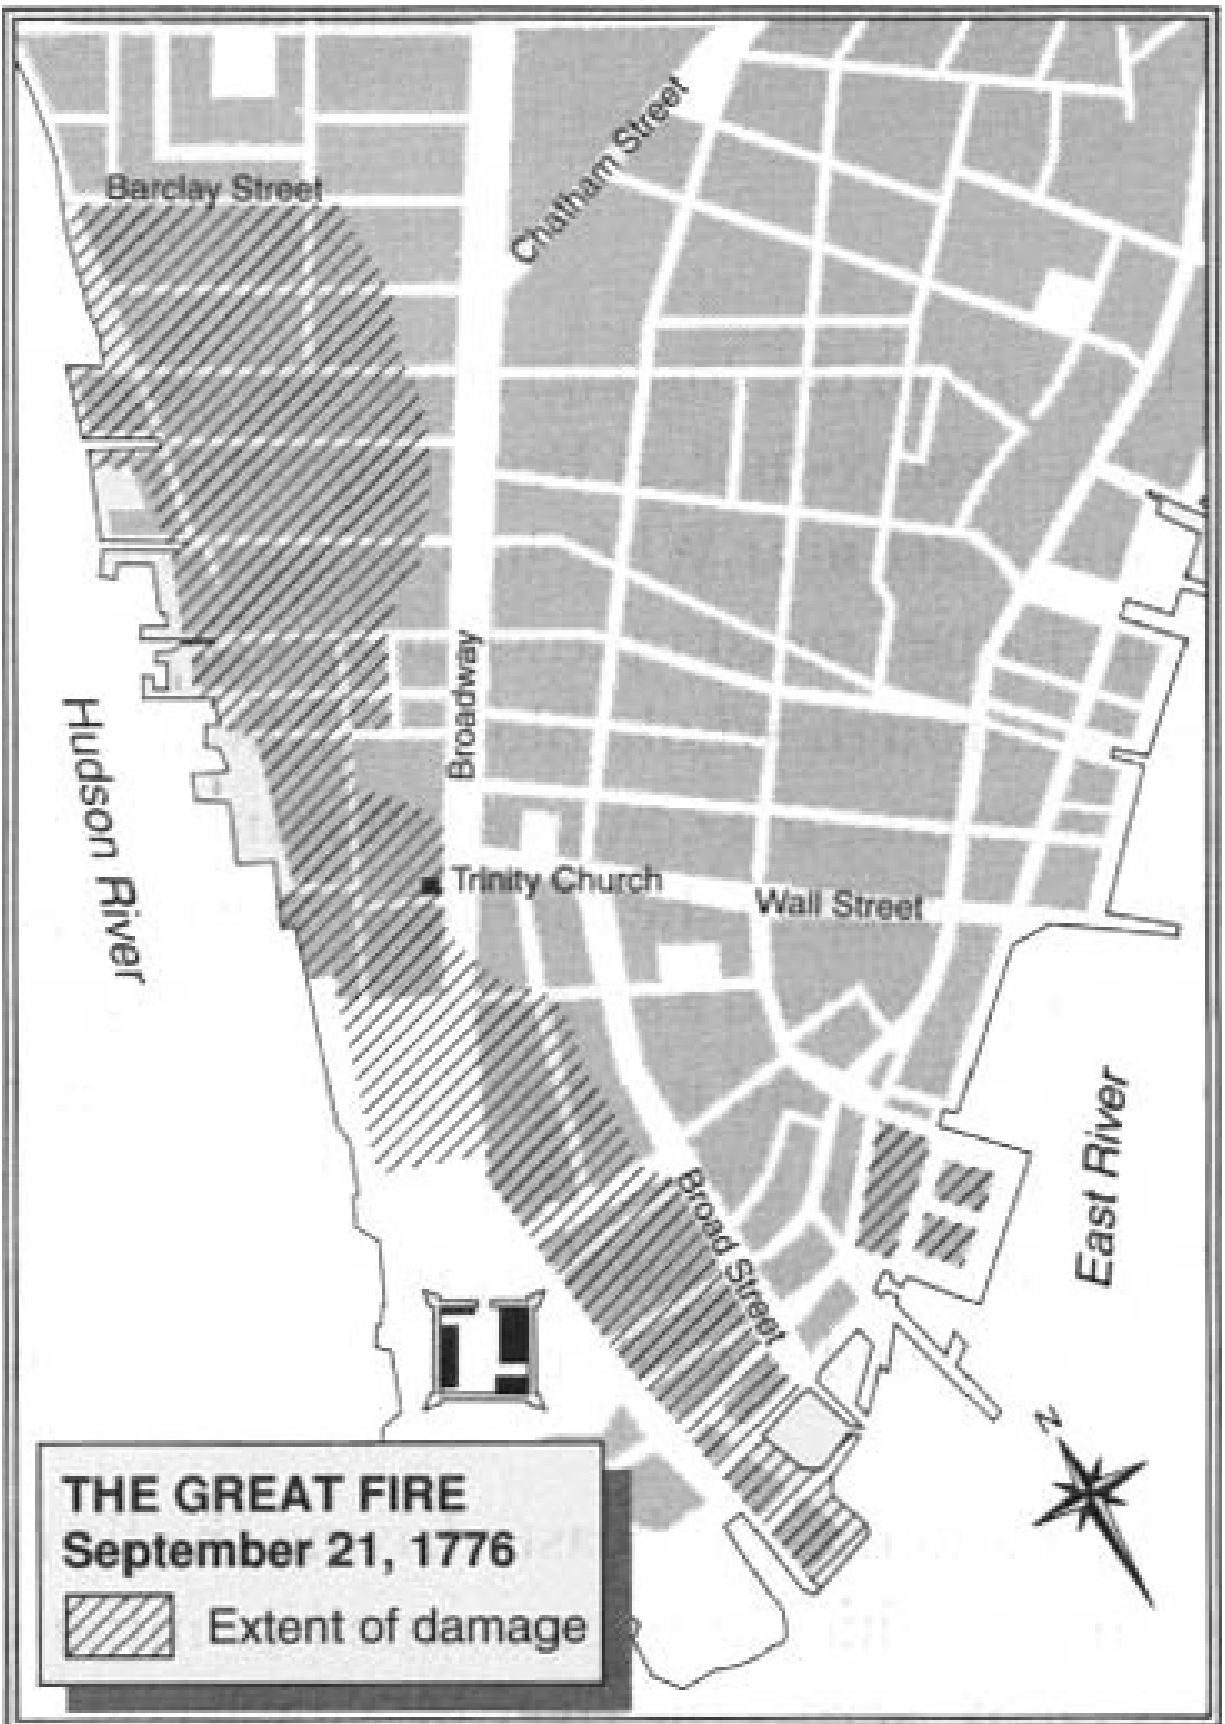

HEAVEN IN FLAMES

Patriot morale got another boost from the conflagration that engulfed the now-occupied city soon after midnight on the twenty-first. It began, apparently, in a tavern called the Fighting Cocks that stood on a wharf near Whitehall Slip. From there, driven by a brisk wind from the southwest, the flames raced uptown across Bridge, Stone, Marketfield, and Beaver streets, sweeping through whole blocks of houses and shops at a time. According to one newspaper account, the confused shouting of men and the terrified shrieks of women and children, "joined to the roaring of the flames, the crash of falling houses and the widespread ruin. . . formed a scene of horror great beyond description." Clutching what few possessions they had managed to gather up, hundreds of people plunged through the heat and choking smoke toward the relative safety of the Common, "where in despair they fell cowering on the grass." Far to the north, on Harlem Heights, Alexander Graydon watched the blaze grow until "the heavens appeared in flames."

At two A.M. the wind shifted to the southeast, driving the flames across Broadway, then up toward Trinity Church, which was consumed in minutes. A contingent of rebels watching from Paulus Hook, across the river in New Jersey, cheered as its steeple collapsed in “a lofty pyramid of fire.” St. Paul’s, half a dozen blocks to the north, escaped a similar fate thanks to the efforts of a hastily organized bucket brigade. British soldiers and seamen were rushed in at daybreak to provide assistance, but not until the blaze reached the empty lots north and west of St. Paul’s, around midmorning, did it finally burn out. Smoldering in the mile-long swath of destruction were the ruins of better than five hundred dwellings, one-fourth of the city’s total.

Many jumped to the conclusion that the fire was the work of rebel arsonists. Furious mobs killed several suspicious characters during the night—one or two for carrying “matches and combustibles under their clothes,” another for “cutting the handles of fire buckets,” a couple of others for being “in houses with fire-brands in their hands.” Various eyewitnesses remembered other things as well: missing fire-alarm bells, broken fire engines and pumps, empty cisterns, and wagonloads of combustible materials concealed in cellars and basements.

Military authorities rounded up about two hundred men and women for questioning, among them a young captain in the American forces named Nathan Hale. Hale confessed that he had come to New York to spy on the British, and because he was out of uniform, General Howe had no choice under the rules of war but to have him hanged the next morning. Hale’s final words from the gallows (most likely located in an artillery park at today’s Third Avenue and 66th Street)—“I only regret that I have but one life to lose for my country,” paraphrased from Addison’s play, *Cato*—made him famous but didn’t settle the question of whether he, or anyone else, had attempted to burn the city. Although no credible evidence of deliberate arson ever came to light, it was Washington who delivered the final verdict while studying the red glow on the horizon from the balcony of the Roger Morris house on Harlem Heights: “Providence, or some good honest fellow, has done more for us than we were disposed to do for ourselves.”

FINALE

The clash on Harlem Heights convinced the ever cautious Howe to encircle the American army rather than attack head-on. On October 12, three weeks after the fire, he took four thousand redcoats up the East River to Long Island Sound and landed on a peninsula called Throg's Neck (Fort Schuyler Park in the Bronx). Their task was to seize King's Bridge, a few miles to the west and Washington's only means of escape across the Harlem River to the mainland. A small party of riflemen gave the redcoats some trouble at Westchester Creek, however, and Howe decided to wait for reinforcements. He waited for six days, then put everybody back on the boats and shifted the attack three miles north to Pell's Point (Pelham Bay Park), where a much smaller force of Americans held him up again on the road to the little hamlet of Eastchester. Washington, meanwhile, moved his army off Manhattan up to White Plains, leaving only a twelve-hundred-man garrison at Fort Washington.

Howe finally worked his way up through Eastchester and New Rochelle to White Plains, which he attacked and drove Washington out of on the twenty-seventh. Again he didn't pursue the Americans, this time because he needed to return to Manhattan and deal with Fort Washington, which continued to threaten his communications with New York. On November fifteenth, following a heavy bombardment from British batteries on the east side of the Harlem River and a frigate anchored in the Hudson, about twenty thousand Hessians and redcoats converged on Washington Heights. After a brief struggle, the fort's bedraggled and vastly outnumbered defenders surrendered. "A great many of them were lads under fifteen and old men, and few had the appearance of soldiers," observed one British officer. "Their odd figures frequently excited the laughter of our soldiers." Washington, who had meanwhile divided his army and taken part of it across the Hudson to New Jersey, watched in horror from Fort Lee as the last American forces on Manhattan were marched off into captivity. He wouldn't set foot on Manhattan again for seven years.

The fall of New York didn't doom the Revolution, as many on both sides had initially expected, but it did change matters profoundly. All told, the American army had taken a terrible beating trying to hold the city. Some thirty-six hundred men lay dead or wounded, and another four thousand,

along with three hundred officers, were prisoners of the enemy. Thousands of others had simply gone home in disgust or despair. Mountains of ammunition and equipment had been lost.

This dismal accounting persuaded many army officers and members of Congress to think twice about the best way to carry on the struggle. Lee's notion of relying on militia and home-grown amateur officers seemed discredited; Washington, among others, now believed the Revolution wouldn't survive unless Congress created a standing army of regular, professional troops who obeyed their officers, held their ground under fire, and didn't head for home whenever they wanted (to which Henry Knox added pleas for a military academy to provide the army with proper officers).

Similarly, the loss of Long Island in August and of Fort Washington in November appeared to demonstrate that the British couldn't be beaten in a Bunker Hill-style confrontation. Instead, Washington decided, he would endeavor to keep the army intact, avoiding the big battle that could lose everything and concentrating instead on striking the smaller, sharper blows that would wear away the enemy's resolve. Thus when Howe finally retired to New York City for the winter, Washington lashed back with surprise raids on the small British garrisons at Trenton and Princeton in late December and early January, two modest but morale-building victories.

Howe would receive the Order of Bath for capturing New York, but his foot-dragging was the subject of recurring controversy. In 1778, after the loss of Saratoga, he was recalled in favor of Clinton and Cornwallis, both of whom promised to be more aggressive generals. Fortunes also changed for the English radicals who between 1764 and 1776 had spoken out so vigorously on behalf of the colonies. With a few prominent exceptions, they were thrown off balance by the American demand for independence, for while they accepted it as a legitimate expression of the popular will, colonial self-determination would blast all hopes that reformers on both sides of the Atlantic could work together toward the same objective.

Republicanism, too, was a problem. By rejecting monarchy and aristocracy, by insisting on the primacy of reason over tradition and traditional authority, and indeed by at least asserting the principle of full political equality, the Americans had moved far beyond all but their most radical counterparts in Britain.

The outbreak of fighting, finally, dampened public enthusiasm for America. British merchants, fearful of the loss of trade, rallied behind the ministry and sent addresses of loyalty to the crown; British crowds turned increasingly patriotic, snapping the connection between radicalism and working-class discontent. Pottery manufacturer Josiah Wedgwood, a longtime supporter of colonial protest, observed ruefully that the town of Newcastle “went wild with joy” when word arrived that His Majesty’s army had captured New York. Even in London, once a stronghold of pro-American sentiment, there was a noticeable decline of enthusiasm for the rebel cause. Not for another generation, by which time the world had greatly changed, would British and American radicals again come within hailing distance of one another.

The Gibraltar of North America

For the thousands of Tories who fled New York between 1774 and 1776, its capture by the British was the signal for a jubilant homecoming. Sporting red badges in their hats as tokens of loyalty, they streamed into town behind Howe's troops; the general's personal chaplain, inspired by this devotion to the royal cause, reopened St. Paul's Chapel with a sermon on Jeremiah 12:15: "And it shall come to pass, after I have plucked them out, I will return again and have compassion on them, each man to his heritage, and every man to his land." Hundreds of people thronged City Hall in October to sign a memorial congratulating General Howe and his brother on their victory. Another crowd turned out in November to sign a "declaration of dependence," reaffirming their "loyalty to our Sovereign, against the strong tide of oppression and tyranny, which had almost overwhelmed this Land."

By early 1777 the Tory flood tide had lifted New York's population to some twelve thousand; two years later, swollen by successive waves of Tory refugees from elsewhere in the colonies, the city had a record thirty-three thousand inhabitants. Conspicuous among the returnees was James Rivington, who won an appointment as "Printer to His Majesty the King" and resumed publication of his *New-York Gazetteer* (later the *Royal Gazette*). The *Gazetteer's* reappearance, along with Hugh Gaine's *Weekly Mercury* and James Robertson's *Royal American Gazette*, would make New York the headquarters of Tory opinion for the remainder of the war. Also back in town, having been run out of Virginia by the rebels, was former governor Dunmore; joining him, at one point, were four other colonial governors and swarms of lesser imperial functionaries with similar stories to tell. All told, an estimated fifty thousand Tories had gathered behind British lines in and around New York City by 1782.

Those were the civilians. As the war waxed and waned in distant theaters, tens of thousands of troops also shifted in and out of the city—Waldeckers in their gaudy yellow-trimmed cocked hats, huge mustachioed Hessians, kilted and tartaned Highlanders, black-capped Anspach grenadiers—all trailed by numerous dependents and camp followers. Between November 1777 and July 1778 their numbers leaped from five

thousand to nearly twenty thousand. By December 1779 they had fallen to four thousand, only to rise again to ten thousand by August 1781 and seventeen thousand by December 1782.

Organized rebel activity on Long Island and in much of Westchester County came to an abrupt end. Soon after Washington's retreat from Brooklyn Heights, perhaps as many as five thousand patriots from Kings, Queens, and Suffolk counties fled across the Sound to Connecticut. In their absence one town after another disbanded its committees, repudiated the authority of Congress, and drafted congratulatory addresses to General Howe and Governor Tryon. Tryon toured the island in October 1776, handing out thousands of certificates of loyalty and administering an oath of allegiance to the militia in his capacity as head of the provincial forces. In Kings County, 593 out of the 630 militiamen took the oath; in Queens, roughly twelve hundred of a possible fifteen hundred did likewise, while some thirteen hundred "freeholders and inhabitants" put their names on a declaration denouncing the "infatuated conduct of the Congress" and describing how they had "steadfastly maintained their royal principles." The army obligingly sent eight hundred stands of arms to Queens, where they were received "with demonstrations of joy."

Military recruiters had an easy time of it for the next few years. Long Island men flocked to Tory militia regiments under the command of Oliver De Lancey, brother of the late governor. In Westchester County, Oliver's nephew James De Lancey (not to be confused with James De Lancey Jr., the late governor's son) raised a troop of some five hundred light horse to hunt for deserters and patrol the regular army's supply routes through the Neutral Ground—a thirty-mile-wide no-man's-land that ran north of Morrisania to the mouth of the Croton River, marking the unofficial boundary between British- and American-held territory.

Thousands of other New Yorkers joined a parade of colorfully named Tory units—the King's American Regiment, the King's Orange Rangers, the Loyal American Regiment, the British Legion, and the Volunteers of Ireland, among others—some of which would see action as far away as Georgia, Canada, and Jamaica. In all, around sixteen thousand New York men bore arms for the king as against thirty-six thousand for Congress. Over the winter of 1779-80, when Washington was rumored to be preparing

an attack on New York, it took only five days to raise two thousand volunteers for the city's defense.

Female Tories served the British as spies and couriers. Lorenda Holmes had carried messages to Howe's forces in 1776. Captured by rebel committeemen, she was stripped naked and exposed to a patriot crowd but, she wrote, "received no wounds or bruises from them only shame and horror of the mind." Holmes carried on, helping to slip loyalists through rebel lines into occupied New York City. When the rebels apprehended her a second time, they held her right foot on hot coals until it was badly burned.

It was men and women such as these, said one British commander, that made New York the principal bulwark of royal power and influence in the colonies. The "Gibraltar of North America" he called it—a proud allusion to the royal fortress that was, even as he spoke, standing fast against the combined forces of France and Spain.

"TOUJOURS DE LA GAÏETÉ"

Superficially, at least, the British occupation restored some of the prosperity that New York had enjoyed in the 1750s. The city's rebounding civilian population opened lucrative new markets for area farmers and, after years of nonimportation, for British manufacturers eager to reduce inventories of clothing, hardware, and other finished goods. Provisioning the huge military machine—five hundred ships jammed the harbor within a month after the city's fall—generated windfall profits for the Waltons, Bayards, Lows, and other Tory merchants. When Parliament authorized a fleet of 120-odd privateers to be fitted out in New York to prey on rebel shipping, it created work for thousands of seamen and attracted immense quantities of goods and money into the local economy. (In one six-month period, between September 1778 and March 1779, privateers came in with 165 prizes worth over six hundred thousand pounds.) Shopkeepers, cloakmakers, milliners, dressmakers, wigmakers, and coachmakers were busy again trying to meet the demand of His Majesty's officers and their wives for all the comforts of home. There was money to be made, too, in illicit trade between the city and rebel-held areas of Westchester, New Jersey, and Connecticut, despite efforts of authorities on both sides to stamp it out. Alexander Hamilton calculated in 1782 that upstate patriots were

buying thirty thousand pounds' worth of luxuries from New York merchants every year, plus an additional eighty thousand from sources in New Jersey, Pennsylvania, and New England. Cartloads of specie were said to arrive in the city every week.

Thanks to this sudden wealth, plus General Howe's own weakness for extravagant living—"Toujours de la gaiete!" he cried as the occupation got underway—New York's fashionable classes were soon caught up in a social whirl that would have been unthinkable only a year or two before. Fox-hunting and golf made a fast comeback, dispelling the gloom of republican austerity. Billiards were all the rage at the King's Head Tavern. Horse racing returned to Hempstead Plains, and its popularity prompted the opening of a new course, Ascot Heath, on the Flatland Plains, five miles east of the Brooklyn ferry. Two rival cricket clubs, the Brooklyn and Greenwich, squared off on Bowling Green or near Cannon's Tavern on Corlear's Hook. Ladies and gentlemen of quality entertained themselves with saltwater bathing parties and concerts, and every two weeks at the City Tavern on Broadway there was a "Garrison Assembly" where local girls danced with dashing officers like the young Captain Horatio Nelson—"genuine, smooth-faced, fresh-coloured" Englishmen "of family and consideration" (as the American prisoner of war Alexander Graydon described them). The John Street Theater, renamed the Theatre Royal, reopened in January 1777 with a production of *Tom Thumb*. Some 150 performances followed over the next half-dozen years, including works by Shakespeare, Garrick, and Sheridan. The actors, mostly officers, were fondly known as "Clinton's Thespians." Audiences usually numbered around 750.

Especially lavish festivities accompanied the Queen's Birthday celebration of 1780, when "a transparent painting of their majesties at full length, in their royal robes" was suspended over the gate of the fort and "illuminated with a beautiful variety of different colored lamps." The presentation of this tribute was followed by an elegant ball and formal supper. "It is said that the ball cost above 2000 Guineas, and they had over 300 dishes," the Rev. Schaukirk noted sourly in his diary. When Prince William Henry (later King William IV) visited New York in September 1781, the social whirl became positively frantic. The prince especially liked

the informal skating parties on the Fresh Water Pond, during which an attendant pushed him around in a chair mounted with runners.

Eating and drinking societies like the Old Church and King Club again crowded into the private rooms of Hull's Tavern or the King's Head, roaring out their loyalty to the crown in song and endless toasts. The St. Andrew's Society, the St. George Society, and other fraternal organizations resumed their annual rites with gusto and aggressively loyalist overtones. In March 1779 the Volunteers of Ireland, a British regiment organized in Ireland that had arrived in New York the previous June, sought to win Irish recruits to the British cause by staging one of the first St. Patrick's Day parades in the city's history. According to the *Weekly Mercury*, "the Volunteers of Ireland, preceded by their band of music," marched out to the Bowery, where a dinner was provided for five hundred people.

"EVERY NEGRO WHO SHALL DESERT THE REBELL STANDDARD"

If anyone had reason to rejoice at the British occupation, it was New York's suddenly flourishing population of runaway slaves and freedmen. Many rebel slaveowners in the city had manumitted their slaves after 1775—partly in response to increasing immigration (which according to one traveler had already produced a surplus of cheap free labor in the city), partly in recognition that human bondage violated their professed attachment to liberty and natural rights, and partly because, fleeing the British invasion, they didn't want the continued trouble and expense of extra dependents.

Besides, in December 1775 Lord Dunmore, governor of Virginia, issued a proclamation freeing all of that colony's indentured servants and slaves who were willing to support the crown. As word of Dunmore's proclamation spread north in 1776, nervous masters everywhere noted the rising numbers of runaways and fretted about the growing likelihood of a black insurgency. Within months, hundreds of slaves from the New York-New Jersey area ran off to seek refuge within the British lines. Some reportedly joined regular British units in preparation for the August invasion of Long Island. General Nathanael Greene warned Washington that eight hundred blacks were drilling on Staten Island, and the Provincial Congress provided a detachment of militia to "guard against the insurrection of slaves." Once His Majesty's forces moved in, moreover,

they found area slaves ready and willing to help them plunder the property of their masters. As one patriot recalled many years later, “The negroes of [Long] Island were all Tories, and pointed out to the enemy the places where goods and plate had been concealed.”

During the next half-dozen years, additional thousands of slaves from Long Island, Staten Island, New Jersey, and Westchester County ran off—a revolution-within-a-revolution that dwarfed the events of 1712 and 1741. (Fully two-thirds of the slaves in Westchester, nearly twenty-two hundred people in all, were said to have fled their masters in the course of the war.) At one point, the volume of fugitives from New Jersey became so great that city officials ordered Hudson River ferryboat operators to stop transporting blacks until further notice. New Jersey’s rebel government underscored the magnitude of the problem by advising masters to transport their slaves into the interior of the state, from where it would be more difficult to reach British lines.

The movement of runaways and freedmen into the city quickened after June 1779 when General Clinton, following Dunmore’s lead, issued a proclamation of his own promising “every Negro who shall desert the Rebell Standdard full security to follow within these lines any Occupation which he shall think Proper.” Many chose to take up arms against their former masters and enlisted in one or another of several army units composed of blacks from all over the colonies, among them the Black Pioneers and Guides, the Royal African Regiment, the Ethiopian Regiment, and the Black Brigade. Led by the dashing Captain Tye, an escaped slave from New Jersey, the Black Brigade won notoriety for its lightning raids on patriot farms and villages in nearby Monmouth County. As early as 1777 a unit of Virginia freedmen occupied a redoubt guarding the strategically important Boston Post Road (now Van Cortlandt Avenue East in the Bronx); area residents called it the “Negro Fort.”

Numerous other fugitives served with regular British units as pilots, guides, and couriers or worked as laborers for the Quartermaster General’s Department, the Wagonmaster, or the Forage and Provision departments of His Majesty’s army. Still others found employment as cartmen, carpenters, and the like, trades from which they had hitherto been excluded. More than a few married, established families, and sent their children to the school for blacks opened in 1778 by the Anglican Church. Many found shelter in or

around various “Negro Barracks” located on Broadway, Church Street, and elsewhere. When they died, they were interred in the Negro Burial Ground above Chambers Street—as happened to “great numbers” of Virginia runaways, whose camp in an open field on the west side of Broadway was swept by a smallpox epidemic. The burgeoning numbers, autonomy, and self-confidence of New York’s freedmen were unmistakable and got a good deal of attention throughout the colonies. “Ethiopian Balls,” where African Americans and British officers mingled freely, drew particular criticism in the rebel press.

“HERRINGS IN A BARREL”

Rich men, officers, and runaway slaves excepted, most inhabitants of occupied New York had little to cheer about. Their hopes for the prompt restoration of civilian government proved embarrassingly naive. General Howe imposed martial law on the city and environs and resisted every appeal to relent, as did his successors, Generals Henry Clinton (1778-82) and Sir Guy Carleton (1782-83). Year after discouraging year, the provincial assembly, city council, and courts remained officially dormant. Governor William Tryon and Mayor David Mathews, though restored to their offices, exercised little or no real power. Nor did William Smith, former stalwart of the Whig Triumvirate, who showed up in New York in 1778 and accepted appointment as chief justice of the colony.

Under martial law, a commandant, appointed by the commander-in-chief, exercised more or less dictatorial power over the day-to-day administration of municipal affairs. Answerable to the commandant was a small coterie of other officials and bureaucrats. A police department enforced military regulations, maintained a night watch, and regulated ferries (by the end of 1780 a two-judge police court had been set up to try cases involving civilians). Andrew Elliot, head of the department for many years, also supervised the collection of customs as superintendent of exports and imports. A Barracks Board arranged housing for soldiers. The Chamber of Commerce, which resumed its meetings in 1779, informally advised the commander-in-chief and commandant on economic matters. Two volunteer companies, the Military Club and the Fire Club, equipped themselves with buckets and pumps to protect the town from the kind of disaster that befell it in 1776.

General Clinton and other officers talked of the need “to gain the hearts & subdue the minds of America,” but the military regime produced exactly the opposite effect. Merchants lost patience with the maddeningly arbitrary system of restrictions, passes, and permits; it didn’t help that the wharves and warehouses of loyal traders were often summarily commandeered for military use, or that the Royal Navy routinely harassed privateers on the grounds that they lured away too many of His Majesty’s sailors. Merchants and seamen alike railed against the press gangs that periodically scoured the city to fill out crews. One “very hot press” in 1781 carried off several hundred able-bodied men, whose affections for the crown must have been sorely tried as a result. White New Yorkers of all classes disapproved of the city’s increasingly conspicuous population of free blacks and runaway slaves. Oliver De Lancey bowed to the prevailing opinion by discharging “all Negroes Mullattoes and other Improper Persons” from his corps in 1777.

Conflicts with poorly paid, poorly provisioned, often poorly disciplined troops sharpened civilian discontent. The first redcoats to enter town in September 1776 went on a rampage, looting private houses and vandalizing City Hall, where they smashed equipment belonging to King’s College, mutilated paintings, and destroyed books. On New Year’s Eve 1777, after performing in a play entitled *The Devil to Pay in the West Indies*, a party of drunken officers—one dressed up like Old Nick himself, complete with horns and tail—disrupted services at the John Street Methodist Church. Nor was that the worst of it. “I could narrate many and very frightful occurrences of theft, fraud, robbery, and murder by the English soldiers which their love of drink excited,” said one dismayed German officer.

Elliot’s police proved next to useless in dealing with the problem, and the police court was thought unreliable because it functioned without the juries that had always been considered a bulwark of English liberty. Civilian complaints against military personnel rarely got anywhere. Courts-martial tended to sympathize with the men in His Majesty’s services and were notoriously lenient on officers accused of wrongdoing; everyone indeed knew of cases in which officers charged with robbing, assaulting, raping, and even murdering civilians had gone free.

Military officials appeared equally unwilling or unable to remedy the city’s desperate shortage of adequate shelter. One-quarter to one-third of its

housing stock had been destroyed by the great fire of September 1776 (which drove three hundred persons to seek admission to the almshouse) and by a second conflagration in August 1778. Agents of the Barracks Board marked rebel-owned buildings with the initials G. R. (for George Rex) and confiscated them for the use of refugees and troops. The Baptist Church, the Brick Presbyterian Church, the First Presbyterian Church, the South Dutch Church, the Middle Dutch Church, the North Dutch Church, the French Church, the Scotch Presbyterian Church, and the Quaker Meeting House—tangible symbols of the dissenting principles to which many loyalists traced the Revolution—were commandeered for barracks, stables, prisons, or storehouses. (Presbyterian churches everywhere on Long Island were also routinely vandalized after 1776.) The two chapels of Trinity Church, St. Paul's and St. George's, escaped such ill treatment, although King's College was used as a military hospital. The Mill Street synagogue, occupied by a loyalist remnant of the Shearith Israel congregation, suffered no appreciable damage either.

Sporadic efforts were made to ease the crisis by regulating the influx of refugees and shifting troops to camps outside the city; at the end of 1777 Commandant General James Robertson also authorized the city vestry to employ rents from Whig-owned property for the relief of the poor and municipal improvements. No steps were taken, however, to rebuild or enlarge the city's supply of housing. With blocks of scorched and crumbling ruins at their backs, civilians and military personnel waged prolonged, sometimes violent struggles for the possession of anything with four walls and a roof. Rents rose 400 percent in the first year of the occupation alone. Few households got through the war without a redcoat or two quartered in a spare room or seated at the dinner table, many with wives and children in tow.

Hundreds, perhaps thousands, of destitute refugees had nowhere to go but "Canvas Town," a pestiferous camp of makeshift tents that sprawled west from the foot of Broad Street through the ruins left by the 1776 fire. The results of so many people jammed together "like herrings in a barrel, most of them very dirty," as the Englishman Nicholas Cresswell observed, were the foul odors that often left city residents gasping for air. "If any author had an inclination to write a treatise upon stinks," Cresswell sniffed, "he never could meet with more subject matter than in New York."

Food and fuel were as hard to come by as fresh air. Within one year of the British takeover, driven by the combination of military and civilian demand, the cost of food in the city jumped 800 percent. Higher prices didn't, however, generate increased supplies. International law at the time allowed armies a right to the "contribution" of food and other essential material—at a fair rate of compensation—from populations under their protection. For farmers in the hinterland of occupied New York, this meant surrendering crops, animals, and equipment, on demand, to army foragers, who paid them with certificates drawn on the Office of Forage in New York City. Inasmuch as the army never matched the going rate for what it took—and from time to time actually froze prices at absurdly low levels—growers and stockmen quickly learned to divert what they produced into the city's flourishing black market or else to restrict production to the bare minimum.

Hard-pressed quartermasters took to importing food, at great expense, from elsewhere in the Empire. Between 1776 and 1778 victualing fleets arrived from Ireland and England with twenty-eight hundred tons of beef, ten thousand tons of pork, twenty thousand tons of bread and flour, a thousand tons of butter, and twenty-four hundred tons of oatmeal and rice. There was never enough to go around, however. Prices continued to go up, not down, and poorer New Yorkers found themselves trying to keep body and soul together on a diet of rice or baked beans. When a French fleet briefly blockaded the city in the summer of 1778, food supplies dwindled so quickly that officials talked of evacuating everyone to avert massive famine. It was the same story in 1779, when mountains of Iroquois corn destined for the army were seized by patriot forces. Periodic epidemics of yellow fever, cholera, and smallpox only underscored the appalling circumstances to which many residents of the city had been reduced.

"BLOOD-SUCKING HARPIES"

The ultimate insult to the patience and principles of loyal New Yorkers wasn't red tape, crime, overcrowding, or chronic shortages—all of which might have been bearable, somehow—but the miasma of decadence and corruption that gradually enveloped the city. Pastor Schaukirk never quite comprehended how the city's most privileged and powerful residents could live so extravagantly at a time of widespread privation. One day he noticed that "the walk by the ruins of Trinity Church and its grave-yard has been

railed in and painted green; benches placed there and many lamps fixed in the trees, for gentlemen and ladies to walk and sit there in the evening. A band plays while the commander is present, and a sentry is placed there, that none of the common people may intrude.” As if this weren’t bad enough, Schaukirk continued, “a house opposite is adapted to accommodate the ladies or officer’s women, while many honest people. . . cannot get a house or lodging to live in or get their living.”

Respectable New Yorkers, according to Judge Jones, took particular exception to the vices of sixty-year-old Commandant Robertson. These included openly keeping a mistress, “smelling after every giddy girl” who caught his eye, and “waddling about town with a couple of young tits about twelve years of age under each arm.” Visitors gaped at the numbers and brazenness of the city’s prostitutes. Said one after attending services at St. Paul’s Chapel: “This is a very neat church and some of the handsomest and best-dressed ladies I have ever seen in America. I believe most of them are whores.” Patriots up and down the continent were scandalized by stories about the city’s commissary of prisoners, a Boston Tory named Joshua Loring, who allegedly promoted an affair between his wife and General William Howe in exchange for a free hand with the shady wheeling and dealing that would make him rich before the war was over. “Profaneness and Wickedness prevaieth,” cried Pastor Schaukirk. “Lord have Mercy!”

Not since the days of Governor Fletcher had official cynicism and venality bedded down so amiably together. One royal investigator reported “peculation in every profitable branch of the service.” According to Jones, army quartermasters, barrackmasters, and commissaries—“blood-sucking harpies” to a man—made away with no less than five million pounds by the end of the war. Even the royal chimney sweep saw his opportunities and took them. “He keeps a half-dozen negroes,” said an irate German officer, “each of whom can sweep at least twenty chimneys a day, and often must clean more; and for each chimney his master, who sits quietly at home, is paid two shillings. . . . The negroes get nothing out of it save coarse food and rags.” General Howe pocketed money intended for farmers whose cattle had been taken by the army. Admiral Arbuthnot sold blank warrants allowing merchants to conduct illegal trade. Proving that civilians could feed at the same trough, Mayor Mathews embezzled money, stole

provisions intended for the poor, charged excessive fees, and ran protection rackets.

“KENNEL, YE SONS OF BITCHES!”

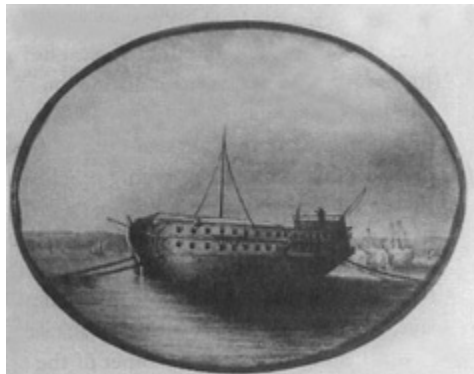

The most chilling stories to come out of occupied New York, however, concerned the thousands of American prisoners of war held in and around the city. Captured officers were permitted to find private accommodations in boardinghouses and taverns, but not common soldiers. As many as eight hundred at a time were jammed into the New Gaol, now called the Provost’s Guard or Prison, on the northeast corner of City Hall Park. Hundreds of others languished in Livingstons’ Liberty Street “sugar house”—a cavernous building formerly used for refining and storing sugar. Sugar houses owned by the Van Cortlandts (near the northwest corner of Trinity churchyard) and by the Rhinelanders (at the corner of Rose and Duane) were also used to hold prisoners, as were the Middle Dutch Church on Nassau Street and the North Dutch Church on William.

Conditions in the sugar houses and the Provost’s Guard dismayed even the most unyielding Tories. Hungry, half-naked prisoners huddled together in appalling squalor, racked by waves of smallpox, yellow fever, and cholera. Many starved or froze to death after scratching out final messages on the walls with their fingernails, and every morning the “dead cart” rumbled up to remove the bodies of those who had succumbed the night before. Abraham Leggett, confined in a room of the Provost’s with a dozen other rebels, remembered being thrown some raw salt beef and spoiled bread. “As soon as the bread fell on the floor it Took legs and Ran in all Directions,” he wrote.

Two men bore special responsibility for these horrors: Commissary Joshua Loring, who made a fortune selling off provisions meant for the prisoners, and the sadistic Provost Marshal William Cunningham, who had once been roughed up by the Sons of Liberty and now took his revenge in merciless brutality. Every evening, Alexander Graydon recalled, “he would traverse his domain with a whip in his hand, sending his prisoners to bed, with the ruffian like *Tattoo of Kennel ye sons of bitches! Kennel, G—ddamn ye!*” Some years after the war, on his way to the gallows for forgery, Cunningham confessed to murdering as many as two thousand American prisoners by starvation, hanging, or poisoning their flour rations with

arsenic. Typically, he said, inmates were hustled out at midnight, bound and gagged, to be hanged from a hastily erected gallows on Barrack (now Chambers) Street. Area residents were under strict orders to shutter their windows and say nothing.

The suffering inflicted on the inmates of the sugar houses and Provost's Guard paled, even so, by comparison with the agonies of rebel prisoners confined to prison ships anchored across the East River in Wallabout Bay. All told, the British employed at least twenty of these ships in the course of the war, using them first for captives taken during the Battle of Long Island and then exclusively for seamen taken on the high seas. The conditions on board were atrocious—hundreds of men packed together in squalid, reeking holds without adequate food or water and brutalized by their guards. Alexander Coffin remembered that his eleven hundred fellow captives on the *Jersey*, most infamous of the prison ships, were “mere walking skeletons. . . overrun with lice from head to foot.” Dysentery was rampant, said Christopher Hawkins, and because only two prisoners at a time were allowed to relieve themselves on the upper deck, he and the others below spent many nights smeared with “bloody and loathsome filth.” Every morning

The prison ship *Jersey*, by James Ryder van Brunt, 1876.
(General Research. The New York Public Library. Astor,
Lenox and Tilden Foundations)

the ships awakened to the call “Prisoners, turn out your dead!” Before the war ended 11,500 men had perished, their bodies simply cast overboard or buried in mass graves on the shore. Bones littered the beach for years.

“ONE GENERAL SCENE OF RAVAGE AND DESOLATION”

Military oppression and corruption also weighed heavily on the areas immediately adjacent to the city. Hessians and redcoats ran amok after the American retreat from Long Island, assaulting civilians and pillaging at will. The Tory Philip Van Cortlandt heard “many frightful accounts” of “cruel unnatural & inhuman” acts committed by His Majesty’s troops on friend and foe alike. Soldiers murdered several persons “in cold blood, plunging bayonets in their bodys & then trampling them under their horses feet, women without distinction taken into the lascivious embraces of Officers & then turned over to the Soldiery, torn from the arms of husbands & parents by Brutal force.” Colonel Stephen Kemble reported that rampaging redcoats had destroyed “all the fruits of the Earth without regard to Loyalists or Rebels, the property of both being equally a prey to them.”

Little of this havoc was accidental. From the very beginning of the war it was taken for granted, especially among the subordinate officers responsible for day-to-day discipline, that the Americans were a cowardly, contemptible rabble—either descended (like the third- and fourth-generation Dutch of Long Island) from Europe’s most benighted and boorish classes or (as in the case of New York’s burgeoning Irish population) the genuine article, fresh off the boat. Rebel and Tory alike would benefit from a dose of Britannic wrath, wrote Lord Francis Rawdon, Sir Henry Clinton’s aide-de-camp, in September 1776. Only by giving “free liberty to the soldiers to ravage at will” could “these infatuated wretches” be made to realize “what a calamity war is.” “At heart they are all rebels,” agreed a high-ranking Hessian.

The yearning to bayonet and torch reached new heights in 1780 when William Franklin, Benjamin’s Tory son and former royal governor of New Jersey, organized the Board of Associated Loyalists in New York. Franklin’s plan was to unite supporters of the crown for self-preservation and revenge, and until Generals Clinton and Carleton put them on a short leash, the four hundred armed Associators compiled a record of atrocities unrivaled on either side. They plundered the country around New York, Jones wrote tersely, “without distinction of Whigs or Tories, Loyalists or rebels.”

Besides Associators, residents of Westchester County had to contend with a vicious little civil war between De Lancey’s “Refugees” and irregular “Cowboys,” who pillaged indiscriminately while pursuing rebel

“Skinners” through the Neutral Ground. On Staten Island, said Lord Rawdon, “a girl cannot step into the bushes to pluck a rose without running the most imminent risk of being ravished” by soldiers “as riotous as Satyrs.” On Long Island, hundreds, often thousands, of regulars were stationed at Bedford, Flushing, Brooklyn, Newtown, Jamaica, Oyster Bay, Hempstead, and other villages after 1776. Clashes with civilians were common and all the more bitter when the troops belonged to one or another of the crown’s special black regiments. Officers and public officials with the authority to protect the local population did little or nothing. The Nassau Blues, a regiment of provincial troops commanded by Colonel William Axtell of Flatbush, entered local lore as the “Nasty Blues” thanks to their thuggish abuse of the town’s residents. Axtell himself allegedly tortured rebel prisoners in the secret chambers of his country house, Melrose Hall.

Always a sore point with loyal civilians was the obligation to quarter troops and prisoners, and the system of “contribution,” pitting military foragers against local farmers and householders, ensured that His Majesty’s forces would never be really welcome, even among their most patient friends. A more and more frequent source of friction, as time went on, was competition for rapidly dwindling stocks of firewood. After making fast work of city fences and shade trees, scavengers and foraging parties turned their attention to the orchards, woodlots, and forests of upper Manhattan and western Long Island. Not even loyalist estates escaped the ax: a Tory regiment stripped Morrisania of livestock and leveled 450 acres of timberland.

The heaviest cutting occurred during the terrible winter of 1779-80, when snow fell almost every day from early November to March and the East River, Hudson River, Long Island Sound, and the Upper Bay became a solid mass of ice. Military authorities couldn’t, or wouldn’t, distribute firewood to civilians, and it became so expensive that some of the city’s poorest inhabitants quietly froze to death. A year or so later, while studying the enemy’s positions on Manhattan from the New Jersey palisades, Washington was astonished to see that “the island is totally stripped of trees; low bushes . . . appear in places which were covered with wood in the year 1776.”

“CURSES UPON THEIR KING”

Only a few years after deliriously celebrating General Howe's seizure of the city, New York's Tories were thus a good deal sadder and wiser. Pastor Schaukirk began to hear it said around town that corruption among "great men" had needlessly prolonged the war, perhaps lost it altogether. Recruiters for Tory units found their work increasingly difficult and started to look elsewhere for men. As General Robertson explained to Lord Jeffrey Amherst: "Those who formerly wishd our approach, and would with Joy have seen Us triumph Over the rebels, will now Arm to defend their All from Undistinguished Plunder." By 1780 or so De Lancey's battalions depended heavily on Connecticut refugees, while the Queen's Rangers, initially made up of New York Tories, consisted chiefly of newly arrived Irish and Scots volunteers.

A few New Yorkers even began working covertly for the Americans. James Rivington, printer of the *Gazette*, became one of Washington's most valuable spies (among other things, he helped obtain the code signals of the British fleet). The well-organized Culper Ring sent female spies into the occupied city, under the pretext of taking baskets of fruit and food to relatives; they relayed information on the disposition of British patrols by hanging a black petticoat and an agreed-upon number of white handkerchiefs from a clothesline behind Mary Underbill's boardinghouse on Queen Street. One of the ring's agents, a woman known only by the code number 355, was captured in 1779 and later perished on board the prison ship *Jersey*. That same year, Elizabeth Burgin eluded arrest after helping over two hundred American prisoners of war escape from the city. "The British offered a bounty of two hundred pounds for taking me," she reported to General Washington. Smuggled down to Philadelphia by friends, she later returned to New York under a flag of truce to retrieve her children.

Toward the end of October 1781, New York Tories received the almost unbelievable news of Cornwallis's capitulation to the combined American and French forces at Yorktown. A few die-hards insisted that the war could still be won. But the winds of opinion in Britain now began to shift decisively toward peace, and a new government formed by the marquess of Rockingham in mid-1782 announced its willingness to begin negotiations with the rebels.

Sir Guy Carleton, who replaced General Clinton as commander-in-chief in May of that year, won praise in the city for a long-overdue anticorruption drive, but his diligence couldn't dispel the pall of gloom that enveloped New York as the loss of the war became more and more obvious. In August the London government accepted the principle of American independence. William Smith, his hand shaking, wrote that the news "shocks me as much as the Loss of all I had in the World & my Family with it." "God d——n them," ranted William Bayard, booking passage on the first ship back to England. "What is to become of me, sir? I am totally ruined, sir. I have not a guinea, sir." Perhaps as many as eleven hundred other Tories would also leave town before the year was out. Local shops advertised china, glassware, and "Genteel furniture" at fire-sale prices.

Preliminary Articles of Peace were agreed to at the end of November 1782. A royal proclamation in February 1783 officially suspended hostilities; Congress quickly followed suit, clearing the way for the completion of a definitive peace treaty in Paris five months later. New York Tories were dumfounded. When an apprehensive throng gathered in early April to hear the royal proclamation read aloud from the steps of City Hall, they responded with "groans and hisses," showering "bitter reproaches and curses upon their king, for having deserted them in the midst of their calamities." Soldiers walked away from their units. Panicky civilians put their houses up for sale, gathered their belongings, and prepared to flee at a moment's notice; a few, utterly overwhelmed, took their own lives.

THE STATE OF NEW YORK

The hopelessness and fear that engulfed the Tories in occupied New York arose not only from the trauma of defeat but also from the recognition that, while they were waiting for the victory that never came, their enemies had revolutionized the world around them. In 1777 the fourth Provincial Congress adopted a written constitution for the "State" of New York that signaled a break with the past more radical than most Tories would have believed possible only a year or two earlier. It required annual elections for the state assembly. It guaranteed trial by jury, due process of law, and freedom of religious worship. It disestablished the Anglican Church and drew a firm line between church and state by prohibiting any form of religious establishment. It opened all public offices to freeholders of the

state and halved the old forty-pound colonial property qualification: henceforth residents of the state owning twenty-pound freeholds, paying two pounds (forty shillings) a year in rent, or admitted as freemen of New York City or Albany could vote in elections for the Assembly. It eliminated representatives from corporations, manors, boroughs, and townships and doubled the number of seats in the Assembly—creating thereby a legislature more responsive to popular opinion. Finally, striking a blow against the old system of viva voce voting, the constitution also required the secret ballot in gubernatorial elections and gave the legislature discretion to experiment with ballots in the elections of its members.

Certain features of the new constitution were more conservative, to be sure. It vested executive authority in a governor elected every three years by male residents of the state owning freeholds worth at least a hundred pounds—a sum big enough to ensure that only men of property and standing would occupy the office. At the same time, the power of the Assembly was checked by creation of a Senate, a Council of Revision (empowered to review and veto all legislative action), and a Council of Appointment (which filled appointive offices above the local level). There was no bill of rights as such, and the constitution was declared to be in effect immediately, without popular ratification. What was more, the preamble of the constitution pointedly warned that popular committees had become the source of “many and great inconveniences” and were no substitute for properly founded governments and the rule of law.

Vis-à-vis New York City, the constitution expressly affirmed the municipal charter granted by Governor Montgomerie in 1730, with one technical adjustment: instead of being appointed by the royal governor and council, the city’s principal officials—mayor, recorder, clerk, and sheriff, among others—would henceforth be chosen by the Council of Appointment. New York would thus remain the “free City of itself”—an autonomous private corporation with absolute title to its own personal “estate.” Its day-to-day affairs would continue to rest in the hands of a private body legally protected from the will of the now sovereign people. Only freemen and freeholders—the “commonality” of the corporation—elected aldermen, assistants, collectors, and constables (and these “charter” elections remained viva voce for another two decades, in defiance of the trend toward secret ballots).

Just months after the constitution was ratified, George Clinton of Ulster County edged out General Philip Schuyler, John Jay, and John Morin Scott to win the state's first gubernatorial election. Born to a Scotch-Irish Presbyterian family of modest circumstances, Clinton was a country lawyer who got into politics in the mid-1760s as an anti-De Lancey Whig. When the war began he wangled an appointment as a brigadier general in the militia. His ardent republicanism and plainspoken manner made him a hero to the small farmers and tenants who were the backbone of the Revolutionary movement in the Hudson Valley outside New York City. But to the great landowning families he remained an outsider, a "new man" thrust into public life by the press of events, and they regarded his elevation to the state's highest office as a scandal. His "family and connections do not entitle him to so distinguished a predominance," Schuyler protested. "A humiliation to the ruling classes," declared Gouverneur Morris. It humiliated them further that over the next half-dozen years Clinton built a devoted following among other "new men" who found their way into the state legislature—radical Whig farmers, shopkeepers, schoolmasters, and exiled workingmen from the city like Daniel Dunscomb (the cooper and former chairman of the Mechanics Committee), Abraham Brasher (silversmith), Abraham P. Lott (a baker active in the Sons of Liberty), and Robert Boyd (blacksmith). Although "unimproved by education and unrefined by honor," in Robert R. Livingston's phrase, the Clintonians were ambitious, upwardly mobile men who saw in independence the promise of both republicanism and opportunity. Several, including Clinton himself, would go on to amass significant fortunes.

Their immediate objective, however, was the suppression of Toryism in the state, and in 1778 the Clintonian-dominated legislature established a permanent Commission for Detecting and Defeating Conspiracies. Dozens of subsequent laws gave the new commission virtually unlimited authority to ferret out "inimicals" and subjected them to increasingly harsh penalties. The Act to Regulate Elections (1778) deprived disloyal persons of the right to vote or hold office. The Banishing Act (also 1778) provided that even "Persons of equivocal and suspected Character" could be summarily expelled from the state. In 1777, moreover, the legislature created commissioners of sequestration for each of the counties not under British control, empowering them to seize but not sell livestock, tools, furniture, and other personal effects belonging to active Tories. The Forfeitures Act of

1779 confiscated all such property, adding houses, land, and slaves to the list. That same year an Act of Attainder declared fifty-nine leading Tories guilty of treason, seized their property, and ordered their immediate execution upon capture. In 1780 the legislature authorized the sale of confiscated Tory property. All told, the estates of some fifteen hundred Tories, including those belonging to the Philippses, Johnsons, and other great landowning families, were forfeited; hundreds of individuals were convicted of treason and banished. No other state, in the end, did more than New York to suppress and punish enemies of the cause, real or suspected.

After 1781, with American independence and the liberation of New York City now a virtual certainty, the Clintonian legislature adopted a pair of measures designed to make life difficult, if not impossible, for Tories who chose to remain in the city once the war ended. The Citation Act of 1782 protected patriots from suits by Tory creditors, while the Trespass Act of 1783 permitted patriots to sue loyalists for damages to property in occupied areas of the state, even when ordered by British authorities.

Over the winter of 1782-83, encouraged by this legislation, patriots began heading for New York to recover houses, land, and other possessions left behind six or seven years earlier. By mid-April, one report said, upwards of two thousand former residents had already returned to the city. Their insistence on the immediate restoration of abandoned property, often coupled with demands for the payment of damages and back rent, produced frayed tempers and tense confrontations. When the merchant John Broome came down from Connecticut to inspect his house on Hanover Square, he found it occupied by British officers. "I am the owner and I should like to make some arrangements respecting the rent," he announced. The officers laughed in his face.

A joint Board of Claims, consisting of officers of both the British and American armies, struggled to resolve such disputes peacefully. Brawls and even organized attacks on Tories nonetheless became common during the summer and fall of 1783. Some of these "violent and interested associations," General Carleton said, were actually planning the outright seizure and redistribution of Tory property once His Majesty's forces withdrew from the city (one group openly described themselves as "levellers"). Pamphlets and newspaper letters warned of more severe

measures to come, and mass meetings around the state clamored for immediate action.

Little wonder, under the circumstances, that many Tories decided to get out of New York as quickly as possible. By the end of June 1783 an estimated ten thousand of them had already accepted the government's offer of free passage with the fleet and left town. Another eight thousand departed in September, followed by eleven thousand more in December.

Of the forty thousand or so Tories who thus abandoned New York between 1782 and 1783—the bulk of whom originally came from Connecticut, New Jersey, Pennsylvania, and other colonies—few returned to their homes or found refuge elsewhere in the United States. Most, perhaps three out of four, made their way to Canada. Many settled in New Brunswick (St. John was incorporated in 1785 with a constitution modeled after the charter of New York City; Hempstead, in Queens County, was founded by former residents of Long Island). Others joined the eight-thousand-odd Tories who established a settlement called Shelburne on the coast of Nova Scotia below Halifax; the Rev. Charles Inglis, rector of Trinity Church since 1777, won appointment as the bishop of Nova Scotia. Adherents to the crown wound up in Ontario, Cape Breton Island, the Bahamas, and elsewhere. Former mayor David Mathews became president of the Cape Breton council. William Smith accepted Carleton's offer to become chief justice of Quebec.

And what of the thousands of slaves and free blacks who had gravitated to New York during the British occupation? All summer long, slaveowners from other colonies turned up in the city looking for their property; Boston King of South Carolina remembered how he and other runaways were filled “with inexpressible anguish and terror. . . when we saw our old masters coming from Virginia, North Carolina, and other parts, and seizing upon their slaves in the streets of New-York, or even dragging them from their beds.” Washington (ever the slavemaster, no matter his exertions on behalf of American liberty) told Carleton that he wanted the British to return all runaways to their rightful owners. Carleton honorably refused on the grounds that those with the British on or before the signing of the provisional peace treaty in November 1782 had been liberated by Clinton's proclamation of 1779. Perhaps four thousand blacks from all over America

thus managed to escape the city while it was still in British hands, most of them, too, destined for Canada or Nova Scotia.

The subsequent history of these black refugees wasn't a happy one. Most settled at Shelburne, Nova Scotia, or St. John, New Brunswick, where trouble with white veterans erupted into race riots in 1784, forcing many to run for their lives yet again. Former members of the Black Pioneers and Guides regiment who founded Birchtown, Nova Scotia (named after the British commander who signed their passports to freedom), stuck it out for a few years longer, but in 1790 over one thousand of them decamped for Sierra Leone. Some individuals made out comparatively well. Bill Richmond, who escaped his Staten Island master in 1776, sailed to England with General Percy and became a celebrated pugilist.

EVACUATION DAY

Protesting “the violence in the Americans which broke out soon after the cessation of hostilities,” General Carleton held on to New York until every Tory who wanted to get out had left. On November 21, 1783, satisfied that he had done his duty, Carleton ordered all British forces to begin withdrawing from Long Island and upper Manhattan. Governor Clinton and General Washington met at Tarrytown and rode down through Yonkers to Harlem, where they waited at a tavern (near the present intersection of Frederick Douglass Boulevard and 126th Street) for word of the final British departure.

Three days later, on the morning of November 25—long celebrated in the city as Evacuation Day—the last redcoats in New York paraded glumly down the Bowery to the East River wharves, from where they were rowed out to the fleet in the harbor. When a certain Mrs. Day prematurely ran up the American flag over her boardinghouse on Murray Street, Provost Marshal Cunningham, resplendent in his scarlet coat and wig, ordered her to take it down. She bloodied his nose with her broom, however, and drove him off. Delirious patriots now thronged the streets, many sporting a special “Badge of Distinction” that consisted of “a Union Cockade, of black and white Ribband, worn on the left Breast, and a Laurel in the Hat.” High-spirited seamen pulled down the signs of taverns that had welcomed the trade of Tories and British soldiers.

A contingent of Continental officers, including General Alexander McDougall, Colonel John Lamb, and numerous other old Sons of Liberty meanwhile assembled at the Bull's Head Tavern on the Bowery to escort Washington and Clinton into town. Joining them there were some eight hundred Continental troops from Massachusetts and New York and a party of mounted townsfolk. Careful to keep a discreet distance behind the British, the Americans marched in formation down the Bowery to Pearl Street, turned west along Wall Street, then stopped opposite Cape's Tavern on Broadway. "The troops just leaving us were as if equipped for show," one eyewitness recalled, "and with their scarlet uniforms and burnished arms, made a brilliant display. The troops that marched in, on the contrary, were ill-clad and weather-beaten, and made a forlorn appearance. But then they were *our* troops, and as I looked at them, and thought upon all they had done for us, my heart and my eyes were full, and I admired and gloried in them the more because they were weather-beaten and forlorn."

At Cape's, a group of patriot citizens formally welcomed Washington. "In this place, and at this moment of exultation and triumph," they declared, "while the Ensigns of Slavery still linger in our sight, we look up to you, our deliverer, with unusual transports of Gratitude and Joy." An infantry and artillery detail meanwhile discovered that the enemy, in a parting insult, had nailed the royal ensign to the flagstaff of Fort George and greased the pole to prevent its removal. John Van Arsdale, a sailor wearing cleats, climbed up and replaced it with the Stars and Stripes while a throng of spectators cheered their approval. Except for Cunningham's bloody nose, there had been no violence. Said one witness: "One day the British patrolled the streets, next day the American soldiers."

Washington's Triumphal Entry, 1788. Washington and his retinue on Broadway, passing St. Paul's Church. (© Museum of the City of New York)

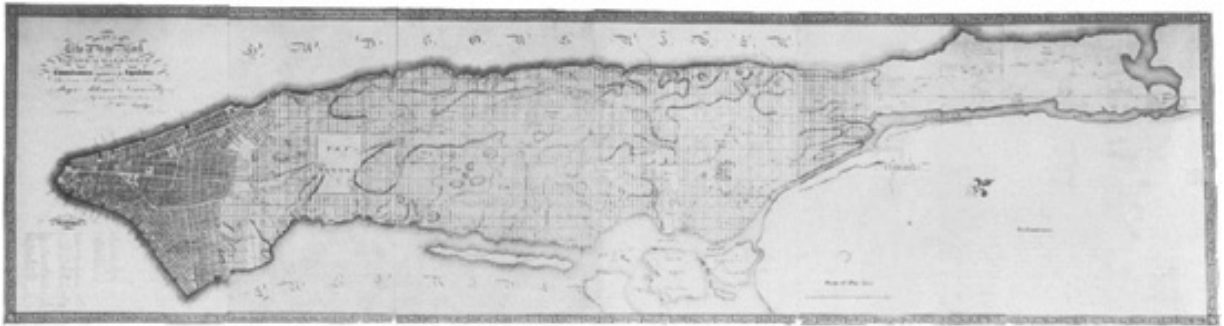

That same evening, Governor Clinton hosted a grand public banquet at Fraunces Tavern for Washington and his officers. Thirteen toasts were drunk, concluding with "May the Remembrance of this DAY be a Lesson to Princes." More banquets followed over the next week, all marked by "good humour, hilarity and mirth." Clinton's dinner for the French ambassador at Cape's Tavern drew 120 guests who consumed 135 bottles of madeira, thirty-six bottles of port, sixty bottles of English beer, and thirty bowls of punch; they also broke sixty wine glasses and eight cut-glass decanters. Bowling Green was the site of a huge display of fireworks on December 2. Spectators saw a "Balloon of Serpents," a "Yew Tree of brilliant fire," and an "Illuminated Pyramid, with Archemedian Screws, a Globe and vertical Sun," climaxed by "Fame, descending" and the launching of a hundred rockets. Printer James Rivington, who had just stripped the British arms

from the masthead of his *Gazette*, said the show that night “exceeded every former Exhibition in the United States.”

On the morning of December 4, Washington bade farewell to his officers in another gathering at Fraunces Tavern. After a brief toast, marked by “extreme sensibility on both sides,” he embraced each of those present in turn. “In every eye was the tear of dignified sensibility and not a word was articulated to interrupt the eloquent silence and the tenderness of the scene.” Escorted by a column of infantry, the Father of His Country walked silently to the foot of Whitehall Street, where a barge waited to take him across to Paulus Hook on the New Jersey shore.

Phoenix

As Washington made his way back to Mount Vernon, New Yorkers got down to the business of rebuilding a city that seven years of enemy occupation and two calamitous fires had reduced to a shambles. In the burned-over district east of Broadway, the spectral shell of Trinity Church loomed menacingly over block after rubble-choked block where, as William Alexander Duer recalled, the skeletal walls of gutted buildings “cast their grim shadows upon the pavement, imparting an unearthly aspect to the street.” Many private residences were unfit for human use. James Duane returned on Evacuation Day and found two of his houses looking “as if they had been inhabited by savages or wild beasts.” Churches and public buildings, commandeered for service as stables or hospitals or barracks, stood in desperate need of repair. Many streets, stripped bare of trees, were obstructed by trenches, redoubts, and other fortifications. Garbage and refuse lay everywhere. Wharves and warehouses had crumbled from years of neglect. The merchant fleet had all but vanished.

Vanished too were the Caribbean markets on which New York’s prosperity had hinged for the better part of a century. British orders in council of July and December 1783 opened the British Isles to American trade but banned American meat, fish, and dairy products from the British West Indies and restricted trade in all other goods to British ships—a tremendous blow to the livelihood of every merchant and artisan in town, not to mention commercial farmers and stockmen in the city’s hinterland. According to some observers, this was only the beginning. John Adams, the American ambassador in London, believed that His Majesty’s government actually had “*disigns of ruining, if they can our carrying Trade, and annihilating all our Navigation, and Seamen.*” It didn’t improve matters that Spain and France, having opened their West Indian possessions to American trade during the war, promptly closed them again with the return of peace.

Perhaps the only really good news was that the Continental Congress had decided to meet in New York pending the selection of a permanent seat for the national government. Congress arrived in the spring of 1785 and took up quarters in City Hall at the head of Broad Street. It was a tight fit: the building already housed the Common Council, the state legislature, and a school. Desperate for space, a rare commodity in the wardamaged city, Congress eventually occupied parts of various other public buildings as well and leased rooms in Fraunces Tavern.

RADICAL RESURGENCE

For the first year or two after Evacuation Day, it appeared that New York's future in these parlous times, if indeed it were to have a future, would be

determined by the same radical Whigs who had been driven out by the British in 1776. Their return to power began when the Council for the Southern District, a provisional government set up by the state legislature for the formerly occupied counties, scheduled Common Council elections for mid-December 1783. Revived by rumors that Tories would attempt to cast ballots—thousands still remained in town, and even conservative Whigs like Robert R. Livingston worried about their intentions—the Sons of Liberty mobilized working people to ensure a substantial margin of victory for radical Whig candidates. Concurrently, a “Committee of Mechanics” put forward a slate of nominees for the Assembly and Senate elections to be held later that same month. Again there were warnings that Tories might try to participate.

Polling began at City Hall on December 29 and closed a week later, with the Mechanics Committee candidates—including Marinus Willett, John Lamb, and Isaac Sears (who had just moved back from Boston)—winning by a four-to-one margin. Instructions for the new assemblymen soon followed from a committee of “late exiled Mechanics, Grocers, Retailers and Innholders.” The committee, whose members included a tallow chandler, a saddler, and a pewterer, demanded that Tories be explicitly disfranchised and excluded from all “advantages of trade and commerce.”

Early in 1784 the Council of Appointment tapped the rich and conservative James Duane for the job of mayor. At first glance this looked like a setback for the radicals, but they raised no complaint. Duane was a proven patriot, after all, and following his inauguration in February, he demonstrated that he was public-spirited as well by donating money earmarked for the customary entertainment, some twenty guineas, to the poor. A Committee of Mechanics, Grocers, Retailers, and Innholders made a special point of complimenting the new mayor on his good judgment.

Duane’s ability to influence the course of events was limited, in any case. Under the terms of the Montgomerie Charter (reaffirmed by the 1777 state constitution) he presided over the Common Council, the Mayor’s Court or Court of Common Pleas (for civil cases), and the Court of General Sessions (for criminal cases). He was clerk of the markets, he appointed subordinate officials such as the high constable and marshals, and he licensed all butchers, tavern keepers, scavengers, cartmen, and porters. The powers of the Common Council, however, were at least as extensive. It

regulated all markets and trades in town. It set the terms under which the mayor granted licenses and made appointments. It also had a fair number of lesser municipal offices at its disposal, and it could change the mayor's compensation by raising or lowering the various market and license fees out of which his salary was paid. With the subsequent appointments of Marinus Willett as sheriff and John Lamb as collector of the port, those posts too belonged to the radicals. So long as Governor Clinton ran the state, they had little to fear from Mayor Duane.

Clinton had in fact already given city radicals their cue to step up the pace of their anti-Tory campaign. Toward the end of January 1784 he opened the new session of the legislature—the first to be held in New York City since independence—with a lament on “the ruins of this once flourishing city” and an impassioned attack on the Tories for the “cruelty and rapine” with which they had opposed the cause of American freedom. Stirred by Clinton's rhetoric, the Sons of Liberty—along with shadowy ad hoc radical groups like the Whig Society—organized a series of mass meetings, culminating in a huge demonstration in the Common at the end of March, to demand not only stricter penalties for former adherents to the crown but also their immediate expulsion from the city by the first of May. Particularly unpopular Tories were tarred and feathered or hamstrung. A party of visiting British officers was set upon and beaten.

With equal zeal, the legislature's radical majority began to spin off anti-Tory legislation. One law barred Tories from holding public office. Another, enacted over the veto of the Council of Revision, authorized election officials to disfranchise any Tory on the testimony of a single witness. A subsequent law ordered the immediate sale of all confiscated property, though doing so plainly violated the Treaty of Paris. Still another imposed a punitive tax of one hundred thousand pounds on those residents of the five lower counties who had chosen to remain under the British occupation and thus hadn't yet paid their fair share for “the blessing derived from freedom and independence.”

The state commissioners of forfeitures meanwhile proceeded to auction off confiscated property. James De Lancey's huge Manhattan estate went on the block, the purchasers including some fifty butchers, gardeners, cartmen, grocers, carpenters, farmers, and assorted other working people—at least some of whom had been De Lancey's tenants before independence.

For fifty-eight pounds, a ropemaker named William Arnold bought a half interest in seven lots of De Lancey's West Farm; John Buchanan, mariner, obtained four lots for £271; James Galloway, rigger, spent eighty pounds for a half interest in eight lots.

The radicalized Common Council now moved to enlarge the powers and responsibilities of the municipal corporation. For seven years now the assorted rents and fees that were the corporation's sole sources of revenue had gone uncollected, leaving it no money with which to repair the ravages of war or pay its outstanding debts. Taxation was the obvious solution. But the mayor and council only had the authority to govern the estate of the municipal corporation: they couldn't levy taxes on residents of the city generally.

At the corporation's request, therefore, the legislature passed a law granting its officers the power to levy a tax on all inhabitants of the city. Although this was a onetime measure—if and when the corporation wanted to impose additional taxes, it would again need to seek legislative approval—it was nonetheless a momentous extension of the corporation's power to govern. Ratifying the popular impulse to local self-determination expressed in the Revolutionary committee system, it began a gradual but inexorable metamorphosis of the corporation from a "private" into a "public" entity that governed as a surrogate of the legislature. Necessarily, too, it cast new doubt on the restrictiveness of the municipal suffrage. Who should now constitute the "commonality" of the corporation: merely those property-owning (male) residents formally admitted to the freemanship, or a broader cross-section of the city's population?

Conservative Whigs protested the delegation of legislative power to the municipal corporation, all too aware that both corporation and legislature were dominated by radicals. The Council of Revision vetoed the tax bill, in part because it permitted assessments "according to the estates *and other circumstances and abilities to pay taxes*" (thereby pitting rich against poor), and in part because it could elevate the city into an "independent republic," a rogue state-within-a-state, immune from higher authority. But the legislature easily overrode the veto, and the law stood.

Equally disturbing to conservatives was the radical assault on two other powerful corporations—King's College and Trinity Church. A group of prominent Whigs led by Mayor Duane had petitioned the legislature to give

King's College a new charter embodying "that Liberality and that civil and religious Freedom" secured by the Revolution. What they got instead from the radical majority was an act creating the University of the State of New York. King's College, renamed Columbia, would henceforth be only one among many prospective institutions of higher learning belonging to and controlled by the university. Furthermore, the university was to be governed by a giant board of regents, most of whose members came from rural parts of the state and could be counted upon to harbor no particular sympathy for an elitist, Anglican institution in the city. This was borne out when the board proposed three highly controversial candidates for president of the university: Joseph Priestly and Richard Price, radical dissenters who had actively supported the American cause, and John Jebb, a reformist Anglican cleric.

Trinity Church presented an even more complicated and potentially explosive case. Only weeks before Evacuation Day, the Tory vestry of Trinity had picked a staunch supporter of the crown, the Rev. Benjamin Moore, to take over as rector (the Rev. Charles Inglis having lately realized that his future looked brighter in Nova Scotia). Even moderate and conservative Whigs were dismayed by Moore's elevation—he "preached and prayed against us during the war," Robert R. Livingston recalled—and the Council for the Southern District decided to place the church under the control of nine trustees, all Whigs, including James Duane, Francis Lewis, Isaac Sears, and William Duer. For rector the trustees chose the Rev. Samuel Provoost, whose forebears had years before drifted with so many other well-to-do Dutch families into the Anglican fold.

Moore refused to step aside. Accordingly, in April 1784, the legislature issued a new charter for Trinity, empowering the trustees to call and induct a rector. Simultaneously, in conformity with the principles of religious liberty embodied in the 1777 constitution, the legislature repealed the Ministry Act of 1693, disestablished the Anglican Church, and adopted a law for the incorporation of non-Anglican religious bodies in the state. Later that same year New York Anglicans hosted a convention that organized the American Episcopal Church in strict accordance with the practices of the Church of England.

What really caught the imagination of the legislature's radical majority, though, was Trinity's valuable Manhattan real estate. Its centerpiece was the

sprawling tract known as the King's Farm, bestowed upon the church almost a century earlier. Soon after Evacuation Day, heirs of Annetje Jans, the original owner, petitioned the legislature for recovery of the property, whereupon the Assembly decided the land properly belonged to the state. In February 1785 it ordered the attorney general to sue the church for possession. The judicial expropriation of Trinity's holdings, if successful, would be a milestone in the transformation of society and an invitation to push that transformation still further.

How much further wasn't clear, although there were plenty of hints. Since Evacuation Day, the Sons of Liberty, the Mechanics Committee, and other radical groups had expressed an interest in such matters as the popular election of mayors, free public schooling, easier naturalization laws, and the abolition of primogeniture and entail. During the war, many had urged the state to combat inflation with policies not unlike those exercised by the municipal corporation—wage and price controls, prohibitions against monopolizers and hoarders, stiff penalties for profiteering, and heavy taxation of unimproved land as well as personal property. John Holt, editor of the *New-York Journal*, had been especially outspoken against the notion that merchants should be free to charge what the market would bear.

At least some radicals seem to have had a penchant, too, for the moral legislation that always lurked just beneath the surface of Anglo-American Whiggism. In March 1784, as a case in point, the Common Council enacted the city's strictest Sabbath law to date, strictly prohibiting labor, public gatherings (except of course at church), sports, games, and even children making noise or playing in the streets on Sunday. Petitions were said to be circulating for "the annihilation of taverns, coffee-houses, billiard tables, ale-houses and theaters." Next year, when Lewis Hallam's Old American Company returned from exile and applied for license to reopen the John Street Theater, the Common Council turned them down with the stern rebuke that this was no time for frivolity. What was more—putting a new spin on an old complaint—the theater's notorious tendency to corrupt manners and morals was a danger to the republic. "Attendance on public Stages intoxicates a populace and diverts their minds from what ought to be the grand object of their study, the public good," asserted one newspaper writer.

Thousands of people had meanwhile continued to pour into New York, boosting its population from twelve thousand at the end of 1783 to twenty-four thousand two years later. Most were refugees hoping to pick up the pieces of their former lives in the city. Scattered among them, however, were wealthy and cosmopolitan newcomers from elsewhere in the state, from other parts of the United States, and even from abroad.

Preeminent among these newcomers—and soon to take the lead in organizing an opposition to the radical resurgence—was twenty-seven-year-old Alexander Hamilton. Although he had lived briefly in the city while a student at King's College, Hamilton spent the first four years of the war traveling the country as Washington's confidential aide and secretary, then settled in Albany after marrying General Philip Schuyler's daughter, Elizabeth. In the company of men like Washington and Schuyler, moreover, Hamilton had become convinced of the need for a strong national government to combat what he considered to be state parochialism and fiscal irresponsibility. His *Continentalist* essays of 1781 called for a constitutional convention to replace the Articles of Confederation (adopted back in 1777) and lavished praise on his friend Robert Morris, a wealthy Philadelphia merchant who served as superintendent of finance for Congress and was largely responsible for the creation of the Bank of North America. The following year, Hamilton appeared before a joint committee of the state legislature to urge "a solid arrangement of finance" for the state and drafted a plan for overhauling state taxes. New York's "radically vicious" system of taxation, he confided to Morris, was a symptom of "the general disease which infects all our constitutions—an excess of popularity. The inquiry constantly is what *will please*, not what will *benefit* the people."

Needing an occupation, Hamilton took a crash course in the law and was admitted to the New York bar in the summer of 1782. A year later he moved his family down to the city, opened a law office on Wall Street, and began to build a practice by representing Tories ensnared by the Trespass Act. "Legislative folly has afforded so plentiful a harvest to us lawyers that we have scarcely a moment to spare from the substantial business of reaping," he gloated to Gouverneur Morris. Publicly, Hamilton professed to have no political ambitions and fended off attempts to nominate him for office. Privately, though, he made no secret of his alarm at the radical

clamor for retribution against the Tories. This “epidemic phrenzy,” he said, could only be the work of “levellers.”

Like Hamilton, William Duer was a newcomer who needed no introduction to New York. Born in England and educated at Eton, Duer had served briefly as an aide to Lord Clive in India before making his way to the West Indies, where his family owned plantations on Antigua and Dominica. In 1768 he came up to New York to buy lumber and was introduced to General Schuyler, a prominent Hudson Valley landowner as well as Hamilton’s father-in-law. On Schuyler’s advice, Duer purchased a tract on the east side of the Hudson near Saratoga, took up permanent residence there, and over the next half-dozen years did a handsome business supplying masts to the Royal Navy and speculating in land. By 1776, now a prominent Whig, Duer had become the main supplier of the Continental forces in New York, raking in profits of a thousand dollars per month. He married Kitty Alexander, daughter of General William Alexander, and with his father-in-law outfoxed their mutual creditors by paying off prewar debts with depreciated Continental paper. Unfazed by the occupation of New York, he arranged to sell flour, cattle, and other provisions to His Majesty’s army under flags of truce and bragged of regularly making 500 percent profits on his investment. When Congress balked at the price General Alexander asked for iron shot manufactured at his New Jersey ironworks, Duer coolly sold it to the British army instead. In another scheme, he took money appropriated to buy food for Continental troops, funneled it into his private account, then bought 6 percent Loan Office certificates—i.e., loaning the money back to the government at a tidy, risk-free profit to himself.

Long before the war ended, radical patriots everywhere had come to regard Duer as the kingpin of corruption among military suppliers and a perfect illustration of the self-seeking that, if unchecked, would sooner or later destroy the republic. In New York, Duer’s wheeling and dealing made him a ready target for radical critics and fed widespread resentment against “mushroom gentlemen” who prospered while their fellow citizens did without. Contemptuous of public opinion, like so many of his associates, Duer brushed off such criticism as the carping of “Paine lovers.” During the spring or early summer of 1783, now very rich and heavily engaged in the

business of supplying provisions to the army, he shifted his residence down to the city.

New Jersey-born Richard Varick, another of Washington's wartime aides, had been admitted to the New York bar on the very eve of independence, but he too didn't settle permanently in the city until after Evacuation Day. Neither did Varick's better-known compatriot, Aaron Burr. Born in Newark, New Jersey, Burr, like Hamilton, had made a name for himself as a gallant young officer in the first years of the war, rising to the rank of major at the age of twenty and joining Washington's military entourage. Unlike Hamilton, Burr soon broke with Washington, resentful of the commander-in-chief's dependence on Hamilton and alleged opposition to his, Burr's, further advancement. Transferred to the staff of General Israel Putnam, Burr subsequently won a promotion to lieutenant colonel and, for a few months, commanded the West Point defenses and the American forces patrolling Westchester County's Neutral Zone. The Zone's muchabused civilians praised his diligence and honesty; his men respected him as a fair yet quick-tempered disciplinarian (he once allegedly lopped off the arm of a mutinous soldier with a single stroke of his saber). By 1779, however, in ill health and believing his prospects still clouded by the rift with Washington, Burr resigned his commission to study the law. He was admitted to the bar in Albany in 1782 and moved down to New York the next year, launching his practice from a house on Wall Street near Hamilton's residence and only two doors from City Hall. In no time at all he was making ten thousand dollars a year and setting his sights on a political career.

Melancton Smith arrived in New York only months behind Duer, Hamilton, Varick, and Burr. A native of Jamaica, Long Island, Smith had moved to Poughkeepsie in his teens and set himself up as a merchant. Well-to-do if not wealthy when the Revolution began, he joined the local Sons of Liberty and, like so many other "new men," saw his public career accelerate. Dutchess voters sent him to the Provincial Congress, where he sat on the Committee for Detecting Conspiracies and developed a reputation as one of the most articulate radical Whigs in the state as well as a close adviser to Governor George Clinton. He also served as a contractor and purchasing agent for the new state government (in which capacity he struck a number of profitable deals with William Duer). In 1784, though,

Smith abandoned Poughkeepsie and shifted his business to New York City. One year later, city voters sent him to Congress.

Another Dutchess transplant was Edward Livingston, younger brother of the chancellor, who forsook life among the upstate landed gentry to open a law office in the city. William Constable, born in Dublin but raised in Schenectady, moved up from Philadelphia (where, among other things, his name had been linked with Duer's in a smuggling scheme) to take over the New York business of an English firm, Phyn and Ellice. John Pintard, a fourth-generation Huguenot born in New York but raised on Long Island and educated at Princeton, got to know the city while serving as the American deputy commissary for prisoners of war. Well before the last British troops had pulled out, Pintard had set himself up in trade. By the end of the decade he presided over one of the city's leading mercantile houses.

A procession of merchants came down from New England, among them Daniel Parker, a native of Watertown, Massachusetts, who had prospered during the war selling flour and forage to the Continental Army, most of the time in partnership with Duer; early in 1783, spurred by news of the impending peace, Parker moved to New York and lobbied Sir Guy Carleton for a contract to supply the British army.

This migration also figured in the founding of Olympia, a speculative development just across the East River from Manhattan. Its story began with two Long Island brothers of New England extraction, Comfort and Joshua Sands, who had clerked with city merchants before the Revolution, taken part in the resistance to British policy, and left when New York fell in 1776. During the war they made a fortune in military provisioning (Washington, among others, considered them crooks), and when they returned to New York in 1783 they founded the highly successful firm of Comfort and Joshua Sands. They also bought the former Rapelje farm, a 160-acre tract lying northeast of the road (now Fulton Street) that ran down to the Brooklyn Ferry.

There the brothers laid out the "City of Olympia," dividing the property into lots and selling them off to a group of interrelated Connecticut families. Many came from the New London area, where they had been employed in the maritime trades, and they seem to have envisioned Olympia as a shipbuilding center; the Sands themselves erected wharves, warehouses, and a huge ropewalk for the production of rigging and cables. A New

England-style Independent church followed within a year or two, and by the end of the decade the little community appeared to be thriving.

In addition to this migration from New England there was an influx of well-to-do, ambitious businessmen from the British Isles. Some had settled in town during the war and collaborated with the British yet chose to stay after Evacuation Day, often to carry on the business of or manage property belonging to departed Tories. Others came over as soon as the outcome of the war was certain.

John Delafield, a thirty-five-year-old English merchant, arrived in the spring of 1783, traveling on the same ship that brought the provisional treaty of peace between Great Britain and the United States. Dominick Lynch, the son of a rich Galway merchant with extensive connections on the Continent, had been in Bruges when he learned that the war was over. Early in 1783, not yet thirty years old, he formed a partnership with Thomas Stoughton to do business in New York. Stoughton sailed immediately and had the firm of Lynch and Stoughton up and running on Greenwich Street well before Evacuation Day. Lynch followed in mid-1785, carrying, it was said, more cash than had been brought to America by any other single individual in living memory.

With “Don” Stoughton—so named because of his subsequent appointment as Spanish consul—Lynch also assumed a leading role in the city’s small yet burgeoning Roman Catholic community. Probably fewer than a thousand Catholics lived in New York at the end of the Revolution. Ferdinand Steenmayer, a Jesuit, had slipped into the city during the war to celebrate Mass secretly in a house on Wall Street. With the elimination of restrictions on Catholic worship, Steenmayer gathered his flock in a loft over a Barclay Street carpenter’s shop. The postwar surge of immigration, virtually doubling the Catholic population overnight, prompted Lynch, Stoughton, and other lay leaders, led by Hector St. Jean de Crevecoeur, the French consul in New York, to arrange for the construction of St. Peter’s Church, the city’s first Roman Catholic house of worship. Lots were purchased on Barclay Street, and the cornerstone was laid in October 1785.

Only months behind Delafield and Lynch was Archibald Gracie. A Scot by birth, Gracie had gone to Liverpool and worked his way up to the position of chief clerk in the branch office of a London shipping house. When the war ended he decided to go into business for himself, setting off

for New York with a cargo of textiles, tin ware, watches, cheese, and “fine London Porter and Liverpool Beer.” By the spring of 1784, not yet thirty years old, Gracie had a house and shop on Queen (now Pearl) Street and was taking an interest in the tobacco trade. He moved to Petersburg, Virginia, in 1785 but often came up to New York with cargoes of tobacco destined for transshipment to European markets. In 1793 he would move back to the city for good.

Cornelius Heeney left Ireland for New York in 1784 and found work as a bookkeeper with a furrier named William Backhouse. Backhouse taught him the business, and Heeney was soon dealing in skins and furs on his own account out of a store on Little Dock (now Water) Street. Both Backhouse and Heeney (another benefactor of New York’s Catholic church) were sometime associates of another young immigrant, a short, stout, square-faced German named John Jacob Astor.

The third son of a butcher in Walldorf, a small village near Heidelberg, Astor had left home at the age of seventeen to seek his fortune in London, where an older brother was established in a musical-instrument house founded by their uncle. When word arrived several years later of the signing of the Treaty of Paris, Astor quit London for New York, where another brother, Henry, had gone to provision Hessian troops and was now flourishing as a cattle trader and butcher (he would soon own the Bull’s Head Tavern on the Bowery). Jacob arrived in March 1784, not quite twenty-one years old, with a modest financial stake in hand. His marriage to Sarah Todd the following year brought him a connection to the Brevoort family and a small dowry. In 1786 he went into business selling imported flutes, pianofortes, and violins in a building on Queen Street owned by his mother-in-law, but his future lay in the fur trade.

PHOCION SPEAKS

Over the winter of 1783-84, moderate and conservative Whigs became increasingly fearful that radical assaults on the city’s Tories would impede economic recovery, perhaps even precipitate some kind of social cataclysm. There were also international repercussions. “Violences and associations against the Tories pay an ill compliment to Government and impeach our good Faith,” John Jay wrote from France. Unfortunately, said Robert R. Livingston, “violent Whigs” had gained the upper hand. Reasonable men—

men of property and social position—still hoped “to suppress all violences, to soften the rigor of the laws against the loyalists, and not to banish them from . . . social intercourse.” But never, Livingston intimated, had things looked so grim for them.

In January 1784 Hamilton published a little pamphlet entitled *A Letter from Phocion to the Considerate Citizens of New-York*. (Phocion was the Athenian general who helped defeat the Macedonians in 339 B.C. and then, over the objections of Demosthenes, advocated conciliation with his former enemies. When the democrats came to power, they forced Phocion to drink hemlock.) Hamilton’s *Letter*, the first sustained appeal for forbearance toward the Tories, “excited a general sensation” by saying openly what the propertied classes had been saying privately for months: that radical Whig attacks on the rights and property of men and women who had ended up on the wrong side of the Revolution were ruining the city’s chances of recovery from years of war and military occupation.

Besides putting at risk the rights and liberties for which the Revolution had been fought, Hamilton argued, such attacks violated the Treaty of Paris. This made the United States look irresponsible in the eyes of other nations and destroyed the climate of confidence essential to international trade. It infringed, too, upon the power of Congress to determine how, and upon what conditions, the war would end—diminishing in turn the ability of that body to lead the nation in time of peace. Finally, persecution of the Tories drove away the very men whose wealth and abilities were essential to the prosperity of a commercial society.

That last point was vital, and key passages in *Phocion* warned the city’s radical mechanics to take heed. Driving away Tory merchants and craftsmen, Hamilton wrote, will not raise your wages: the former are essential to the city’s economic health; the latter do you no harm. Wages in town have risen “sufficiently high” as it is, and “those classes of the community who are to employ you” will not in any case go on paying “exorbitant prices” for labor even if its supply dwindles. Besides, if you disturb “the economy of the political machine” by trying to elevate any of the “departments of industry” above its “natural height,” then “society at large suffers.” Indeed, “the only object of concern with an industrious artisan, as such, ought to be, that there may be plenty of money in the community, and a brisk commerce to give it circulation and activity.”

The Revolution is over, Hamilton continued. Direct popular intervention may have freed the nation from tyranny, but the liberty of the people—meaning “their *right* to a *share* in the government”—is now secure. The citizens of New York should return to their shops and countinghouses, leaving public affairs in the hands of those persons most fit to rule.

Just as dangerous as popular interference in government was the corporatist ethos that had in the past gone virtually hand in hand with radical Whig demands for economic and social justice. The truth was, Hamilton wrote, “that all monopolies, exclusions and discriminations in matters of traffick, are pernicious and absurd.” This applied not only to repeated attempts by local and state authorities to regulate wages and prices during the war but also to their continuing vendetta against the Tories. It didn’t necessarily apply to the central government. Unlike his mentor Robert Morris, Hamilton always saw a role for vigorous government intervention at the national level, now to promote trade, now to mitigate the competitive “jealousy” between states that could shatter the republic. Municipal laissez-faire and federal activism, in other words, were opposite sides of the same coin. New York’s future prosperity depended on both. And both, Hamilton repeated, had been gravely impaired by local and state abuse of the Tories.

Phocion, together with a *Second Letter from Phocion* that appeared in April 1784, underscored what many people in New York already suspected: Colonel Hamilton, as he was generally known, was the only moderate or conservative Whig gifted with a coherent vision of the city’s political economy. Resolutely opposed to arbitrary government and anchored in the principle of equality before the law, that vision was undeniably republican—the kind of republicanism that scorned popular opinion and trusted only governments led by the rich and well-born few.

THE EMPRESS OF CHINA

Perhaps, though, New York’s future was brighter than Hamilton imagined. One morning in late February 1784, only a month or so after the appearance of his first *Letter from Phocion*, crowds of spectators lined the East River waterfront to mark the long-awaited resumption of overseas trade. For months ice had jammed the Narrows and East River, bringing business in the city to a standstill while acute shortages of food, shelter, and firewood,

exacerbated by heavy snowfalls, wore at everyone's nerves. Now, as winter began to relax its grip on the city, ship after ship slid away from the East River wharves, shook out its sails, and filled away down toward the harbor.

As the fleet passed the Battery, said a report in the *New York Packet*, "A large party of gentlemen" could be seen, "congratulating each other on the pleasing prospect of so many large ships being under sail in the bay." One ship in particular commanded their attention: the copper-bottomed, black-hulled *Empress of China*, bound for the Orient. She was, boasted the *Independent Gazette*, "the first ship from this new nation, to that rich and distant part of the world." New York owed a special debt of gratitude to "the gentlemen, whose ambition to discover new resources of wealth, by forming new channels for the extensions of our commerce" had thus prompted them to "risque their property" in the voyage.

Such an undertaking would have been unthinkable before the Revolution, when trade with the Chinese was an exclusive privilege of the British East India Company. Independence removed that obstacle, and as the end of the war drew near China had beckoned to entrepreneurs in every American port. First off the mark was John Led-yard, a Connecticut adventurer who had served as a corporal of marines on the third and final voyage of Captain James Cook. Ledyard turned up in New York City in the summer of 1783, touting a scheme to trade for furs along the Pacific Northwest coast and peddle them in Canton. Unable to find backers, he went to Philadelphia and got the attention of the financier Robert Morris. Intrigued, Morris agreed to raise some \$120,000 for the purchase of ships and trading goods, eventually putting up half the money himself. The other half came from the New York firm of Daniel Parker and Company, one of whose partners was William Duer.

Over the autumn of 1783, amid all the commotion of the British evacuation, Parker and Company found a ship on the ways in New England, hired a crew, and began to assemble a cargo. Three thousand pelts were purchased, but when the idea of a second voyage to the Pacific Northwest fell through, causing Ledyard to go off in a huff, Morris and Parker shifted their focus to another commodity: ginseng root. Ginseng was prized in China as a cure for everything from indigestion and high blood pressure to impotence; one Chinese emperor was said to have paid ten thousand dollars for an especially rare sample. Happily, ginseng also grew wild in the Ohio

and Mississippi valleys, where native peoples had been harvesting it for trade since the 1750s. Agents of Morris and Parker scoured the backwoods of Pennsylvania and Virginia for all they could get their hands on, and eventually they had some thirty tons of it stashed in the holds of the *Empress of China* when she passed the Narrows on her way to the Far East.

Six months later, having been escorted part of the way by friendly French warships, she dropped anchor in the Pearl River below Canton. Another four months of bartering ensued, during which her pelts and ginseng were exchanged for several hundred tons of tea and fifty tons of “export” chinaware (so called because it was manufactured specifically for the Western market). Trading on their own accounts, agents of the investors and members of the crew also packed in a wide variety of other commodities, including silk and satin clothing, wallpaper, lacquered fans, umbrellas, exotic plants, and even delectable Shanghai roosters.

A five-month return voyage brought the *Empress of China* back to New York on May 11, 1785, fifteen months after her departure. Her return caused a sensation. Local papers hailed it as a promise that the city would soon be out of the economic doldrums. New Yorkers could now look forward, said one, to “a future happy period in our being able to dispense with that burdensome and unnecessary traffick, which hitherto we have carried on with Europe—to the great prejudice of our rising empire. . . . Providence is countenancing our navigation to this new world.” Constable, Rucker, and Company of New York, whose partners included Robert Morris and Gouverneur Morris, easily sold the *Empress of China*’s cargo, returning profits of between thirty and forty thousand dollars to her investors.

This was a 30 percent return on their original investment, but given the time and risks involved, it was disappointing. So was the venality of Daniel Parker. Scarcely had the *Empress of China* cleared New York than Parker’s creditors began to hear rumors of certain irregularities in his accounts. He finally admitted to embezzling huge sums of money, then skipped to Europe, leaving Duer and other investors to sort things out. Angry, embarrassed, and teetering on the edge of disaster themselves, they were looking for ways to cut their losses even before the *Empress of China* returned to New York. Years of recrimination and litigation would follow.

Five ships left New York for China in 1786. There was excited talk around city taverns and coffeehouses about opening new routes to Russia

too, and at least one New York vessel, *Betsy*, had already ventured out to Madras. In the decade or so to come, trade with China and the East Indies would make rich men of such merchants as John Pintard, John Broome, and Robert Lenox.

Isaac Sears wasn't so lucky. After moving to Boston in 1777, Sears made a fortune during the war and was almost certainly the "Captain Sears of Boston" to whom Duer and his associates offered shares in the *Empress of China* in 1783. He too returned to New York late in 1783, moved into a mansion at Number 1 Broadway, opposite Bowling Green, and took an active part in the revitalization of the Sons of Liberty. By 1785, however, Sears was in trouble. Besieged by creditors, he pleaded immunity from arrest as a member of the Assembly and sailed for China. He died and was buried in Canton in October 1786.

The fate of the *Empress of China*—let alone what became of Isaac Sears—made it clear that no new trade route, even at a 30 percent rate of return, was in and of itself sufficient to ensure New York's future prosperity. Two or three years after Evacuation Day, the fitful condition of business had become a subject of debate in local newspapers, taverns, and coffeehouses. It would also make Alexander Hamilton the man of the hour.

The Revolution Settlement

In February 1784, finally free from imperial constraints, a group of merchants assembled at the Coffee House to organize New York's first bank. Banks were considered essential for commercial expansion, and proposals for one kind or another had been circulating around the city since before Evacuation Day. Hamilton had been trying to arrange something with Robert Morris's Bank of North America at Philadelphia, but when the Coffee House meeting came out with an attractive proposal for a Bank of New York, he changed his mind and resolved to "fall in" with the project. He also helped turn the new bank into an instrument for reconciling former enemies and deflecting radical attacks on the Tories. Alexander McDougall became the bank's first president; William Seton, a Tory, took the job of cashier. Its board of directors included Thomas Stoughton, lately arrived from England, and such prominent Tories as Joshua Waddington and Nicholas Low. Patriots like Melancton Smith, Marinus Willett, Isaac Sears, and John Lamb signed its petition to the legislature for a charter. As early as June 1784 the bank was doing business out of the old Walton Mansion on Pearl Street.

Prominent merchants also revived the Chamber of Commerce, the bulk of whose pre-Revolutionary members had sided with the British. Like the bank, the chamber heeded Hamilton's plea for reconciliation. Many Tories gained admission at its first meeting in April, and one of them, John Alsop, was elected president. More Tories joined up over the next few years, along with Whigs of every description, including William Duer, John Lamb, Alexander McDougall, and Isaac Sears, who became the chamber's vice-president. This was a signal that the town's principal men of business were welcome regardless of their opinions (allegiance to money being the only really reliable test of character) and that at least some radical Whigs too were eager to advance the city's trade and commerce.

Hamilton's program for rehabilitating Tories moved into the courts in the summer of 1784 with the case of *Rutgers v. Waddington*. Widow Elizabeth Rutgers had fled New York in 1776, leaving behind the family's brewery on Maiden Lane. Joshua Waddington, a very rich and highly unpopular Tory

merchant, became the agent for two British brewers who took over the Rutgers brewery and operated it under license of the British commissary-general and, later, the commander-in-chief. When Rutgers pressed Waddington for eight thousand pounds in damages and back rent under the 1783 Trespass Act, Waddington refused to pay. Rutgers sued, and the case went before the Mayor's Court in June. To represent her, Rutgers hired a team of distinguished attorneys that included John Laurence, Robert Troup, and Attorney General Egbert Benson. Hamilton appeared for Waddington.

Hamilton took the position, as he had in his *Phocion* letters, that the Trespass Act was null and void. It violated a maxim of international law that citizens could not be held liable for actions, otherwise illegal, committed at the order of military forces. It also specifically violated the Treaty of Paris. Congress had negotiated and approved the treaty in the name of the Confederation, Hamilton reminded the court: it was the law of the land and couldn't be repealed at the whim of one or another state. Benson and Troup responded that the Trespass Act was a proper exercise of legislative power and couldn't be set aside or repealed except by the legislature.

Duane's ruling, handed down in August, was a split decision. Rutgers could recover for the period when Waddington held the property under license from the commissary-general; she couldn't recover for the time Waddington held it by authority of the British commander-in-chief, who was acting in accordance with the law of nations. As for the validity of the Trespass Act itself, Duane found no legislative intent to overrule international law. He did allow, on the other hand, that when a legislature failed to anticipate all the consequences of a statute, courts were obliged to interpret or even disregard it altogether.

Radical Whigs were appalled. The Assembly hauled in Duane to explain himself, censured his decision as a violation of legislative autonomy and a threat to law and order, then reaffirmed the Trespass Act. Hamilton was savaged in the papers for giving aid and comfort to "the most abandoned and flagitious scoundrels in the Universe," and there were rumors of a plot to have him killed. Waddington, worried that the case might be lost on appeal (if not that his attorney would go down in a blaze of pistol fire), negotiated a compromise settlement with Mrs. Rutgers.

As the first anniversary of Evacuation Day approached, New York's Tories, reassured by Hamilton's exertions on their behalf, had begun to make their peace with independence and republicanism. This in turn facilitated the growth of an alliance with conservative Whigs that would, in Hamilton's words, confront the radicals with "all the mercantile and monied influence" of the city—old Anglo-Dutch merchant families, newly arrived exporters and importers, resident agents of British trading firms, key members of the bar and other professions, and leading public creditors. For Robert Troup, one of Hamilton's most dedicated lieutenants, this was perhaps the most decisive event of the city's postwar history. "Soon after we regained possession of New York," Troup later recalled, "we permitted the Tories to enlist under our banners; and they have since manfully fought by our side in every important battle we have had with the democracy."

Over the fall and winter of 1784-85, Hamilton broadened the scope of his alliance by wooing the great Hudson Valley landowning families—Livingstons, Schuylers, Van Cortlandts, and their ilk. Their incessant jockeying for precedence had always made it difficult for them to work together, but Hamilton's message was brutally frank: cooperate or go under. As he told one of the redoubtable Livingstons, this was no time for men "concerned *for the security of property* or the prosperity of government" to quibble among themselves.

RAPPROCHEMENT

Hamilton's bid for the support of New York City's laboring population also began to get results. When elections were held for the state assembly in June 1784, defecting mechanic voters scuttled the radical ticket. Even Isaac Sears went down to defeat, running behind conservatives like Comfort Sands. (Among the new assemblymen that year was Aaron Burr, making his political debut with no principles to speak of—a development almost as noteworthy as the election of former Tories.) Several months later, the Tory merchant Nicholas Bayard drew enough votes in the balloting for City Council to defeat the incumbent Out Ward alderman Thomas Ivers. Stunned, Ivers protested that Bayard was ineligible because of his previous collaboration with the enemy. The council seated Bayard anyway, which must have struck even Hamilton as something of a miracle.

The movement of artisans and tradesmen into Hamilton's camp gathered momentum over the next several years as Governor Clinton and his supporters appeared to lose interest in restoring the city's trade and grew increasingly disdainful of Congress. Toward the end of 1784 the legislature's radical majority slapped a 2.5 percent duty on goods imported into the state and a punitive 5 percent duty on British goods entering from the West Indies. Outside the city, Clinton's impost was wildly popular, not least of all because the hundreds of thousands of dollars it soon funneled into the state treasury kept land taxes low.

Inside the city, however, the impost threatened disaster. New Jersey and Connecticut, over half of whose imports came through the port, objected vociferously to the New York impost and threatened an all-out trade war that could devastate the municipal economy. Britain not only kept its West Indian islands off limits to American shipping but began dumping its own products in the New York market. By 1786 almost twice as much tonnage had entered the port from the former mother country than from all other foreign nations combined. Local artisans and mechanics, confronted with an avalanche of cheap British manufactured goods—thirty thousand hats and ninetyseven thousand pairs of shoes between 1784 and 1786 alone—charged that Clinton had played into Britain's hands with a policy “which tends in some degree to defeat the purposes of our late revolution.”

Nor were they happy with Clinton's go-it-alone strategy for the state. In 1786, buoyed by revenues from the impost, the legislature enacted a financial program that was tantamount to a declaration of independence from the Confederation. The law provided for an issue of two hundred thousand pounds in paper money. It also set aside revenues sufficient to “fund” (i.e., pay off) the entire state debt as well as that portion of the federal debt represented by Continental Loan Office certificates and notes issued for supplies furnished to the Continental Army. Holders of Continental securities (worth around \$2.3 million in all) could exchange them for state securities of equal value, at the same rate of interest. Some fifty thousand pounds of the new paper money would go to pay part of the back interest that the United States had thus far failed to pay on these securities.

Clinton's program dismayed Hamilton and his circle. For years moderate and conservative Whigs had urged federal assumption of all Revolutionary

War debts on the theory that the surest way to strengthen the Confederation government was to get the resources and influence of the public creditors behind it. Now, at least in George Clinton's New York, public creditors would be harnessed to the state government instead, and the idea of a stronger Confederation seemed suddenly more remote than ever. The city's working people had their own reasons for repudiating the governor's policy. His veiled threats of secession from the rest of the country were an affront to people who had for twenty years advocated both republicanism *and* national union.

In the 1785 Assembly elections, accordingly, conservative and moderate Whigs ran well ahead of the field, capturing the votes not only of former Tories but of many working people as well. Isaac Sears received the fewest votes of any winner, and only two mechanics were elected, shoemaker William Goforth and smith Robert Boyd, neither strongly identified with the radicals. Only James Duane's defeat by Thomas Tredwell in a race for the state senate could have been construed as a radical victory. The Mechanics Committee, recently reorganized as the General Society of Mechanics and Tradesmen, played a key role in swinging public opinion against radical candidates. It endorsed three conservative merchants known for their close ties to Hamilton: Robert Troup, William Duer, and Evert Bancker.

During the summer and fall of 1785, city newspapers were full of talk that merchants and artisans had begun to realize that each had an interest in the prosperity of the other. Popular hostility to Clinton mushroomed the following year, when the city stumbled into a mini-recession that was widely blamed on the governor's paper-money and funding bills. Caught short by a sudden rise in the price of depreciated public securities, a number of prominent investors went under, dragging their creditors down too. Others dumped huge quantities of imported goods on the market to raise cash, driving down prices and, briefly, causing a spasm of unemployment in the city's laboring population. Although timely loans from the Bank of New York saved a few of the better-connected casualties, among them the Sands brothers, petitions for bankruptcy inundated the legislature.

The almshouse, built to hold no more than four hundred people, became so overcrowded during the summer and fall of 1786 that the city government ran out of funds for public assistance and had to borrow nine

hundred pounds from the bank. New commissioners of poor relief appointed by the City Council (which had only the year before scrapped the old system of elected vestrymen) struggled to rid the town of nonresident paupers. So many debtors were languishing in jail by the beginning of 1787 that a Society for the Relief of Distressed Debtors was organized to provide them with bread, wood, clothing, and other essentials.

Against this background, Hamilton's conservative alliance swept into power. Richard Varick, Nicholas Bayard, and Hamilton himself won seats in the Assembly in 1786 (this was the only elective office Hamilton would ever hold). Nicholas Bayard, Richard Harison, Comfort Sands, and Richard Varick followed suit in 1787 along with two former Tories, Gulian Verplanck and Nicholas Low. That year's local elections confirmed that Clinton and the radicals had lost their grip on the city and its environs. Former Tories were voting openly throughout the region, and in Queens nearly one-fourth of the successful candidates had supported the crown during the Revolution.

THE RADICAL RETREAT

Though Governor Clinton won reelection in 1786—no conservative was even willing to run against him—the radicals were already too weak to prevent the reversal of nearly the entire body of anti-Tory laws for which they had been responsible over the previous decade. In 1784 and 1785 the legislature removed the acts of attainder against thirtyodd loyalists. By 1785 numerous rank-and-file Tories began to make their way back to New York from Canada and other places of refuge, hopeful that the worst was at last over.

Tories not banished by name were restored to full citizenship in 1786, and the act disqualifying them from the practice of law was repealed. In 1787, led by Hamilton and Varick (now speaker), Assembly conservatives easily beat back an attempt to deny seats to a number of former Tories. They then removed all election laws denying Tories the vote and methodically revoked the Trespass Act, the Citation Act, and, early in 1788, all other statutes inconsistent with the Treaty of Paris. In 1792 the legislature would decide to allow even banished Tories to return, providing only that they recognized the state's tide to confiscated property, including slaves.

Radical threats against Trinity Church and Columbia College were repelled as well. One of Hamilton's law clerks dug up a long-lost deed that rescued Trinity's Manhattan real estate from confiscation, and shortly thereafter the relieved vestry began construction on a new church building. The college was saved when Duane, Jay, and Hamilton convinced the legislature to let Columbia elect its own board of governors, leaving it within the state university yet well insulated from meddlesome radicals. The new board promptly offered the job of president to William Samuel Johnson, the Tory son of William Johnson, first president of King's College.¹

ESTATE SALES

Perhaps the most telling sign of the ebbing of anti-Tory radicalism came in 1788, when the state commissioners of forfeiture closed their books on the formerly occupied counties. Over the previous five years they had confiscated, broken up, and sold off the estates of more than two dozen prominent Tories in the New York area, including James De Lancey, Oliver De Lancey, William Bayard, Roger Morris, John Watts, Frederick Philipse, and Isaac Low. Their combined losses exceeded \$1.2 million (claims for compensation they filed with the British government put the total closer to \$10 million).

Yet given contemporary assertions that Tories owned two-thirds of the property in the city, this was a far cry from the leveling frenzy initially feared by moderate and conservative Whigs. Statewide, some 70 percent of all confiscations had occurred in Albany and Tryon counties. New York, Kings, and Queens counties together represented a mere 2 percent of the total, and the estates of some very conspicuous Tories survived more or less intact.

Nor had there been a serious shift in the class composition of landownership in the city. While some tradesmen and shopkeepers had purchased parts of confiscated estates, a substantial majority of buyers were well-to-do Whig lawyers, merchants, and established landowners. Nearly two hundred individuals acquired pieces of James De Lancey's holdings on the east side of Manhattan. Yet fully half of the total sales can be attributed to no more than fifteen or so buyers, including William and James Beekman, four members of the Livingston clan, merchants John Delafield,

Dominick Lynch, and John Delameter, and sugar refiner Isaac Roosevelt. Many of De Lancey's former tenants, unable to compete against these high bidders, promptly found themselves thrown off land they had occupied for years, with no compensation for the often extensive improvements they had made at their own expense.²

It was much the same story in neighboring counties. In Kings, Colonel Aquila Giles, Esq., snared all of William Axtell's Flatbush estate. The bulk of John Rapalje's estate, the largest in Brooklyn, went to ex-Tories Comfort and Joshua Sands. In Queens, property belonging to the Ludlow and Golden families went to no more than a dozen purchasers. The Manor of Bentley, Christopher Billopp's Staten Island estate, went to a single purchaser. North of the city there was a more democratic redistribution of confiscated Tory property, and many tenants of Frederick Philipse's ninety-two-thousand-acre Westchester estate purchased their holdings.

Big buyers, in fact, had an edge. State law gave preference in the purchase of confiscated estates to holders of soldiers' pay certificates and allowed purchasers to pay for land with state securities. Speculators had been purchasing both kinds of government obligations at fire-sale prices from the original holders—who either needed cash or didn't believe that the government would ever make good on its promise to pay off, or both. The gamble was that if the government did redeem the certificates and securities at or near par (face value), the current holders would pocket a very considerable profit. This so-called stockjobbing—buying and selling government notes to make money—had a very unsavory reputation. Nonetheless, by the mid-1780s millions of dollars' worth of depreciated securities had already been engrossed by a handful of New York's leading merchants and financiers.

Confiscated-estate sales gave the speculators a splendid opportunity to convert still-doubtful paper into solid land, overwhelming smaller buyers as they did so. Many then subdivided their new tracts for profitable resale, thus sustaining secondary speculation in forfeited Tory property well into the next decade. The legislature did little to deter any of this, since a number of radical as well as conservative Whigs were deeply implicated in the game. Indeed, Sears made such a poor showing in the 1784 Assembly elections partly because of revelations that he, Marinus Willett, John Lamb, John Morin Scott, and other sometime Sons of Liberty were using

depreciated veterans' pay certificates to speculate in confiscated Tory estates. In his two *Phocion* letters, Hamilton had warned the city's mechanics that their heroes had feet of clay. Who could deny it now?

ORDER OUT OF CONFUSION

Four or five years after Evacuation Day, radical and conservative Whigs had come to agreement on a number of fundamental political and social questions. This "Revolution Settlement," to borrow a term from British history a century earlier, was unplanned, informal, tacit, unenforceable, and extremely fragile. It was nonetheless real, and its effect, as James Hardie would later recall in his *Description of New York* (1827), was that "the British had scarcely left our city, when order seemed to arise out of confusion."

Key elements of New York's Revolution Settlement read like an obituary for the radical resurgence of 1783-84. By 1786 or 1787 it was accepted on all sides that the rule of self-appointed committees should give way to the rule of law, that there were to be no further confiscatory assaults on private property, that former Tories should be admitted to the full privileges of citizenship, and that vital institutions—the municipal corporation itself, Columbia College, Trinity Church—would remain in the hands of the propertied classes.

Conservative Whigs knew, however, that the radical insurgency had been blunted, not defeated, and that the base lines of public discourse in the city would have to change. To avoid the taint of royalism, they could no longer dispute such principles as natural rights, government by consent of the governed, and popular sovereignty. Never again could they advocate religious establishments as essential for the preservation of order and property, and they raised no objection when the state legislature adopted a succession of laws between 1782 and 1787 that repealed primogeniture and entail, provided for the commutation of quitrents, and abolished all feudal obligations and tenures in the state—gutting, that is, the legal infrastructure set up in the wake of the 1664 conquest and Leisler's Rebellion. They squirmed but didn't resist when the legislature divided every county into townships, further weakening the power of the great upriver manor lords. They likewise accepted the fact that the legislature would henceforth determine the powers and privileges of banks, colleges, benevolent

societies, and other chartered corporations. Even former Tories understood that from now on the issue wouldn't be *whether* to have a republic but *what kind* of republic to have.

What was more, following Hamilton's lead, conservative Whigs and former Tories had begun to acknowledge that the route to public office now ran through a mobilized, demanding electorate. Gone forever were the days when men of wealth and social position could presume the deference or indifference of voters: political power henceforth required organization, a readiness to curry support among ordinary people, and a willingness to abide by what happened at the polls. That Hamilton and company had virtually driven the Clintonians out of town by 1787 or 1788 only clinched the point. Public life in New York would never be the same.

Some things, on the other hand, did not change, and the outer limits of the Revolution Settlement were defined by its failure to address issues of gender and race.

DAUGHTERS OF LIBERTY

For New York women, as women, the Revolution was an ambiguous experience. On the one hand, they had helped mobilize resistance to Britain and made often crucial contributions to the war effort—spying on the enemy, collecting money and clothing and provisions for the army, making bandages and ammunition, tending the wounded, carrying water and powder during battle, on occasion fighting alongside regular troops (women were active on the Tory side too, but much less so). The state legislature acknowledged the extent of their involvement when it allowed that women could be convicted of treason—an unprecedented admission that they had the capacity to choose their own political allegiances, independently of their husbands and fathers. None of this, on the other hand, led to fundamental changes in the gender system itself—the different roles and rights assigned to men and women—which survived the conflict with Britain unchanged, even strengthened.

Most important, republicanism put new emphasis on defining the right to participate in politics and government as an attribute of property. It was axiomatic among male revolutionaries that republics were vulnerable to persons with the wealth, power, and influence to make others do their

bidding. This meant, among other things, that voters as well as officeholders must possess sufficient property to be politically independent—free, that is, to discern and serve the public good without fear for their livelihoods.

By the same token, people having little or no property should be disqualified from taking part in public affairs because they were too easily led, swayed, and dominated. Inasmuch as New York law continued to follow the doctrine of “coverture,” which didn’t allow women to hold property in their own names, it seemed more obvious than ever (to men) that women, like children and slaves, had no right to vote, much less hold office. Thus, while colonial authorities sometimes permitted well-to-do widows to cast ballots in municipal and provincial elections, that practice would not survive the Revolution. In fact, New York became the first state to officially disfranchise women when the constitution of 1777 specifically defined the electorate as *male*. No matter the extent of their contributions to the struggle against Britain: republican women were destined by republican men to be passive, second-class citizens.

Then, too, what conventional male wisdom considered to be the inherent foibles of women—their impulsiveness, their love of luxury and self-indulgence, their limited powers of reason—only made it more apparent that they deserved no role in republican politics and government. Not surprisingly, the new republic’s ideal citizen was unfailingly identified by male attributes and duties: *his* preparedness to take up arms in defense of the state, *his* authority as the head of a household of dependents, *his* pride as an autonomous producer of wealth, *his* responsibility to sit on juries and pay taxes. If anything, “woman” and “citizen” were considered irreconcilable opposites, states of being forever at war with one another.

Among the propertied classes, this resurgent patriarchalism gave rise to a notion that the chief duty of women was to bear and raise sons for service to the republic. But while it seemed to endow their work with new public significance, what came to be called Republican Motherhood essentially compelled women to return to the “sphere” of family and household. For women of the white laboring classes, republican patriarchalism could have still more calamitous consequences. War heroine Elizabeth Burgin, finding herself penniless, wrote General Washington directly: “I am now Sir very Desolate without Money without Close or friends to go to,” she explained,

as “helping our poor preseners Brought Me to Want Whitch I dont Repent.” Her plea brought results, but it was an isolated success: few women who worked for the army, or widows of enlisted men, ever received equitable assistance. Poor women, moreover, could hardly afford to devote their lives to childrearing and found the new standard of republican motherhood virtually impossible to meet—which to men and women of property became prima facie evidence of irresponsibility and moral depravity. Although propertylessness brought poor men too under increased suspicion, they at least could derive some small measure of comfort from knowing that the republic belonged to men.

EMANCIPATION

Within a year of the Treaty of Paris, Massachusetts, New Hampshire, Vermont, Pennsylvania, Rhode Island, and Connecticut—all of the northern states, that is, except New York and New Jersey—had either abolished slavery outright or adopted programs for its gradual abolition. When Gouverneur Morris and John Jay tried to insert a clause into the 1777 state constitution “recommending” the eventual abolition of slavery, they ran into a wall of resistance; Morris himself admitted that “it would at present be productive of great dangers to liberate the slaves within this state.” In 1781 the legislature did agree to manumit slaves who had taken up arms against the British, but this was a grudging response at best to General Clinton’s offer of freedom to slaves who remained loyal to the crown. When the Society of Friends took steps to free all slaves owned by the state’s Quakers, their example inspired little or no imitation. (The appropriateness of indentured servitude was another matter. In 1784 a group of citizens purchased the freedom of a parcel of servants, observing that “the traffick of White People” was contrary “to the idea of liberty.”)

Slaves in and around the city grew increasingly restless after the war, stirred by the ideals of the Revolution as well as by local traditions of resistance and rebellion. For Jupiter Hammon, a slave who had published occasional religious verses and essays while serving three generations of the Lloyd family in Queens, this new mood was profoundly troubling. In *An Address to the Negroes of the State of New-York* (1787), the seventy-year-old Hammon urged his fellow bondsmen not to dwell upon the idea of freedom and not to forget their duty to obey their masters. Many slaves had

nonetheless already rejected that advice. Some pressured their masters for improved treatment, occasionally even extracting written promises of freedom. Large numbers of others simply disappeared—so large, in fact, that runaway notices filled local papers and gangs of white “blackbirders” were able to make a living as free-lance slavecatchers.

In January and February 1785, frustrated by the state’s foot-dragging on abolition and alarmed by a recent attempt to seize free blacks for sale as slaves, thirty-two prominent citizens of widely divergent political views—radical Whigs, conservative Whigs, even the odd Tory or two—met at the Coffee House to organize the New York Manumission Society. Among those present were Governor George Clinton, Alexander Hamilton, Egbert Benson, Mayor James Duane, Melancton Smith, and a strong contingent of Quakers (including Robert Bowne and John Murray). John Jay was elected president of the society, notwithstanding the fact that he owned five slaves—no disqualification, to be sure, considering that at least half the society’s founders were slaveowners; Governor Clinton alone owned eight.

That same year, antislavery members of the legislature—urged along by the New York Society of Friends and the Manumission Society—brought in a bill for the gradual abolition of slavery. After a ferocious fight with assemblymen from Kings, Richmond, and Ulster counties, whose predominately Dutch constituents still relied heavily on slave labor to work their farms, the bill passed. The Council of Revision promptly vetoed the measure because it denied free blacks the right to vote or hold public office.

Some weeks later, however, the council did approve a voluntary emancipation law that allowed masters to manumit slaves between twenty-one and fifty years of age without any obligation for their subsequent upkeep (a break with colonial precedents)—on condition that local overseers of the poor first certified, in writing, that the slaves would be able to provide for themselves. (Manumission of a slave over fifty still required owners to post a bond of two hundred pounds to ensure that he or she wouldn’t become a public burden.) Getting the “poor certificate” now became central to the process for obtaining liberty. In Quamio Buccau’s case, as he later recalled, his master, William Griffith, having decided to free him and his wife, Sarah, summoned the overseers of the poor to the house. The couple was called into Griffith’s office “and there we stood as if

we were just married. Squire Adams asked me how I felt—and I told him ‘I feel very well. I tank you, Sir: I feel very well in my limbs.’”

Though the Manumission Society prodded other masters to free their slaves, few New Yorkers followed Griffith’s example during the next fifteen years. The society, lowering its sights, concentrated instead on publicizing cases of abuse and set up a registry to protect freedmen against reenslavement. In 1786 it won adoption of a law freeing all slaves who still remained state property as the result of the confiscation of Tory estates. (How many is unknown, though a dozen or so men and women formerly belonging to the Philipse, Axtell, Bayard, and other Tory families were being supported at public expense as late as the 1820s.)

That same year, too, the society founded an African Free School in a one-room building on Cliff Street. There, besides learning to read and write, boys could acquire the values and discipline that would keep them from “running into practices of Immorality or Sinking into Habits of Idleness.” Girls were admitted after 1792. To be accepted, however, free blacks had to stay sober, not associate with slaves, and live clean lives—by which the society meant, among other things, that they would tolerate no “Fiddling, Dancing or any noisy Entertainments in their houses.”

In 1788, having discovered that numbers of New Yorkers were selling a “very considerable” number of slaves to agents of southern planters in anticipation of further restrictions, the society persuaded the legislature to stop the sale of slaves for removal to another state and to prohibit the importation of slaves into the state. It did not, on the other hand, oppose the adoption of New York’s first comprehensive slave code since 1730—a severe setback to the antislavery cause inasmuch as it ensured that the institution would have a solid legal foundation for the foreseeable future. Nor did it press to have the port closed to ships involved in the slave trade, as other northern states had done.

By 1790 slavery had been solidly reestablished in New York. True, the percentage of blacks in Manhattan’s population had fallen to 10 percent, and roughly one-third of the 3,096 African Americans in the city were now free. Yet the absolute number of slaves was growing, and, taking the southern six counties of New York as a whole, nearly three of every four blacks were still slaves. Moreover, those 9,447 men, women, and children

represented an investment of nearly one and a half million dollars, a sizable obstacle to emancipation.

The use of slave labor remained as widespread as ever. One in five white households in the city, scattered broadly through every ward and representing all but the very poorest classes, owned at least one slave. Two-thirds of the merchants kept slaves, mostly for use as domestic servants—cooks, butlers, gardeners, stable hands, and the like. (Females still significantly outnumbered males, constituting 57 percent of the total black population in 1786.) One of every eight artisans held slaves too; numerically, artisans remained the city's largest group of slaveholders and continued to depend on slave labor for production in workshops, breweries, ropewalks, sail lofts, and shipyards. In the immediate hinterlands of Manhattan, the pervasiveness of slave labor was even more striking. Forty percent of the white households within a ten-mile radius of the city owned slaves—a higher proportion than in the whole of any southern state. In Kings County, still strongly Dutch and still heavily dependent on its servile work force to produce goods for the urban market, blacks comprised one-third of the forty-five hundred residents; in some parts of the county, two of every three white households owned slaves. Only in Westchester, two-thirds of whose slaves disappeared between 1776 and 1783, did it appear that the Revolution had inflicted any lasting damage on the institution of slavery.

The Grand Federal Procession

In May 1787 delegates from a narrow majority of the thirteen states met in Philadelphia to identify “defects” in the Articles of Confederation and propose such remedies “as shall appear to them necessary to render the constitution of the Federal Government adequate to the exigencies of the Union.” To represent New York, the state legislature had chosen Alexander Hamilton and two veteran Clintonians, Robert Yates and John Lansing, declaring that the three would attend “for the sole and express purpose of revising the Articles of Confederation.” But when the Philadelphia Convention got down to work at the end of the month, it became apparent at once that the delegates were ready to draw up a brand-new frame of government for the United States.

Hamilton treated the convention to a remarkable five-hour lecture in which he confessed his admiration for the British system and proposed his own plan for a “completely sovereign” national government, all but eliminating the states and stipulating the election of a president and senate for life. But he realized that such notions “went beyond the ideas of most members,” and at the end of June, bored and irritated, he returned to New York. Yates and Lansing followed in short order, protesting that their instructions didn’t “embrace an idea of such magnitude as to assent to a general constitution.” In their absence, the convention proceeded to draft a federal constitution. Congress (still sitting in New York) officially transmitted the resulting document to the states, ratification by nine of the thirteen being required for it to take effect.

In New York, the proposed government faced an uphill fight. Advocates of ratification, now called Federalists, looked very strong among the wealthiest classes throughout the state and among all segments of the population in the city—thanks in no small part to Hamilton, who finally signed the Constitution as better than “anarchy and Convulsion.” In the rural upriver counties, however, home to the bulk of the state’s population and the heartland of Clintonianism, it was the “Antifederalists” who seemed unassailable.

“WHAT ARE YOU, BOY, FEDERAL OR ANTI-FEDERAL?”

Both sides rehearsed their arguments in a heated newspaper and pamphlet war that began in the summer of 1787 and raged for the better part of a year. Hundreds of essays and pamphlets and broadsides, for as well as against ratification, would be published in the city, and no one, it seemed, could talk of anything else. Apologizing to readers who wanted “NEWS, as well as POLITICS,” Thomas Greenleaf of the *New-York Journal* explained that “the RAGE of the season is, Hallow, damme, Jack, what are you, boy, FEDERAL or ANTI-FEDERAL?” (There were now half a dozen papers published in the city. Francis Childs’s *Daily Advertiser*, founded in 1785, appeared daily, only the third paper in the country to do so. The *New York Morning Post*, founded in 1783, became a daily in 1786. John Holt’s *New-York Journal*, taken over by Greenleaf early in 1787, briefly became a daily in 1787—88 because Greenleaf said he would otherwise be unable to print half of the essays he received supporting or opposing the Constitution.)

Antifederalist opinion drew heavily on the radical Whig conviction that concentrated power was a menace to liberty. Under the Constitution, Antifederalists charged, the federal government’s broad prerogatives—to tax, to raise armies, to regulate commerce, to administer justice—would sooner or later overwhelm the states, pulverize individual rights, and sink the republic under a mass of corruption. Then, too, large republics had always succumbed to tyrants or dissolved in civil war. The great diversity of the American people, to say nothing of the distances separating them, offered no reason to hope that the United States could escape a similar fate.

Under the Constitution, Antifederalists also stressed, Congress would be too small and too remote from the people to represent them effectively. The widely circulated *Letters from the Federal Farmer*, a pamphlet that first appeared in November 1787 (probably written by Melancton Smith), stressed the inadequacy of representation under the Constitution. “Natural aristocrats” and demagogues, it argued, would have a better chance of winning election to Congress than men drawn from “the substantial and respectable part of the democracy.” No wonder, other Antifederalists said knowingly, that the Constitution was supported by the rich and well-born few.

Federalists, defending the Constitution, asserted that under the Articles of Confederation the country was falling apart. While Congress looked on helplessly, violent factionalism and insurrection had afflicted one state after another—most recently Massachusetts, where insurgent farmers led by Daniel Shays had closed courts in the western part of the state and in January 1787 mounted an abortive attack on the federal arsenal at Springfield. Trade and commerce meanwhile continued to languish, public credit had evaporated, and Congress, powerless to defend its own interests against foreign nations, had become an international laughingstock. The Constitution would end this misery by establishing a stronger, more energetic national government—which of course, Federalists said, explains why it had met with such opposition from popular demagogues and state politicians fearful of losing influence.

Toward the end of October 1787, the *Independent Journal* ran the first of eighty-five essays by “Publius.” Published together the following May as *The Federalist*, they were the fruit of a brilliant collaboration between Hamilton, Jay, and Congressman James Madison of Virginia. Their exhaustive, clause-by-clause defense of the Constitution remains the most famous contribution to the debate on either side and a landmark of American discourse on government. Two crucial arguments of *The Federalist*, both related to the issue of representation, would have seemed especially compelling to readers in New York.

First, under the Articles of Confederation too many decisions of national importance depended on state governments that had been taken over by the wrong sort of men: men unprepared by wealth or education to conduct public business, “men of factious tempers, of local prejudices, or of sinister designs . . . [who] practice with success the vicious arts by which elections are too often carried”—exactly the kind of “democratical” leaders, in other words, who had followed George Clinton into office in New York after 1776. But the Constitution would set things right by causing an “ENLARGEMENT of the ORBIT” of government sufficient to exclude from power all but the “proper guardians of the public weal.” Congress, having powers commensurate with its responsibilities, would draw more “fit characters” into public life, and large electoral districts would ensure the election of those “who possess the most attractive merit and the most

diffusive and established characters”—which was, of course, the very thing that worried the Antifederalists.

Second, it was wrong to think that these “diffusive and established characters”—in New York City, this meant the merchant elite—would be unable to comprehend “the interests and feelings of the different classes of citizens.” They had to stand for election, after all, and would always want to pay close attention to the “dispositions and inclinations” of the voters. Also, by virtue of their ties to all segments of the laboring population, merchants had a very clear picture of what was good for the mass of their fellow citizens. Indeed, honest tradesmen knew that “the merchant is their natural patron and friend; and they are aware, that however great the confidence they may justly feel in their own good sense, their interests can be more effectually promoted by the merchant than by themselves. They are sensible that their habits in life have not been such as to give them those acquired endowments, without which, in a deliberative assembly, the great natural abilities are for the most part useless.”

But for many New Yorkers it was a third contention of *The Federalist* that must have clinched the case: ratification of the Constitution was indispensable to their future prosperity. By giving Congress the exclusive power to regulate foreign commerce, “Publius” declared, the Constitution would permit the United States to extract “commercial privileges of the most valuable and extensive kind” from Great Britain—above all to reopen the lucrative West Indian markets that had anchored the city’s economy before independence. Similarly, allowing Congress to create a navy “would enable us to bargain with great advantage for commercial privileges” in the event of war between European nations; it would also provide employment for seamen as well as for the many artisans engaged in building and outfitting ships. A string of other powers bestowed on Congress—to borrow and coin money, to establish post offices, to fix the standard of weights and measures, to make uniform laws of bankruptcy—would meanwhile remove annoying obstacles to the expansion of domestic markets. The only alternative to ratification, in fact, was national ruin. “Poverty and disgrace would overspread a country which, with wisdom, might make herself the admiration and envy of the world.”

VOX POPULI

By January 1788, when the regular session of the legislature got underway, five states—Delaware, New Jersey, Pennsylvania, Georgia, and Connecticut—had ratified the Constitution, and conventions were deliberating in several others. After stalling for several weeks, the Clintonian legislature called for a ratification convention to meet in Poughkeepsie in mid-June. The election of delegates would take place at the end of April. Each county would send as many delegates as it had assemblymen. And—in an unusual but noncontroversial move—existing property requirements would be waived so that all free male citizens aged twenty-one and over would be entitled to vote.

During February and March upstate Antifederalists organized a network of county committees that distributed literature, nominated candidates, and aroused voters in anticipation of the election. In New York City, though, they moved hesitantly at best. Public opinion there was running strongly in favor of the Constitution, and news that Massachusetts had ratified in early February was greeted with spontaneous demonstrations and a parade. John Lamb, Melancton Smith, Marinus Willett, and other city Antifederalists finally set up a committee in April, but it stuck to dispatching essays and pamphlets to Antifederalist committees throughout the northeast and didn't even bother to get up a proper municipal ticket for the Poughkeepsie convention. Most of the key Manhattan leaders put their names up in Ulster, Dutchess, and Queens counties, where they were almost certain of victory. By contrast, the New York City "Federal Committee" pulsed with activity. It got up an impressive slate of candidates, including John Jay, James Duane, and Alexander Hamilton, and had its slate endorsed by special meetings of the "German inhabitants," the "Master Carpenters," a group of "Mechanics and Tradesmen," and the St. Andrew's Society, among others.

When the votes were tallied at the end of April, Antifederalists came out well ahead statewide. Queens went Antifederalist by a five-to-four margin. Kings, Richmond, and Westchester came in solidly Federalist. Manhattan produced a Federalist landslide: all told, 2,836 men went to the polls there—the highest turnout thus far in the city's history—and John Jay paced the Federalists with 2,735 votes, an impressive 96 percent of the total. Nicholas Low, who trailed the ticket, got 2,651. Governor Clinton received a paltry 134 votes, and Marinus Willett and William Denning garnered just 108 and 102 votes, respectively. Willett, chastened, was said to be coming round to

the view that the Constitution “might be right—since it appears to be the sense of a vast majority.”

The convention thus promised a face-off between rural and urban forces, and between delegates whose backgrounds differed in other ways as well. Federalists were predominantly merchants, lawyers, former officers in the Continental Army, Anglicans, socially prominent, well-off, and college educated; most had had experience in high public office. Antifederalists were mostly older than their counterparts and had entered politics later in life. They were the “new men” associated with Governor George Clinton: farmers, rising entrepreneurs, sometime militia officers, Presbyterians, self-educated, self-made, radical Whig in outlook, and utterly lacking the social connections and graces that had been essential to political advancement before the Revolution.

On Saturday, June 14, 1788, while crowds cheered and cannon boomed, New York’s delegates to the ratifying convention boarded Hudson River sloops for the village of Poughkeepsie, seventy-five miles upriver. Governor Clinton and his party left later the same day, almost unnoticed. When the convention got underway in the village courthouse the following Tuesday, however, Clinton had a happier time of it. The Antifederalist majority, obviously in control, settled him in the chair and had two staunch opponents of the Constitution appointed secretaries.

The outnumbered Federalists weren’t without resources, even so. Alexander Hamilton, Robert R. Livingston, and John Jay were three of the foremost orators in the nation. Of them one observer remarked: “Hn’s harangues combine the poignancy of vinegar with the smoothness of oil: his manner wins attention; his matter proselytes the judgment. . . . L pours a stream of eloquence deep as the Ganges. . . . Mr. Jy’s reasoning is weighty as gold, polished as silver, and strong as steel.” Melancton Smith readily admitted that the Federalists had all the “advantages of Abilities and habit of public speaking.”

Time was now on the Federalists’ side too. Eight states had already ratified the Constitution, and conventions in two more, New Hampshire and Virginia, were in session. Ratification by either one would be sufficient to dissolve the old Confederation and launch the new federal union. All the Federalists in New York had to do was keep the opposition from bringing the issue to an early vote. They thus scored an important tactical victory of

their own on the opening day when the convention agreed to discuss the Constitution clause by clause before deciding whether to ratify.

Six days later, on June 25, express riders reached New York City and Poughkeepsie with word that New Hampshire had ratified. In Poughkeepsie the Antifederalists insisted that the news didn't upset their calculations—without Virginia, they reminded everyone, federal union remained highly problematic—but Virginia, it soon turned out, had ratified that very day. The news got to New York City at three o'clock in the morning of July 2. Bells began to peal and continued until dawn, when ten twenty-four pounders fired a loud salute to the new government. William Livingston, who had set out immediately for Poughkeepsie, galloped up to the courthouse around noon the same day and burst in upon the convention with the story. Federalist delegates cheered, and spectators paraded around the building with fife and drum. With only New York and Rhode Island now out of the Union, it seemed certain that the Antifederalists would accept the inevitable and vote for the Constitution.

They didn't. Rallied by Smith, the Antifederalists put forward a plan for limited or conditional ratification: they would agree to the Constitution providing that, within a specified period of time, a "bill of rights" was added to safeguard freedom of the press, freedom of conscience, and other individual liberties. If the desired amendments failed to materialize, the state would withdraw its ratification. Hamilton and the Federalists denounced the idea, contending that it would cause more trouble and confusion than outright rejection of the Constitution. The Antifederalists were adamant, however, and for another several weeks it remained unclear what the convention would do.

THE FEDERAL SHIP *HAMILTON*

Down in New York City, the Antifederalists' demand for a bill of rights raised a hurricane of indignation, not least of all because Congress had already started talking about where to go if the Poughkeepsie convention failed to ratify the Constitution. "You have no idea of the rage of the Inhabitants of this City," Samuel Blachley Webb wrote a friend, adding that if ratification did not happen soon, "I do not believe the life of the Governor & his party would be safe in this place."

Many people suggested that the city should secede from the state and ratify the Constitution separately. Newspapers in Pennsylvania and Connecticut as well as New York carried reports that Richmond, Kings, Queens, Suffolk, and Westchester counties were also prepared to cast their lot with a new state if the convention failed to ratify. There was speculation about the likelihood of civil war, and when John Lamb led a party of Antifederalists down to the Battery to burn a copy of the Constitution, they had to fight their way out of the angry crowd that surrounded them.

Federalist spokesmen in Poughkeepsie reminded the opposition that Congress was important to the city and that the city was indispensable to the state. Jay told the convention that Congress pumped a hundred thousand pounds a year into the municipal economy. In fact, he said, “All the Hard Money in the City of New York arises from the Sitting of Congress there.” Chancellor Livingston worried that the state’s isolation from the Union would be economically ruinous and raised the possibility that “the Southern part of the State may separate.”

Hamilton went further: a separation was inevitable, he warned, if New York rejected the Constitution. Although Governor Clinton reprimanded Hamilton from the chair for this “highly indiscreet and improper” threat, Antifederalists were now clearly worried about the mood of the city.

It was in this setting that city Federalists mounted a “Grand Federal Procession” to celebrate the Constitution. Similar events had been staged in Boston, Philadelphia, Charleston, and other cities, and during June, if not earlier, arrangements were underway for something equivalent in New York. Originally scheduled to coincide with the city’s Fourth of July festivities, the New York procession was repeatedly postponed because its organizers kept waiting for word of ratification from Poughkeepsie. Finally, their patience at an end, they called for participants to assemble in the Common at eight o’clock on the morning of July 23.

Five thousand men and boys representing sixty-odd trades and professions showed up despite a light drizzle, all in costume and accompanied by colorful floats and banners proclaiming the happiness and prosperity that would follow from stronger national union. The Bakers, positioned near the front of the column by white-coated assistants with speaking trumpets, held aloft a ten-foot “federal loaf” and “a flag, representing the declension of trade under the old Confederation.” After

them came the other trades with banners proclaiming the certain return of prosperity under the new government. “May we succeed in our trade and the union protect us!” declared that of the Puke Makers and Hair Dressers; further down the line of march were the Black Smiths, hammering away on an anchor and chanting: “Forge me strong, finish me neat, I soon shall moor a Federal fleet.”

Towering over every other display was the “Federal Ship *Hamilton*” in the Seventh Division. A scaled-down thirty-two-gun frigate, twenty-seven feet in length, it rumbled along behind a team of ten horses “with flowing sheets, and full sails . . . the canvass waves dashing against her sides, the wheels of the carriage concealed.” A “federal ship” had figured in similar processions elsewhere, but none honored a specific individual. Its preeminent role in the New York proceedings was dramatic testimony to Hamilton’s effectiveness in linking adoption of the Constitution to the city’s economic well-being. As the nearby banner of the Ship Joiners proclaimed: “This Federal Ship Will Our Commerce Revive / And Merchants and Shipwrights and Joiners Will Thrive.” There was even talk that day of renaming the city “Hamiltoniana” in his honor.

The marchers headed down Broadway to Great Dock Street, where the *Hamilton* exchanged salutes with a Spanish packet, then swung over to Hanover Square and moved through Queen, Chatham, and Arundel streets to Bayard’s Tavern on Bullock Street. The Committee of Arrangements, members of Congress, and “the Gentlemen on Horseback” reviewed the marchers outside the tavern, and the *Hamilton* changed pilots to guide it from the “Old Constitution” to the new. More cannon were fired. Everyone then sat down to a banquet at tables set up around a canvas pavilion designed by a French architect, Major Charles Pierre L’Enfant. After a feast of roast ham, bullock, and mutton, the day-long festivities concluded with a toast to “the Convention of the State of New York; may they soon add an eleventh pillar to the Federal Edifice.”

Order of Proceffion, In Honor of the Constitution of the United States.

AT eight o'Clock on Wednesday Morning the 13d of July, 10 Guns will fire, when the PROCESSION will parade and proceed by the following Route, viz: Down Broad-Way to Great-Dock-Street, thence through Hanover-Square, Queen, Chatham, Division, and Arundel-Streets; and from thence through Bullock-Street to Bayard's-House.

1. 24 specimens with Transverse.
2. a piece of Acetabulum.

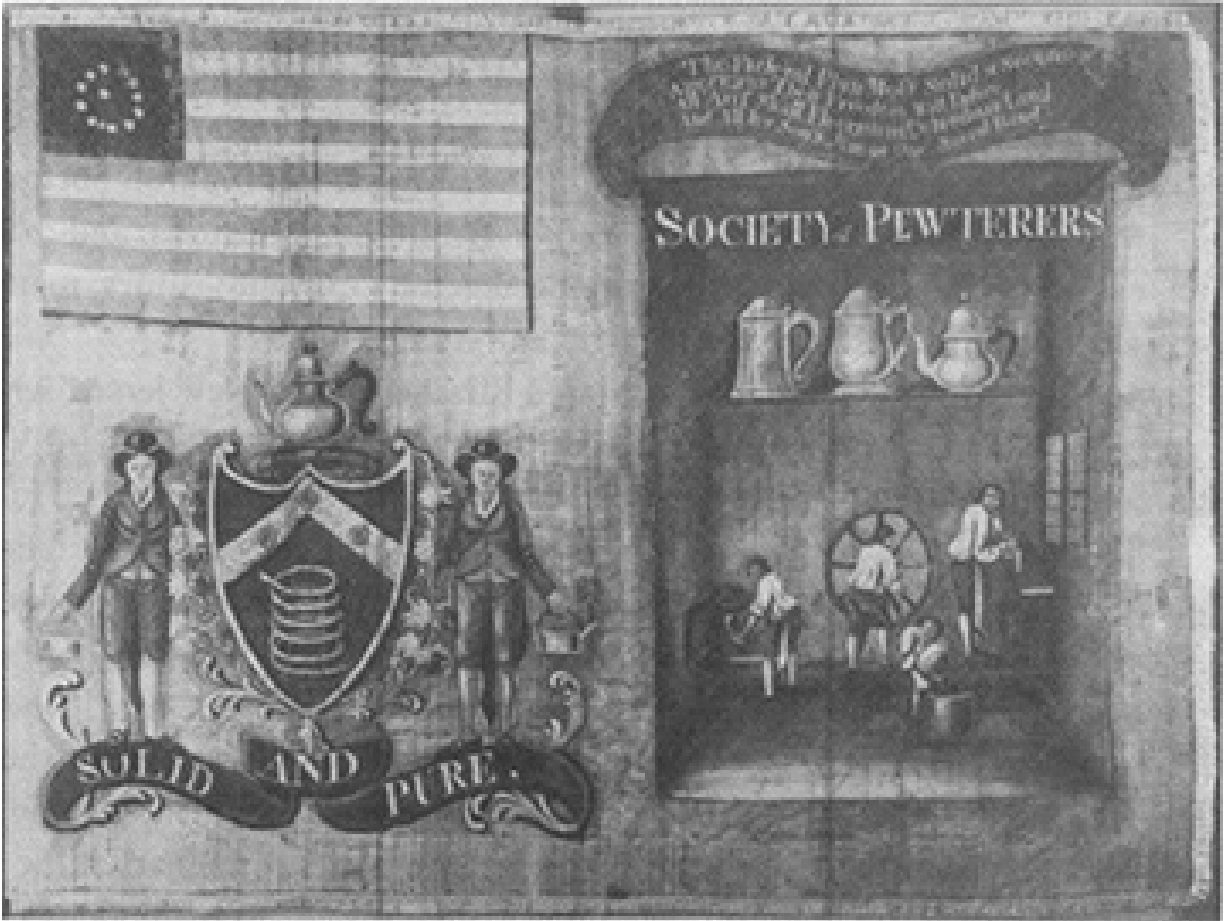

[illegible]

By Order of the Committee of Arrangements,
RICHARD PLATT, *Chairman*

Artisans dominated the first eight “divisions” in the line of march, followed by lawyers, merchants, and clergy—testimony not only to the depth of support for the Constitution among working people, but also to the importance of the organized trades in the public life of the city after Independence. (© Collection of The New-York Historical Society)

Antifederalists scoffed and sneered, but the Grand Federal Procession was an event of almost transcendent significance in New York’s post-Revolutionary history. Nominally, it dramatized the breadth of local support for the Constitution and, by implication, the city’s determination not to be left out of the new federal union. No less important, arguably even more so, the massed presence of the trades also gave tangible expression to the organized artisanal presence that was already altering the course of municipal affairs. After two decades of upheaval and war, New York’s numerous mechanics had come to see themselves as equal citizens, actively engaged in the life of the community. Their best qualities—their respect for labor, their selfless interdependence, their usefulness to society, their unflinching patriotism—were the very essence of republican virtue.

Up in Poughkeepsie, the Antifederalists had already decided to surrender. That morning, even as the marchers were moving out of the Fields, Samuel Jones, the Queens Antifederalist, made a motion to ratify the Constitution “in full confidence” that a bill of rights would be forthcoming. Melancton Smith supported the motion, explaining that he feared the consequences if New York spurned the Union—“Convulsions in the Southern part, factions and discord in the rest.” Jones’s motion passed. The Federalists, in turn, accepted thirty-two “recommendatory” and twenty-three “explanatory” amendments to the Constitution and agreed to urge a second convention to consider them. A final vote next day produced a margin of thirty to twenty-seven for ratification—the narrowest in any state.

An express rider carried the news down to New York City on the evening of the twenty-sixth. Jubilant crowds again surged through the streets. One group ransacked the office of Greenleaf's Antifederalist *jbwrwal* and made off with his type. Another paraded over to Governor Clinton's residence, gave three hisses, and beat the rogue's march; there was talk of going after John Lamb as well, but nothing came of it. More commotion followed a few days later when the Federalist delegation returned from Poughkeepsie. Cheering crowds greeted them at the waterfront, and eleven-gun salutes were fired before each of their houses.

INAUGURATION DAY

At the end of the summer of 1788, the Confederation Congress designated New York City as the temporary seat of the new federal government. Both it and the City Council then vacated City Hall so the building could be converted into a suitable capitol by L'Enfant. He gave it a complete facelift and turned its interior into a showcase of plush, some said extravagant, neoclassicism. In November, as elections for the new government got underway, the old Congress adjourned for good, leaving the country with no central government for the next five months.

L'Enfant's work was substantially complete by March 4, 1789, when the new Congress convened in what was now Federal Hall—over which, in honor of the occasion, flew the flag of the “Federal Ship *Hamilton*.” After waiting anxiously for a month to get quorums, the Senate and House were at last able to count the ballots cast by presidential electors. To no one's surprise, George Washington was the unanimous choice. Genuinely dismayed by the news, Washington left Mount Vernon for New York in mid-April, hoping to have “a quiet entry to the city devoid of ceremony.” He felt, he said, like “a culprit who is going to the place of his execution.”

His week-long journey to Manhattan proved anything but quiet. Every town, village, and hamlet marked the president-elect's passage with ecstatic crowds, honor guards, booming artillery, ringing church bells, banquets, speeches, triumphal arches, and rose-strewn streets. New York churned with anticipation. “All the world here are busy in collecting flowers and sweets of every kind to amuse and delight the President in his approach and on his arrival,” one man wrote. Washington portraits went up everywhere. The initials G. W. appeared on front doors, buttons, and tobacco boxes. Local taverns and boardinghouses were besieged by excited visitors, many of whom had to settle for lodgings in nearby villages and campgrounds.

On April 23, Washington entered Elizabethtown, New Jersey, where an official welcoming committee from New York (Robert R. Livingston, Richard Varick, Egbert Benson) was waiting in a red-canopied barge to escort him across the Hudson River. As the barge pulled away from the New Jersey shore, rowed by thirteen harbor pilots in sparkling white uniforms, it was surrounded by a dense mass of vessels, one of which bore musicians and a chorus whose voices were barely audible above the roar of cannon from shore batteries and a Spanish warship in the harbor. One witness, who watched the barge pass the Battery, commented that the

“successive motion of the hats” of cheering bystanders “was like the rolling motion of the sea, or a field of grain.” Governor Clinton and Mayor Duane greeted Washington at Murray’s Wharf at the foot of Wall Street on the East River. Clinton said a few words, which almost nobody could hear over the din, and then, preceded by a military guard and two marching bands, escorted Washington up Wall Street through throngs of well-wishers. Turning into Pearl Street, the procession moved slowly along to Cherry Street and the Presidential Residence, a private mansion that had been handsomely refurbished at a cost of twenty thousand pounds (all of it raised by private contributions).

Thursday, April 30, was Inauguration Day, and the city awakened at dawn to a salute from the guns on the Battery. At nine o’clock, hour-long services got under way in all churches. Congress assembled at noon and dispatched a party of dignitaries to fetch the president-elect from his Cherry Street residence. After some inevitable confusion over the formalities—there were no precedents to rely upon, after all, and nobody remembered to bring a Bible—Washington stepped out on the second-floor balcony of Federal Hall, dressed for the occasion in a plain suit of “superfine American Broad Cloth” from a mill in Hartford, Connecticut. He hoped, he had said, that it would soon “be unfashionable for a gentleman to appear in any other dress” than one of American manufacture.

“The scene was solemn and awful beyond description,” wrote one spectator. Chancellor Livingston administered the oath of office, then, overcome by emotion, bellowed, “Long Live George Washington, President of the United States!” The densely packed crowd below responded with “loud and repeated shouts” of approval, and Washington went back inside to deliver his inaugural address. Afterward, he and the members of Congress walked up to St. Paul’s on Broadway for a worship service.

That evening, visitors and residents jammed the streets to gawk at “illuminations”—huge backlit transparent paintings of patriotic subjects erected here and there around the city. One, at the lower end of Broadway, showed Washington with the figure of Fortitude, flanked by the Senate and House and surmounted by the forms of Justice and Wisdom. Another, displayed at the John Street Theater, showed Fame descending from heaven like an angel to bestow immortality on the new President. Even the residence of the Spanish minister was bedecked with moving transparencies

that depicted the past, present, and future glories of America. Bands played, houses and ships in the harbor blazed with candles, and the skies above crackled with a two-hour-long display of fireworks. Washington, who watched the show from Chancellor Livingston's house, had to get home on foot because the streets were too full of people for his carriage to pass.

Capital City

New York had been the de facto capital of the nation since 1785, but the transition from Confederation to Constitution gave new snap and sophistication to life in the city. Trailing behind President Washington came a multitude of Revolutionary heroes and near-heroes—"the most celebrated persons from the various parts of the United States," as the French reformer Brissot de Warville wrote in his *New Travels in the United States* (the first American edition of which appeared in New York in 1792). A brief stroll through the streets of lower Manhattan could bring residents face to face with Vice-President John Adams, Secretary of War Henry Knox, Attorney General Edmund Randolph, Congressman James Madison, or Senator John Hancock; Thomas Jefferson, currently American ambassador to France, would arrive in another six months or so to take up his duties as secretary of state. So many of the republic's most famous men converged on New York over the spring and summer of 1789 that the painter John Trumbull moved to the city in December to finish the portraits on his monumental canvas *The Declaration of Independence*.

Washington drew numerous prominent New Yorkers into the new federal orbit. John Jay became the first chief justice of the Supreme Court. Alexander Hamilton was named secretary of the treasury on the recommendation of Senator Robert Morris (Hamilton was "damned sharp," Morris told Washington, who surely knew it already); Hamilton in turn chose William Duer for assistant secretary of the treasury. Gouverneur Morris took the post of ambassador to France, General John Lamb became collector of the port, and Richard Harison got the office of U.S. attorney. Chancellor Livingston thought he deserved a cabinet-level appointment but came up emptyhanded—the only notable New Yorker to be snubbed by the administration. Although James Duane wanted to join General Philip Schuyler in the Senate, Governor Clinton arranged for the selection of Rufus King, a well-connected Massachusetts politician who had just moved down to the city. Instead, Duane got the job of first judge of the federal district court of New York. Richard Varick took over as mayor.

Municipal and state officials did their best to accommodate the federal government's need for space and quiet deliberation. Congress complained that the ringing of bells at funerals disturbed its deliberations; local authorities obligingly banned the practice. The chief executive's hemorrhoids flared up, and his doctors insisted that he stay in bed for six weeks; a chain was stretched across the street outside his residence to reduce the clatter of traffic. Additional renovations were required on Federal Hall; officials organized a lottery to raise seventy-five hundred pounds.¹

There was even talk about turning lower Manhattan into the federal district envisioned in the Constitution, complete with government offices, residences, parks, and gardens; one plan designated Governors Island, just across the harbor, as the site for a presidential mansion. Eager to cooperate, the city demolished the old Anglo-Dutch fort on the Battery over the summer of 1789, uncovering, among other things, the coffin of Lord Bellomont and the cornerstone of the church erected during Willem Kieft's regime a century and a half earlier. Once the fort was down, workmen began construction of a three-story brick building with ample quarters for all three branches of the government. When finished two years later, Government House, as it was called, commanded spectacular harbor views and an elegant waterfront promenade.

Provisions were dear and housing hard to come by, as ever, but New York's cosmopolitan attractions made up for a good deal of discomfort. As wide-eyed St. George Tucker of Virginia recorded in his diary, the "hurly burly and bustle of a large town" held a unique fascination of its own. "You may stand in one place in this City and see as great a variety of faces, figures, and Characters as Hogarth or Le Sage (author of *Gil Bias*) ever drew."

There were plenty of other things to do, however. Opposition to playhouses had receded again, and Lewis Hallam the younger had reopened the John Street Theater with a performance of Royall Tyler's *The Contrast*, a sentimental comedy set in postwar New York. A new racetrack, the Maidenhead, was now operating just behind the old De Lancey mansion, and two new pleasure gardens had appeared: Brannon's, near the southwest corner of present Spring and Hudson streets, and the United States, an establishment on Broadway once run by the widow Montayne. Much

frequented by students from Columbia College, Brannon's was renowned for its "curious shrubs and plants" and excellent ice cream; the United States pitched its advertisements to the "Fair Sex" and noted that "select companies or parties, can always have an apartment to themselves, if required."

A "VORTEX OF FOLLY AND DISSIPATION"

But would the federal government stay? The selection of a permanent site for the national capital remained a topic of passionate controversy around the country, New York being a far from popular choice. Its raw juxtapositions of wealth and poverty, its preoccupation with commercial profit, its tolerance (even laxity) in matters of religion and morality, its raucous crowds—none of these recommended the city to the nation's overwhelmingly rural and agricultural population. Leading the opposition were hardshell republicans who feared that New York's "British" and "aristocratic" tendencies, to say nothing of its fleshpots, would sooner or later fatally corrupt the leaders of a free people. Everything they heard or saw over the next couple of years convinced them the end was already in sight.

Much would be made of Brissot's observation that "if there is one city on the American continent which above all others displays English luxury, it is New York, where you can find all the English fashions." One evening at dinner he encountered two ladies in "dresses which exposed much of their bosoms. I was scandalized by such indecency in republican women." And was it really true, as a horrified Senator William Maclay of Pennsylvania reported, that many New Yorkers still observed the King's Birthday "with great festivity"? Or what about Mrs. John Jay, the former Sarah Van Brugh Livingston, handsome and high-spirited daughter of William Livingston (long-ago editor of the *Independent Reflector* and later revolutionary governor of New Jersey)? She had married Jay in 1774, accompanied him on his diplomatic missions to Spain and France (becoming a favorite of Parisian society), and had now made their house on lower Broadway the center of New York's smart society. Had she actually thrown her doors open to Lady Kitty Duer, Lady Mary Watts, Lady Christiana Griffin, and other American matrons not yet reconciled to republican forms of address? And what manner of idolatry prompted the

Common Council to hire John Trumbull to paint a portrait of Washington for City Hall? (“Flattery to the living rulers is always dangerous,” scolded “Vox Res Publica.”) If Thomas Jefferson is to be believed, when he arrived to take up his duties as secretary of state in the spring of 1790 he was the only republican in town.

Very worrisome indeed, notwithstanding the suit of plain brown broadcloth in which Washington took the oath of office, was the courtly style of entertaining adopted by the chief executive and his wife. His Tuesday afternoon levees and her Friday evening receptions were, as one observer wrote, “numerously attended by all that was fashionable, elegant, and refined in society; but there was no places for the intrusion of the rabble in crowds, or for the more coarse and boisterous partisan—the vulgar electioneer—or the impudent place-hunter—with boots and frock-coats, or roundabouts, or with patched knees, and holes at both elbows. . . . Full dress was required of all.” When the president appeared in public, it was noted, bands sometimes struck up “God Save the King.” His lady, it was noted, always returned visits on the third day, preceded by a footman.

Not overlooked, either, was the president’s cream-colored coach, drawn by a team of six horses—reputedly the finest equipage in the city—or the “bountiful and elegant” dinners served up by Samuel Fraunces, now the president’s head steward, who also supervised a household staff of twenty servants, maids, housekeepers, cooks, and coachmen. It didn’t help that in 1790 Washington moved his official residence from Cherry Street to the mansion built by Alexander Macomb at Number 39 Broadway, an even grander house at a better address. The rent was a breathtaking twenty-five hundred dollars per year. To the *Boston Gazette*, New York was a “vortex of folly and dissipation” into which republican virtue and simplicity had long since vanished.

New York’s champions, numerous and articulate, pooh-poohed all the commotion. Oliver Wolcott (related to the Livingstons, after all) made the city sound like a bastion of propriety: “There appears to be great regularity here,” he testified; “honesty is as much in fashion as in Connecticut; and I am persuaded that there is a much greater attention to good morals than has been supposed. So far as an attention to the Sabbath is a criterion of religion, a comparison between this city and many places in Connecticut would be in favor of New York.” Other advocates of the city emphasized its

beauty and temperate climate (notwithstanding an influenza epidemic and heat wave in 1789 that resulted in numerous fatalities). According to one newspaper, only a single member of Congress fell ill while in New York—a point that became the subject of an extended commentary by Dr. John Bard, a local physician and president of the Medical Society, who pronounced New York “one of the healthiest cities of the continent.” The proof of this assertion, he said, was readily visible “in the complexion, health and vigor of its inhabitants.”

MONEYED MEN

What couldn't be shrugged off so easily was New York's growing notoriety as a cauldron of financial speculation. Over the previous half-dozen years, “moneyed men” throughout the United States, often as not in league with European financiers, had come to think of heavily depreciated state and Continental securities as good investments. (As early as 1786, William Duer owned sixty-seven thousand dollars' worth of Continental paper outright, and another two hundred thousand in partnership with half a dozen other New York investors.) If the American experiment in self-government succeeded, they reasoned, the value of their holdings would be multiplied many times over. The tempo of speculation quickened in the months before Washington's inauguration, as investors became more and more certain that the new federal government would take immediate steps to put the nation's finances in order.

New York afforded speculators two advantages. Rapid population growth—and above all a stream of immigrants with cash, credit, and connections—favored the city with an abundance of capital. “More money is to be had in Your City” than anywhere else in the country, a Philadelphia merchant complained to Andrew Craigie in 1789. As the national capital, furthermore, New York churned with valuable rumors, tips, and inside information that took days, even weeks, to reach buyers and sellers elsewhere. There was no substitute for rubbing elbows with important people in the government on a day-to-day basis, Craigie said. “I know of no way of making safe speculations but by being associated with people who from their Official situation know all the present & can aid future arrangements either for or against the funds.”

The early summer of 1789 brought word that southern state securities were both cheap and plentiful, some selling for as little as ten cents on the dollar. Over the next six months, seventy-odd New Yorkers scooped up \$2.7 million worth of South Carolina, North Carolina, and Virginia obligations—roughly a third, all told, of their outstanding debts. Leading the pack was the firm of Herman LeRoy and William Bayard, with a combined investment of over \$580,000. Andrew Craigie and four others were each in for a hundred thousand dollars or more. William Constable, another participant, told an English investor that “*those in the secret*” expected to come away with huge profits in the very near future. “My opinion is founded on the best information,” he wrote. “I cannot commit to paper my reasons, nor explain from whence I have my information, but I would not deceive you.”

Constable’s “secret” was that Treasury Secretary Hamilton (“our Pitt,” Constable called him reverently) would soon go before Congress with a financial plan calculated to boost the value of state and federal securities. How did Constable know? No evidence exists that Hamilton breached the confidentiality of his office. Assistant Treasury Secretary Duer, on the other hand, talked freely to Constable and their other New York friends and was himself deeply involved in speculation. Hamilton surely knew of Duer’s activities and did nothing—which encouraged the widespread suspicion that he was masterminding a corrupt conspiracy against the republic.

The denouement came in mid-January 1790, when Congress received from Hamilton a fifty-page *Report Relative to Public Credit*. According to Hamilton’s figures, the unpaid foreign and domestic debts of the United States amounted to some fifty-four million dollars. Outstanding state debts came to another twenty-five million. The total—nearly eighty million dollars—was the country’s “price of liberty,” Hamilton said. Yet, he added, neither the old Confederation nor many of the states had fulfilled their duty to pay off this sacred debt as promised. The annual revenues of the new federal government weren’t even enough to cover the interest on the debt (currently around \$4 million a year), let alone retire the principal, and numerous public creditors had been waiting for their money for years. This intolerable negligence had brought the nation to a “critical juncture” in its history. Not only was “the individual and aggregate prosperity of the

citizens of the United States” in jeopardy, but their very “character as a People” and “the cause of good government” hung in the balance as well.

No one in Congress opposed paying the national debt. At issue was who owed how much to whom, and where the money would come from. Hamilton’s recommendation followed what he, Robert Morris, and other conservative nationalists had been advocating for a decade or more. First, Congress should consolidate the various foreign and domestic debts incurred by both the confederation and federal governments since 1776 and “assume” (i.e., take responsibility for) unpaid state Revolutionary debts, with accumulated interest. Second, it should “fund” the whole amount “at par” (i.e., face value), meaning that it would provide sufficient revenue to pay the interest and part of the principal every year. As to the mechanics of the process, Hamilton gave Congress a choice of six different plans. The one eventually chosen called for state and federal creditors to exchange their old notes for new 6 percent federal “stock.” Accumulated interest, if any, would be paid in 3 percent stock.

Without funding and assumption, Hamilton reasoned, the United States could never achieve the stability, prosperity, and strength it needed to survive. As in Britain a century earlier, the creation of a funded national debt would restore the government’s credit among those persons, at home and abroad, who possessed “active wealth, or in other words . . . monied capital.” The assumption of *state* debts, Hamilton continued, would bind every public creditor to the new federal system by powerful “ligaments of interest.” If it succeeded, they would profit; if it failed, they would lose. Politically, in other words, funding and assumption together would cement the union by enhancing the authority and reputation of the central government vis-a-vis the states. Economically, too, funding and assumption would do wonders for the country. Public confidence in government stock would enable it to function like money, thereby increasing the money supply, driving down interest rates, and stimulating the development of agriculture, commerce, and industry.

No sooner had Hamilton’s report become public knowledge, Chancellor Livingston reported sourly, than a mania for speculation in public securities immediately “invaded all ranks of people.” New York went wild. Even prominent Antifederalists like George Clinton and Melancton Smith took the plunge. Big investors became celebrities. Stories circulated of their

high-stakes derring-do, richly embroidered with talk of secret couriers and chests full of cash.

Prince of the New York speculators was none other than William Duer. After less than six months on the job, Duer abruptly resigned from the treasury—"I have left to do better," he explained—and promptly threw himself into daring and complex schemes. Through his wide network of connections in the United States and Europe, he arranged for or encouraged the influx of millions of dollars from investors in Boston, Philadelphia, Amsterdam, Paris, London, and elsewhere. Suddenly one of the richest men in the country, he lived like an Eastern potentate in the former Philipse mansion, attended by a regiment of servants and fawned over by important visitors. Jefferson called him "the king of the alley." The Rev. Manasseh Cutler, who attended one of the chic dinner parties given by Duer and his wife, the former Kitty Alexander, had never seen anything like it. "I presume he had not less than fifteen different sorts of wine at dinner, and after the cloth was removed, besides most excellent bottled cider, porter, and several other kinds of strong beer."

THE COMPROMISE OF 1790

Outside New York, and to no small degree because of the financial delirium there, Hamilton's proposals roused fiery resentment. Funding at par, by allowing creditors to swap depreciated obligations for new interest-bearing paper at face value, was legalized fraud, critics said. Speculators with money and inside information—for surely Hamilton was in cahoots with Duer and other New York speculators—were raking in immense unearned profits at the expense of patriotic republicans who had been tricked out of their property. Assumption especially angered the South. Northern states owed a disproportionate share of the debts Hamilton proposed to take over, meaning they stood to gain a financial windfall at the expense of southern taxpayers. Besides, northern speculators had by now bought up so much of the outstanding southern state debt that they would pocket the real profits of assumption—again at southern expense.

In Congress, James Madison of Virginia rallied opponents of Hamilton's proposals with two of his own: no assumption of state debts at all, and no funding of the national debt without making a distinction between the original and subsequent holders of government paper. The debate over

Madison's alternatives went on, inside Congress and out, for weeks. Toward the end of February, the House defeated his discrimination idea.

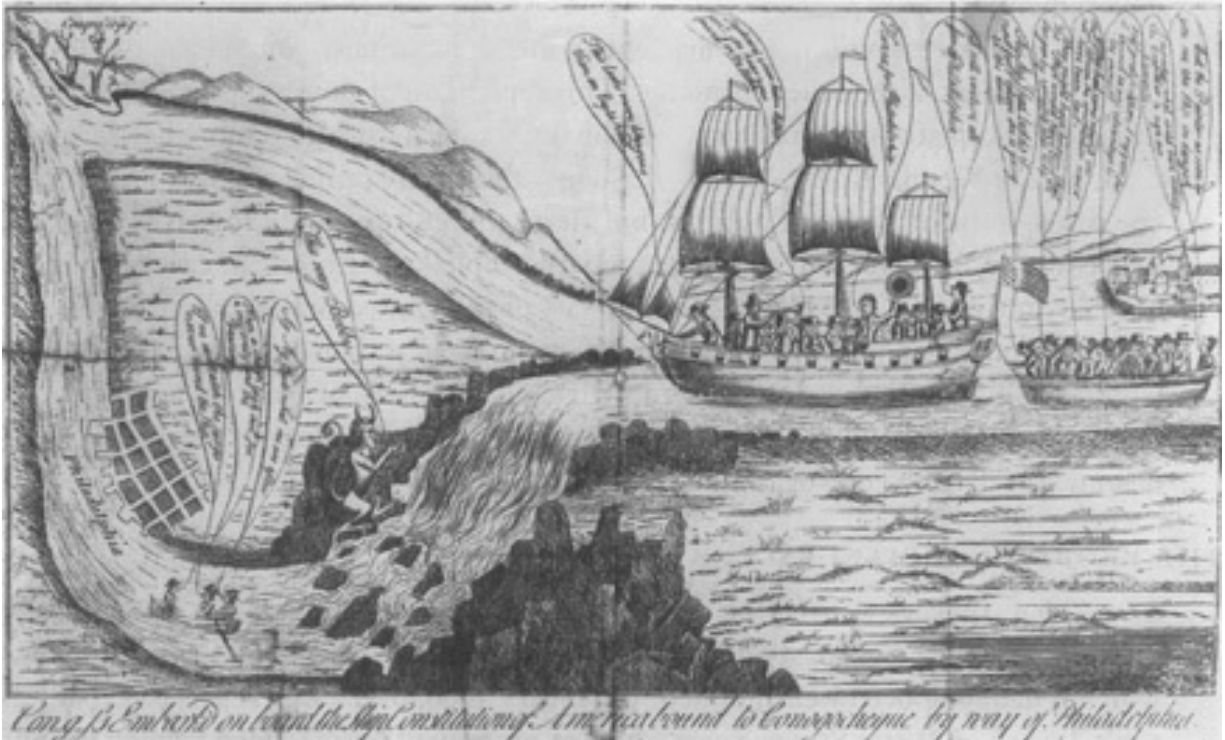

Assumption failed a preliminary vote in mid-April. By early June, while more or less certain his funding scheme would get through, Hamilton was increasingly fearful that assumption wouldn't survive a second and decisive ballot.

It was at this juncture, Jefferson later recalled, that Hamilton offered a compromise. The two men chanced to meet one day in the street, just outside the president's house, Hamilton appearing "sombre, haggard, & dejected beyond despair, even his dress uncouth & neglected." Hamilton begged Jefferson to reassure southern congressmen that assumption was vital to the well-being of the republic; in return, he would round up enough northern votes to move the national capital to a site on the Potomac River.

Anxious to get the government out of the clutches of New York "moneyed men," Jefferson suggested that Hamilton and Madison join him for dinner the next evening at his house on Maiden Lane. There the bargain was sealed.²

At the Poughkeepsie convention, New York Federalists had more or less promised that the federal government would remain in New York if the Constitution were ratified. Now, shocked and embarrassed by this latest turn of events, they geared up for a fight to keep the federal government in the city as long as possible (or, failing that, to locate the federal district along, say, the Susquehanna, or even in Baltimore). Hamilton was adamant, however. His financial program, he told Senator Rufus King, was "the primary object; all subordinate points which oppose it must be sacrificed." King and the others did as they were told. Early in July, Congress voted to build a permanent capital in a ten-mile-square federal district on the Potomac; for the remainder of the decade, pending completion of the necessary construction, the government would return to Philadelphia. In due course, both houses approved assumption as well as funding, completing Hamilton's victory.

On August 12, 1790, Congress met for the last time in Federal Hall. Two weeks later, on August 30, Washington stepped into a barge moored at Macomb's Wharf on the Hudson and left Manhattan, never to return. Abigail Adams vowed to make the best of Philadelphia but knew that "when all is done, it will not be Broadway."

“Congress Embark’d on board the Ship Constitution,” a New Yorker’s satirical view of the decision to move the federal capital to the Potomac. It is the Devil who lures the ship of state onto the rocks, but his words—“This way, Bobby”—echo the widespread belief that Robert Morris and other Pennsylvanians were behind the move. (Library of Congress)

New Yorkers watched the federal departure with both regret and irritation. “No more Levee days and nights, no more dancing parties out of town thro’ the summer, no more assemblies in town thro’ the winter,” lamented one resident. Everyone blamed the Pennsylvanians—to which Senator William Maclay, who had never liked New York anyway, testily replied that its residents “resemble bad school-boys who are unfortunate at play: they revenge themselves by telling notorious thumpers.” Even Washington came in for a share of abuse when he signed the Potomac bill into law. Hamilton, whose role in the deal wouldn’t come to light for years, emerged unscathed.

Yet by the end of the summer, the loss of the capital had been forgotten. Passage of the funding and assumption bills restored between forty and sixty million dollars in hitherto virtually worthless certificates of

indebtedness to face value— a sudden accession of wealth that bathed the city (or at least its successful speculators) in prosperity. Even the state government had invested a couple of million dollars in securities that, redeemed at par, brought a tidy sum into the treasury. Eager investors were meanwhile bidding up the price of the new 6 percent and 3 percent federal securities, dreaming of fortunes to come.

To a visiting British diplomat, the city's future seemed utterly secure, capital or no capital. New York, he said, "is certainly favored to be the first city in North America, and this superiority it will most assuredly retain whatever other spot be made the seat of government."

It was an arresting thought: henceforth the United States would have two centers, one governmental, the other economic. This separation of powers, as emphatic as anything in the Constitution, had no parallel in the Western world. London, Paris, Amsterdam, Berlin, Vienna, Rome, Madrid, Lisbon—these were capitals in the fullest sense of the word, hubs of national politics, business, and culture (only the rivalry between Moscow and St. Petersburg even vaguely resembled the American case). That New York already promised to become the first city of the United States, independent of the apparatus of state power, was an augury of its uniqueness. Nowhere else in the republic would the marketplace come to reign with such authority, or painters and politicians alike bow so low before the gods of business and finance. No longer the capital city, its destiny was to be the city of capital.

THE PROBLEM OF MANUFACTURES

Some New Yorkers wanted the city to become a center of industrial manufacturing too—filled with English-style factories, not just the small artisanal workshops with which it had long been well supplied. In January 1789, over "wine, cakes, etc." at Rawson's Tavern on Water Street, a committee of prominent businessmen formed the Society for the Encouragement of American Manufactures, commonly known as the New York Manufacturing Society. The promotion of industry was nothing new: the nonconsumption and nonimportation movements twenty-five years before had inspired similar projects, none of which met with much success. Yet the inception of a new federal government, President Washington's words of encouragement for the country's infant textile industry, and the

strength of the city's capital market suggested that large-scale manufacturing was an idea whose time had come. Even Governor Clinton, idol of the state's rural republicans, had been heard to say that "the promotion of manufactures is at all times highly worthy of the attention of government." No one was surprised when nearly two hundred investors bought up all Manufacturing Society stock at twenty-five dollars per share.

Before the year was out, the Manufacturing Society had opened a textile factory on Crown (later Liberty) Street. It had a carding machine and two hand-operated spinning jennies, and it employed fourteen weavers and 130 spinners, an impressive labor force by contemporary standards; it was also said to have cost \$57,500—almost as much as the city had spent to renovate Federal Hall. A young Derbyshire immigrant named Samuel Slater offered to build and install, from memory, the spinning jennies whose design the British government guarded as carefully as the crown jewels. The factory's managers turned him away, however, and within a year or two were forced to close their doors. Slater moved on to Pawtucket, Rhode Island, where he built the first successful cotton mill in the United States for the firm of Almy and Brown.

Advocates of manufacturing didn't quit. The New York Society for the Promotion of Agriculture, Arts, and Manufactures, founded in 1791 by Robert R. Livingston and others, remained for years one of the country's leading exponents of direct government support for American industrial development. Local organizations of manufacturers and workingmen likewise bombarded Congress with demands to protect infant industries from foreign, especially British, competition. Individual entrepreneurs, including many British immigrants and New Englanders, went on experimenting with cotton mills, iron foundries, pottery works, breweries, and thread mills. One visitor saw a cotton mill at Hell Gate on the East River in 1794.

The demise of the Manufacturing Society was nonetheless a signal that large-scale industrial manufacturing faced immense obstacles in New York. Manhattan lacked the water power necessary for mills and factories. City real estate was already very expensive, almost prohibitively so for high-risk ventures that might take years to show a profit. Inexperienced management, the lack of up-to-date technology, and competition from low-cost British imports compounded the problem. Besides, investors could almost always

do better, with less danger, in shipping, insurance, and other mercantile enterprises, to say nothing of land or stock speculation. Over time, more and more of New York's merchants and financiers came to think of manufacturing as a nuisance. It threatened to open competitive outlets for capital, they charged, while the protectionist trade policies advocated by its proponents posed a danger to the free movement of goods, money, and credit across national boundaries.

SCRIPTOMANIA

Fighting over the direction of the nation's political and economic future resumed in Philadelphia in mid-December 1790 when Hamilton dispatched a second report on public credit to Congress. Among other things, the report recommended creation of a Bank of the United States. British experience proved, Hamilton said, that a bank was vital to national stability and prosperity. It would facilitate the financial operations of the treasury. Bank stock, a portion of which could be bought with the new public stock, would forge yet another link between public creditors and the federal government. Because its notes would serve as a circulating medium, and because its capital could be loaned out to private entrepreneurs, a national bank would further stimulate the nation's trade and commerce. Jefferson and Madison protested that the Constitution gave the federal government no authority to charter such a bank, but the necessary legislation sailed through Congress and was signed into law by the president at the end of February 1791.

The new Bank of the United States got off to a shaky start. Against Hamilton's wishes, the BUS board of directors decided to open a branch in New York, where the Bank of New York had just lost another attempt to get a charter from the state. The BONY's capital resources were larger than ever, but the number of shareholders had dwindled to twenty-five or so, mostly wealthy merchants like Rufus King, Isaac Roosevelt, and Nicholas Low—exactly the men to whom the BUS branch could be expected to appeal for support. Was there room for two banks in New York? Would the potential danger to the BONY cause a local backlash against the new federal institution? Certainly Governor Clinton and his friends thought a state bank might offset the power of the BUS, and they decided to give the BONY a charter after all, reserving the right for the state to buy a hundred shares of stock for fifty thousand dollars.

None of this had been sorted out when, on July 4, 1791, BUS stock went on sale in Philadelphia at twenty-five dollars a share. Within two hours, frenzied buyers—led, as Madison and Jefferson had feared, by northern and European “moneyed men”—snapped up the entire offering. In no time at all, bank stock as well as federal loan certificates were on the auction blocks in New York as well, and as Madison reported to Jefferson, the Coffee House was in “an eternal buzz with the gamblers.” City newspapers began printing the latest quotations, and special express couriers rode in with current prices on the Boston and Philadelphia markets. “O that I had but cash” was the general cry, reported the *New-York Journal*, “how soon would I have a finger in the pie!”

The value of BUS “subscription shares” or “scrip” climbed steadily—from \$25 to \$45 to \$60 almost overnight, from \$60 to \$100 in two days, from \$100 to \$150 in a single day. Toward the end of October shares in the bank were selling for \$170. It was clear by this time that a number of Hamiltonians had acquired big stakes in the BUS as well as seats on its board; some indeed had seats on the BONY board as well, giving the two banks something close to interlocking directorates. (The state of New York hedged its bets by investing sixty thousand dollars in BUS stocks.) In the meantime, according to one of Andrew Craigie’s associates, ordinary mechanics and shopkeepers had begun to dream of making easy money in the market—a danger because “ideas of this kind being disseminated amongst the various Classes of people become subversive of private industry, happiness, & economy.”

Hamilton too worried about the “scriptomania” raging in New York, but his attention was momentarily diverted by another of his projects, the Society for Establishing Useful Manufactures. The purpose of the SUM was to promote the industrialization of the United States, diversifying the country’s economy and reducing its dependence on imported, chiefly British, manufactures. SUM shares, valued at a hundred dollars each, could be purchased with either federal securities or BUS stock as well as specie—an ingenious arrangement that not only enabled the project to draw upon the increasing sums of foreign as well as domestic capital sluicing into the New York financial market but would also, in the process, help brake excessive speculation by stabilizing the demand for government bonds.

Although its operations would be located at Paterson, New Jersey, the SUM's New York connection was repeatedly underscored—by the fact that a majority of its directors were big New York speculators, by the board's decision to make William Duer its first governor or president, by the speed with which its stock was taken up by New York investors, and by its selection of L'Enfant to lay out a company town (his sense of grandeur proved too expensive, however, and he was let go). As of November 1791 over \$625,000 had been raised toward an initial capitalization of one million dollars—the bulk of it from the city, where SUM stock was selling at or above par. A month later Hamilton gave Congress a *Report on Manufactures* that urged federal support for all such undertakings (because, among other things, idle “women and Children are rendered more useful” by employment in manufacturing).

PANIC

At the end of December 1791, former assistant secretary of the treasury William Duer mobilized a small group of New York speculators—among them Alexander Macomb, John Pintard, William Livingston, and Royal Flint—for a daring attempt to manipulate the city's stock market. The plan called for “the Company” or “the Six Per Cent Club,” as it was known, to make massive secret purchases of government paper and bank stocks (Duer himself had bought over half a million dollars' worth in the previous nine months alone). To keep the market percolating, the club would also announce the formation of a new bank with an initial capitalization of a million dollars, then hint that this so-called Million Bank would merge with both the Bank of New York and the Bank of the United States. Stocks of all three institutions were certain to rise in value. When they had gone up far enough, the club would unload its holdings at tremendous profits—and perhaps (though Duer's exact intentions remain hazy) seize control of the Bank of New York as well.

Shares in the Million Bank went on sale in January 1792. Excited investors bought the entire offering within a matter of hours, and the ensuing cry for bank stocks of every description threw the city into what startled participants referred to as a “bancomania.” By the end of the month, competing groups of speculators had entered the fray with two more banks having a combined capitalization of \$1.2 million. As the financial market

surged higher and higher, New Yorkers feverishly bought and sold stocks in all five banks. “The merchant, the lawyer, the physician and the mechanic, appear to be equally striving to accumulate large fortunes” through speculation, marveled one witness to the hysteria. Duer and company plunged deeper and deeper into debt to finance their purchases, Macomb even kicking in fifty thousand dollars from the SUM treasury—practically its entire cash surplus.

Early in March, while promoters of the three new banks maneuvered for money and legislative approval, stock prices leveled off, then declined. Coincidentally, the government notified Duer of a \$250,000 discrepancy in his accounts as assistant treasury secretary. Cornered, and no longer able to raise cash, Duer began to sell. On March 10, as panic engulfed New York, he stopped payment on all his debts; two weeks later his creditors had him arrested and thrown in debtor’s prison. Macomb and Walter Livingston soon went to jail as well; John Pintard escaped his creditors by fleeing across the Hudson to Newark.

New York appeared to have been struck by a disaster of staggering proportions. Duer alone owed more than \$750,000. Judge Thomas Jones said that estimates of all losses ran as high as three million dollars—a huge sum, representing the savings of “almost every person in the city, from the richest merchants to even the poorest women and the little shopkeepers.”

“Everything is afloat and confidence is destroyed,” one man grieved. “The town here has rec’d a shock which it will not get over in many years.” No one escaped—“shopkeepers, widows, orphans, butchers, carmen, Gardeners, market women & even the noted bawd, Mrs. McCarty,” lost their life savings. “Such a revolution of property perhaps never before happened.” All told, two dozen leading merchants were ruined; the Million Bank and its competitors never opened their doors. Business languished, and ships lay at the wharves with no one to buy their cargoes. Artisans, mechanics, and cartmen couldn’t find employment. Farmers couldn’t sell their produce. Over in Paterson, the directors of the SUM (absent Duer and Macomb) forged ahead with plans for the construction of factories and housing for workers, but the wounds were fatal, and within a few years the project foundered.

Hamilton, watching the nation’s first financial crisis unfold, was appalled. The whole point of his financial program was to transform the

nation's public creditors into a class of proto-capitalists able to lend the government stability and facilitate the production of tangible wealth—not reel off on speculative binges that paralyzed the economy. “There should be a line of separation between honest men and knaves,” he fumed, “between respectable stockholders and mere unprincipled gamblers.” In March and again in April he ordered the treasury into the market in an effort to restore confidence and give “a new face to things.” It helped, but not much. Where, and how, to draw the line between “respectable stockholders” and “gamblers” would remain a central dilemma of American capitalism for the next two centuries. The demise of the SUM had meanwhile soured Hamilton's interest in such projects, and when Congress refused to act on his *Report on Manufactures*, he quickly lost interest in the subject.

Duer was lucky to be behind bars. Everyone blamed him for the panic, and threats against his life were commonplace. “I expect to hear daily that they have broken open the jail and taken out Duer and Walter Livingston, and hanged them,” wrote one resident. On the night of April 18 a stone-throwing crowd of between three and five hundred persons, working people as well as merchants, converged on the jail shouting, “*We will have Mr. Duer, he has gotten our money.*” “Nothing much happened, but the scene was repeated for the next several evenings and the mayor prudently increased the guard at the jail. Duer appealed to his old ally Hamilton for assistance. Hamilton advised him, stiffly, to make a clean breast of his affairs and settle with his creditors. “Adieu, my unfortunate friend,” wrote Hamilton. “Be honorable, calm, and firm.”

UNDER THE BUTTONWOOD TREE

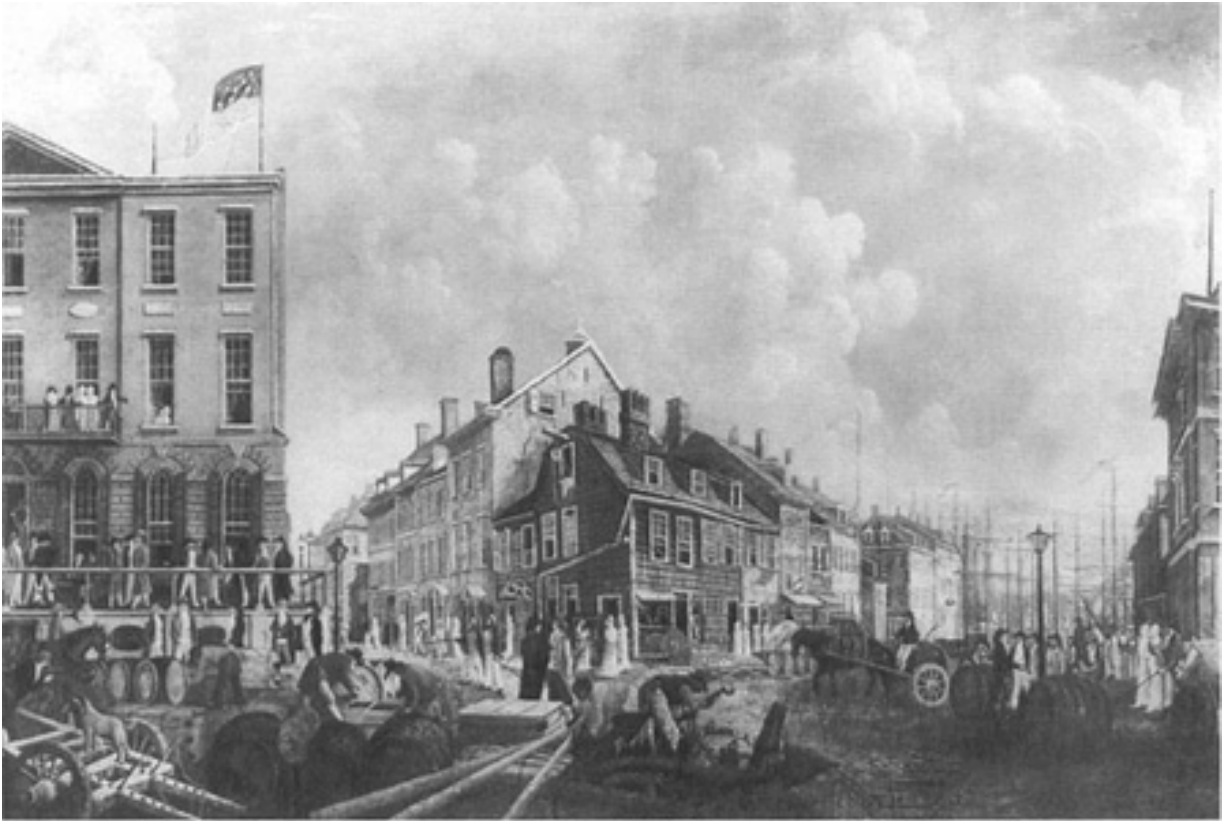

Like Hamilton, New York's “moneyed men” came out of the Panic of 1792 eager to draw the line between honest investment and knavish speculation. When trading in public stocks began two or three years earlier, the market was dominated by auctioneers who knocked down consignments of government paper to the highest bidder like any other commodity (and often, indeed, side by side with other commodities). Two of the most active, Leonard Bleecker and John Pintard, formed a partnership in July 1791 and held auctions in the Long Room of the Merchants' Coffee House, three times a week at one P.M. and three times a week at seven P.M. Although these events were open to the general public, the great majority of stock

purchases appear to have been made either by wealthy “dealers,” also known as “jobbers,” who bought and sold on their own accounts (often, like Duer, using borrowed money), or by “brokers,” who acted on behalf of specific customers. Between auctions, dealers and brokers would meet outside to trade stock among themselves. During the summer of 1791 they gathered under a buttonwood (sycamore) tree on Wall Street.

That September, as the volume of sales increased and bank stocks joined public stocks on the market, the city’s auctioneers, dealers, and brokers drew up the first set of rules governing the sale of securities. Five months later, in February 1792, the auctioneers opened a Stock Exchange Office in “a large convenient room for the accommodation of the dealers in stock” at 22 Wall Street. Then, in March, Duer failed and the market collapsed.

In the ensuing panic, the auction system came under heavy criticism for having been too easily manipulated by unscrupulous auctioneers and dealers who rigged prices and circulated false rumors. At the end of March, hoping to restore confidence in the market, a number of dealers and brokers met at Corre’s Hotel and signed a promise to boycott future auctions and find “a proper room” in which to do business; several weeks later, the legislature flatly outlawed the auctioning of federal or state securities.

On May 17, 1792, twenty-four brokers and dealers drew up the so-called Buttonwood Agreement, which laid the foundations for a structured securities market without the now discredited auctions. The signers agreed to a fixed minimum commission rate, and they promised “that we will give a preference to each other in our Negotiations.” Early in 1793 the brokers and dealers moved into an upstairs room of the elegant new Tontine Coffee House, situated on the northwest corner of Wall and Water streets. Wags dubbed it “Scrip Castle.” (The Wall Street “curb market” didn’t disappear, however: in warm weather, stock traders continued for many years to assemble on the pavement outside.)

The Tontine Coffee House, by Francis Guy, c. 1820. The Coffee House was the large building on the left, occupying the northwest corner of Wall and Water streets. Note the merchants and traders gathered on its balcony, as well as the presence of women in the street below—a reminder that private residences were still common in this part of town. (© Collection of The New-York Historical Society)

Construction of the Tontine Coffee House symbolized the fear of disorderly capital markets that became a recurring feature of the city's economic life. It was also an early indication that the Panic of 1792 wouldn't, as some had feared, cause prolonged harm to the city's economy. By the following June a local paper could declare that rumors of New York's problems "have been very exaggerated and falsified. . . . Credit is again revived—and prosperity once more approaches in sight. . . . Trade of every kind begins to be carried on with spirit and success." Events unfolding in France would accelerate the recovery and thrust New York further ahead of its rivals than anyone could have imagined.

Revolutions Foreign and Domestic

The summer and fall of 1789 found New York agog with the news of revolution in France. Parisian rioters sack the Bastille! The National Assembly issues a Declaration of Rights! The nobility surrenders feudal privileges! For many residents, this was the death knell of despotism and the dawn of the republican millennium. Manhattan crowds hailed “the Friends of revolution throughout the world,” and French liberty caps enjoyed a sudden vogue. The new Uranian Society, founded by thirty recent Columbia graduates to debate current events, resolved that the French Revolution was a blessing to mankind. Even Alexander Hamilton was caught up in the excitement. “As a friend to mankind and to liberty I rejoice in the efforts which you are making,” he confided to Lafayette.

By the autumn of 1792 the situation had grown more complicated. Prussian and Austrian forces had invaded France; fighting had broken out in the streets of Paris; Louis XVI had been arrested; a new National Convention had abolished the monarchy and proclaimed France a republic. The winter of 1792-93 brought still more astonishing intelligence: the Prussians and Austrians had been repulsed; Louis had been guillotined for treason; France had declared war on Great Britain, Spain, and Holland. In the summer of 1793 word came that Maximilian Robespierre’s radical Jacobins were preparing a campaign of terror against all enemies of the Revolution.

These distant events were made startlingly immediate by the arrival in New York of a stream of political refugees or *émigrés*—Bourbon absolutists, constitutional monarchists, and republicans, among them such literary and political luminaries as Charles Maurice de Talleyrand, the due de La Rochefoucauld-Liancourt, Victor-Marie du Pont de Nemours, Chateaubriand, Volney, and Prince Louis Philippe, the future monarch. “The City is so full of French,” observed the English traveler William Strickland in 1794, “that they appear to constitute a considerable part of the population.” A *French and American Gazette* was founded in 1795 as a bilingual paper; the following year it became the purely French *Gazette Française*.

The ferment of revolution was at work nearer home too, in the French colony of Saint-Domingue (modern Haiti). Inspired by appeals for liberty, equality, and fraternity and by the April 1792 decree abolishing slavery, Saint-Domingue's 450,000 blacks rose against their masters. Troops sent from France to restore order were routed by insurgents under the command of Toussaint Louverture. By the end of 1793, 90 percent of the colony's forty thousand whites, royalists as well as republicans, had fled to the United States. All told, four or five thousand people, creole planters and black servants alike, debarked in New York City.

Like the French, the exotic Domingans were a conspicuous addition to the population. John F. Watson, an early nineteenth-century antiquarian, remembered well how their appearance caused frissons of excitement among townsfolk who thought they had seen everything: "Mestizo ladies, with complexions of the palest marble, jet black hair, and eyes of the gazelle, with persons of exquisite symmetry, were to be seen escorted along the pavements by white French gentlemen, both dressed in the richest materials of West India cut and fashion; also coal black negresses in flowing white dresses, and turbans of 'muchoir do madras,' exhibiting their ivory dominos, in social walk with white, or mixed Creoles." Altogether, Watson recalled, they formed "a lively contrast with our native Americans, and the emigres from old France, most of whom still kept to the stately old Bourbon style of dress and manner; wearing the head full powdered a la Louis, golden headed cane, silver-set buckles, and cocked hat."

Maintaining such appearances wasn't easy, even for the most eminent *émigrés*. Many found work as dancing masters, fencing masters, milliners, musicians, gunsmiths, jewelers, weavers, furniture makers, watchmakers, booksellers, printers, and the like. Anthelme Brillat-Savarin, the future gastronome, played in theater orchestras, taught French, and, at Little's Tavern, gave the proprietor instruction in how to prepare partridges *en papillate* and other delicacies. Other *émigrés* earned their livelihoods as laborers, dockworkers, hod carriers, or draymen. The widow and children of John Berard du Pithon, once a wealthy Domingan planter, were supported by their slave, Pierre Toussaint, a successful hairdresser—so successful that he eventually became the city's most celebrated coiffeur and a trusted confidant of powerful society matrons.

WARS AND RUMORS OF WARS

President Washington's cabinet was sharply divided on the issue of how the United States should act toward the belligerents in Europe. Jefferson favored recognition of the French republic, strict compliance with the 1778 Franco-American treaty, and prompt accreditation of the new French ambassador, Edmond Genêt. Hamilton, now concerned that the revolution in France had gone too far, advised withholding diplomatic recognition, suspending the treaty, and ignoring Genêt. A second war with Great Britain, he argued, would ruin his program for national growth and development. President Washington tried to steer a middle course. At the end of April 1793 he issued a Neutrality Proclamation, declaring that while the United States government would abide by the treaty and receive Genêt, it wouldn't take sides in the conflict. American citizens were advised to act in a "friendly and impartial" manner toward all the warring powers. Three months later Jefferson submitted his resignation.

New York's merchants applauded neutrality. The city had only just rebounded from the 1792 panic, and the local economy remained dependent on Great Britain. Not only did virtually all foreign manufactured goods come from the British Isles, but many New York importers continued to function on British capital and credit as well. Furthermore, although the export business was gradually diversifying as city traders sought new markets in China and elsewhere, there was still hope on the docks of fully restoring trade with the British West Indies. If war with France, a sister republic, was almost unthinkable, war with Great Britain might well sink the city's economy.

European war might nevertheless do wonders for business—assuming the United States could remain neutral and trade with all the warring parties. As early as May 1793 the highly regarded mercantile firm Lynch and Stoughton noted that demand on the Continent for American produce was growing fast and should realize handsome profits. The future looked even better after France opened its West Indian colonies to American commerce. Staple exports to the Caribbean soared during the summer of 1793, along with the earnings of more than a few city merchants.

But neither Britain nor France accepted American neutrality for long. Britain said it sustained French colonial trade; France claimed that it reneged on the 1778 alliance and perforce aided the British. Each proceeded by turns to punish the United States for its impartiality, and for the better

part of the next decade, New Yorkers contended with a succession of diplomatic crises, international incidents, and threats of war.

First to strike were the British. In the summer of 1793 His Majesty's government began a massive deployment of naval power to enforce a blockade of France and French colonial possessions. Neutral commerce with the French West Indies was banned under the so-called Rule of 1756, according to which trade with enemy colonies prohibited in time of peace couldn't be legalized in time of war. This was a direct blow at the United States, whose vessels dominated the carrying trade throughout the Caribbean. Hundreds of American ships, dozens of them from New York, were seized and confiscated by the British over the winter and spring of 1793-94. Numerous American seamen, among them many New Yorkers, were impressed into the Royal Navy or imprisoned in West Indian jails. Lurid stories circulated that the British, who continued to occupy five forts on New York territory in violation of the 1783 peace treaty, were urging the Iroquois to attack frontier settlements.

It was an uprising by some home-grown Manhattan "Indians," however, that almost put an end to Washington's neutrality policy.

REPUBLICAN SPIRITS

On October 12, 1792, several hundred New Yorkers in war paint, bucktails, and feathers had gathered solemnly around a fourteen-foot obelisk dedicated to the memory of Christopher Columbus. "Transparent devices" on each face of the obelisk depicted key events in the career of that "nautical hero and astonishing navigator"—Columbus receiving a compass from Science, Columbus wading ashore in America, Columbus at the end of his life, neglected by all but the "Genius of Liberty." Many of those present would have recalled the figure of Columbus that led the Grand Federal Procession of 1788, but this ceremony—marking the three hundredth anniversary of his initial landfall—was the new nation's first proper Columbus Day celebration. It was also one of the first public events staged by a new organization in town, the St. Tammany Society, or Columbian Order.

Twenty years earlier, back in the tumultuous 1770s, Philadelphia patriots had celebrated a St. Tammany Day in honor of the mythical chief

Tamamend, whom the Delawares credited with carving out Niagara Falls and other heroic feats. After Independence, Tammany Societies arose in many parts of the country as vehicles for the expression of popular patriotism and republicanism; often they represented hostility to the Society of the Cincinnati, an elitist organization of former Continental Army officers. A Tammany Society had appeared in New York in 1786 or 1787 but languished until 1789, when the merchant John Pintard and a onetime Tory upholsterer named William Mooney took it over, charging it with a new sense of purpose.

One of his principal goals, Pintard told Thomas Jefferson, was to “collect and preserve whatever relates to our country in art or nature, as well as every material which may serve to perpetuate the Memorial of national events and history.” Two years later, in 1791, the society’s American Museum opened in an upper room of City Hall; when those quarters proved inadequate, the museum moved to the Merchants’ Exchange on Broad Street. Contrary to Pintard’s expectations, though, its holdings consisted mostly of stuffed animals and doleful curiosities like the “perfect Horn, between 5 and 6 inches in length, which grew out of a woman’s head in this city.” In 1795 the society washed its hands of the whole thing.

More fruitful was Pintard’s wish to put the society on a “strong republican basis” and to endow it with “democratic principles” that would help check the resurgence of New York’s “aristocracy” (a curious ambition given Pintard’s association with William “King of the Alley” Duer). Any citizen able to pay a small initiation fee and modest dues could join, and by the mid-nineties some five hundred residents of the city had done so. Some Tammany members were youthful lawyers and merchants, but most were “artisans” or “mechanics” (masters and journeymen in the skilled trades, as distinct from apprentices, cartmen, sailors, and laborers).

At first Tammany stuck to displaying its republican zeal via comic-opera appropriations of Native American nomenclature and ritual. Rank-and-file members, called “braves,” were assigned to “tribes.” They elected a board of directors or “sachems,” who in turn picked the society’s “grand sachem” (a position Mooney held for many years), and once a month they all congregated in their headquarters or “Wigwam” for an evening of eating, drinking, singing, storytelling, and debates on issues of current interest. The

braves' choicest moments were a handful of holidays—Washington's Birthday, Independence Day, Columbus Day, Evacuation Day, and the society's own Anniversary Day (May 12)—when they paraded through town in full Indian regalia, cheered patriotic orations, then sat down for mammoth open-air banquets along the East River. By the mid-1790s their Anniversary Day spree was widely considered the premier public event in the city.

Under the spur of revolutionary events abroad, however, Tammany became increasingly involved in local politics. New York's laboring population was showing signs of restlessness with Hamilton and the Federalists. The General Society of Mechanics and Tradesmen, irate because it had failed to pry a charter of incorporation out of the legislature, had run its own ticket in the 1791 elections, four of its nominees capturing seats in the Assembly. Artisans grew even more disaffected—and drew closer to the rival Clintonians—during the national furor over the Federalist financial program. Though Hamilton's handiwork remained more popular in New York than elsewhere in the country, its less savory consequences—rampant speculation in public stocks, followed by the unnerving Panic of 1792—raised troubling questions about privilege, greed, corruption, and other antirepublican tendencies in Washington's administration. The General Society, increasingly vocal on this point, warned city residents against an “overgrown monied importance” and “the baneful growth of aristocratic weeds among us.” Philip Freneau, poet-editor of the antiadministration *Daily Advertiser*, complained in verse that “some have grown prodigious fat / And some prodigious lean!”

This was one of the last occasions on which the braves and sachems appeared in their original Indian costumes. (© Collection of The New-York Historical Society)

Governor George Clinton, joined by the disaffected Livingston clan, had meanwhile opened lines of communication with Madison and Jefferson. The two Virginians came up for a tour of the state in 1791, saying they intended only to “botanize.” Yet there was enough political talk thrown in along the way to justify the later belief that their trip founded the Virginia-New York axis of a new national opposition party.

The 1792 gubernatorial elections confirmed that the Federalist chokehold on New York was weakening. Clinton survived a tough contest with John Jay to capture his sixth three-year term, drawing 603 votes in the city to Jay's 739—a substantial broadening of support for the governor, who had received only a hundred or so votes in the city as an Antifederalist candidate for the Poughkeepsie convention.

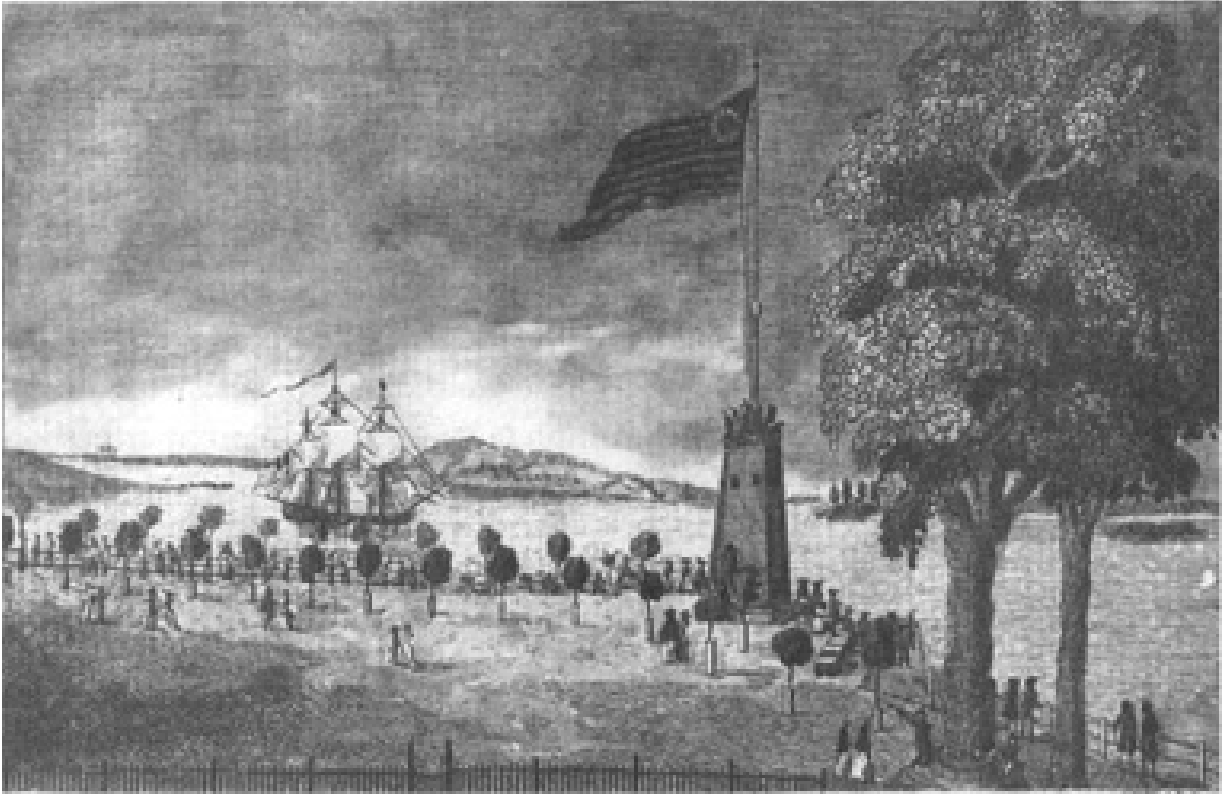

The spirit of opposition ripened during 1793 as the tempo of the French Revolution quickened. Mechanics, laborers, and some smaller merchants began to believe that international republicanism was in mortal danger—here from the machinations of Tory-loving “moneyed-men” like Hamilton and Duer, there from the armies of reactionary despots, and on both sides of the Atlantic from the malevolent influence of British agents, British arms, and British gold. Did not American neutrality at such a moment smack of political heresy and betrayal?

New York Federalists, on the other hand, shocked by the execution of Louis XVI and the rise of the radical Jacobins, concluded that the revolution had gone off the rails. The upheaval in France was being “conducted with so much barbarity & ignorance,” said Rufus King, that sensible people could no longer countenance it. American neutrality was more imperative than ever, Federalists argued, and the Chamber of Commerce, a Federalist stronghold garrisoned by the city's principal merchants, reiterated that American involvement in the war would mean economic disaster.

While remaining officially nonpartisan, the Tammany Society began to mobilize popular support for the French Republic. Tammany braves and their friends greeted every scrap of good news from France with noisy parades and raucous banquets. After its Anniversary Day festivities in May 1793, four hundred participants trained through the streets in red liberty caps. When the French warship *L'Embuscade* (Ambush) docked in New York in June, Tammany men led a tumultuous throng down to Peck Slip, where they showered the arriving officers and crew with tricolor cockades and chorus after chorus of “La Marseillaise,” the Revolutionary anthem. In July, Tammany turned the “Glorious Fourth” into a celebration of international revolution, a day-long carnival of parades, fireworks, bell ringing, singing, guzzling, stuffing, sermonizing, and speechifying.

Later that same month, a British frigate, the *Boston*, hove into port. Her crew fell to brawling with the crew of *L'Embuscade* and the pro-French regulars of waterfront grogshops. At one point, a large party of French sailors and sympathetic residents marched down to Bowling Green, where they dug up and demolished fragments of the statue of George III torn down some seventeen years earlier. The captain of the *Boston* then challenged his French counterpart to a naval duel. On August 1 both ships dropped down to positions off Sandy Hook, trailed by nine boatloads of excited spectators from the city. To their immense satisfaction, *L'Embuscade* claimed the victory after a fierce two-hour exchange of cannon fire and was escorted back to Manhattan by the French fleet, fifteen ships of the line that miraculously sailed into view just as the smoke was clearing. Thousands of cheering residents converged on the Battery to greet the French. Women collected old linen to make bandages for injured French sailors, and in an emotional ceremony, *L'Embuscade's* colors were presented to the Tammany Society as a token of republican fraternalism.

Republican fraternalism had its limits, though. Only days later, Edmond Genet, the French ambassador, arrived on the scene, cockily predicting that New York would give him a hero's welcome. "The whole city will fall before me!" he crowed. The problem was that "Citizen" Genet had repeatedly thumbed his nose at Washington's Proclamation of Neutrality by commissioning American privateers to prey on British and Spanish commerce in the West Indies. This undiplomatic behavior caused a furor around the country, and the cabinet had just voted to ask the French government to bring him home; even Secretary of State Jefferson admitted that Genet had become a political liability. His reception in the city was thus chillier than he had bargained on. White Matlack of the General Society of Mechanics and Tradesmen escorted him to a banquet at the Tontine Coffee House, and over the next few months he dined with various opposition leaders—mostly, it was said, because he had tens of thousands of dollars to spend on refitting the French fleet. (Recalled by the Jacobin regime in early 1794, Genêt applied for asylum, took an oath of allegiance to the United States, and retired to a farm near Jamaica on Long Island. He later married Governor Clinton's daughter, Cornelia, and settled down to dabble unsuccessfully in business and tinker with steam-propelled balloons and other mechanical gadgets.)

The French warship *L'Embuscade* off the Battery in 1798, drawn by John Drayton. Washington Irving said the flagstaff on the right looked like a giant butter chum, and the “churn” was a local landmark for years. (I. N. Phelps Stokes Collection. Miriam and Ira D. Wallach Division of Art, Prints and Photographs. The New York Public Library. Astor, Lenox and Tilden Foundations)

THE DEMOCRATIC-REPUBLICANS

Genêt notwithstanding, the French Revolution still commanded a broad following in New York. In mid-January 1794 boisterous celebrations erupted again over reports (subsequently proved false) that the French had captured the Duke of York. The “lower class of citizens,” Peter Livingston noted with satisfaction, still loved the French so much that they were “almost to a Man . . . Frenchmen.”

Consistent with Livingston’s judgment was the success of a new organization, the Democratic Society. One of forty similarly named groups around the United States—at least some of which seem to have been

founded with Genet's assistance—the New York Democratic Society made its debut in early February 1794, vowing “to support and perpetuate the EQUAL RIGHTS OF MAN.” Its leaders were a cross-section of “old Whigs” and Clintonian “new men” like Commodore James Nicholson (the president), David Gelston, Henry Rutgers, Melancton Smith, and two young lawyers of whom much would be heard in the very near future, Tunis Wortman and William Keteltas. Rank-and-file members, somewhere between one and two hundred strong, included master craftsmen, apprentices, and laborers, among them many recent Scottish and Irish immigrants (Donald Fraser, president of the Caledonian Society, was another of the Democratic Society's founders).

Resolutely pro-French, the Democratic Society clamored for war with Britain. Throughout the spring and summer of 1794 New York churned with rallies, demonstrations, and marches. When French forces recaptured Toulon, the Democratic Society organized eight hundred working people to parade through town in liberty caps, arm-in-arm with French officers, as thousands of cheering onlookers lined the sidewalks. At Corre's Tavern the celebrants downed toasts to the armies and fleets of France (nine cheers) and to the destruction of Britain's “venal and corrupt” government (nine cheers). That evening, republicans and Frenchmen gathered at the Tontine Coffee House to sing the “Marseillaise” and dance the carmagnole. The Tammany Museum exhibited a guillotine, complete “with a wax figure perfectly representing a man beheaded!”

New York's Federalists were horrified, all the more so when residents of the city, anticipating a British attack, decided to build fortifications on Governors Island. Every morning for nearly a month, drums beating and banners flying, shipwrights, cordwainers, journeymen, tallow chandlers, sailmakers, and Columbia College students trooped down to the Battery, where boats waited to carry them over to the island. “To-day,” wrote an amazed English visitor, “the whole trade of carpenters and joiners; yesterday, the body of masons; before this, the grocers, school-masters, coopers, and barbers.” Never, however, was the demise of the merchant-mechanic alliance more apparent than at the city polling places, where a fledgling “Democratic-Republican party”—a confederation of Clintonians, Livingstons, and popular societies—whittled down big Federalist majorities

with organization, discipline, and conscious appeals to the interests and sentiments of workingmen.

New York's Democratic-Republicans didn't invent their electioneering practices out of whole cloth. The genealogy of such tactics reached back through the ratification struggle of 1787-88 to the pre-Revolutionary committees, perhaps as far back as the Morrisite "party of the people" in the 1730s or even the Leislerian movement in the 1690s. Nor had political parties or "factions" suddenly acquired legitimacy: their presence continued to be widely regarded as *prima facie* evidence of corruption and conspiracy. But in the furious press of events, actions ran far ahead of ideas. Federalist foreign and domestic policies had united disparate opposition forces and prompted them to seek power, in concert, by means not yet considered entirely right or proper. Unlike any of their predecessors, moreover, the Democratic-Republicans of New York had already begun to establish close working relations with similar parties emerging in Virginia, Pennsylvania, and elsewhere around the country—not yet a national party in the modern sense, but close.

In the spring 1794 legislative elections, thanks in great part to exertions by the Democratic Society, the Democratic-Republican ticket ran extremely well among small masters, tradesmen, mechanics, and apprentices, especially in the city's poorer wards. It wasn't enough to win, but it set the stage for the December congressional elections, in which Edward "Beau Ned" Livingston challenged the Federalist incumbent John Watts for the privilege of representing New York City. This was a race, said one excited Democratic-Republican, between "friends and enemies to the French or the swinish multitude and the better sort" (on the theory that Beau Ned, despite his wealth and connections, was really a man of the people).

Livingston defeated Watts by a margin of eighteen hundred to sixteen hundred—an upset that not only gave local Democratic-Republicans a voice in Congress but demonstrated the party's increasing strength among the city's middling and lower classes. Beau Ned did exceptionally well, it was noted, in the uptown wards that were home to the same working people who had so recently trooped out to work on the Governors Island fortifications. Once again, it was the Democratic Society that got them to the polls.

BROKEN HEADS

In an effort to avoid another conflict with the former mother country, President Washington dispatched Chief Justice John Jay to Britain to negotiate. It wasn't a popular mission in Jay's hometown. When he left for England in May 1794, only a couple of hundred well-wishers came to see him off. The militia, many of whose members belonged to the Democratic society, flatly refused to parade. As Jay's ship weighed anchor, Governor Clinton, Chancellor Livingston, and the French consul stood together on the deck of a nearby French man-of-war, loudly singing French revolutionary anthems.

Democratic-Republicans worried because Jay, like other New York Federalists of his class, was an acknowledged Anglophile. Indeed, when Jay arrived in England and found his counterparts in a conciliatory mood, he quickly came to terms. By November 1794 Britain had agreed to evacuate the frontier forts, open British ports in the West Indies to American vessels, and submit disputed pre-Revolutionary debts to joint commissions.

But the United States paid a stiff price for these concessions. Jay tacitly abandoned the principle of freedom of the seas. He consented to give Britain most-favored-nation status in its trade with the United States. He promised that foreign (i.e., French) privateers would not be allowed to operate out of United States ports. He accepted a commercial accord in which American ships not exceeding seventy tons burden would be allowed to enter the British West Indies—providing the United States renounced the international carrying trade in cotton, sugar, and molasses. On the impressment of American seamen and compensation for slaves carried off during the war—two issues that had poisoned Anglo-American relations for years—Jay's treaty said nothing.

In the uproar that followed, Jay and his party were very nearly destroyed. While still in England, and before his treaty's terms were made known, Jay had been elected governor after George Clinton declined to stand for a seventh term. Soon after Jay returned at the end of May 1795, the U.S. Senate, after weeks of intense secret debate, narrowly ratified the treaty, except for the article limiting American trade with the West Indies. By July 1, when Jay was sworn in as governor, critics had begun a furious campaign in New York and elsewhere to dissuade President Washington from signing

the pact. This opposition was bolstered by a new British crackdown on neutral vessels carrying provisions to France. Twenty-seven ships owned by New Yorkers were seized in the course of the summer, more even than in the 1793-94 crisis.

It was in this context that, in mid-July 1795, New York's Democratic-Republicans scheduled a Saturday noon "Town Meeting" to express their "detestation" of the Jay Treaty. "Our demagogues always fix their meetings at the hour of twelve," scowled one Federalist, "in order to take in all the Mechanics & Labourers—over whom they alone have influence and who in public meetings have a great advantage as they are not afraid of a black eye or broken head."

It was by all reports the greatest such assemblage in twenty years and reminded everyone of the tumultuous popular rallies of the 1770s—except, that is, for the French tricolor flying alongside the American flag on the balcony of City Hall and the presence of numerous radical *emigres* and political fugitives from Ireland and Scotland, overwhelmingly sympathetic to the Democratic-Republicans. Grant Thorburn, an immigrant Scottish artisan whose earlier radical sympathies had by this time cooled, recalled what to him were the most frightening and disreputable elements of the crowd: "The Irish (patriot) laborer, his face powdered with lime, shirt sleeves torn or rolled up to his shoulders, came rattling up with his iron shod brogues; and the clam-men were there; and the boat-men were there; and the oyster-men were there; and the ash-men were there; and the cart-men were there."

Alexander Hamilton was there too, surrounded by a small contingent of Federalists, who "looked on the multitude like affectionate parents beholding with sorrow the frantic tricks of their erring children." Hamilton began to speak, Thorburn said, and although "his clear, full voice sounded like music over the heads of the rabble," he was shouted down and pelted with stones. A large body of demonstrators, led by Peter R. Livingston, newly elected grand sachem of the Tammany Society, then marched off to Bowling Green, where they burned a copy of the treaty.

Later that day a group of Revolutionary War veterans paraded with French and American flags and burned a picture of Jay "holding a balance containing American independence and British gold, the latter predominating." Hamilton, still full of fight, quarreled on the street with

Commodore James Nicholson, head of the Democratic Society and honorary captain of the Federal Ship *Hamilton* in 1788. Nicholson accused his former ally of being “an abetter of Tories” and used “other harsh expressions.” Hamilton promptly challenged Nicholson to a duel, and Nicholson accepted. Moments later Hamilton had a second confrontation with prominent opponents of the treaty, shouting that he would “fight the whole party one by one . . . the whole detestable faction.” The former secretary of the treasury had become a mere “street Bully,” sneered Beau Ned Livingston.

The following Monday saw another and bigger crowd, perhaps as many as seven thousand people, return to City Hall and adopt a package of resolutions denouncing the Jay Treaty. As for Hamilton and Nicholson, their seconds worked out a face-saving settlement. Hamilton had nonetheless become so worried about the safety of his friends and himself in New York that he asked the federal government to station troops on Governors Island—a striking reversal of fortune for the man who eight years earlier had been the hero of New York’s working people.

Washington assented to the treaty in August, but despite his tremendous prestige, it continued to create controversy. In the city’s volatile, superheated atmosphere it became more and more difficult for organizations like the Tammany Society to maintain even an official political neutrality. Over the winter of 1794—95 Tammany Federalists pressed the membership to endorse President Washington’s criticism of “self-created” societies in the United States—above all the Democratic Societies, which Washington held responsible for the recent Whiskey Insurrection in Pennsylvania. When Tammany Democratic-Republicans, many of whom belonged to the New York Democratic Society, refused, the Federalists pulled out en masse. By spring Tammany allied itself openly with the new Democratic-Republican party, which now began to use “Tammanial Hall”—the Long Room of Abraham (Bram) Martling’s Tavern on Chatham Street (now Park Row)—as a kind of campaign headquarters on election day.

“Gallomania” also gripped the Democratic-Republican wing of fashionable society. Ladies and gentlemen with advanced principles as well as advanced means acquired a taste for French expressions, French food, French waltzes, French opera, French books, and French mattresses. Fancy boardinghouses became *pensions françaises*; upscale taverns became

“restaurants” and began serving dinner at three in the afternoon, in the French manner, instead of noon. Well-to-do Democratic-Republican wives adopted low-cut gowns and gauzed coifs *a lafranfaise*, spurning the buckram and brocades still favored by Federalist matrons. Similarly, their husbands rejected powdered wigs, knee britches, and shoe buckles as insignia of the *ancien regime*. Instead, they wore their hair in the radical “Brutus Crop”—brushed forward from the crown—and affected the bloused shirts, linen cravats, and baggy pantaloons that were the uniform of continental revolutionaries.

But this was 1795 not 1775; New York, not Paris. Despite the liberty caps, choruses of “La Marseillaise,” and take-no-prisoners rhetoric, neither the Democratic-Republican party nor the popular societies allied with it were in a revolutionary frame of mind. They were rising enterprisers, successful craftsmen, aspiring journeymen, and respectable mechanics, not a mass of propertyless proletarian levelers. They demanded equality of opportunity and participation, not equality of condition. Their class-consciousness (if that is the word for it) admitted distinctions only between the productive and nonproductive classes of society—between those who came by their money through hard and honest labor, and those, like parasitic bankers, speculators, stockjobbers, and idle landlords, who relied on privilege and politics, money and monopoly to gain their position.

For all its limits, on the other hand, this artisanal republicanism was infused with egalitarian, democratic aspirations scarcely imagined a decade or two earlier. Over the next decade, indeed, it would bring about fundamental changes in the political system of the city.

“AS GOOD AS ANY BUGGERS”

One day in mid-November 1795 Gabriel Furman, a well-to-do merchant and prominent alderman, set out to return from Brooklyn to Manhattan via the ferry that docked at the foot of Fulton Street. Furman ordered the ferrymen, Thomas Burk and Timothy Crady, both recent arrivals from Ireland, to leave ahead of schedule. They refused. An argument ensued, Furman yelling that he would have “the rascals” thrown in jail, Crady yelling back that he and Burk “were as good as any buggers” and would use their boat hooks on anyone who tried to arrest them. As soon as the ferry

got across to Manhattan, Furman summoned a constable and had the two marched off to the Bridewell while he thrashed them with his cane.

After twelve days behind bars, Burk and Crady came up for trial before the Court of General Sessions on charges of insulting an alderman and threatening the life of the constable. Neither man was allowed legal counsel; there was no jury; Furman was the only witness; and the presiding judge, Mayor Richard Varick, was clearly out to make an example of them. “We’ll learn you to insult men in office!” he shouted. The court found Burk and Crady guilty on both counts and sentenced them to two months at hard labor. For extra measure, Crady also received twenty-five lashes on his bare back.

The case took a new turn some weeks later when Burk and Crady broke out of jail and escaped to Pennsylvania. Writing as “One of the People,” lawyer William Keteltas (a youthful newcomer from Poughkeepsie) wrote an account of their ordeals for Thomas Greenleaf *Journal*. Keteltas denounced the court for its “tyranny and partiality.” Burk and Crady had been punished, he said, merely to “gratify the pride, the ambition and insolence of men in office.” The accusation stung, coming at a time when the mayor and aldermen were under fire for turning nine prisoners from the Bridewell over to a British man-of-war as alleged deserters.

The case of the long-gone Irish ferrymen suddenly blossomed into a republican cause célèbre in which upper-class arrogance menaced the dignity of ordinary citizens. “Do we live in a city,” asked one angry newspaper writer, “where the Mayor or an Alderman or two have a right to strip us naked and give us as many lashes as they please at a whipping post for what they may deem an insult to a magistrate?” Keteltas stoked the fires by petitioning the Assembly to impeach Varick and the magistrates for their “illegal and unconstitutional” conduct. In January 1796 the Assembly rejected the petition. Keteltas wrote another article for the *Journal* berating the Assembly for “the most flagrant abuse of [the people’s] rights” since independence. The Assembly in turn censured Keteltas for his “unfounded and slanderous” remarks. Keteltas repeated his attack on the Assembly.

Early in March, in an uncanny reenactment of Alexander McDougall’s experience twenty-five years before, the Assembly summoned Keteltas to explain himself. He showed up with two thousand supporters, admitted authorship of the offending newspaper articles, and refused to apologize

(amid loud “clappings and shoutings”). When the Assembly then sentenced him to jail for “a breach of the privileges” of the house, the crowd hoisted him into a “handsome arm chair” and carried him off to the Bridewell, chanting, “THE SPIRIT OF SEVENTY-SIX! THE SPIRIT OF SEVENTY-SIX” After Keteltas got out a month later on a writ of habeas corpus, another crowd pulled him through the streets in a phaeton decked out with French and American flags, a liberty cap, and a large picture of a man being whipped, above which was the inscription “*What, you rascal, insult your superiors?*”

The Keteltas affair helped siphon away more of the Federalists’ popular constituency. A record four thousand residents of the city went to the polls in the spring 1796 legislative elections, and while the Democratic-Republicans failed to capture any of New York’s twelve Assembly seats, they pulled five hundred votes more than the year before. More important, two-thirds of the Democratic-Republican voters were men of little or no property, many of them the immigrants whose numbers had grown markedly in recent years. Six months later, in the September Common Council elections, two Democratic-Republican candidates, including a leader of the Democratic Society, won by substantial majorities.

New York’s Federalists fumbled the 1796 congressional and presidential elections too. Beau Ned Livingston easily beat back a Federalist attempt to capture New York City’s congressional seat, not only solidifying Democratic-Republican control of the wards “chiefly inhabited by the middling and poorer classes of the people” but mobilizing hundreds of new voters as well.

Washington’s decision not to seek a third term set off a scramble in both parties for acceptable candidates. Democratic-Republicans united around Thomas Jefferson but had trouble agreeing on a vice-presidential nominee. Aaron Burr was the front-runner. Many Democratic-Republicans didn’t trust him, however: too young, too pushy, too devious, they said. Some knew that Burr’s notorious love of fine clothes, luxurious household furnishings, expensive wines, fancy carriages, and big houses was driving him further and further into debt. Characteristically, when he acquired the lease for Richmond Hill, the estate in Greenwich built years before by Abraham Mortier, he borrowed huge sums—from friends, from family, from law clients—to refurbish it in the opulent style with which he wished to be identified; General John Lamb alone signed more than twenty

thousand dollars' worth of Burr's notes, a gesture he came to regret many times over. Burr even dammed Minetta Creek to create a grand ornamental pool by the main gate (approximately the present junction of Spring Street, MacDougal Street, and Sixth Avenue).

The Federalists' problem was their standard-bearer, John Adams. Because Adams had never quite approved of Hamilton's financial program—he once described banking as “downright corruption”—Hamilton and a corps of New York Federalists labored behind the scenes to have a narrow majority of electoral ballots cast for Thomas Pinckney, a former U.S. envoy to the Court of St. James. Adams won anyway, leaving a residue of bitterness that would in time help destroy the party. Worse yet (owing to the fact that electors didn't yet distinguish between presidential and vice-presidential candidates) Jefferson trailed Adams by only three votes and was therefore elected vicepresident. Nationwide, the Democratic-Republicans' organizational sophistication, their mastery of electoral politics, and the mass appeal of their democratic credo had never been more obvious. Locally, their strength was underlined in the 1797 elections, when for the first time Democratic-Republicans won every seat on the city's delegation in the state assembly.

BLACK COCKADES

In 1798 trouble with France abruptly derailed the Democratic-Republican express. A new right-wing government, the Directory, ousted the radical Jacobins and took immediate steps to upset the Anglo-American rapprochement. It embargoed American vessels in French ports, refused to honor bills for goods received from American merchants, and looked the other way while colonial authorities illegally plundered and confiscated American property. Squadrons of French “picaroons,” or privateers, descended on the West Indies over the winter and spring of 1795-96, taking several hundred American prizes and abusing American seamen. In December of 1796 the Directory broke diplomatic relations with the United States. The following March it announced that all neutral ships carrying enemy goods would be liable to seizure and that Americans impressed by the British navy, willingly or not, would be hanged if captured.

John Adams, just inaugurated as Washington's successor, offered to negotiate, but the attempt fell apart when Talleyrand, the Directory's

minister of foreign relations, demanded a bribe from the American delegation. (Talleyrand's contempt for Americans owed much to his experiences as a refugee in New York, where he had been reviled as a libertine and intriguer.) In the wake of this so-called XYZ Affair, Congress enlarged the army and navy, strengthened coastal fortifications, slapped an embargo on American trade with France and French colonies, closed American ports to French vessels, raised taxes, and authorized the arming of privateers.

By 1798 a furious quasi-war raged on the high seas. American losses to Caribbean picaroons rose steadily, and French corsairs ranged as far north as Long Island Sound to prey on American commerce, making it unsafe to sail from New York to Philadelphia without a convoy. Maritime insurance rates in New York ballooned, sometimes reaching as much as 40 percent of the value of a ship and its cargo—too high for many merchants, whose inability to carry on business sent ripples of unemployment through the city's working population. American trade with Great Britain seemed to be in some danger too. The Bank of England had suspended cash payments, two ominous mutinies had shaken the Royal Navy, a rebellion had broken out in Ireland, and the Directory's brilliant young general, Napoleon Bonaparte, was massing an army in preparation for an invasion of England itself.

As national opinion swung heavily against France, the Federalist Chamber of Commerce and the Federalist Common Council appropriated sixty thousand dollars for another frenzy of fortification building in New York. Congressional Federalists, sensing an opportunity to crush the Democratic-Republican opposition, meanwhile rammed through a series of bills, collectively known as the Alien and Sedition Acts, that set new standards for nativist paranoia and political repression. One, the Naturalization Act, aimed to stanch the flow of immigrants into the Democratic-Republican party by changing the residence requirement for full citizenship from five to fourteen years. The Alien Act authorized deportation of aliens suspected of "treasonable or secret" inclinations. Another measure authorized the jailing, for up to two years, of anyone convicted of publishing "false, scandalous and malicious writing" that might bring the U.S. government into disrepute. President Adams signed all this legislation into law and made it known that he was prepared to ask

Congress for an open declaration of hostilities against France at any moment.

New York's Democratic-Republicans were all but swept aside. Four thousand city residents signed a memorial to President Adams, praising his patriotism and firmness. Federalist crowds tore down a liberty cap from the Tontine Coffee House and gathered at night outside the residence of Representative Livingston, cursing Beau Ned as a Jacobin and singing "God Save the King." Companies of eager young men began drilling on the Battery every evening between five and eight o'clock. The black cockade, once a Tory insignia, became fashionable again as a symbol of scorn for the French tricolor. Governor Jay, who had taken a leading role in the building of fortifications, won reelection easily, beating Chancellor Livingston, the Democratic-Republican candidate, by the greatest majority to date in a gubernatorial election.

Galvanized by this sea-change in the public mood, Hamilton dashed off a series of newspaper essays called "The Stand," urging Congress to step up preparations for war, and more or less accusing the Democratic-Republican opposition of cowardice and treason. He soon got a chance to take up sword as well as pen. Washington came out of retirement to head a new fifty-thousand-man Provisional Army and tapped Hamilton for his second in command. Hamilton immediately began preparing a list of "Jacobins" for the army to round up once the shooting started.

Over the next year or so, the demoralized Democratic-Republicans assembled bravely now and then to sing the "Marseillaise." A liberty pole or two went up in westside neighborhoods that remained strongholds of Democratic-Republicanism and "Gallomania." From time to time, too, Democratic-Republicans held their own in street brawls with Federalists (during one melee on the Battery somebody even beat up the president's personal secretary). Every election nonetheless showed the party losing ground at an alarming rate.

Democratic-Republican gloom was lifted somewhat by a spunky young Irish immigrant named John Daly Burk. Expelled from the University of Dublin as a deist and republican, Burk fled to America. He arrived in New York in 1797 and made a modest name for himself with the production of two patriotic, passionately anti-British plays: *Bunker Hill* and *Female Patriotism, or the Death of Joan d'Arc*. In June of the following year,

probably with the help of Aaron Burr, Burk became part owner and editor of a small weekly paper called the *Time Piece* and quickly turned it into one of the hottest, most widely read antiadministration papers in the country. Federalists up and down the continent soon demanded something be done to shut him up. The *Time Piece*, declared Abigail Adams, was a “daring outrage which called for the Arm of Government,” and quotations from Burk’s inflammatory essays helped speed passage of the Sedition Act through Congress.

Burk vigorously defended freedom of the press, winning the admiration of Democratic-Republicans in every state. They admired him all the more when, as head of the New York lodge of the United Irishmen, he repeatedly expressed his hopes for the success of an Irish rebellion against England and for a French invasion of the British Isles. But Burk’s career as a New York journalist proved short-lived. In July 1798, following the appearance of two provocative articles in the *Time Piece*—one intimating that President Adams had falsified a diplomatic communique, the other that Secretary of State Timothy Pickering was a murderer—Burk was arrested on charges of sedition and libel. Federal district judge Robert Troup, Hamilton’s right-hand man in the city, applauded the arrest as an opportunity to find out “whether we have strength enough to cause the constituted authorities to be respected.”

Prominent New York Democratic-Republicans, led by Aaron Burr and Tammany sachem Peter R. Livingston, stood bail for Burk. He promptly went back to hammering the administration and denouncing the charges against him as an attempt to muzzle the press. Disputes among the owners of the *Time Piece* caused them to suspend publication in September 1798, however, and, suspecting that the legal odds were stacked against him, Burk now offered to settle out of court. He would voluntarily leave the country, he said, if the government dismissed the case against him. Adams and Pickering agreed. When Burk boarded a ship for France six months later, British secret agents tried to grab him—or so he charged afterward—at which point “some of the best men in America” persuaded him to go instead to Virginia. He lived there under an assumed name until the expiration of the Alien and Sedition Acts several years later.

New York Federalists had no time to savor their victory over the *Time Piece*. Party moderates, believing there was still room for negotiations with

France, made clear to President Adams that he couldn't get a formal declaration of war through Congress. Adams, for his part, was annoyed that most of his cabinet took their cues from Hamilton, and he came to see the New Yorker's hubristic visions of military and imperial glory as positively dangerous. "That man," he told Abigail, "would in my mind become a second Buonaparty [*sic*] if he was possessed of equal power." Though prowar Federalists fought him bitterly, Adams prevailed, and soon American negotiators were on their way to Paris, where the Directory had developed sober second thoughts about war with the United States. The Irish rebellion fizzled. Admiral Horatio Nelson smashed the French fleet in the Battle of the Nile. In the maritime quasi-war, the scales shifted in favor of the United States as a thousand-odd privateers and three new frigates—the *United States*, the *Constellation*, and the *Constitution*—cleared American coastal waters of enemy vessels. By the end of 1799, if not before, they controlled the Caribbean as well. In November of that year Napoleon overthrew the Directory and communicated his readiness to settle quickly. French and American negotiators came to terms in 1800.

FEDERALISTS IN RETREAT

Having reaped major political benefits from the quasi-war with republican France, New York Federalists contemplated the prospect of peace with something akin to panic. With the spring 1800 elections at hand, Hamilton appealed to the mechanic vote by arranging a legislative ticket that included a ship chandler, a baker, a potter, a mason, a shoemaker, and two grocers. However, deprived of war with France, none of the Federalists did well at the polls. Dr. Samuel Latham Mitchill, a Democratic-Republican Columbia professor, won the city's congressional seat, taking over from Edward Livingston. All thirteen of the city's Assembly seats went to Democratic-Republicans, giving the party a narrow majority in the state legislature. As that body chose the state's federal electors, the sweep guaranteed that New York would back Jefferson's second run for the presidency against Adams later that year.

No one deserved more credit for the victory than Aaron Burr. As head of the General Republican Committee, Burr prepared a roster of all voters in the city and had party workers visit every known Democratic-Republican to round up support and contributions. His house was crowded with

messengers and committeemen and poll watchers who ate while they mapped strategy and napped on the floors rather than go home to sleep. Burr also introduced “fagot voting” into the party’s political repertoire during this campaign, enfranchising scores of working people who failed to meet the property requirement for voters by making them joint owners of a single piece of property. “Fagot” or “bundle” voters made all the difference in several close contests.

Suddenly, everyone in the country knew about Aaron Burr. Democratic-Republicans hailed the New Yorker as a master of the electioneering arts—a political genius who had found the fulcrum upon which the mighty Federalists could be levered from power. Even Federalists were impressed. One asked Burr how the Democrats had won the election. He replied: “We have beat you by superior *Management*.” When the congressional Democratic-Republican caucus nominated Jefferson for the presidency, it selected Burr as his vice-presidential running mate.

Among the Federalists, all was confusion and recrimination. In an extraordinary letter to Governor Jay, Hamilton proposed a maneuver to prevent the state legislature from choosing Democratic-Republican electors. Call a special session of the outgoing legislature, he advised Jay, and have it alter the procedure so as to ensure victory for the Federalists. No matter that everyone would see this as a brazen attempt to thwart the popular will. “In times like these in which we live,” Hamilton wrote, “it will not do to be overscrupulous.” Jay, whose sense of rectitude wasn’t so easily laid aside, refused.

President Adams blamed the loss of New York on Hamilton. That “bastard” New Yorker, he said, had organized a “damned faction” of “British partisans” who would destroy the Federalist party unless checked by moderates such as himself. Hamilton struck back with a pamphlet accusing Adams of “disgusting egotism,” “ungovernable indiscretion,” and “distempered jealousy.” As election day drew near, all semblance of unity among the Federalists vanished in a riot of charges and countercharges. “Wonderful,” declared Jefferson from the sidelines.

By mid-December 1800 all America knew that the Democratic-Republicans had captured the presidency by an electoral college margin of seventy-three to sixty-five, that the outcome in New York had been decisive, and that that outcome rested on the Democratic-Republicans’

ability to mobilize the artisans and laborers of New York City. What was not clear was who the president *was*. As Jefferson and Burr had each received seventy-three votes, the final decision was up to the outgoing House of Representatives, where Federalists would have the decisive role.

Jefferson or Burr? Most congressional Federalists favored Burr, but New York Federalists—notably Hamilton—warned party leaders around the country that Burr was a self-serving, unprincipled rogue and demagogue —“the most unfit and dangerous man of the community.” True, Hamilton said, Jefferson was “a contemptible hypocrite.” The Virginian was nonetheless basically decent, and manifestly the lesser of two evils. The House deadlocked for six days and thirty-five ballots, with talk of civil war growing on all sides, until the lone congressman from Delaware, a Federalist, changed his vote to Jefferson and the thing was done.

On March 4, 1801, rejoicing New York Democratic-Republicans celebrated the inaugurations of President Jefferson and Vice-President Burr. A month later George Clinton dragged himself out of retirement to lead the party in that year’s gubernatorial election. He defeated the aristocratic Stephen Van Rensselaer to win a seventh term; for the first time in his long career, he won a majority among city voters as well.

The Democratic-Republican takeover of the state legislature in 1800 vaulted yet another Clinton to a position of power in New York: the governor’s nephew and political heir apparent, De Witt Clinton. Born in 1769, De Witt was the third son of Mary De Witt and General James Clinton, an Irish-Presbyterian veteran of the Revolutionary War. He graduated from Columbia College in 1786, studied law in the office of Samuel Jones, then served a five-year political apprenticeship as his uncle’s private secretary, during which he was an active Antifederalist and became involved in upstate canal projects and real estate speculation.

In 1796 De Witt married the beautiful Maria Franklin of New York City. She was the daughter of wealthy Quaker merchant Walter Franklin, a founder of the New York City Chamber of Commerce and former owner of the Cherry Street mansion briefly occupied by President Washington. Franklin had died during the Revolution, leaving his daughter a sizable inheritance, including a country estate in Newtown, Queens.

A year after his marriage, Clinton entered politics. His commanding appearance—handsome, heavily framed, and over six feet tall, he would come to be known as the Magnus Apollo—helped him win a seat in the state assembly along with his rival-to-be Aaron Burr. In 1798 Clinton moved up to the state senate. After the Republican sweep of 1800, he was elected one of the four members of the all-powerful Council of Appointment (and its informal leader). Using his command of state patronage, he had former congressman Edward Livingston installed as mayor and rewarded a small army of party regulars with municipal and county jobs.

“POLITICAL EQUALITY AND THE CORPORATION”

Behind Clinton and Burr, the Democratic-Republicans were now ready to attack the last bastion of Federalist power in New York, the Common Council. Federalists had controlled the council more or less continually since the mid-1780s, thanks in large part to ancient constraints on political participation. Under the city charter, voting in elections for the Common Council was restricted to freeholders owning property worth at least twenty pounds (fifty dollars) and to residents of the city admitted as freemen. In 1790, out of sixty-seven hundred adult white males in New York, only eighteen hundred (28 percent) were qualified to vote in municipal elections. Federalists likewise benefited from the old practice of viva voce voting. Voters in charter elections declared their preferences aloud in the presence of election inspectors; the Federalist-controlled council naturally took pains to see that at least two of the three inspectors in each ward favored that party. The candidates were there too, making careful note of who voted for whom. Journeymen, small shopkeepers, carters—men whose livelihoods might well depend on the patronage of big merchants or successful master craftsmen—needed more than a little courage to stand up for what they believed when doing so could cost them their jobs.

The formal case for changing all this was laid out by James Cheetham, an admirer of Tom Paine who fled England in 1798 and became a political journalist. His landmark *Dissertation Concerning Political Equality and the Corporation of New York*, published in 1800, argued with clarity as well as conviction that the city charter violated the Spirit of Seventy-six and broke every precept of republican government. The time had come, Cheetham

announced, for the popular election of mayors, for secret balloting, and for the extension of the suffrage in municipal elections to every resident who could vote in assembly and congressional elections—by 1801, an estimated 62 percent of adult city males compared to the 23 percent currently eligible.

The political stakes were evident. The excluded body of voters embraced small shopkeepers, mechanics, and journeymen who were by this time overwhelmingly Democratic-Republican; if they took part in charter elections, nothing would save the Federalists from defeat. Predictably, the Federalist council refused all appeals to democratize the charter. When Democratic-Republicans turned to the state legislature for help, Federalists objected strenuously to legislative interference with the ancient “rights and privileges of the Freeholders.” One newspaper writer warned less high-mindedly that liberalizing suffrage requirements would hand the municipality over to “*Irishfreemen*.” A reform bill passed the Assembly in March 1803, only to be tabled in the Senate.

Then, in the summer of 1803, an audit of the federal attorney’s office in New York revealed the disappearance of some forty-four thousand dollars. The head of that office was Mayor Edward Livingston. Although his own integrity was not in question, Livingston resigned both posts and moved to New Orleans. In his place the Council of Appointment named De Witt Clinton, who only the year before had been sent to the United States Senate by the state legislature. As Clinton told his uncle George, being mayor was the better job because its influence in presidential elections made it “among the most important positions in the United States” (besides, it was worth as much as fifteen thousand dollars a year).

Clinton’s return to New York helped break the deadlock over democratizing the municipal charter. In April 1804 a compromise reform bill passed both houses of the legislature. While rejecting suffrage for all taxpayers, the bill enfranchised twenty-five-dollar renters and introduced the secret ballot into municipal elections. It also defined “freemen” as all freeholders and rentpayers eligible to vote—to all intents and purposes abolishing freemanship as a privilege distinct from the ownership of property. Cheetham hailed the new law as a “Second Declaration of Independence to the Citizens of New York.” And in that year’s more democratized municipal elections, the Democratic-Republicans added the Common Council to their list of conquests.

Whipped by Jefferson and now evicted from City Hall, many party elders—John Jay, Rufus King, Gouverneur Morris, Richard Varick, Philip Schuyler, Comfort Sands, and others—decided to quit public life altogether until the voters came to their senses. After twenty-five years of struggling to contain the democratic impulses unleashed by the Revolution, they had had enough.

Other, typically younger, Federalists drew the opposite conclusion from defeat. As Hamilton advised the King, do not lose hope that “the people, convinced by experience of their error, will repose a *permanent* confidence in good men.” Elections clearly had their drawbacks, but good men had to go along or they would be doomed to political extinction (a point Hamilton had been making since the early eighties). If they lost this time around, there was no alternative other than to try again the next. Even in New York, after all, Federalists continued to enjoy a strong following in certain trades, and they hadn’t yet fully tapped nativist hostility to the foreign-born, especially Irish, immigrants crowding into the city.

In 1801, accordingly, Hamilton helped establish the *New York Evening Post* as a party organ, with William Coleman as editor. The following year he unveiled his plan for a new, nationwide Federalist organization to be called the Christian Constitutional Society. As he envisioned it, the society would finance the publication of newspapers and pamphlets in every part of the country. It would “promote the election of *fit* men.” It would also encourage—especially in “the populous cities”—the formation of clubs, charities, and schools to uphold the true principles of Christianity and the United States Constitution. Initial reactions to the idea were cool. There is no telling where it might have led, however, for two years later Hamilton was dead.

INTERVIEW IN WEEHAWKEN

Early in 1804 George Clinton, governor of New York for twenty-one of the last twentyseven years, announced his intention not to seek an eighth term (rumor had it that he would replace Burr as Jefferson’s vice-presidential running mate later in the year). The state’s Democratic-Republicans, now divided by mushrooming hostility between proand anti-Burr factions, couldn’t agree on a replacement. The Clinton-Livingston wing put up Chief Justice Morgan Lewis; Burr’s raised their leader’s standard. Jefferson

denounced Burr's candidacy. So did Hamilton, who, reiterating his belief that Burr was a scoundrel, threw his support to Lewis. Burr narrowly carried New York City, but Lewis won by a huge margin statewide.

His political career in shambles, Burr lashed out at the man who had thwarted him ever since their days as young officers on Washington's staff. Soon after the election he wrote to Hamilton demanding an explanation for a certain newspaper report that he, Hamilton, "looked upon Mr. Burr to be a dangerous man, and one who ought not to be trusted with the reins of government." Hamilton let it be known, through an intermediary, that his remarks "turned wholly on political topics, and did not attribute to Col. Burr any instance of dishonorable conduct, nor relate to his private character." Burr nevertheless demanded an "interview" on the field of honor. Hamilton's views on dueling had shifted after his eldest son was killed in a political duel only three years before. To run from Aaron Burr, however, was unthinkable. He accepted the challenge.

Early on the morning of July 11, 1804, Hamilton and Burr, accompanied by their seconds, crossed over to Weehawken, New Jersey, on the west bank of the Hudson opposite the present foot of 42nd Street. Their seconds cleared a proper site near the shore, loaded the pistols, and positioned the two men a mere ten paces apart. At the signal, Burr slowly raised his weapon, aimed, and fired. Hamilton, who had previously declared his intention to let Burr get off the first shot, fell mortally wounded. Burr fled the scene at once. Hamilton's seconds brought him back across the river in a small boat, docking at the foot of what is now Horatio Street in Greenwich Village. He was carried to the nearby home of William Bayard, where he died the next day after what his doctor termed "almost intolerable" suffering.

Hamilton's funeral two days later was a poignant reminder of the political consensus he had once inspired in New York—and had subsequently done so much to destroy. The Democratic-Republican Common Council instructed "all classes of inhabitants" to suspend their usual business and ordered muffled bells to toll from dawn to dusk. At noon a long, somber funeral cortege wound its way through the streets toward Trinity Church. Every social group and civic organization—military officers, students of Columbia College, merchants, attorneys, the Society of Cincinnati, the General Society of Mechanics and Tradesmen, even the

Tammany Society—was represented in the procession, trailed by a mass of “citizens in general.” Warships in the harbor fired their minute guns. Merchant vessels flew their colors at half-mast. Gouverneur Morris delivered a moving funeral oration at Trinity.

While tributes to Hamilton poured in from all over the country, Burr kept out of sight. Two weeks after the duel, facing a murder indictment and fearing his house would be attacked by a mob, he slipped out of town into obloquy everlasting.

Queen of Commerce, Jack of All Trades

American neutrality during the Napoleonic Wars paid off handsomely for New York. Despite persistent losses to belligerent navies and privateers, fifteen or so years of supplying distant combatants transformed the city into the nation's premier port and marketplace.

In war-ravaged Europe, the demand for American products became almost insatiable. As early as 1795 Noah Webster reported that French purchases of meat, flour, leather, and cloth were opening a new era of affluence for the United States. Between 1795 and 1800, as a result of the Jay Treaty, the value of American exports to Great Britain trebled, while the United States emerged as the single most lucrative overseas market for British exports. The West Indies plantation economies, isolated from Europe, also grew more dependent on supplies of grain, meat, and timber from the mainland. West Indian officials coolly ignored attempts by their home governments to restrict neutral commerce and allowed American ships to come and go without interference.

Thanks to the turmoil in Europe, moreover, the United States captured much of the international carrying trade. Sugar from the West Indies, wine from Madeira, cotton and spices from India, manufactures from Europe—all of them and more crisscrossed the oceans in American bottoms by the turn of the century. From 1795 to 1800 American shipments of Caribbean sugar to Europe doubled—over six hundred U.S. ships engaged in trade with Saint-Domingue alone—while American reexports of European goods to Latin America grew by a factor of seven.

The consequences for New York were astounding. Between the early 1790s and 1807, the value of imports through the city rose from \$1.4 million to \$7.6 million. By the later 1790s New York had pulled decisively ahead of Philadelphia as the leading port of entry in the United States. In 1806 alone, the value of New York's imports was almost twice that of Philadelphia's. More striking still was the jump in exports through New York, which went from around \$2.5 million in 1790 to \$26 million in 1806, a tenfold increase. By 1799 the port handled nearly one-third the nation's

overseas trade; almost one-fourth its coasting trade also moved through the East River waterfront.

Little or none of this would have happened had Europe been at peace, or had the United States been dragged into war on one side or the other. But neutrality doesn't explain why New York proved so much more successful than, say, Philadelphia or Boston in responding to heightened foreign demand for American products. How did the city become the principal link between the United States and world markets?

CONNECTIONS

Geography was part of the answer. That New York possessed one of the best harbors in the world—deep, directly accessible to the open sea, and rarely blocked by ice, even in the depths of winter—was an old story. But those assets counted for relatively little until the final decade of the eighteenth century, when merchants began to employ big, deep-draft vessels—brigs, barks, and ships—that could make Philadelphia, one hundred miles from the mouth of Delaware Bay, only on a flood tide. The bottom-line case for New York was simple: larger cargoes could move in and out more rapidly and surely than elsewhere.

This efficiency helped New York reestablish its old commercial partnership with Great Britain. By the early 1790s more ships were leaving Liverpool for New York than for any other American port, and New York had regained its former role as the American terminus of the transatlantic postal “packet” service from Falmouth, providing city merchants with vital mercantile information days, even weeks, ahead of competitors in other seaports. Ratification of the Jay Treaty, followed by the appointment of Rufus King (another pro-British New Yorker) as American ambassador to the Court of St. James, all but sanctified this special neocolonial relationship.

Equally critical was the expansion of New York's continental hinterlands. In the mid-1790s, following Anthony Wayne's victory over the Indians at Fallen Timbers and ratification of the Jay Treaty, tens of thousands of settlers began occupying western territories wrested from the Six Nations of the Iroquois after the Revolution. Most were land-hungry New England Yankees, squeezed off their rocky farmsteads by

overpopulation and declining yields. Up the Mohawk Valley and over the Adirondacks they raced, aiming for the rich country below Lake Ontario, a few even setting their sights as far west as Ohio.

This migration dwarfed anything of its kind in the previous history of the New World. During the winter of 1794-95 alone, some twenty thousand migrants flooded through Albany, and that was only a hint of what lay ahead. All told, between 1790 and 1800 the population of New York State rose from 340,000 to 589,000—the great majority of the increase attributable to the rapid occupation of the frontier. By 1810 the state had 959,000 inhabitants, nearly three times as many as when Washington was first inaugurated.

From this vast region's burgeoning towns and villages—Buffalo, Rochester, Syracuse, Elmira, Ithaca—an ever-widening stream of farm produce cascaded down toward the Atlantic seaboard, where New York merchants hustled it out along well-traveled sea routes to markets in the West Indies and Europe. So relentless was the pressure for improved transportation between the coast and the interior that in the first two decades of the nineteenth century, the legislature granted charters of incorporation to hundreds of bridge and turnpike companies; as early as 1808 New Yorkers had already invested more money in road company stock than had the residents of any other state. The legislature also handed out exclusive franchises for stagecoach service that markedly improved the city's connections with Albany, Boston, and Philadelphia. In 1792, moreover, the state subsidized two private canal companies, one to link the Hudson with Lake Champlain, the other to connect the Hudson with Lake Ontario. Both did much to facilitate trade and communication, further helping the city establish dominion over an agricultural hinterland that stretched, at its fullest extent, from the upper Connecticut River Valley to the shores of Lake Erie, encompassing sizable portions of northern and western Pennsylvania as well.

For wealthy and well-connected residents of New York City, the rapid settlement of the state's northern and western territories brought additional rewards from land speculation and development. In 1791 state commissioners, chaired by Governor Clinton, auctioned off 5.5 million acres of Iroquois land for better than a million dollars. Syndicates of city investors grabbed most of it, some purchases dwarfing the grants made by

Fletcher and Cornbury a century earlier. Alexander Macomb got his hands on a princely 3.6 million acres; Melancton Smith, Marinus Willett, James Clinton, Jonathan Lawrence, James Kent, and many others came away with thousands of acres apiece.

At almost the same time, New York merchants were gaining control of another agricultural hinterland, this one in the American South. Here the story hinged on cotton rather than foodstuffs. The world's chief markets for raw cotton were Manchester and other great British textile manufacturing centers, where the production of muslin and broadcloth continued to drive the industrial revolution. Prior to 1790 North America had supplied relatively little of Britain's voracious demand for cotton, in part because the time-consuming work of removing seeds from the lint made it commercially less attractive than other cash crops. Only scattered shipments passed through New York in the 1780s and early 1790s, city merchants shunning it as a "dull article."

Then, in 1792 or 1793, a Connecticut inventor named Eli Whitney devised a handcranked mechanism—afterwards called the cotton engine, or "gin"—that did the job quickly and cleanly. Virtually overnight, the production of cotton below the Mason-Dixon line doubled, then doubled again. In 1796 over six million pounds were exported from the United States, the bulk of it to Great Britain. By 1804 cotton exports had climbed to thirty-five million pounds, and British manufacturers were buying more cotton from the United States than from Britain's own colonial possessions. Cotton suddenly became a major component of American trade with the former mother country, and it was on the way to becoming the nation's single most valuable export.

New Orleans shipped out more cotton than any other American city because it was cheaper and easier to raft bales down the Mississippi River than to send them overland to eastern ports. However, New York possessed several distinct advantages of its own that enabled its merchants to divert a significant part of that traffic through the East River waterfront of Manhattan.

For one, New York commanded a much stronger regional market. Slave societies couldn't generate the same level of consumer demand for foreign manufactures as did seaboard cities and midwestern towns, so British buyers coming to New Orleans for cotton found themselves unable to sell

their own exports as quickly or profitably as they could along Pearl Street or in Hanover Square. New York's attractiveness was enhanced by a superior commercial infrastructure and abundant human resources—ships, wharves, storehouses, auction rooms, sailors, cartmen, dockworkers—which made it possible to move mammoth quantities of cotton directly to European mills more efficiently and reliably.

Above all, New York enjoyed financial resources second to none in the country. By the turn of the century Manhattan had more banks and a greater volume of financial transactions than any other American city. New York's primacy in trade with the British Isles had also made it the nation's principal market for the bills of exchange that were the lifeblood of international commerce. As cotton production mounted, southern planters relied more heavily on the New York financial market to turn the receipts they received from exporters into cash. Shrewd merchants like Isaac Hicks soon took to advancing money to southerners (at customary rates of interest) and, in the absence of southern banks, to handling transactions between them and northern creditors (for a percentage). From time to time Hicks also acted as an agent for southerners wanting to use the proceeds from cotton sales to speculate in other commodities on the New York market. Using "factors" (resident agents) and correspondents, other city merchants bought cotton outright from planters for shipment back to New York or, more often, directly to Liverpool or Le Havre.

New York also had an unrivaled concentration of insurance firms. During the wartorn nineties, the mounting cost of private insurance for ships and cargoes had prompted a number of wealthy New York merchants to organize marine insurance companies. Three appeared in 1796 alone: Archibald Gracie's New York Insurance Company, Nicholas Low's United Insurance Company, and Comfort Sands's Associated Underwriters—all of which soon expanded their operations to include coverage of houses and lives as well as vessels. Within the first half-dozen years of the next century, five additional insurance firms would be established in the city.

As a hub of speculation too, New York was now far ahead of its rivals. While the pace of activity on the Tontine exchange was glacial by modern standards, rarely exceeding a hundred shares a day, and few businesses as yet relied on issues of stock to raise money, New York brokers nonetheless offered more than stocks to wager on—elections, sporting events,

international affairs, even the weather—and siphoned cash from all over the country. As one envious Philadelphia merchant said in the mid-nineties, the “immense capital” pouring into the city lubricated every aspect of trade and commerce and explained why New York “now far exceeds us in her exports and imports.”

The upshot was the renowned “Cotton Triangle,” in which New York brokered the exchange of southern cotton—and, more important, the money from sales of southern cotton—for British manufactures. New York ships ran cotton from Charleston or Mobile or Savannah to Europe, returned to New York with manufactured goods (and immigrants), then worked down the coast again to exchange their goods for more cotton—ringing up, at every turn, substantial profits in sales, freight charges, and commissions. By 1798 cotton already accounted for half of the city’s domestic exports; a decade later one-fourth of the cotton reaching Liverpool from the United States came through the East River waterfront. Eventually, New York superintended so great a share of the South’s output that forty cents of every dollar paid for southern cotton allegedly wound up in the pockets of city merchants.

Once again, New York had hitched its economic well-being to the institution of slavery.

RIDING THE WAVE

The quickened tempo of local commerce drew throngs of aspiring businessmen to Manhattan, and their lean and hungry willingness to take entrepreneurial risks further accelerated the velocity of trade. In 1790 the city directory listed 248 merchants; by 1800 there were over eleven hundred—a fourfold increase.

A large body of newcomers came down from New England, bringing new expertise, capital, and connections—the urban wing, as it were, of the great exodus populating upstate New York and the Ohio country. The brothers Nathaniel and George Griswold arrived from Old Lyme in 1794 and established the firm of N. L. and G. Griswold, whose blue-and-white checkered house flag was known in the West Indies, South America, and China. (Local wags liked to say that a cargo stamped “N.L. & G.G.” meant “No Loss and Great Gain.”) They were joined by Lows from Salem,

Grinnells from New Bedford, Goodhues from Salem, and a host of other Connecticut Yankees, including Anson G. Phelps, Elisha Peck, and William E. Dodge—more than enough, all in all, to warrant formation in 1805 of the New England Society in the City of New York. At their annual dinner, the members drank toasts to “the Universal Yankee nation!”

With the New Englanders came additional numbers of Scots, English, Irish, and French immigrants eager to make their fortunes in the city’s surging economy—none more successfully, as it happened, than young John Jacob Astor. Since his arrival in New York shortly after Evacuation Day, Astor had developed a keen interest in the fur trade. He began buying furs in Manhattan and shipping them back to London, soon accumulating enough capital to open his own warehouse in Montreal (still the center of the North American fur trade) as well as to purchase a lot and building on Little Dock Street, in the heart of the business district, for an office and residence. By 1793 he had become the most important fur merchant in the United States. When Britain agreed to abandon its western posts in the Jay Treaty of 1794, Astor moved aggressively into the Great Lakes and began to pull trade away from the St. Lawrence toward the Hudson. Over the next decade his agents ranged as far west as St. Louis, sending thousands of pelts every year back to New York City.

In the mid-1790s, recognizing the limits of European and American demand for furs, Astor also began to participate in the China trade. At first he bought space on Canton-bound ships owned by other merchants, shipping otter, beaver, and fox skins (along with ginseng) and bringing back tea, silk, and porcelain. He consigned these goods to local auction houses, to local retailers, or to Manhattan wholesalers for reshipment to Bordeaux or Hamburg. In the early 1800s Astor began building his own ships and had become the executive manager of a far-flung mercantile empire, with employees and agents in several countries and headquarters in New York. By 1808, when the state legislature chartered his American Fur Company, he had become the city’s first and only millionaire.

Early on, convinced that Manhattan—and Manhattan real estate—had a golden future, Astor began to invest his profits in land. He bought two lots and four half-lots from his brother Henry in 1789. Two years later, he acquired the first of what would become sizable holdings along the waterfront. After the turn of the century, flush with China trade profits, his

interest in real estate grew more systematic, more ambitious, and more calculating. Weekends often found him on his horse, scouring the countryside north of the city for parcels—as in 1803, when he bought a seventy-acre farm that ran west of Broadway to the Hudson River between 42nd and 46th streets. That same year, he’ also gained control of Richmond Hill when the high-living Burr, hard pressed for cash, sold Astor the leasehold on 241 lots for \$62,500; the following year, with Hamilton in his grave, Burr sold off still more land to Astor before heading into exile. Over the next decade, Astor continued to buy or lease additional parcels just north of the developed city—then sat back to await further developments.

CONCOMITANTS OF COMMERCE

The success of Astor and his fellow businessmen had innumerable ramifications for New York, perhaps the most obvious being the transformation of its waterfront. Ships from all over the world jammed the East River docks during the wartime boom—more ships “than I ever before saw, except on the Thames below London Bridge,” wrote the English traveler William Strickland. “Bales of cotton, wool, and merchandize; barrels of potash, rice, flour, and salt provisions; hogsheads of sugar, chests of tea, puncheons of rum, and pipes of wine; boxes, cases, packs and packages of all sizes and denominations, were strewed upon the wharfs and landing-places, or upon the decks of the shipping,” observed another English visitor, John Lambert.

Presiding over this waterfront whirl were the merchants, great and small, who according to the English actor John Bernard worked harder and lived faster than any he had seen in America:

They breakfasted at eight or half past, and by nine were in their countinghouses, laying out the business of the day; at ten they were on their wharves, with aprons around their waists, rolling hogsheads of rum and molasses; at twelve, at market, flying about as dirty and as diligent as porters; at two, back again to the rolling, heaving, hallooing, and scribbling. At four they went home to dress for dinner; at seven, to the play; at eleven, to supper, with a crew of lusty Bacchanals who would smoke cigars, gulp down brandy, and sing, roar, and shout in the thickening clouds they created, like so many

merry devils, till three in the morning. At eight, up again, to scribble, run, and roll hogsheads.

No less dramatic was the increased size and scale of enterprise in the city. As shipping boomed in the 1790s and early 1800s, importers and commission merchants began consolidating capital into partnerships, expanding their operations, and erecting grand new brick warehouses. These massive structures—importer William Lupton’s fourstory building covered two town lots and ran back sixty feet—changed the ambience of the waterfront by crowding out artisanal workshops. A mere eight merchants amassed 75 percent of the property along Front Street between Wall Street and Old Slip, and Pearl Street was well on its way to becoming a solid block of wholesale establishments.

The mounting demand for access to the waterfront prompted the merchants who ran the municipal corporation to extend the shore around Manhattan’s southern tip. In 1798 the city began the filling, grading, and paving of South Street, a new seventy-foot-wide border, and by 1801 new wharves, slips, and piers were under construction from Whitehall to the Fly Market. Spiked wooden poles were drop-hammered into the river bottom to form sea walls, then the water lot they enclosed was filled in with rubbish, earth, and cinder. In some places the traditional sheet piling was supplemented by cribworks—wood-frame, boxlike receptacles filled with loose stone and sunk to the river bottom as a base for larger and sturdier docks.

As in the past, the city enjoined proprietors of adjoining land to carry out these projects, under the direction of municipal surveyors. On completion, the developers received clear title to the filled water lots along with the right to collect the fees from pier users. The Common Council did, however, require that dockside fronting slips be reserved as “publick property,” to ensure that private wharf owners would not be able to jack up food prices by charging monopoly rents to market boats. In 1806, moreover, the city began to develop public basins at its own expense, retaining the right to wharfage.

The increase in traffic coming down the Hudson from the interior prompted commercial development along the west side of Manhattan as well. By 1810 West Street had been created on landfill, its new facilities for

docking providing a grand counterpart to South Street across town. By 1807 the Hudson side had fifteen wharves, nearly half the thirty-plus on the East River. By then, too, ships that through the 1790s had still been forced to anchor offshore and transfer their cargoes to smaller boats—lighters—for loading and unloading were now able to pull directly into shore, their bowsprits arcing out over South Street. The result was a circumferential forest of spars, and the “tall masts mingled with the buildings,” John Lambert wrote in 1807, “together with the spires and cupolas of the churches, gave the city an appearance of magnificence.”

Streets adjacent to the eastside docks were equally alive with commercial activity. Bankers and brokers elbowed their way into the blocks nearest the Tontine Coffee House at Wall and Water, epicenter of mercantile transactions (and the site, not coincidentally, of New York’s first hackney station). Insurance companies, accountants, and law firms rented space in subdivided old town houses—one ad placed in 1803 announced the availability of an “Office and Cellar in Pearl Street near the Coffee Houses”—their presence announced by shiny brass plates.

Merchants’ operations also grew more specialized in the 1790s and 1800s. Emerging alongside the all-purpose general traders were new commission merchants, brokers, jobbers, factors, importers, and auctioneers. Many devoted themselves to handling just one or two lines of goods (textiles, drugs, provisions, hardware) or one kind of trade (retail or wholesale, import or export). Businessmen advertised on a much larger scale too, and papers began to carry ever greater quantities of the commercial information merchants needed to operate in an ever larger and more impersonal market. From 1796 a weekly newspaper, the *New-York Price-Current*, devoted itself entirely to covering these complex affairs.

Business took on a newly organized quality as well. In the twenty-odd years after Evacuation Day, for example, the number of booksellers in the city jumped from five to thirty, and the importance of the New York print market was in turn recognized, in 1802, by formation of a national trade organization, the American Company of Booksellers. In June of that year it held the “first Literary Fair ever in the United States.” Dealers from every part of the country converged on the Long Room of the Coffee House, snapping up half a million books in five days. The New-York Association of Booksellers, a local organization, appeared shortly thereafter.

Book buyers weren't the only out-of-town merchants to descend on the city. Some came to attend fairs and auctions, others to shop (along with locals) in the expanding retail district above the wharves or in the fine specialty shops that lined lower Broadway, William Street, and Maiden Lane. (There was, however, as yet "no appearance of shop windows as in London," one English observer noted, "only stores which make no shew till you enter the houses.")

So many transients arrived, for business as well as pleasure, that taverns and boardinghouses proved unable to accommodate the influx. This dilemma led to the construction of New York's first hotel in the modern sense—the five-story, 137-room City Hotel, which opened in 1794 on the west side of Broadway just north of Trinity Church. Besides room and board, it offered the facilities for public dining and dancing hitherto provided by taverns. Its gracious accommodations and excellent wine cellars were specifically designed to attract a wealthy clientele, and its "very handsome" street-level shops, elegant barroom, and coffeehouse fronting Broadway became important mercantile gathering spots. So did Pearl Street House (which opened around 1810). Aimed specifically at commercial travelers from around the nation, especially western New York and Ohio, it advertised explicitly that it was not intended "for the accommodation of families or ladies."

By the first decade of the new century, Manhattan's downtown district, like its docks, was a pandemonium. Bankers, brokers, and insurance men darted in and out of offices, contending for elbow room in the old Dutch streets with craftsmen, hucksters, slaves, women hurrying to market, and a noisy cavalcade of wagons, carts, and carriages. "Everything in the city is in motion!" exclaimed a French traveler, adding that New York's opulence reminded him of "ancient Tyre, which contemporary authors called the queen of commerce and the sovereign of the seas."

DOWN TO THE SEA IN SHIPS

Shipbuilding in New York languished during the British occupation, and by Evacuation Day the old East River yards at Dover and Roosevelt streets were no longer in use. During the 1790s, however, new shipwrights arrived to meet the rising domestic demand for the big, deep-draft vessels needed to link the city with the Far East, Latin America, and Europe. One of the first

was London-born Charles Brownne (who managed to evade parliamentary restrictions on the emigration of skilled craftsmen to the United States, perhaps in part by adding *ne* to his given name of Brown). Another was Forman Cheeseman, who started a yard near the foot of present-day Rutgers Street in the 1790s, then joined with Brownne in 1800 to open a larger yard on a parcel bounded by what are now Montgomery, Clinton, Cherry, and Monroe streets. Scotsman Henry Eckford, who learned his trade in Quebec, moved to the United States in 1796, built one vessel in Brooklyn near the ferry in 1801, then joined with Edward Beebe in making boats near the bottom of Jefferson Street. One of Eckford and Beebe's most famous commissions was the *Beaver*, commissioned by John Jacob Astor for the China trade and specifically designed for larger cargoes. When the *Beaver* came down the ways in 1805, it was the equal of anything the great British East India Company had afloat.

As the expanding city engulfed adjacent farmland, the shipyards pushed up to and around Corlear's Hook, whose fine-sanded beach had long been used for bathing and Baptist immersions. Christian Bergh opened a yard there, and in 1804 Brownne too moved up to a spot near the foot of Stanton Street known as "Manhattan Island"—an oasis of solid ground near the shore but almost isolated from Manhattan proper by salt meadows or marshes. When Brownne moved on again in 1810, Eckford, together with Adam and Noah Brown, would take over the famous "island."

The revival of shipbuilding was accelerated by government contracts for naval vessels. Forman Cheeseman got one in 1800 to build the frigate *President*. Shrewd merchants encouraged this federal connection by bankrolling construction of another frigate at the yards of Peck and Carpenter, then handing the ship over to the navy for use against the Barbary pirates. But the biggest beneficiary of government orders lay across the East River in Brooklyn. Back in 1781 John Jackson and his brothers had purchased a crescent-shaped, half-mile-long parcel of land on muddy Wallabout Bay, part of the old Rapalje estate. They eventually built a shipyard on the site and, in 1798, contracted with the navy to build the *the John Adams*, one of the biggest ships afloat. Three years later, when the Jacksons put their forty-two-acre yard up for sale, the navy bought it for a hefty forty thousand dollars. The Common Council encouraged the sale by

granting the U.S. government New York's rights to the Brooklyn shoreline between the high and low water marks.

Although Brooklyn's Navy Yard built no new ships during the remainder of the Napoleonic Wars, it did outfit many privateers and helped establish the East River as the site of the nation's best and most active shipyards. With both sides of the river providing ample work for brass foundries, caulkers, joiners, riggers, and sailmakers, the city became a mecca for skilled maritime tradesmen. In 1792 there had been no more than thirty shipwrights and ship carpenters in town; in 1805 there were 117.

The city's most notable achievement in nautical construction, however, involved not sail but steam. Many people had thought of applying steam power to ships—among them a Connecticut Yankee named John Fitch, who had built a steamboat that successfully paddled up and down the Delaware River in 1787. Fitch won a monopoly from New York state to build and run boats propelled “by the force of fire or steam.” Lacking money for development and promotion, however, he got nowhere. (The legend that he tested another prototype on the Fresh Water Pond in 1797 is almost certainly not true.)

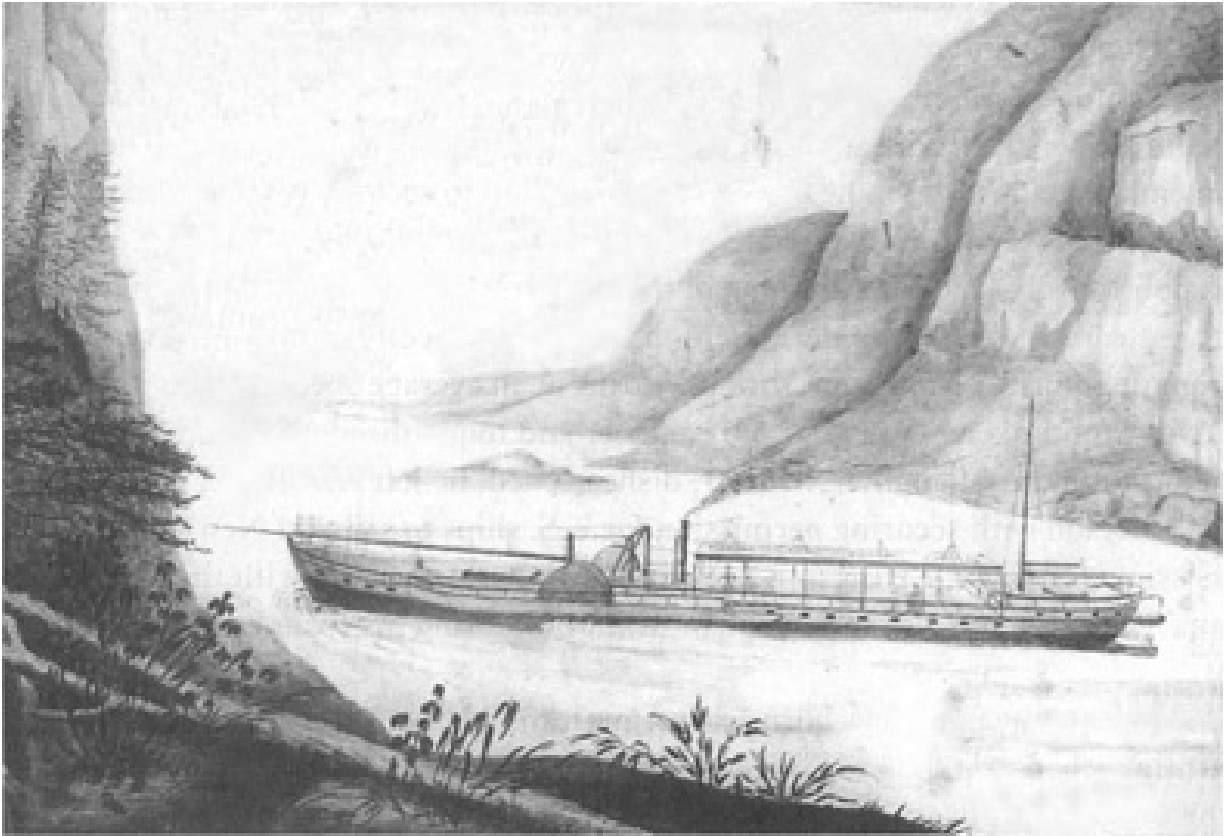

Chancellor Robert R. Livingston, on the other hand, had both cash and connections. An ardent amateur inventor, he had long sought a way to speed travel between the city and Clermont, his Hudson River estate, no miles to the north. In 1798 Livingston, aided by his political ally De Witt Clinton, got the legislature to assign him the monopoly over future steamboat travel, on the condition that he produce, within a year, a vessel capable of running upriver from New York to Albany at an average speed of four miles per hour. Livingston tinkered away but, no engineer and too pigheaded to take advice, botched one prototype after another. In 1801, disheartened, he left for France, charged by President Jefferson with securing permission for U.S. ships to sail past New Orleans up the Mississippi. In Paris, Livingston *bought* the Mississippi, along with the rest of the Louisiana Territory, and also met the man who would bring his steamboat quest to fruition.

Robert Fulton, a Pennsylvania-born Irish American, had gone to London in 1786 to study painting, then switched to civil engineering. Fulton moved to Paris in 1797, drawn by the promise of government subsidies for technological development. He was working on a torpedo to blow up the English fleet when he met Livingston there in 1802. Livingston was

attracted by Fulton's theoretical knowledge, practical experience, and access to prominent French scientists (he also dressed well and had the manners of a gentleman). Fulton, attracted by Livingston's money and influence, embraced the New Yorker's project and in 1803 tried out an experimental steamboat on the Seine, with great success. On the strength of this, an excited Livingston got his monopoly rights extended.

In 1806 Fulton moved to New York City and set out to construct a full scale steamboat. In doing so, he sought out and took the advice of talented local craftsmen. He contracted with shipwright Charles Brownne's Manhattan Island establishment to build a 146-foot-long, twelve-foot-wide, flat-bottomed, straight-sided vessel. He engaged Scotch millwright Robert McQueen to construct the ironwork paddle mechanism and a local coppersmith to produce the boiler (with metal supplied by importer Harmon Hendricks). From England, Fulton obtained a Boulton and Watt twenty-four-horse-power engine with piston, rods, and air pumps made to his own specifications.

By August 17, 1807, Fulton was ready for his initial voyage. A crowd of New Yorkers trekked two miles up to the Christopher Street dock to watch. The venture seemed comically crackpot, even (given the danger of exploding boilers) excitingly suicidal. But Fulton's boat departed without mishap, hissing and churning its way northward, steadily overtaking assorted sloops and schooners. By midmorning next day it arrived at Clermont, having averaged a speed of four and a half miles per hour. Livingston came on board, and the partners pressed on to Albany. Arriving the following morning, Fulton immediately hung a placard over the side advertising places for the return trip at seven dollars—more than twice what sloops charged. Only two Frenchmen dared clamber aboard a vehicle that resembled, as one spectator put it, a sawmill mounted on a raft and set afire. Still, on the way back, the riverbanks were filled with kerchief-waving, cheering people and huzzahing West Point cadets.

Robert Fulton's sketch of his steamboat on the Hudson River accompanied his application for a patent in 1809. The vessel was not called the *Clermont* until after the inventor's death in 1815. (American Society of Mechanical Engineers)

In September Fulton began scheduled service from a dock at the foot of Cortlandt Street. He officially enrolled the vessel as the *North River Boat*—only later was it renamed the *Clermont*—but most people simply called it “the steamboat”: there was, at that time, no other in the world.

Well aware that he needed the social sanction of New York gentry as much as their capital, Fulton made steamboating socially acceptable, even fashionable. He revamped his boat, concealing its ugly boiler and furnace. He added a deck awning, sleeping accommodations for fifty-four, and a bar. He fitted up cabins for men and ladies with elegant mahogany furnishings and posted regulations dictating proper comportment. Wealthy passengers flocked aboard.

Fulton meanwhile settled into New York City. In 1808 he married Harriet Livingston, the chancellor's second cousin, a move rendered

socially acceptable, despite Fulton's plebeian background, by his technological and commercial success. Fulton bought a fine mansion on the corner of Marketfield and State, obtained servants (one a young slave woman), and joined the General Society of Mechanics and Tradesmen.

By the end of 1812 Fulton had six steamboats in operation, most of them built at Charles Brownne's yard. (His 1808 contract for *Car of Neptune* called for having "all the joiners' work done in the best New York style, and of seasoned stuff.") He and his partner had also dispatched boat builder Nicholas Roosevelt and a team of New York workmen to Pittsburgh in 1811, having won an exclusive franchise to service the New Orleans Territory. Following plans supplied by Fulton, Roosevelt built the *New Orleans*, which made its way down the Ohio and Mississippi to the Gulf, outracing a Chickasaw war party. The partners' dream of monopolizing steam traffic on the Mississippi was soon blocked by local opposition, but by providing planters and farmers in the South and West with the capability of sending their goods up the great inland waterways—reversing the hitherto natural flow of commerce down to New Orleans—they had done New York City an inestimable service.

CAPITALIZING CRAFTS

Alongside these impressive maritime developments came subtler but arguably more profound changes in Manhattan manufacturing. The revitalization and expansion of trading networks, and the city's emergence as the nation's premier entrepot, spurred some master craftsmen to revise traditional processes of production. The presence of out-of-town buyers, the ready availability of raw materials, and the general increase in population and wealth all suggested to would-be artisan-entrepreneurs that by expanding production for distant consumers they could reap far greater profits than by catering only to a walk-in, custom-made trade.

When Scotland-born Duncan Phyfe came down to New York in 1792, all of twenty-four years old and just out of his apprenticeship to an Albany cabinetmaker, he faced an uncertain future. The city's economy was rebounding from the shock of that year's financial panic, and with the outbreak of war between Britain and France shortly thereafter, local taverns and countinghouses rang with talk of the windfall profits that lay just ahead in neutral commerce. Cabinetmaking was a fiercely competitive line of

work, however. There were already scores of cabinetmakers in town, plus scores of chairmakers, carvers, gilders, turners, upholsterers, and practitioners of other closely related crafts. More were on the way too, carried toward the city on gusts of revolution from France, the British Isles, and the West Indies. For young journeymen like Phyfe, merely surviving, let alone getting ahead, didn't promise to be easy.

One thing in Phyfe's favor was the latest of those abrupt shifts in taste that periodically shook the Anglo-American markets in art, architecture, and interior design. On the very eve of American independence, British builders and designers had made their own break from the increasingly intricate Greco-Roman motifs characteristic of Georgian country houses and Chippendale furniture. Recent archaeological excavations at Pompeii, Herculaneum, and Paestum had thrown new light on the classical world and inspired more nuanced interpretations of antiquity.

The best of these interpretations came from architect-decorator Robert Adam and a pair of talented cabinetmakers, George Hepplewhite and Thomas Sheraton. Soon after the war, their work—lighter, thinner, more decorative than Chippendale's—began to attract attention among the propertied classes of the United States as well as England. Its appeal on this side of the Atlantic derived partly from the traditional linkage of classical learning to social status (New York's Columbia College, for example, still required applicants to prove their competence in ancient Latin and Greek by translating long passages from Cicero and the Gospels). At the same time, however, the purity and restraint of the new classicism seemed tailor-made for a republican political culture, and during the Federalist administrations of George Washington and John Adams its influence became so pervasive in America that it has since been called the Federal style.

Phyfe, who had a nose for opportunity, built up an affluent clientele with adept interpretations of Adam, Hepplewhite, and Sheraton designs (later incorporating French Directoire motifs as well). He was no mere copyist: his workmanship equaled or excelled the best that London or Paris had to offer, and his finely carved lyres, eagles, acanthus leaves, wheat ears, reedings, and moldings were matchless. He wasn't cheap either. A single cane-bottom mahogany side chair could run as high as twenty dollars—close to a month's wages for an ordinary workingman. Card tables fetched sixty-five, and a carved rail sofa \$122.

A chance encounter in 1798 with John Jacob Astor's daughter, who touted his work among her friends, sent demand for Phyfe's work soaring. Orders began pouring in from other parts of the country too, and by the end of the first decade of the nineteenth century well-to-do residents of every state regarded a Duncan Phyfe settee, sofa, or sideboard as the ne plus ultra of refinement; Henri Christophe, the black emperor of Haiti, wanted a Phyfe bed for the royal bedroom. Phyfe had meanwhile become a rich man and was investing heavily in Manhattan and Brooklyn real estate.

One key to Phyfe's increased output was his reduction of the complexities of cabinetmaking to a sequence of elementary steps, making it possible to replace expensive journeymen with semiskilled workers from abroad. (At his peak he employed as many as a hundred journeymen at a time in his large workshop on Partition Street.) Phyfe maintained high standards, nevertheless, but many of his contemporaries, by simplifying designs and standardizing parts, began to mass-produce cheap "stick furniture," knowing that New York's wholesale merchants stood ready to purchase entire inventories for shipment to out-of-city markets. In 1795 one master cabinetmaker was able to dispatch five thousand Windsor chairs to the West Indian market.

Duncan Phyfe wasn't the only New York artisan to break with traditional practices and make a fortune in the buoyant 1790s and early 1800s. Stephen Allen, an enterprising sailmaker, claimed to have amassed thirty-two thousand dollars between 1796 and 1802 alone. Allen's breakthrough—*a* by-product of the wartime shipbuilding boom—came when he began buying his materials (sail duck and bolt-rope, marlin and twine) directly from wholesalers and auctioneers, cutting out the ship chandlers who traditionally supplied the city's sailmakers.

Cowperthwaite's Chair Manufactory in the 1820s. Although his establishment was less famous than Duncan Phyfe's, Cowperthwaite's advertisement conveys both the scale and fierce competitiveness of manufacturing in the city. (© Collection of The New-York Historical Society)

The Lorillard brothers took a different path. During the Revolution, old Pierre Lonllard, the Huguenot immigrant who had launched New York's first tobacco "manufactory" back in 1760, sided with the patriots, fled town, and was killed by Hessian soldiers. His widow held the family and business together until her sons George and Peter were able, in 1792, to move their production operations to the banks of the Bronx River, where they harnessed its water power to turn the wheels of a wooden snuff mill. (In about 1800 they replaced it with one of native field stone, which sits today in the New York Botanical Garden in Bronx Park.) They added a warehouse and homes for workers, and soon they were operating the largest tobacco-

producing unit in the United States. Innovative at marketing, they would later print up broadsides advertising their snuffs, cigars, and cut tobacco and send them to every postmaster in the United States (many of whom also ran general stores). The third brother, Jacob, borrowed three thousand dollars from George and Peter and went into the tanning trade. He too opted for increasing production while lowering costs, investing in newly invented leather-rolling machinery and erecting his own bark mill for making tannic acid. Jacob prospered so rapidly that by the early nineteenth century he owned three houses, two leather stores, and forty acres of Manhattan real estate and was ready to move into banking and politics.

On a less spectacular scale, myriad entrepreneurially inclined master tailors and shoemakers cut costs and raised output by reorganizing the labor process of their trades. They purchased leather or cloth on a wholesale basis—either on their own or with the backing of merchant-investors—and distributed it to immigrant journeymen or poor women to turn into low-quality (“slop”) shoes or shirts, paying them a fraction of the piece rates customarily earned by skilled journeymen. (This, of course, required workers to put in longer hours to stay in the same place, forcing shoemakers, for instance, to peg and stitch from five in the morning till eight at night.) By relying on wage-workers who labored either in the large workplaces of master craftsmen or in their own home or basement shops, artisan entrepreneurs were able to churn out an evergrowing volume of clothing and shoes for the slave populations of the American South and the Caribbean, for farmers in the western hinterlands, and for the laboring poor of New York and other seaboard cities. The new entrepreneurs marketed these products as well, either taking to the road themselves or turning the goods over to established merchants to retail.

Once artisan-entrepreneurs entered this world of volatile markets, brutal competition, and a growing influx of cheap British manufactures, their ability to make a profit depended on their ability to hold down labor costs. One of the easiest ways to do this was by circumventing their customary responsibility to train up apprentices in the “mysteries” of their crafts. Taking on many more youths than they could care for, masters paid them low wages and offered cash payments in lieu of room, board, and education. The arrival every year of thousands of immigrants further corroded relations between masters and journeymen by steadily enlarging the pool of

“free” labor—men and women who could be hired and fired at will, who required no initial capital investment or long-term care and feeding, and whose desperate need to earn a livelihood allowed employers to pay them subsistence wages.

Women Working in a Millinery Shop, n.d. by Alexander Anderson. Although it discloses nothing about the organization of the shop, Anderson’s engraving is a reminder that female waged labor figured importantly in the municipal economy. (Print Collection. Miriam and Ira D. Wallach Division of Art, Prints and Photographs. The New York Public Library. Astor, Lenox and Tilden Foundations)

THE END OF SLAVERY

When the English traveler William Strickland visited New York in 1794, he discovered himself in a place that looked like most provincial British cities, except for the thousands of blacks “who may be seen of all shades till the stain is entirely worn out.” “Most of the inferior labor of the town is performed by Blacks,” he added, and on the surface it might well have seemed that slavery had become even more entrenched in the city since 1790. Between 1790 and 1800, as New York’s economy took off and its population leapt toward the sixty-thousand mark, the absolute number of slaves jumped by nearly 25 percent to twenty-five hundred—one of the

sharpest such increases on record. After 1790, moreover, the number of white households relying upon some form of black labor more than tripled, and many of them had purchased their human property quite recently. By 1800 three-fourths of New York's slaveholders had not owned slaves ten years before.

Yet support for the institution of slavery in New York was thinner and more fragile than ever. New slaveowners were by and large the big winners in the economic sweepstakes of the nineties—merchants, lawyers, bankers, brokers, artisan-entrepreneurs, speculators—and their primary interest was domestic service, chiefly by women. Artisans had continued their decades-long retreat from the use of black male labor, preferring to draw as needed on the plentiful numbers of cheap wage-workers who didn't have to be housed, clothed, or fed. Some masters in more traditional trades like baking and butchering still found slaveowning an attractive proposition, but by 1800 only about one artisan in every seventeen owned slaves, proportionally just half as many as a decade before. The Manumission Society had meanwhile continued to promote its African Free School as evidence that blacks were as capable as whites at becoming "safe and useful members" of society, while its Standing Committee frequently attempted to win freedom for slaves whose masters violated the law against purchasing or selling slaves out of state.

What was more, the proportion of slaves in the black population had declined sharply because the number of free blacks rose from eleven hundred to thirty-five hundred between 1790 and 1800—a threefold increase, the result of a high birthrate, migration from elsewhere in the United States, and the arrival of the "French Negroes" swept up in the West Indian exodus. Once it was a safe assumption that virtually any African American in New York was enslaved. By 1800 well over half the city's black residents were free, and the impact of this shift on the city's racial dynamics was profound.

Free blacks harbored and aided runaways, and the number of escapees escalated sharply in the 1790s. Some fled to nearby free states, but many vanished into the city itself. Thus, in 1795, eighteen-year-old Calypso was "seen running with a bundle of cloaths and her shoes in her hand through Pearl and Cherry Streets, then turning into Oliver, then into Rutgers, and finally into Roosevelt Street on the left hand; here were lost her tracts

[sic].” Even African-born slaves who could barely speak the local language found refuge there: one fifty-year-old man who “talks bad English” had run away from Flatbush and was, his master complained in the press, rumored to be living in the city, where he “pretends to be free.”

On occasion free blacks actively resisted white dominion. In 1798 Sally Gale stole some items from a store and was chased by Finch, a white man, to a cellar in Hague Street. Here, however, a “Mulatto Man Stood at the Door with some kind of weapon in his hand and Declared he would knock the said Finch’s Brains out if Offered to Come in.” Militant West Indian blacks, in particular, brought their own long experience of concerted resistance to the institution. In 1796 some “French Negroes” started several fires by throwing burning coals wrapped in oiled paper into open cellars. Soon frightening rumors were commonplace about plots to burn the city. Lewis Morris wrote that gentlemen had taken to serving on the watch every night and had succeeded in securing some suspicious blacks, while others had been “shot down owing to their not answering quick.” Even the most obdurate masters must have wondered whether owning one’s cook or butler might not be getting too difficult—too *dangerous*—to be worthwhile.

Politics also played a role in eroding support for slavery. When the French Revolution broke out, popular enthusiasm for liberty, equality, and fraternity more than once spilled over into demands for emancipation of the slaves—as it did in 1789, when the crowd at the John Street Theater gave a thunderous ovation to an epilogue that linked the liberation of “Afric’s sable Sons” to the cause of international republicanism:

Shall Freedom’s Sons on others put the chain!
Detested thought! soon may we hope to see,
Columbia, Europe, Asia, Afric, FREE,
One Genius reigns through all— ETERNAL LIBERTY.

In the years that followed, the General Society of Mechanics and Tradesmen, the Sailmakers Society, and other organizations representing or allied with the city’s mechanics openly endorsed abolition. The Democratic-Republican party, despite its alliance with southern slaveowners in national politics, absorbed these sentiments—along with radical refugees from Britain who strongly favored emancipation—and

party papers like the *Argus* published antislavery articles by authors who signed themselves “A Consistent Democrat” and “An Invariable Friend to the Equal Rights of Man.” Condemning slavery became all the easier as city artisans retreated from slaveholding and the proportion of slaves in the overall population shrank, calming old anxieties about competition from new-made freemen (by 1800 slaves comprised a scant 4.5 percent of the city’s inhabitants).

Federalists as well found the dynamics of party rivalry propelling them to a more activist position on the slavery question. As anglophiles, they were well aware of the rise of abolitionism in Britain and the moral opprobrium with which transatlantic opinion increasingly regarded slaveholders. After passage of the Alien and Sedition Acts, when Federalists needed to prove that they remained genuine friends of liberty, antislavery seemed an attractive and responsible reform. Given that Federalists like John Jay had been conspicuous in the Manumission Society and as advocates of gradual emancipation, it also seemed likely that freed slaves would support them at the polls. (The black vote indeed later provided a margin of victory for Federalists on at least one occasion, and it would be Democratic-Republicans who protested; in 1811, 1814, and 1815 they voted to limit black access to the ballot.)

While the critics of slavery grew stronger, its defenders grew weaker. Resistance to emancipation still ran highest among the Dutch inhabitants of Kings, Queens, and other rural counties where the system remained economically vital. In 1800 nearly 60 percent of the white households in Kings County owned at least one slave, more than had done so in 1700. In towns outside of Brooklyn, between 70 and 80 percent of households held slaves (three out of every four in New Utrecht, for instance). The political influence of Dutch farmers had nonetheless declined because the bulk of farm commodities sent to Manhattan—certainly those destined for export—now came from upstate communities settled by New Englanders, old opponents of slavery, and a reapportionment of the legislature in 1796 gave them greater political clout.

Encouraged by John Jay’s election as governor at the end of 1795, the Manumission Society had in the meantime decided to make another attempt to get a gradual emancipation act through the legislature. A bill to that effect was introduced early in 1796, and after three years of intense public

debate and parliamentary maneuvering, the legislature adopted a gradual emancipation plan in January 1799 (approval by the Council of Revision followed in March). In both the Assembly and Senate, delegates from New York City joined forces with their upstate counterparts to overcome opposition by Dutch legislators from Long Island and elsewhere. As Senator Erastus Root recalled, the Dutchmen “raved and swore by *dunder* and *blixen* that we were robbing them of their property. We told them that they had none and could hold none in human flesh. . . and we passed the law.”

But this was *gradual* emancipation, carefully designed to minimize the cost to slaveowners. Not one slave was freed by the new law: all who were currently slaves would remain so for life, and while any of their children born after July 4 of that year would be technically free, they were required to remain in service to their mother’s master until reaching the age of twenty-five (if female) or twenty-eight (if male). Furthermore, masters had five years to turn over ill or elderly slaves to the local overseers of poor without incurring the usual financial obligations for their support. They were likewise allowed to jettison without penalty all slave children over the age of one, a provision that proved popular in the lower six counties of the state, where hundreds of infants were abandoned.

Assured now of slavery’s eventual demise, owners hastened to cut their losses. Many put their slaves on the market at once, and in spite of the ban on out-of-state sales it was soon being reported that the exportation of slaves to the West Indies had increased “to an alarming magnitude,” often under “circumstances of great barbarity.” Other masters allowed slaves to negotiate self-purchase arrangements or promised them early emancipation in exchange for a commitment to trouble-free service for a fixed number of years.

After the passage of the gradual emancipation act, therefore, slavery disintegrated with unexpected speed. Between 1800 and 1810 the number of officially recorded manumissions in the city jumped to 260 while the total number of slaves shrank by 43 percent to just under fifteen hundred. The free black population meanwhile climbed to some seventy-five hundred. By the end of the first decade of the nineteenth century, 84 percent of nearly nine thousand New York blacks were free, as against 33 percent in 1790.

PROGRESS AND POVERTY

Freedom had decided drawbacks. African Americans found themselves pitched into the new wage-labor market, but on unequal terms that ensured they would occupy the bottom of the city's occupational hierarchy. Some black women, perhaps one out of twenty, were able to secure positions as shopkeepers, fruiterers, bakers, boardinghouse keepers, or hawkers selling buttermilk or hot corn in the city's streets and markets. Some took in washing as independent entrepreneurs. But the vast majority continued to perform the same heavy domestic work, albeit for wages, that they had done as slaves—and in much the same circumstances too, living in the garrets, cellars, or outbuildings of white households.

Two-thirds of the free black community, however, resided in independent black households, headed by men who for the most part earned their livelihoods as laborers. Perhaps one in four retained artisanal skills from slavery days, and while black men were increasingly excluded from many crafts, some managed to earn a living in shoemaking, baking, butchering, tanning, and carpentry. A few black New Yorkers established themselves as tavern or dance hall keepers, shopowners, peddlers, and service providers. A majority of the city's two dozen oystermen (and later its oyster shops) and probably all of its two-hundred-odd chimney sweeps, for example, were free blacks, and several freedmen became well-known tobacconists, barbers, and caterers.

Given their limited options, perhaps 40 percent of adult freedmen took to the sea, and there were some appealing aspects to life as a black Jack Tar. During the war years, seafaring jobs were plentiful, and seamen's wages on risky but profitable "neutral" voyages were three times what they had been previously. Captains offered new sign-ups a portion of their wages in advance—especially important for recently freed slaves. And not only did African Americans receive equal pay for equal work, but maritime custom and the rough egalitarianism of deep-sea tars helped insulate skilled black seamen from white antagonism and broke down racial barriers. Black and white sailors not only lived, worked, and ate together, they often looked alike, wearing their hair in queues secured with eelskin and tattooing themselves with a similar array of anchors, mermaids, and crucifixes.

But if racism weakened at sea, it hardly disappeared—as John Jea, an ex-slave from New York, found out in 1806 when he took a job as ship’s cook (a position, like that of steward, often reserved for blacks). Initially Jea “was very much pleased in going on board the vessel, but the case was soon altered” as brutal white sailors “used to flog, beat, and kick me about, the same as if I had been a dog.”

During their stints on land, many black sailors supplemented their pay by working as day laborers—toting and hauling in warehouses, rigging ships, and unloading cargoes along the docks. While they were at sea, their wives bore the burden of keeping the household together by taking in washing and ironing. If their husbands abandoned them or were lost at sea, they might have to resort to prostitution. Black men too might turn to crime as an available option, and African-American New Yorkers were active in the establishment of a thriving underground market in stolen clothing.

Most freed blacks in New York thus lived a precarious existence in which sudden unemployment, illness, or old age could easily push them into pauperism. In some years, as many as 70 percent of black families in the city received outdoor relief, and the number of those in municipal institutions rose steadily, from nine in 1790 to 72 in 1810: ten in debtor’s prison, seventeen in the public hospital, and forty-five in the almshouse.

They weren’t alone. As the commissioners of the almshouse reported in 1795, the ranks of the truly impoverished included a growing percentage of white immigrants —some 44 percent, in fact, of the 620-odd paupers under their care. Two years later the commissioners observed that the Irish alone accounted for 148 out of the 770 paupers in the almshouse. The problem became steadily worse after the turn of the century. In 1801 the *New-York Gazette* reported that nine hundred immigrants had entered the port in a four-week period, many “without money, and without health and strength to enable them to earn even the most scanty subsistence.” Camped out in outerward hovels, some were actually “*expiring from the want of sustenance.*”

Then, too, notwithstanding the general prosperity of the 1790s and early 1800s, more city residents than ever were becoming vulnerable to the seasonal fluctuations of trade that always brought misery to small tradesmen, common laborers, journeymen, seamstresses, and their families. Their “incessant application to labor,” as the Society for the Relief of

Distressed Debtors put it as early as 1788, “will not enable them to subsist themselves, and their families, and at the same time, secure a small provision for their support during a temporary failure of supplies.” A writer in the *Daily Advertiser* in 1791 observed, “Many of our small tradesmen, cartmen, day labourers and others dwell upon the borders of poverty and live from hand to mouth.” In January 1797 “Six Hundred Journeymen Mechanics and Tradesmen now out of Employ” petitioned the city that they were, “in consequence of the season, without work; and many of them, by reason of large families, in want of sufficient FIRE and FOOD.”

The revolution in the organization of work that lay at the bottom of this phenomenon didn’t occur overnight, and the city’s vibrant economy served—up to a point—to cushion its impact. Yet every year the gulf between rich and poor grew wider. At the beginning of Washington’s first term, in 1789, already more wealth was concentrated in fewer hands than at any time prior to independence. The richest 2 percent of the population—a mere eighty-eight individuals—owned almost 25 percent of the city’s total assessed wealth. The richest 20 percent owned nearly 75 percent; the poorest 50 percent owned under 7 percent. By 1800 the richest 20 percent owned almost 80 percent of the city’s wealth. The bottom half owned under 5 percent.

In that bottom half, moreover, were numerous small masters, journeymen, and apprentices for whom the advent of capitalist production had meant not prosperity and respectability but traumatic decline. Instead of the decent independence they could have expected a generation earlier, they now found themselves slipping into the ranks of casual wage-laborers, domestic servants, food hawkers, tea-water men, chimney sweeps, seamen, deckhands, and the other propertyless poor who lived on the margins of society. They had to compete with immigrants and freed blacks for jobs. When too old or too sick for work of any kind, they had to apply to the city for outdoor relief or—perhaps the crudest blow of all to a respectable mechanic’s aspirations of independence—beg for shelter in the almshouse. Given that the number of city households headed by women grew by 30 percent during the 1790s—from one in twelve to one in nine—it appears that quite a few workingmen simply disappeared, perhaps to look for work elsewhere in the country but leaving their wives and children behind. As in

the past, women—sick, abandoned, or widowed—outnumbered all other residents of the almshouse.

Worse was yet to come. After 1800 wage rates in New York leveled off, then fell, sinking to eighty cents a day by 1805. The cost of food, fuel, and shelter continued nonetheless to climb, stripping innumerable laboring people of the last hope that they could maintain a decent standard of living. A string of extremely hard winters around the turn of the century deepened the distress caused by a string of yellow fever epidemics. Scarcely a winter now passed in which city officials didn't have to find food, fuel, and medical care for thousands of destitute residents.

It was becoming more and more apparent, in short, that the expansion of opportunity for some New Yorkers meant its constriction for others.

The Road to City Hall

The revolution did little to change either the structure or orientation of municipal government. Aldermen continued to be elected by freeholders and freemen of the corporation (until the right of representation was expanded in 1804), and the Common Council was still composed overwhelmingly of merchants and lawyers, with a sprinkling of substantial master craftsmen. Its standing committees—like Lamps, Streets and Roads, Public Buildings, Auditing of Accounts—carried on as they had before the Revolution, supplemented, as necessary, by special committees for, e.g., repair of the Brooklyn ferry house, improvements at the Battery, or building a new watch house. The mayor and council continued to function as the Court of Common Pleas (for civil cases) and the Court of General Sessions (for criminal cases).

Beneath this apparent stability, however, lay an ongoing metamorphosis in the city's relationship to the state. In colonial days, all council actions had to be approved by the governor, who could veto them at will. Now there was much more give and take. The city often asked the state legislature—the acknowledged font of sovereign authority—for explicit grants of power to undertake actions not authorized under the Montgomerie Charter. Almost always the legislators approved these ad hoc requests for specific delegations of authority to raise money or undertake particular public projects. At other times, however, the legislature intervened in municipal affairs on its own initiative, overriding the city on matters that were clearly within its competence under the charter. The state was particularly active where patronage was concerned, and the first decades after independence witnessed a considerable transfer of appointing power from the mayor and Common Council to the statewide Council of Appointment (which appointed the mayor).

By increments, without anyone expressly intending it to happen, the corporation gradually came to be recognized as primarily an agent of the state, with its “private” personality, so jealously guarded by earlier generations, remembered, if at all, as a relic of the rapidly receding colonial past. New York City did not, however, become a puppet of New York State:

politically, the municipality remained active in shaping its own destiny, with the state acting in tandem rather than in opposition to its initiatives.

As the city-state association grew ever closer, the two governing bodies drew physically farther apart. Before 1796 the state Legislature and Common Council often cohabited in the Broad Street Exchange. In January 1797 however the state government moved north to Albany. A variety of reasons were advanced for the change of venue: epidemics, threats of war, the high cost of living, and proximity to the state's developing hinterland. Also a factor was the already well advanced rivalry between upstate and downstate interests. Perhaps not coincidentally, the decision to relocate came shortly after John Jay became the first Manhattanite in state history to win the governorship.

Whether together or at opposite ends of the Hudson River, however, the two jurisdictions agreed in continuing many colonial-era mercantilist policies in the new republican world. While the state relinquished control of customs-related matters to the national government—after 1789 the Port of New York's collector, gaugers, weighmasters, land and tide waiters, surveyors, and searchers became federal officers—it was the Council of Appointment that chose the seaport's harbormasters, wardens, and pilots.

The state also took control of monitoring exports, even though its charter specifically authorized the corporation to do so. The state gave the Council of Appointment the right to name the surveyors and packers of bread, flour, beef, and other inspectors of commodities being shipped out from the port, and a series of laws between 1785 and 1799 laid down elaborate specifications regarding the quality and packing of flour and meal and the dressing, grading, branding, casking, and storing of beef and pork. Staves, lumber, flaxseed, pot and pearl ashes, butter and lard—all were examined and certified by state inspectors.

When it came to examining products brought to the city for local consumption, an army of municipal measurers, weighmasters, gaugers, and inspectors took over. Stationed at markets, slips, and wharves, they measured, weighed, gauged, and inspected timber, planks, grain, salt, hay, lime, charcoal, coal, hemp, flax, hides, anchors, and cables—for a fee, half paid by the buyer, half by the seller. By 1800 there were at least sixty-four public measurers, five weighmasters, four weighers of hay, twenty-two

inspectors of hay, two gaugers of liquor, and thirteen inspectors of firewood.

The city-run system of public markets was flourishing at century's end. Although two of the five leading pre-Revolutionary markets had been abandoned, three new ones had been added (including Catherine Market near Catherine Slip). The old ones had been improved, including the oldest—the Fly Market, at the foot of Maiden Lane—which now consisted of three market houses, for meat, country produce, and fish. Under the aegis of the mayor, who served as clerk of the market, and the council, which regulated the deputy clerks, markers and sealers of weights and measures, inspectors, porters, packers, and cullers, the city prohibited forestalling, engrossing, and regrating and paid close attention to sanitary conditions (oysters could not be sold between June 1 and September 30). As a result, the quality of food sold in New York City was generally good.

At the same time the city was maintaining close oversight of distribution, however, it was dismantling pre-Revolutionary restrictions on production. In this they were supported by entrepreneurial masters, who believed that the explosive commercial and demographic expansion of the nineties would pay off only for those having the freedom as well as the character to act. What was the point of the Revolution, they asked, if not to free individuals from arbitrary, artificial, and oppressive restraints?

The Fly Market, 1816. Women are conspicuous in this scene both as venders of produce and, in the covered meat market (background), as consumers. (© Collection of The New-York Historical Society)

During the later 1780s and 1790s the old requirement that none but freemen be permitted to engage in “any art, trade, mystery, or occupation, within the city, saving in time of fairs” was permitted to lapse. On the books, violators remained subject to fivepound fines, but as one observer noted in 1807, “no prosecutions are brought against those who carry on business without taking out their freedom.”

For a time, the city insisted that all butchers have their cattle slaughtered at the municipal abattoir, but vigorous protests won a ruling that licensed butchers could kill their own livestock on their own premises. The city would continue to crack down on fraudulent practices—for example, falsely designating meat as having been slaughtered according to Hebrew law—but tended to overlook sharp practices such as forestalling (meeting drovers up-island, cornering whole herds, and charging other butchers what the market

would bear), in this case a latitude butchers deplored, as they were the ones who got skinned.

A similar ambivalence marked the bakers' response to the assize—the regulation of bread prices by a committee of the Common Council. Although officials kept close track of the price of flour and adjusted bakers' charges to bakers' costs, the breadmen grew increasingly restive. Finally, in 1800, the Common Council acceded to demands by master bakers that the price of bread, like that of other commodities, be determined in the marketplace. Competition, they argued, “would create an Emulation among the Bakers and would of course produce good Bread . . . at a reasonable price.” A year later, however, when the cost of flour fell sharply, the bakers refused all appeals to lower their prices accordingly. The council then reinstated the assize, at which point the bakers went on strike, refusing to bake until allowed the price they wanted for their bread. Although the council got them back to work with a substantial increase, a group of “wealthy citizens” formed the New York Bread Company to manufacture bread in such quantities that residents would never again have to pay more than the market would bear. This wasn't at all what the bakers had intended in denouncing the assize: free markets were one thing, industrial enterprises operated by semiskilled labor another. Besides driving them out of business, cried the bakers, the Bread Company was the opening wedge of a capitalist labor system that would in time annihilate the crafts, reduce mechanics to mere wage-slaves, and destroy the republic. The threat receded after a spectacular fire—apparently accidental—destroyed the Bread Company's main building in May 1803, but wrangling over the pros and cons of unfettered market economies went on in earnest. Not until 1821 would the City Council finally abandon the assize once and for all.

Cartmen continued to be strictly supervised. The mayor issued licenses, the council set prices they could charge to haul loads, and city officials disciplined violators of ordinances. To avoid monopolization and price-gouging, the city insisted that all cartmen remain independent one-horse entrepreneurs; fleets of company-owned carts driven by wage-workers were strictly forbidden. The city did, however, organize the men into companies of forty-nine (each under supervision of a foreman), and by 1800 there were twenty such, comprising a thousand truckmen. In an effort to rein in street chaos, moreover, a 1799 state law required that carts, carriages, wagons,

and sleighs keep to the left when passing other vehicles; the city adopted a like ordinance in 1800.

Like bakers and butchers, cartmen were ambivalent about municipal regulation, though in general they found paternalism in their interest. The freemanship requirement, dropped for others, continued in effect for carters, protecting them against competition from farm-based laborers, Irish immigrants, and black slaves. On the other hand, cartmen complained that by issuing so many licenses, the city created excessive competition and lowered their incomes, keeping many on the edge of subsistence.

SHAKING HANDS WITH DEATH

In 1793 an epidemic of yellow fever battered Philadelphia, and compassionate New Yorkers raised five thousand dollars for the suffering city. There was, however, no agreement on what caused the yellow fever (in fact, the agent was a virus transmitted by the *Aedes aegypti* mosquito), and in a politicized era the dispute quickly took on political overtones. Federalists tended to depict it as a foreign contagion—the biological counterpart, so to speak, of French Jacobinism. Republicans answered that it was the product of “nauseous stench” rising up every summer from the city’s “abominably filthy” waterfront and other unsanitary conditions for which only the negligence and incompetence of Federalist magistrates were to blame. Yet etiological positions were not rigid. Many merchants, generally Federalist in their politics, preferred to fault the local environment rather than imported contagions, which could lead to trade-disrupting quarantines. Indeed, virtually every city body that addressed the problem chose to sidestep the controversy by advocating *both* quarantine and sanitation.

In 1793 the predominately Federalist municipal government established a semiautonomous Health Committee, composed of aldermen and citizen volunteers, which cut off communications with Philadelphia, presumed source of the pestilence. Committee inspectors patrolled the waterfront with full power to turn away or quarantine persons as well as goods arriving from that city. In close conjunction with these efforts, the committee also set out to track down “Nuisances in this City,” such as the “dead horses, dogs, cats, and other dead animals lying about in such abundance, as if the

inhabitants accounted the stench arising from putrid carcasses a delicious perfume,” as one letter to an editor put it sardonically.

The fever passed by in 1793, and the following year Governor George Clinton officially reinsitituted the Health Committee. The group in turn got the Common Council to lease Bellevue, a rustic estate owned by Quaker merchant Lindley Murray that overlooked the East River north of the settled city, for the use of fever victims.

In 1795 yellow fever was reported to be widespread in the West Indies. Early summer, while hot and humid, passed uneventfully, though Dr. Valentine Seaman noticed (without understanding the significance of his observation) that “musquitoes were never before known, by the oldest inhabitants, to have been so numerous as at this season, especially in the *south-eastern* part of the City.” In mid-July, the health officer was summoned to attend three sick seamen aboard a vessel in the East River. He caught the disease and died eight days later. More cases surfaced on the waterfront. The Health Committee denied any occasion for alarm, but many wealthy men sent their families out of town in August. Then the number of cases shot upward, touching off a mass September exodus. Well-to-do residents shuttered their businesses and decamped for Greenwich, Harlem, and other nearby country villages, leaving thousands of unemployed mechanics and laborers to fend for themselves. Health Committee members made daily rounds, giving medical treatment, distributing relief, and sending victims up to Bellevue. The fever burned on through October until cool weather brought a sharp reduction in mortality, but by then the epidemic had claimed a record 732 victims—and had proved, according to Mayor Richard Varick, “most fatal among the poor emigrants, who lived and died in filth and dirt.”

Milder outbreaks followed in the summers of 1796 and 1797, during which the Health Committee removed the sick to a new “pesthouse” on Bedloe’s Island, while at the same time moving to purchase Bellevue outright, as well as the adjoining property of merchant Samuel Kipp, for an isolation hospital. The legislature, meanwhile, created a permanent Health Office, staffed by commissioners selected by the Council of Appointment, and gave it the right to make and enforce ordinances for cleaning the city.

In 1798, amid frantic preparations for war with France, the fever slammed into New York with greater fury than ever. The first cases came to

light at the end of July, again in the dock areas by the East River. Within weeks every resident able to do so had fled, crowding into “every vehicle, from the humble dungcart to the gilded carriage” to escape, as Grant Thorburn described the scene, “fear quickening their pace, and the destroying angel at their heels.” Left behind were the poor and dependent, many made destitute by the death or incapacity of the household wage-earner. The doctors of New York remained on the job—twenty of them falling victim to the fever—while the new state health commissioners, aided by zealous watchmen, carted the sick up to Bellevue and established three “cook houses” where the poor were given soup, boiled meat, and bread. At the peak of the epidemic in September and October, sixteen hundred to two thousand were fed each day, and another eight hundred at the almshouse, the cost covered by Common Council appropriations and donations from wealthy merchants and other towns. Thorburn too stayed on, making nails for a Warren Street carpenter who was trying to keep up with the demand for coffins; two little boys hawked the pine boxes around town on a bandwagon, stopping at intersections to sing out, “Coffins! Coffins of all sizes!” “Death and we shook hands so often in those times,” Thorburn recalled, “that his bony fingers appeared as soft as a lady’s glove.”

When the crisis finally passed, the disease had claimed 2,086 lives—close to 5 percent of the population. While a number of prominent citizens lay dead, Melancton Smith and printer Thomas Greenleaf among them, the great majority of victims, as in previous epidemics, were poor. Many were buried in the new potter’s field, just opened in 1797, to the north of town on the site of today’s Washington Square.

Shaken by this catastrophe, the Common Council established a committee to investigate its causes. Their report, made public in 1799, came down hard on unsanitary conditions, attributing the disease to “filthy sunken yards” filled with offal, putrefying matter in pools of stagnant water, damp cellars, foul slips, decayed docks, open sewers, and overflowing privies. The report called for sweeping reforms, which it admitted would inconvenience and abridge the property rights of citizens. But the public welfare came before individual rights, the committee concluded, and the Common Council should have “great and strong power, to clean up the city.”

The Common Council drafted a bill for the legislature embodying virtually all the recommendations. The legislature enacted it promptly, and in the next few years municipal authorities would embark on a series of unprecedented interventions in hitherto private affairs. (The state also passed a new quarantine act in 1799 and built a quarantine station on Staten Island, at Tompkinsville. By 1800 the first buildings of the new Marine Hospital were ready to receive fever victims and to accommodate sick passengers removed from incoming vessels.)

While these initiatives were underway, fever flare-ups remained mild until the summer of 1803, when again, one physician wrote, “the wealthy early abandoned the city, and the poor are daily falling victims to its ravages.” The state-appointed Health Commission did excellent work, but in the wake of this latest epidemic the Common Council decided to establish its own Board of Health, to be headed by Mayor De Witt Clinton. The legislature agreed and ceded all powers to the new body, including the authority to order any vessel into quarantine. The city supplemented the new Board of Health with an even more novel office, that of city inspector. Its mission would be to gather information about public nuisances and propose ordinances to “remove or correct” them, in order to ensure “the future health of the City.” The task was soon assigned to John Pintard, who had on his own been collecting mortality statistics for the city since 1802. At his urging, the Common Council soon expanded the city inspector’s tasks to include maintaining a Register of Births and Marriages and keeping a record of admissions and deaths at Bellevue.

The first Board of Health was constituted just as the epidemic of 1805 broke—during which time, Pintard reported, twenty-seven thousand of the city’s estimated seventy-five thousand residents fled town, most to Greenwich Village, taking along the Customs Office, the post office, and the offices of many newspapers and businesses. The Board of Health didn’t hesitate to use its powers, and the Common Council backed it up with a virtually unlimited expense account. The board evacuated all contaminated streets near the East River and set up tents and barracks at Greenwich and Bellevue for anyone who couldn’t afford to rent temporary quarters. This proved effective, though the Board didn’t know why (evacuation left no one for the infected mosquitoes to bite).

After 1805 yellow fever disappeared from New York for fourteen years. While this probably had more to do with a parallel decline of the disease in the West Indies, it was due in part to the burst of municipal action triggered by the disaster of 1798, above all a drainage campaign that might have reduced, albeit inadvertently, breeding places for mosquitoes.

EXCREMENT AND FROG-SPAWN

When city authorities cast about for possible sources of pollution, they didn't have to look much farther than the no-longer Fresh Water Pond. The seventy-acre-wide, sixty-foot-deep spring-fed basin where the Lenapes had once caught fish and killed ducks was, by 1800, what one contributor to the *Daily Advertiser* termed "a shocking hole . . . foul with excrement, frog-spawn and reptiles." Nearby residents had made the pond a "very sink and common sewer. It's like a fair every day with whites, and blacks, washing their clothes, blankets, and things. . . suds and filth are emptied into this pond, besides dead dogs, cats," and the like. Worse yet were the potteries, breweries, tanneries, rope-walks, and furnaces that lined the pond's southern and eastern banks. Landed and mercantile interests meanwhile complained that runoffs from the pond fed a stretch of marshes and swamps between modern Chambers and Canal that nearly cut the island in two, blocking the northward flow of population. One outlet, a sluggish stream, ran along modern Canal Street before losing itself in the swampy wooded salt marshes known as Lispenard's Meadows, where for decades gentlemen had taken guns and dogs to shoot woodcock and snipe. To the southeast, a second outlet ran through a smaller tidal marsh, still known as "the Swamp," and along the course of Roosevelt Street, a foul muddy alley, to the East River.

The city had been eyeing these obstacles for some time, and in 1791 it purchased all claims to the pond from the heirs of Anthony Rutgers. It could not, however, decide on what to do next. Some advocated a Venetian strategy: making the pond into an inland harbor by cutting broad canals to both rivers. Others wanted to embark on a giant real estate development. But in the aftermath of the 1798 epidemic, the health commissioners pressed for and got a Common Council decision to drain the swamps, then in 1803 ordered the Fresh Water itself filled in. A drain was cut through the marsh along the line of present-day Canal Street to carry off water from the

underground springs that fed the pond and meadows. Then Bunker Hill, east of Broadway on what is now Grand Street, was leveled and its earth and stone dumped in the pond. By 1807 the pond was “rapidly turning to dry land”; by 1813 (some say 1815) it had disappeared.

But not completely. Although the springs remained (as they do to this day), the landfill process, having ignored the old watercourses, upset the area’s natural drainage. The result was a boggy tract that oozed and sank unevenly. The principal street across it—first called Collect, later Centre—had to be laid with planks to be passable, and the cellars of the buildings that soon covered it were constantly full of water.

To correct the situation, the Common Council had an eight-foot ditch dug down the middle of Canal Street to convey storm water from the Collect Street area to the Hudson. Because the canal didn’t flow swiftly enough, however, it became a stinking open sewer. When the city covered it over in 1819, the engineers failed to install air traps, and it became a stinking closed sewer.

Canal Street was not the only pathway along which New Yorkers were forced to hold their noses despite dramatic new cleanup efforts by fever-fearing municipal authorities. The 1798 post-epidemic report had urged the city to assume direct responsibility for cleaning the streets, rather than leaving the job to individual householders, and in 1798 it created a Street Commission. The commission hired carts and laborers to clear the streets of dirt, manure, and offal twice a week. In 1802 a separate Superintendent of scavengers was appointed to oversee the collection of garbage. The sweepers and scavengers were never particularly effective, however, and the city continued to rely heavily on its ever-present hogs to clean up.

Human excrement compounded the problem. Backyard privies routinely overflowed, sending their effluvia to mix with street debris and storm water in polluted puddles. In 1800 the city required that all privy pits on the east side be cleaned out, a labor largely undertaken by poor blacks attracted by the wages, but even then problems remained. Night soil was still dumped in the river, and the haphazard construction of docks and slips had so obstructed the natural movement of water that the noxious mass piled up along the waterfront, generating nauseous stench in warm weather. Under the 1799 legislation, the Common Council had the power to require renovation of piers and wharves, with alterations to be assessed against the

property owner; this brought some relief, but it was not a real solution. Only sewers that went beyond conveying excess storm water to carrying human wastes might do the job. And although an 1803 report on the London sewer system sent back by Rufus King, ambassador to England, was well received, nothing came of it, because only indoor water closets could supplant privies, and they in turn were dependent on a nonexistent supply of water.

WATER

New Yorkers were keenly aware that the city had a water problem. The 1798 postepidemic report had blamed many of the city's health problems on the lack of plentiful fresh water. Some citizens began agitating to revive a municipal waterworks project that had been launched just before the Revolution.

In 1774 Irish-born civil engineer Christopher Colles had begun construction of a thirteen-mile conduit system of bored pine logs, connected to a well and pump just west of the (still) Fresh Water Pond. War intervened and the project lapsed. By the 1780s contamination of Manhattan's underground streams had fouled nearly every source of drinking water, except Colles's waterworks and the privately owned Tea Water Pump on Chatham Street, and they too were worsening rapidly.

When citizens called on the Common Council to revive Colles's project, however, the authorities demurred, pointing to the expense involved. The populace pressed on, and many inhabitants signed a petition in 1788 requesting the city to begin laying pipes; again the corporation pled financial inability. Then came the epidemics, the 1798 report that called for a fresh water supply, and the launching of a public effort by Philadelphia. Responding to proposals for an aqueduct from the Bronx River, the Common Council now approved a municipal waterworks and drafted a bill for the legislature's approval, explicitly disavowing a for-profit solution on the grounds that such an enterprise would "not be undertaken by a Company unless upon the Prospect of considerable Gain; and that such Gain must be acquired at the Expense of the Qty." Aaron Burr, John Murray (president of the Chamber of Commerce), and Peter H. Wendover (president of the Mechanics Society), argued that the aldermen should abandon their plan in favor of a privately operated water company, a

position Alexander Hamilton hammered home to the Council in a separate concurring opinion. Within weeks the Federalist-controlled legislature had approved a charter of incorporation drafted by Burr, for the Manhattan Company. The charter empowered the company to build dams, dig wells, divert streams, lay pipes, and do whatever else might be necessary to supply the city with fresh water (which, it was generally assumed, would be tapped from the Bronx River, as per the city's original plan). A crucial, vaguely worded clause also permitted the company to use its surplus capital for any "monied transactions or operations" consistent with the law—including trade, insurance, and, Burr's real object, a bank.

Burr and his wealthy backers had long been interested in launching a third bank in the city. The Bank of New York and the local branch of the Bank of the United States (known to all simply as "the Branch Bank") had done very well since the outbreak of war in Europe, both moving into larger quarters before the end of the decade. Yet their clubby, interlocking directorates and their habit of loaning money only to shareholders had given rise to much discontent in countinghouses around town. There was ample capital for a third bank too, but Burr and his associates, worried that the two existing banks would fight if the legislature tried to create a third, devised the idea of using the water company as a front. No one was really fooled, in any event, and by September 1799 the bank of the Manhattan Company (forerunner of the Chase Manhattan Bank) was up and running. It soon proved extremely profitable.

The waterworks were another story. The Manhattan Company had no intention of tying up its capital in an expensive Bronx River Aqueduct and instead revived the Colles project, sinking new wells at Reade and Centre, right near the anything-but Fresh Water Pond. Although engineers urged iron pipes, the company, keeping the interests of its stockholders uppermost, opted for cheap hollow logs. And despite estimates that New York needed three million gallons a day—for which the city plan had envisioned a reservoir of a million gallons—the company erected on the north side of Chambers Street one that would hold only 132,600 gallons, then, perhaps in compensation for its fundamental inadequacy, grandly decorated its facade with four Doric columns and a statue of Oceanus standing guard. Instead of buying a steam engine, it made do with a

horsepowered pump. By mid-1800 it had laid but six miles of pipe, which supplied only four hundred homes with water.

Complaints mounted rapidly—of inadequate delivery, of the company's refusal to provide water to flush gutters, of its unwillingness to pipe water into the markets, of its habit of not filling in streets it dug up. Burr was removed from the board of directors, but his replacement and soon-to-be company president De Witt Clinton, himself one of the leading investors in the enterprise, proved to be no more public-minded. Indeed, after he became mayor in 1803, Clinton routed a bill through the Common Council stipulating that all city funds be held by the bank of the Manhattan Company, and despite now vociferous outcries at negligent management and insufficient facilities, a Democratic-Republican state legislature renewed the charter in 1808.

Thanks to Burr and his cohorts, who had hijacked a civic movement in order to launch a profit-making venture, New York would remain without a decent water supply for another four decades, the city would grow steadily dirtier as it grew steadily bigger, and in the not too distant future it would again be visited by yellow fever and even deadlier plagues.

FIRE

The Manhattan Company didn't do much to help the city's efforts at expanding its firefighting capacity either. While in the beginning it refrained from charging the corporation for the use of its water in putting out blazes, its system was so limited that it reached only a small portion of the city. Also, it had no hydrants, only hard-to-find and harder-to-open fire plugs, forcing firemen to drill holes in the wooden mains to gain access.

The city nevertheless pressed ahead, energetically expanding its activities, though not to the extent of establishing a professional fire department. (The Fire Department of the City of New York, established in 1791 and incorporated in 1798, was not a municipal agency but rather an organization for the relief of disabled and indigent firemen and their families, to which the city contributed money from fees and chimney fines.)

What the city did do, in 1791, was pass an ordinance appointing fire wardens in each ward, who entered houses to check fireplaces and stoves and to make sure that each had its requisite number of leather fire buckets.

Apart from the three hundred men named from among the freeholders and freemen to man the seventeen engine companies and two hook-and-ladder brigades, every citizen was required to turn out, buckets in hand, and assemble into bucket lines under the supervision of the wardens. The mayor, recorder, and aldermen were also expected to show, and they were supplied with special white wands, five feet long and topped by a gilded flame, to help direct the action.

In December 1796, however, a big fire swept through the commercial district and destroyed a million dollars' worth of stores and merchandise, prompting city officials to adopt more effective approaches. In 1799 New York imported from Hamburg "two fire Engines with long Hoses, to convey Water from the River into the interior of the City," and created Supply Engine Company No. 25 to man the new machines. Hoses, connected from one engine to another, soon proved more efficient than bucket lines, and after another great fire, in 1804, the Common Council redoubled its efforts to add engine companies. In 1806 it obtained authority from the legislature to pull down or blow up buildings to stop the progress of a fire. By 1807 City Inspector Pintard reported that the city's firefighting force, under direction of a chief engineer, now included seven engineers, forty-eight fire wardens, thirty-six hook-and-ladder men, and 778 men to work the fire engines. It also invested in new equipment, soon acquiring 13,087 feet of hose. By 1811 bucket lines, and with them the colonial-era reliance on mass mobilization of the citizenry, were a thing of the past.

The municipality's growing involvement in firefighting was echoed by its increased commitment to regulating construction. A statute requiring that new buildings be made of brick or stone and topped with slate roofs had been passed back in 1761, but its implementation had been postponed repeatedly. State laws of 1791 and 1796 resurrected the rules, and in 1801 the city got the legislature to grant it even more sweeping regulatory authority. Henceforth it could appoint surveyors to see that all new buildings (as well as streets, wharves, and slips) were constructed in a manner laid down by the Common Council: builders had to obtain certificates before starting work and adhere to city codes governing the quality of building materials.

The city also received authority to make property owners correct or improve existing structures. An act of 1800 allowed the Common Council, within certain designated areas, to buy, at fair valuation, any houses or lots below city standards and dispose of them in such manner as “will best conduce to the health and welfare of the said city.” Municipal authorities even won the right to tear down houses and oversee the erection of “proper & wholesome Buildings thereon”—apparently the city's first warrant to engage in slum clearance—though in the next decades such powers were usually exercised only in the case of abandoned buildings. The Board of Health, for its part, was given the right to enforce hygienic standards that went beyond issues of simple cleanliness to matters of population density. An 1804 Common Council ordinance regulating lodging houses was the first piece of legislation to specify maximum densities in housing.

Municipal powers were likewise expanded to include oversight of existing and future roads. In 1793 systematic house numbering and street signs (“direction boards”) were introduced, helping to rationalize the city's

built environment. The next year, one of intensely anti-British excitement, brought some overdue change in street names too. King, Little Queen, Prince, Princess, and Duke became Liberty, Pine, Cedar, Rose, Beaver, and Stone, respectively. Eventually, several dozen city streets would be named or renamed after Revolutionary heroes and other patriot worthies: Broome, Clinton, Duane, Franklin, Gansevoort, Greene, Horatio (Gates), King, Lafayette, Madison, Mercer, MacDougal (Street and Alley), Magaw, Montgomery, Sullivan, Thompson, Varick, Washington (Fort, Mews, Place, and Square), Willet, and Wooster, among others. A considerable number of Tory street names remained unchanged, however, including Beech, Cornelia, Desbrosses, Delancey, Abingdon, Fort Charles Place, Great Jones, Hanover, Nassau, Oliver (De Lancey), Pell, Pitt, Prince, Rivington, and Warren.

Strategic improvements were effected on key routes. In 1796 the city horse market was removed from Wall Street. In 1802 the Common Council pushed to have the main roads leading in and out of town “turnpiked” (paved). Broadway was extended north and regulated up to Canal—which involved leveling a fifty-foot-high hill at Duane Street—and then on till it intersected the Bowery at 14th Street. The Bowery, meanwhile, was turnpiked from Bullock (Broome) Street on up to the forks of Kingsbridge and Bloomingdale roads, at modern-day 233rd Street, and another two new bridges were thrown across the Harlem River. Finally, and most grandly, in 1804 the corporation decided to regulate the city’s future expansion and ordered the commissioner of streets to prepare a plan for “new streets hereafter to be laid out and opened.”

POVERTY

Via the commissioners of the almshouse, the municipality continued to provide outdoor relief—usually food, clothing, and firewood—to residents pitched into temporary dependency. In February 1796 the commissioners visited and subsidized forty families, “either by giving them money, where they supposed they might be trusted with it, or by leaving orders on neighboring grocers.” In addition, they supported, as of 1795, 622 paupers inside the almshouse, including the aged, lunatic, and blind. Some residents had been there for decades, like blind Susana Wilson, who had entered in 1761.

Between the mid-eighties and the mid-nineties, the almshouse budget soared from \$12,500 to over \$29,000, far exceeding all other municipal expenditures. A report to the mayor and aldermen by the commissioners of the almshouse in 1796 said: “We cannot help being alarmed at the enormous and still growing expense of this department, arising not so much from the increase of our own poor, as from the prodigious influx of indigent foreigners in the city,” especially the Irish, who often wound up in the almshouse. The almshouse, however, was falling apart. By 1796 there were 770 dependents in a sixty-year-old building capable of handling half that number. It was agreed that the structure was in such “Ruinous Condition” that repairs were useless. The state legislature authorized a municipal lottery, and in 1797 the new three-story, \$130,000 almshouse (on the site of today’s Tweed Courthouse) was ready for occupants. Yet it was soon as outrageously overcrowded as its predecessor—by January of the following year it housed a record nine hundred paupers—and the Common Council began debating the possibility of erecting an enormous new edifice up at Bellevue.

Governor Jay proposed more immediate relief. Reacting to pleas from municipal officials, Jay urged the state legislature to assume some financial responsibility for alien dependents, suggesting they be treated as “the poor of the state.” The 1798 legislature agreed and authorized a 1 percent tax on auction sales in New York City to support the “foreign poor” there. The law also supported Manhattan’s first efforts at professionalizing the administration of relief, by allowing the Common Council to appoint and pay commissioners. After 1800 these commissioners in turn delegated direction of outdoor relief to an almshouse superintendent and his hired aides. By 1802 the city was spending thirty-five thousand dollars on outdoor relief alone, better than twice as much as a decade earlier.

Beyond this, authorities wouldn’t go. In the winter of 1804 City Inspector John Pintard told the council that winter fuel shortages were becoming endemic and that it was the “duty” of municipal government to relieve the situation. He urged the council to buy five hundred cords of firewood before winter then resell it according to ability to pay, using robust paupers from the almshouse to saw, stack, and deliver. The aldermen rejected the proposal, only to find that very winter an ice-clogged harbor forcing suspension of fuel deliveries from Westchester and New Jersey. In

the ensuing crisis, committees of volunteers in each ward distributed fuel and food to the needy (fifty-four hundred persons were aided in just one week in January). But in June of that year, when warm weather had returned, Mayor Clinton authorized the chief marshal and his fortyplus deputies to round up “all idle Strollers, Vagabonds and disorderly persons whom you shall suppose would become chargeable to the City.” The magistrates would give them sixty days in the Bridewell or transportation out of the city.

UP THE RIVER

Throughout these decades, as the city expanded its involvement in fire prevention, market regulation, sanitation, and poor relief, it also enhanced its police powers. Beside the marshals, it could call on an expanded constabulary, under the direction of High Constable Jacob Hays. Appointed by Mayor Livingston in 1802 to the position he would hold for nearly fifty years, Hays, of Jewish parentage though reared in the Presbyterian faith, would convert the job from its eighteenth-century role as a server of court writs into that of de facto police commissioner. Under his command were sixteen elected constables and seventy-two members of the watch.

Hays’s men increasingly absorbed the responsibility of the magistrates to maintain public order. The mayor and aldermen were still expected to appear at major disturbances to assert municipal authority, and while they still possessed considerable political and economic influence, the city was getting too big for such measures. In addition, upstanding citizens could no longer be counted on to rally on behalf of authority, any more than they could be counted on to show up with buckets at fires. Hays relied more on physical coercion than social deference to break up disturbances, plunging into crowds with his staff to seize individuals in a viselike grip and haul them off to jail.

The mayor and aldermen also drew back slowly but surely from the exercise of their judicial functions, giving rise to a de facto separation of powers. Under De Witt Clinton, the jurisdictional reach and number of meetings of the Mayor’s Court increased steadily, forcing him to turn its proceedings over to the recorder. He maintained his involvement in the Court of General Sessions, but there too specialization took hold, and the adjudication of petty criminal cases was spun off to new special justices of

the peace. Since 1798, moreover, a new Police Office had been established, in which police justices sat to examine all those detained overnight by the watchmen; this new layer of judicial officials heard complaints, examined witnesses, imposed small fines or penalties, and passed only the serious cases on to the higher courts.

For those placed in detention while awaiting trial for violation of municipal ordinances or state laws, or those few found guilty and sentenced to prison—only eighty-three during the ten years between 1784 and 1794—the destination was the old New Gaol (1759) on the northeast corner of the Common. Here too were incarcerated debtors, who were expected to pay for their own food, clothing, and fuel. At the northwest corner—separated from the New Gaol by the almshouse—sat the Bridewell, built on the eve of the Revolution, with space for 400 vagrants, disorderly persons, and prostitutes. This creaky, colonial-era institution was about to undergo a transformation, however.

In 1764, an Italian nobleman named Cesare Beccaria had published his landmark *Essay on Crimes and Punishments*, denouncing inhumane punishment as both the major cause of crime and an instrument of despotism. During the seventies and eighties Beccaria became a pillar of enlightened opinion on both sides of the Atlantic. His ideas influenced John Howard, an English penologist who fought the death penalty and advocated imprisonment at hard labor in place of corporal punishment. Howard and Beccaria in turn fired the imagination of Thomas Eddy. Born in Philadelphia in 1758 to a prominent family of Tory sympathizers, Eddy had settled in New York after the Revolution and become a successful insurance broker, a Federalist, a Quaker philanthropist who promoted a variety of humanitarian causes (including antislavery), and a commissioner of the almshouse. In the mid-1790s, Eddy marshaled politically influential acquaintances—Philip Schuyler and George Clinton, among others—to reform the state's antiquated criminal code. It was, he said, a relic of "barbarous usages" and "monarchical principles" ill suited to "a new country, simple manners, and a popular form of government."

The idea was to replace a system of harsh laws, mitigated by frequent grants of clemency, with milder statutes and fewer pardons. There were good practical as well as ideological reasons for modernizing the criminal code. It had, for one, patently failed to stop criminal behavior. The list of

offenses punishable by death in New York had grown longer and longer during the eighteenth century and by Eddy's day had come to include housebreaking and malicious mischief as well as murder; lesser infractions were punished by lashing, branding, flogging, and the pillory (though a 1785 city ordinance had given magistrates limited authority to substitute confinement at hard labor in the Bridewell for corporal punishment). Even so, the incidence of crime in every category had seemed to rise at least as rapidly as the city's population, and its law enforcement officials had real trouble keeping up. In certain neighborhoods their authority had virtually evaporated. One resident later recalled that this was a time when "no man would venture beyond Broadway towards the North River by night without carrying pistols, and the watchmen marched on their beats in couples; one to take care of the other."

Eddy now proposed to use imprisonment as an alternative to corporal punishment. In New York, as elsewhere, prisons had always been thought of only as places to detain idle and suspicious persons, vagrants, and debtors. Soon after the Revolution, however, this notion had begun to give way before the arguments of Beccaria and Howard—not merely that prisons could also be employed to punish, correct, and deter lawbreakers but that they were the most humane, effective, and politically appropriate means of doing so. After all, what more fitting penalty could a republican people impose on those who violated its laws than the loss of their personal liberty?

Eddy's reform campaign bore fruit in 1796 when the state legislature abolished corporal punishment and trimmed the number of capital offenses from sixteen to three (treason, murder, theft from a church). Persons convicted of lesser crimes like burglary and arson were to be sentenced to hard labor in Newgate Prison, the state's first penitentiary, which stood on the Hudson River shore at the foot of Amos (now Roth) Street in Greenwich Village. Named warden when it opened in November 1797, Eddy saw Newgate as a historic opportunity to prove that a rational legal system, affording certain yet humane retribution for infractions of the law, would actually reduce crime and promote public virtue. To that end, he arranged religious and moral instruction for all inmates while subjecting them to strict discipline. Those who responded positively won special privileges; those who didn't wound up in solitary confinement, which Eddy considered

a progressive way to make prisoners “perceive the wickedness and folly” of their conduct, experience “the bitter pangs of remorse,” and prepare themselves for “future amendment.”

Newgate Prison from Greenwich Street. “Unseen from the world,” according to a contemporary account, evildoers here “expatiate their transgressions in contrition and repentance.”
(© Collection of The New-York Historical Society)

In reality, Newgate was a fiasco. Designed to house 432 inmates in fifty-four eight-person cells, it soon became overcrowded, dirty, pestiferous, and violent. Its inmates resisted prison regulations and failed to work together productively. (Eddy himself described them as “wicked and depraved, capable of every atrocity, and ever plotting some means of violence and escape.”) Many were West Indian blacks—the “French Negroes”—who had a history of opposition to white authority. About 20 percent of the prison’s population, moreover, were women. They had separate quarters and exercise facilities, but their presence made for trouble. “The utmost vulgarity, obscenity, and wantonness characterizes their language, their habits and their manners,” said one scandalized ex-con. “Their beastly salacity, in their visual amours, is agonizing to every fibre of delicacy and virtue.”

Frequent riots—no fewer than four in its first seven years of operation alone—caused severe damage to prison buildings and at least several

fatalities among the inmates. Breakouts grew so common that the city formed a special squad of armed watchmen to surround the prison at night; after an especially serious riot in 1804, the public outcry forced Eddy to resign.

DEPARTMENTS AND DEBTS

Despite the failure or limitations of some of its parts, the municipal-state administrative apparatus as a whole had been transformed by the time Eddy departed office. Where power had been almost completely centralized in a handful of magistrates at the time of Washington's inauguration, responsibility for various aspects of city government had now been parceled out to administrators with sharply denned duties. A superintendent of scavengers looked after the cleaning of streets, while their repair was the province of the Street Department. A Board of Health oversaw disease-related issues. A superintendent of wells and pumps concerned himself with water supply. A superintendent of public buildings and grounds (1800) had oversight of the Battery, the Common, and the potter's field (with his own force of special constables and marshals to prevent injury to trees or grass). The chief engineer looked after firefighting, the high constable ran the police force, the almshouse commissioners tended to poor relief, the city jailer dealt with correctional facilities, and the city inspector had a wide range of responsibilities, including the collection of municipal statistics. In 1801, the legal responsibilities of the recorder were transferred to a new official, the corporation attorney. That same year, some duties of the city treasurer were transferred to a new office of the comptroller, whose particular duty was to audit municipal accounts.

This growing division of labor among financial officers was accompanied by a profound shift in the way the city met its expenses. The rising cost of poor relief, police, jails, street cleaning and repair, fire equipment, lamps, wells, and the compensation of public officials had quadrupled the city's budget between 1790 and 1800 alone, driving per capita expenditures up from \$1.87 to \$4.29. To pay for it all, the city drew on two funds. The first, its revenue account, consisted primarily of receipts from corporate properties, franchises, and fines—including income generated by slips, docks, markets, the rental of corporation lands, and, particularly lucrative, the monopoly income gained from leases to ferry

operators plying the East River between Peck Slip, Fly Market, and Catherine Slip and various points on the Brooklyn and Queens shorelines. The second fund, its tax account, consisted mainly of income from state-authorized taxes and from a liquor excise levy.

At first, the city drew most of its income from revenues, but as its initiatives and expenses mounted, it began calling on the state ever more routinely for authorization to tax. In 1787 the mayor, recorder, and aldermen were constituted as a Board of Supervisors to set tax rates when special levies were allowed; the board in turn appointed city tax assessors. Soon the bulk of the city's income was coming not from the corporation's private "estate" but from taxes. In 1800 they amounted to \$112,000.

Still the city's income couldn't keep pace with its spending. To cover the shortfall the corporation began to borrow—mainly from the Bank of New York—to cover specific contingencies, such as the costs of dealing with yellow fever, building a new almshouse, or acquiring Bellevue and the lots for a new potter's field. Sometimes the city borrowed in anticipation of forthcoming tax returns. Finally, in 1812, the city was allowed to set up a permanent bonded debt of nine hundred million dollars at 6 percent interest, known as New York City Stock.

CITY HALL

All of this activity—constructing wharves, fighting fevers, draining swamps, charting the future development of the city—had silently revolutionized municipal government, giving it, in practice if not yet in law, an increasingly "public" identity and legitimacy. Now the Common council decided that it needed a proper home. Nothing much was wrong with the old building down on Wall Street, elegantly renovated only a decade before. Nor was there a pressing need for additional office space. Government House, having served as the official residence of the governor, was currently being leased for a hotel and could easily have been pressed into service. What the council sought, rather, was the kind of public "ornament" that New Yorkers had never really given much thought to. The city's present wealth and future prospects now exceeded those of any other in the country, the council complained, but it lacked even a single public structure of suitable size and opulence.

The Common Council chose the Common or Park—recently fenced and lavishly stocked with a variety of shade trees—as the site for a new city hall, then held a competition for the building’s design. Twenty-six architects and builders, including the renowned Benjamin Henry Latrobe, submitted plans. The winning entry, awarded a prize of \$350, came from the firm of Joseph Francois Mangin and John McComb Jr.

Mangin was an *emigre* architect who had worked on the place de la Concorde in Paris and (allegedly) made his way to New York via Saint-Domingue in the midnineties. On Washington’s recommendation, he was commissioned to design fortifications for the city. Appointed city surveyor soon thereafter, Mangin, along with a German engineer named Casimer Goerck, prepared an official map of the town and projected new streets into the rolling meadows of northern Manhattan. By the end of the decade his credits also included Rickett’s Equestrian Circus on Greenwich Street, the Park Theater, and Newgate Prison in Greenwich. The exterior he and McComb proposed for the new City Hall clearly reflected his sense of scale and proportion.

Mangin’s role in the project soon faded, however. Nervous about expenses, the council insisted upon alterations—reducing the depth of the building, shortening its wings, and substituting Newark brownstone for marble on its rear (which was obscured by the nearby almshouse anyway). Maybe Mangin quit in a huff, maybe the council fired him for fighting the changes: one way or the other, he was out of the picture when construction got underway in the summer of 1803. McComb, his erstwhile partner, was now the supervising architect (at a salary of six dollars per day), and it was McComb who in the end got the credit for seeing the building through to completion eight years later (at a cost of half a million dollars—twice the initial estimate).

McComb, a home-grown “mason and master builder,” was to architecture in New York what Duncan Phyfe was to furniture—an enterprising artisan who would win fame and fortune purveying the new Federal style to the city’s propertied classes. In the facade of Government House, completed in 1791 when he was just thirty, McComb had combined a Georgian portico with four slender Ionic columns of the kind favored by the English architect Robert Adam. On the pediment above the roofline, along the cornices, and at the sides of the building, his judicious

deployment of pilasters, dentils, and other classical motifs created an effect that was up-to-date and elegant without being pretentious.

As the work on City Hall progressed, McComb achieved the same effect with even more convincing artistry. He deftly blended the principal elements of Mangin's French Renaissance facade—its palace-like horizontal massing, central pavilion, and swagged window panels—with Federal-style detailing derived from the design book of Robert Adam. Inside, inspired by plans of an English Palladian mansion, McComb created a magnificent rotunda that rises the full height of the building to a skylight at the center of the coffered dome. From the ground level of the rotunda, a pair of flying marble staircases sweep up to a second-story circular gallery ringed by Corinthian columns. In the wings that extend off the rotunda on both floors, McComb placed offices for the mayor and governor, the City Council chambers, and assorted other hearing rooms, committee rooms, and courtrooms, all finished with the moldings, swags, and pilasters that were by now his trademark.

When it was finally done, Benjamin Henry Latrobe sourly dismissed the new City Hall as a “vile heterogeneous composition . . . the invention of a New York bricklayer and a St. Domingo Frenchman.” Prevailing opinion, however, held that McComb had produced a masterpiece. As an emblem of the municipal corporation's enlarged sense of responsibility for the city's affairs—for its legitimacy as a “public” entity in a republican society—the building could hardly have been more apt.

Philosophes and Philanthropists

A year or so after Evacuation Day, Robert R. Livingston bought a house on Bowling Green—only to discover that the municipal corporation meant to sell off a dozen nearby lots fronting the Hudson River for commercial development. This was a terrible mistake, Livingston warned Mayor James Duane. The corporation should stop construction along the Hudson River waterfront, not encourage it. Ban new streets and wharves. Let the “opulent persons” living in this part of town close off Greenwich Street and extend their gardens all the way to the river. Thus, “instead of the noxious odor of warves & dram shops they will in the midst of a town enjoy the pure air of the country—Few among them are so tasteless or so interested [i.e., selfish] as to permit the sight of wretched houses smokey chimneys & dirty streets to shut off their prospect of one of [the] finest rivers in the world.”

Livingston’s attempt to find a home insulated from the seamier aspects of urban life was as yet far from typical among well-to-do New Yorkers. Like master craftsmen, they were accustomed to living and working in the same building, and the boundaries between “family” and “business” life, between “private” and “public” spaces, were highly porous. Every day their families rubbed elbows with customers and clients, clerks and apprentices, servants and slaves. Indeed the households of prominent merchants ranked among the largest work establishments of the eighteenth century. Typically the first floor contained a store or counting room, with patrons, employees, and family members alike moving freely through adjacent hallways and rooms. Not even the second-floor drawing rooms and bedrooms were ever completely sequestered from this traffic, and the third would be filled with children, clerks, and servants engaged in domestic as well as business-related chores. It was the same story out of doors, for commercial neighborhoods, like commercial households, were spaces shared by all classes. In 1790 merchants constituted only a third of the residents of the dockside area. The majority of their neighbors were artisans, shopkeepers, and the laboring poor.

After 1790, however, Livingston’s peers began to follow his example. The frequency of pestilential diseases, the increasing tempo of business, the

construction of ever bigger warehouses, the conversion of older residences into boardinghouses, the proliferation of artisanal workshops, and the profusion of shanties and cellars filled with impoverished Irish immigrants—all of these transformed the waterfront streets that wealthy New Yorkers had called home for a century or more. So, too, the impact of republicanism on class relations meant that gentlemen and their wives could no longer command an easy deference from the mechanics, sailors, and laborers living nearby. Thus, like Livingston, they decided to look for houses in less congested and troublesome parts of town.

More precisely, they decided to live and work in different places. Merchants transferred their countinghouses to their warehouses near the East River wharves, using the ground floors to sell and display goods while keeping the upper floors for storage. They then moved their families across town, into new residences whose richly ornamented interiors, generous yards, and many amenities—carriage houses, smokehouses, icehouses, liquor vaults, private pumps—were clearly designed for domestic isolation rather than trade. Once underway, the movement to separate home and work advanced rapidly. In 1800 one in ten merchants or professionals listed separate houses and workplaces in city directories. By 1810 better than half did so.

The west side of Manhattan meanwhile became New York's most exclusive quarter. Not only did this part of town lie within convenient walking distance of coffeehouses, storehouses, and offices, but thanks to recent municipal improvements it was acquiring certain unique charms as well. After razing Fort George, the city had extended Broadway through the site, erected a bulkhead from Battery Place to Whitehall Street, and installed a spacious walk along the water's edge shaded by elm trees. As early as 1793 civic boosters were hailing the emerging little park as "one of the most delightful walks, perhaps in the world," much frequented by the city's "genteel folk." Another local attraction was nearby Bowling Green, recently refurbished with brick or fieldstone sidewalks and planted with stately Lombardy poplars to replace trees lost during the war.

As early as 1786 a notice in one of the local papers called lower Broadway "the center of residence in the fashionable world," and over the next decade it would be lined with four-story Federal-style mansions occupied by Jays, Gracies, Delafields, Macombs, Lawrences, and Varicks.

(Hamiltons, Morrises, and Hoffmans lived close by on Whitehall, Beaver, and lower Greenwich streets.) “There is not in any city in the world a finer street than Broadway,” La Rochefoucauld proclaimed in the mid-nineties. “From its elevated situation, its position on the river, and the elegance of the buildings, it is naturally the place of residence of the most opulent inhabitants.”

The “opulent inhabitants” hadn’t entirely escaped their less affluent fellow citizens, for members of other classes lived on adjacent streets, virtually next door. Greenwich Street, for instance, was home to numerous artisans and shopkeepers as well as a small population of free blacks. Petty crime was a recurring problem, and by the turn of the century weekend crowds of working people converged on the Battery. There, as Washington Irving observed condescendingly, “the gay apprentice sported his Sunday coat, and the laborious mechanic, relieved from the dirt and drudgery of the week, poured his weekly tale of love into the half-averted ear of the sentimental chambermaid.” Newspapers deplored the parties of naked boys and young men who could always be seen swimming off the Battery in hot weather—an offense against refined sensibilities that the Common Council struggled for years to eradicate. Far more disturbing was the neighborhood’s vulnerability to disease. In 1799 Elizabeth Bleeker, who lived on lower Broadway, was shocked when a black man dying of yellow fever “came up our alley and laid himself down on the ground.”

In the early nineteenth century, Bowling Green was a center of fashionable society in the city. The fence encircling the little park still stands. (© Museum of the City of New York)

These plebeian intrusions didn't precipitate another patrician exodus, but some merchants, professionals, and prosperous master artisans did begin to drift a bit farther north, searching for houses that (as one builder advertised in 1803) were "in so healthy and airy a situation as to render retirement to the country unnecessary during the summer." Streets running west to the river were popular—Vesey, Barclay, Park Place, and Murray—especially where they fronted open spaces like the campus of Columbia College. Broadway north from Cortlandt Street attracted the likes of John Jacob Astor, who settled on Broadway in 1803, along with assorted Kings, Rutherfords, and Roosevelts. After 1806, when Trinity began requiring its tenants to build with brick rather than wood, genteel housing reached as far as Chambers Street, on the north side of the Park where City Hall was under construction. Indeed it was widely assumed, as the Common Council asserted, that "the Elegance and situation of this Building" would so increase the value of nearby real estate that it was destined to be "the center of the wealth and population of this City."

When the Englishman John Lambert passed through New York in 1807, the milelong stretch of Broadway from Bowling Green to the Park was firmly established as the axis of respectable society. At the lower end of the street, rich merchants and lawyers and brokers lived side by side in rows of “lofty and well built” town houses. Above them ranged block after block of “large commodious shops of every description . . . book stores, print-shops, music-shops, jewelers, and silversmiths; hatters, linen-drapers, milliners, pastry-cooks, coachmakers, hotels, and coffee-houses.” From eleven to three every day, Lambert remarked approvingly, the whole of Broadway from Bowling Green to the Park was the “genteel lounge” of New York, “as much crowded as the Bond-street of London” with strolling ladies and gentlemen turned out in the latest European fashions.

Few wealthy residents as yet were prepared to venture farther north, however—as Trinity Church found to its cost. Inspired by the soaring real estate market, the ever alert vestrymen decided to develop part of the old church farm near the Hudson River into an elite residential square of the kind that graced London’s West End. In 1807 the church obtained Common Council permission to enclose a grassy pasture bounded by Varick, Beach, Hudson, and Laight (near what is now the entrance to the Holland Tunnel). To lure the right kind of people so far from the center of town, the vestry hired John McComb to put up a suitably refined chapel in honor of St. John, facing the proposed square from the east side of Varick Street. McComb directed the building of St. John’s between 1803 and 1807 while continuing to supervise construction of City Hall, and it proved to be a gem of patrician neoclassicism. Its pedimented portico, supported by four Corinthian columns and topped by a 214-foot clock tower and steeple, made it the most imposing church in the city; its bells could be heard as far south as the Battery and as far north as Greenwich.

Delighted, the vestrymen of Trinity began laying out, grading, and planting their development on the opposite side of Varick. But Hudson Square, also known as St. John’s Park, failed to attract settlers. The vestry’s terms—ninety-nine-year leaseholds on lots surrounding the park—didn’t appeal to the city’s property-savvy upper classes, and except for a handful of stonecutters and other artisans who settled nearby, McComb’s church was left virtually alone in its pasture for another twenty years.

Genteel families would nonetheless venture farther north for summer homes. Some well-to-do city merchants even built or rented country estates for their families on Brooklyn Heights, from which Washington had so narrowly escaped a scant twenty years before. There they had everything—cool ocean breezes, stunning views of the harbor, and ready access to their places of business. “The men go to New York in the morning,” it was said, “and return . . . after the Stock Exchange closes.” Vacationers also flocked to places like Governors Island, Harlem, and even New Jersey; in 1797 President John Adams came up to Eastchester in the Bronx to escape the yellow fever in Philadelphia.

PARLOR SOCIETY

When James Watson, a wealthy merchant, decided to enlarge his Federal style residence on State Street, he hired John McComb, who embellished it in 1806 with a distinctive curved porch and graceful Ionic columns, purportedly carved from ships’ masts. (Watson’s house still stands, sole survivor of an entire block of elegant town houses that once faced the Battery.) The basic elements of the Federal style—brick facade, high stoop, recessed front door, discreet trim—were nonetheless inherently simple, and from the street it wasn’t usually so easy to gauge who occupied a residence or how it was being used. Indeed, the unpretentiousness of its dwellings was a matter of some pride to an elite that took republicanism seriously and eschewed much of the “reserve and *haut ton* so prevalent in the old country,” as visiting British astronomer Francis Baily put it.

A Federal-style townhouse, therefore, could easily be sheltering people in relatively modest circumstances. Between 1790 and 1820 master builders erected hundreds, probably thousands, of such residences for the prosperous master craftsmen, smaller merchants, and up-and-coming professionals who constituted the city’s middling classes. Other, almost identical domestic structures accommodated commercial or professional operations or had been recycled into boardinghouses. This very uniformity obscured significant and growing differences in wealth and power among residents of the city, and veiled as well important changes taking place within the buildings themselves.

One such change was the expanded use of genteel homes for socializing. In the seventeenth and eighteenth centuries, well-to-do New Yorkers were

accustomed to “entertaining” one another in taverns and coffeehouses (with results often verging on the riotous). They continued to do so in the early nineteenth century, taking advantage of the more commodious public rooms in new city hotels to host gatherings of the St. Andrew’s, St. George’s, St. David’s, Friendly Sons of St. Patrick, the German, St. Stephen’s, and New England societies. In 1792 a number of New York gentlemen founded what was perhaps the nation’s first country club, the exclusive Belvedere House, at what is now Cherry and Montgomery streets. It boasted an octagonal ballroom, two private dining parlors, two card rooms, a barroom, and overnight accommodations for members. Dancing-assemblies continued to play a crucial role in determining social status—an invitation from the City Assembly was more highly prized than one from the rival Juvenile Assembly. Subscription concerts were another draw, and at least seven fashionable musical companies—the New York Musical Society, the St. Cecilia Society, the Columbian Anacreontic Society, the Harmonica! Society, the Polyhymnian Society, the Philharmonic Society, and the Euterpean Society—flourished at one time or another during the eighties and nineties. Equally prestigious was the fancy new (1798) two-thousand-seat playhouse on Chatham Street (now Park Row) facing the Common. Designed by *emigre* engineer Mark Isambard Brunei, the Park Theater, as it came to be known, cost a princely \$130,000 and was specifically calculated for the comfort and convenience of the city’s respectable classes.

At the same time, however, the disappearance of clerks, clients, and customers from the genteel household facilitated the redeployment of its interior spaces for less public forms of socializing. Formal parlors, drawing rooms, and dining rooms acquired new prominence as the setting for gentlemen to entertain business associates as well as for those events—suppers, teas, receptions—with which their families solidified ties to others of similar wealth and status. With this shift, too, came a heightened emphasis on the role of upper-class women as domestic managers. On New Year’s Day, when city gentlemen threaded their way through the streets to call at one another’s homes, it was their wives and daughters who remained behind to serve food and drink to visitors—assisted by a growing domestic labor force. The ensuing demand for household help was largely responsible for the brief revival of slavery during the 1790s, after which it fostered the growth of “intelligence offices,” recruiting agencies for waged servants. By the early 1800s, upper-class women in New York were

expected to hire, train, and supervise swarms of household workers, overwhelmingly female, who cooked, served, cleaned, washed, drew water, hauled wood, mended clothes, minded children, and emptied the slops. It wasn't easy, either, as newly wed Eliza Southgate Bown discovered in 1803. "Mercy on me," she cried, overwhelmed by the myriad details of setting up a proper home, "what work this housekeeping makes! I am half crazed with sempstresses, waiters, chambermaids, and everything else—calling to be hired, enquiring characters, such a fuss."

LEARNED MEN AND CULTIVATED WOMEN

When the federal capital departed for Philadelphia, Manhattan's intellectual life suffered a grievous setback. Losing Thomas Jefferson would, alone, have been a blow to any cultured community. But New York had lost the entire federal establishment, something it could ill afford for, as one French traveler remarked, "this city does not abound in men of learning."

During the 1790s, however, would-be New York philosophes—primarily youthful merchants and professionals who aspired to be men of letters as well as men of affairs—began to create associations to incubate a worthy municipal culture. In the parlors of their new town houses, and in Manhattan's taverns and coffeehouses, earnest young men gathered to debate and discuss literary, political, and scientific ideas in their Uranian, Horanian, Calliopean, Law, and Philological societies, or their Sub Rosa, Turtle, Black Friars, and Belles Lettres clubs.

The most fruitful of these group efforts at civic and self-improvement was the Friendly Club, creation of Elihu Hubbard Smith, a twenty-two-year-old, Yale-educated physician who came down to New York from Connecticut in 1793 to join the staff of the New York Hospital. Smith soon became acquainted with a handful of other ambitious men just embarking on what would prove to be distinguished careers. Among them were William Woolsey, future financier and corporate president; James Kent, soon to be one of America's leading legal scholars and chancellor of New York State; and William Dunlap, who as playwright, theater manager, and drama critic would help establish the professional stage in the city.

In addition, Dr. Smith linked up with Dr. Samuel Latham Mitchill, Manhattan's closest approximation to a native renaissance man. In 1797

Smith and Mitchill collaborated on launching the *Medical Repository*—the country’s first professional journal of medicine, and a source of original scientific essays, book reviews, and reports on scholarly work in Europe. The versatile, Hempstead-born Mitchill had attended King’s College, received his medical degree from Edinburgh in 1786, then served as surgeon general of the state militia. After the Revolution he became “Professor of Natural History, Chemistry, Agriculture, and other Arts Depending Thereon” at Columbia; cofounded, with his good friend Robert R. Livingston, the New York Society for Promoting Agriculture, Arts, and Manufactures (1791); carried out the first geological survey of the Hudson River Valley; promoted sanitary reforms in the city; helped found the College of Physicians and Surgeons in 1807; and served, as an ardent Jeffersonian Republican, three terms in the state assembly and thirteen years as U.S. congressman and senator.

Sometime near the end of 1793, Smith’s formidable coterie formed themselves into the Friendly Club and embarked on a program of intellectual improvement. Once a week for the next five years, members assembled in one another’s private lodgings or in taverns to discuss literature, science, philosophy, and politics. As inhabitants of what Smith liked to call the “republic of intellect,” they avidly explored the most progressive ideas of the age. They pored excitedly over William Godwin’s *Inquiry Concerning Political Justice* (1793), an electrifying attack on monarchy and property. They rejected the “vulgar superstitions” of Christianity, according to James Kent, and cast their lot with deists.

One of the most popular subjects to occupy the all-male membership of the Friendly Club was the rights of women. The works of European feminists were readily available in the United States by the mid-nineties. Many Manhattanites thrilled to Mary Wollstonecraft’s *Vindication of the Rights of Women* (1792), her generation’s most articulate statement of what women deserved and what they might become with equality. Only a year or two after its initial publication, pamphlets for and against Wollstonecraft were standard fare in New York bookshops. Newspaper and magazine editors openly competed for readers of “the fair sex” by reprinting excerpts from the *Vindication* and running lengthy exchanges between its critics and defenders. Articulate and well-informed women sent in essays to local newspapers and magazines, disputing offensive characterizations of female

intelligence, attacking the sexual double standard, challenging legal and political discrimination, and questioning the institution of marriage. In 1796 Wollstonecraft's partisans got their own periodical, the *Lady and Gentleman's Pocket Magazine of Literature and Polite Amusement*, which promoted women's rights with zeal, though not profitably enough to keep it from going out of business after a few issues.

In 1798 the Friendly Club persuaded Charles Brockden Brown to move up from Philadelphia. Described sometimes as the first American to make a profession of literature, Brown was a catch—an authentic man of letters, widely read as well as sociable, whose views owed much to both Wollstonecraft and Godwin. During his three-year residence in the city, besides publishing two novels with female protagonists, *Wieland* and *Ormond*, Brown produced an influential women's rights tract entitled *Aleuin: A Dialogue*.

Against this background, well-to-do New York families began to place a higher priority on the education of young women. How, it was asked, could respectable wives and mothers contend with their new social and managerial responsibilities without some degree of formal schooling? How could they inculcate republican virtue in their children without some knowledge of history, natural science, and philosophy? Aaron Burr, who had pronounced Wollstonecraft's *Vindication* "a work of genius" and vowed to read it aloud to his wife, had their daughter, Theodosia, tutored in Latin and Greek; at the age of nine she was reading two hundred lines of Homer and half a dozen pages of Lucian every day. The Jays, Kents, Duanes, and other prominent families shipped their daughters off to one or another of the many new female boarding schools that had sprung up around the country since independence (the three most favored by New Yorkers being the Moravian Young Ladies Seminary in Bethlehem, Pennsylvania, the Philadelphia Young Ladies Academy, and Miss Pierce's School in Litchfield, Connecticut). Still other well-to-do New York families came to depend upon the academy for women founded in 1789 by Mrs. Isabella Graham, a widow recently arrived from Scotland. The earliest institution of its kind in the city's history, "Grandmother" Graham's school was quartered in an old Georgian mansion on lower Broadway, a reputable address for what was still considered daring work.

CULTIVATING CITIZENS

“The history of the City of New York,” Elihu Hubbard Smith once wrote with some asperity, “is the history of the eager cultivation & rapid increase of the arts of gain”; its residents think of nothing but “Commerce, News, & Pleasure.” From the outset, accordingly, he and other members of the Friendly Club made a special point of disseminating a wide range of literary and scientific “information” to the reading public. By 1793 or 1794 they were providing all the original articles for the *New York Magazine*, a publication launched in 1790 by Thomas and James Swords and edited initially by Noah Webster. The journal featured a melange of materials ranging from sentimental romances to essays on the rights of man and woman by Godwin and Wollstonecraft. It wound down in 1797, about the time that the members of the Friendly Club disbanded. A number of former members founded the *Monthly Magazine and American Review* in 1799, the editorial philosophy of which closely followed that of the *New York Magazine*; it too sputtered out within a year. In 1801 Hocquet Caritat, the *emigre* proprietor of the most influential bookstore in town, established a “Literary Assembly” in a reading room of the old city hall. Caritat hoped it would become a place where writers, lawyers, scientists, doctors, and clergymen would come to discuss books and ideas, but like the efforts of the Friendly Club, it made little headway against the city’s preoccupation with money making—even after Caritat took the radical step in 1803 of inviting women to attend.

The struggle against municipal materialism finally began to bear fruit when it engaged the formidable energies of city inspector John Pintard. For years, inspired by the example of the Massachusetts Historical Society (1791), Pintard had advocated the creation of a similar institution in New York to improve its intellectual and cultural tone. In 1804 he assembled a group of Friendly Club alumni, merchants, attorneys, and clergymen to found the New-York Historical Society. Its mission was “to collect and preserve whatever may relate to the natural, civil or ecclesiastical History of the United States in general and of this State in particular.”

Historical preservation—especially of relics and records—held special meaning for men who had seen the city’s only two substantial libraries destroyed during the Revolution—that of Columbia College, and the New York Society Library, of which Pintard had been a trustee. The latter had made a comeback, and by the time it moved into its new quarters on Nassau

Street in 1795 it owned over five thousand books, but it remained a general reading library for well-to-do shareholders. Pintard hoped the Historical Society would in time “become like the extensive Libraries of the Old World inestimably valuable to the erudite Scholar.”

The Historical Society swiftly attracted prestigious supporters, including Dr. Samuel Latham Mitchill, Dr. David Hosack (physician, botanist, and founder in 1801 of the Elgin Botanical Gardens), members of old New York families (like Peter Gerard Stuyvesant, the director’s great-great-grandson), judicial luminaries (like state attorney general Egbert Benson, the society’s first president), and political leaders (like Governor Daniel D. Tompkins and Mayor De Witt Clinton, who provided the group with rent-free quarters in Federal Hall on Wall Street). Though its finances were precarious, the Historical Society quickly published an *Address to the Public* (1805) calling for donations of materials and for answers to queries concerning points of local and national history. In 1809—the year the society was incorporated and in which it purchased Pintard’s own library—members gathered to commemorate the bicentennial of Henry Hudson’s voyage by listening to the Rev. Dr. Samuel Miller’s *Discourse on the Discovery of New York*, followed by a banquet at the City Hotel. Two years later, the Historical Society issued the first volume of its *Collections*, which featured documents on city life under the Dutch and the never-before-printed Duke’s Laws of 1665.

As it happened, Pintard’s labors on behalf of the Historical Society coincided with a mounting interest among wealthy New Yorkers in painting and the fine arts. Some of the country’s foremost artists—Ralph Earl, James Sharpies, Charles Willson Peale, Gilbert Stuart, John Trumbull, John Wesley Jarvis—all set up shop in the city at one time or another in the eighties and nineties. Prosperous burghers, as the poet William Cullen Bryant later recalled, “began to affect a taste for pictures, and the rooms of Michael Pfaff, the famous German picture dealer in Broadway, were a favorite lounge for such connoisseurs as we then had, who amused themselves with making him talk of Michael Angelo.” What was more, reformers and civic improvers like Pintard began to sense that art—the right kind of art, under the right kind of circumstances—could also help lift the sights of New Yorkers and teach them virtues vital to a republican society.

In 1802 Chancellor Robert R. Livingston and his brother Edward, the newly appointed mayor, raised several thousand dollars to establish the New York Academy of the Fine Arts (later the American Academy of Fine Arts), with none other than John Pintard as its first secretary. The academy was not an association of artists but of wealthy patrons. Its purpose, Mayor Livingston explained, was to expose New Yorkers to the best European sculpture and painting, thereby affirming “the intimate connection of Freedom with the Arts—of Science with Civil Liberty.” It would also be “useful and ornamental to our city.” That proved overly optimistic. The academy’s first exhibition, which opened in the summer of 1803 at the Greenwich Street Pantheon (formerly Rickett’s Equestrian Circus), was a disappointment. Consisting mostly of plaster casts of “the great remains of Antiquity” owned by the Louvre, it failed to attract popular interest and was cut short by that year’s epidemic of yellow fever. John Vanderlyn, a young artist introduced to New York art patrons by Aaron Burr, was dispatched to Europe to make more casts and paint copies of Raphael, Caravaggio, Titian, Rubens, and other Old Masters. The academy’s shareholders, businessmen ill-prepared to promote art appreciation among the general public, began to bicker among themselves, however, and the academy soon languished.

Its prospects brightened again in 1804, when John Trumbull returned to New York to take over as director. Trumbull was immediately swamped with commissions, private as well as public. Between 1805 and 1808 he produced a series of portraits for City Hall that included such local luminaries as De Witt Clinton, James Duane, Alexander Hamilton, John Jay, Peter Stuyvesant, Richard Varick, and Marinus Willett (all of which would hang alongside his *George Washington in New York*, painted back in 1790). Yet Trumbull paid more attention to his own work than to the academy’s affairs, and after his departure in 1808, the organization again went into decline. Its officers ceased to meet, and by 1815 its collections were put in storage.

The academy’s demise did not mean, on the other hand, that the new Historical Society would have to carry on by itself. Business-minded New York wasn’t ready for art, but neither were men like John Pintard ready to abandon the campaign for municipal uplift and enlightenment.

“ACTIVE EXERTIONS & USEFUL IMPROVEMENTS”

It wasn't accidental that Pintard, Clinton, Mitchill, Dunlap, and many of their friends were also active in Freemasonry, an international movement devoted to personal betterment, fraternal loyalty, and the diffusion of knowledge to dispel (as Mitchill put it) "the gloom of ignorance and barbarism." Under the leadership of Robert R. Livingston, grand master from 1784 to 1801, the Masons founded ten lodges in the city. Arguably the most influential was the Holland Lodge, whose masters included both Clinton and Pintard, and whose members included such eminent and powerful residents as John Jacob Astor, Cadwallader D. Golden (grandson of the colonial governor), and Charles King (president of Columbia College).

De Witt Clinton, in particular, was an ardent Mason. From master of the Holland Lodge (1794) he rose to become grand high priest of the Grand Chapter, grand master of the Grand Encampment of New York, and grand master of the Knights Templar of the United States, the highest office of the Cerneau Scottish Rite body. What attracted him, apart from the opportunity lodge work gave him to establish links with powerful men throughout the city, state, and nation, was the fraternity's lineage of descent from "scientific and ingenious men" and its commitment to having each member "devote to the purposes of mental improvement those hours which remain to him after pursuing the ordinary concerns of life."

Even when his public life was at its busiest, Clinton found time for an impressive range of intellectual interests. He belonged to, and often led, the most prestigious literary and learned organizations of his day. He studied botany, zoology, geology, ornithology, ichthyology, and chemistry, and his published papers, which earned the praise of scientific societies throughout the United States and Europe, covered such disparate subjects as the fish of New York State, Iroquois language and customs, archaeology, and the cockroach. Justifiably proud of his achievements, Clinton could describe himself with aplomb—others called it insufferable vanity—as "distinguished for a marked devotion to science; few men have read more, and few men can claim more various and extensive knowledge."

Clinton was never content with private scholarly pursuits, however, and he was among the first New Yorkers to say that people of his class had a duty to improve the lives of others. As early as 1794, in an address to the Black Friars Club, he summoned patrician New Yorkers to reject

“selfishness” and enlist in the cause of “disinterested benevolence.” They should rise “from the couch of affluence and ease,” he said, not only to encourage the “polite arts and useful sciences” but to build schools and hospitals, care for the poor, and modernize the penal system. This was an idea practically unknown in New York before independence, and it drew heavily on Clinton’s identification with the Masonic movement (“the most *antient benevolent institution in the world*” he called it), on his frank admiration for contemporary British reformers, and on his personal connections with such prominent Quaker philanthropists as Thomas Eddy and John Murray Jr. (both of whom he met through his wife, also a member of the Society of Friends). What Clinton added was an emphasis on the urgency of benevolence—not simply to rectify social ills but also to overcome the privatism of the propertied classes and reaffirm their legitimacy.

During the 1790s and 1800s, Clinton and other well-to-do New Yorkers would create a battery of humanitarian and educational associations to improve the lot of their fellow citizens. In time, their membership rolls comprised a who’s who of the city’s most successful and influential citizens—merchants, lawyers, bankers, brokers, physicians, clergymen, Columbia College faculty—many of whose names turn up over and over again in an astonishing variety of causes.

As a rule, these associations were solidly Protestant and determinedly bipartisan. (The Society for the Promotion of Agriculture, Arts, and Manufactures, for example, was founded in the early nineties by George Clinton, John Jay, Philip Van Cortlandt, Edward Livingston, and James Duane, among others, a judicious balancing of political tendencies and temperaments that would be duplicated often in years to come.) Nominally private, they often received generous support from both municipal and state governments—as well they might considering the roster of governors, mayors, legislators, assemblymen, and other public officials who were their founders and managers. They were guided by an awakening sense of civic pride, by compassion, and by an absolute certainty that the best people ought to toil, directly and personally, for the public good—as they denned it. “What a field our large city presents for active exertions & useful improvements!” exulted John Pintard.

No one was more active than Pintard himself. After leaving the office of city inspector in 1809, he became secretary of the Mutual Insurance Company, his sole source of income for the next twenty years (during most of which time he and his family lived frugally in rooms above the company's Wall Street office). It was abundantly clear by then, however, that his real work lay in benevolence and philanthropy. In all, over the course of thirty-odd years, he would be the prime mover in dozens of similar organizations.

Never far from Pintard's mind was the knowledge that men such as himself were all too scarce in New York. The city's wealthiest residents were on the whole unable or unwilling "to attend to the multiplied demands on humanity & benevolence," he once told his daughter. "Here, these duties fall oppressively heavy on a few public spirited citizens." But in the end virtue was its own reward. "The further I go down the hall of life," he added modestly on another occasion, "the more I rejoice in the retrospect of being a coadjutor in some of our great benevolent and charitable institutions and that when I depart—it will cheer me that I am leaving the world better than I found it."

When genteel reformers like Pintard talked about leaving the world a better place, they meant, above all, ameliorating the misery of their city's lower classes. Pintard himself admitted that this mass of humanity—immigrants, working poor, the aged and infirm, blacks, widows, orphans—seemed hardly worth the trouble. They were, he said censoriously, "improvident, careless, and filthy." Yet if Pintard and his colleagues believed anything, they believed in what De Witt Clinton had called "the progressive improvement of human affairs." Shown the way, they thought, even the meanest people (the bulk of them, anyway) could become decent, productive citizens. This wasn't simply altruism. A permanent class of paupers, unincorporated into legitimate political and social institutions, posed a threat to the republic.

In this spirit, the Society for the Relief of Distressed Debtors set out in 1787 to provide short-term assistance to some of the city's neediest residents. Its managers—almost exclusively business and professional men—would include, at one time or another, such luminaries as Clinton, Pintard, Eddy, Dr. Hosack, and Divie Bethune, a wealthy Scottish merchant. At first, the society's aim was to provide occupants of the debtors' prison

with food, blankets, clothing, fresh water, and firewood. This was no small task. Over five hundred debtors were arrested in New York County every year. By posting a bond with the sheriff, those with means could be released to live within prescribed “gaol limits.” Those without means, rarely fewer than a hundred at a time, were locked up and required by law to supply their own necessities. Conditions in the prison verged on the nightmarish.

In the later 1790s the society distributed food to indigent victims of the yellow fever, and after 1800 its charitable horizons widened steadily. In 1802 the society opened a permanent “soup house,” near the jail on Frankfort Street, that dispensed soup to the urban poor at four cents a quart—or free, during epidemics and depressions. New Yorkers took to calling it the Humane Society (a change of name that became official in 1803). During the hard winter of 1804-5, their Frankfort Street operation, and a second “soup house” they opened on Division Street, distributed eighty-four hundred gallons of soup to residents of the city’s poorest wards. The group also dispensed soup tickets for handing out to street beggars in place of money and provisions, lest the poor convert such offerings into liquor.

The city’s doctors had meanwhile taken steps to provide impoverished residents with medical care. In 1791, inspired by similar projects in Europe and Philadelphia, the Medical Society opened the New York Dispensary on Beekman and Nassau streets. Supported by private donations, it treated over two thousand patients in its first five years. In 1791, too, the state provided money to reopen New York Hospital, originally founded in the 1770s but soon forced to suspend operations because of a devastating fire and the turmoil of war. Now designated “the public hospital,” it provided free treatment to the “sick poor” from immigrant ships and the city’s emerging slums. It housed the first nursing school in the United States, established in 1798 by the Quaker physician Valentine Seaman, and soon after the turn of the century it absorbed another charitable institution, the Lying-in Hospital, which had been founded in 1799 to provide care for impoverished pregnant women. In time, and at federal expense, the hospital also began to take in indigent seamen from the navy and merchant marine.

Genteel ladies too immersed themselves in philanthropic work among the poor and laboring classes. In 1797, by which time she was earning a comfortable income from her school, Isabella Graham joined forces with others, notably Elizabeth Ann Seton, wife of a successful merchant, to

organize the Society for the Relief of Poor Widows with Small Children. Applicants for assistance were to receive only “necessaries,” never money, and only after “particular enquiry” had determined their moral fitness; no assistance would be given, either, unless younger children were sent to school and older ones placed into trades or into service with “sober virtuous families.” Efficient and resourceful, the society expanded quickly. Within two years it was supplying firewood, food, shoes, clothing, and meal tickets to 150-odd widows and some 420 children.

Mrs. Graham followed up this project with a workhouse for needy women. After a protracted campaign for municipal support, she and her followers, organized as the Society for the Promotion of Industry, founded the House of Industry and won an annual appropriation of five hundred dollars from the legislature. At one time or another over the next decade (it failed in 1820), the House of Industry employed more than five hundred women as tailors, weavers, spinners, and seamstresses.

These and other female charities enabled women (well-to-do women, at any rate) to break the male monopoly on the city’s public life and assert for the first time a separate and distinct role in municipal affairs. Although respectable to a fault and indifferent to women’s rights as such, these initiatives worried even reform-minded men. Women calling meetings, women running organizations, women raising money, women contending with local officials about budgets and leases and regulations—where would it end? Many men nodded approvingly when Bishop John Hobart of New York publicly denounced the whole idea “of *females* laying aside the delicacy and decorum, which can never be violated without the most *corrupting* effects on themselves and public morals” to become agents of social change.

“THE SLOW PROCESS OF EDUCATION & RELIGIOUS INSTRUCTION”

Although committed to charitable works, New York’s philanthropic pioneers did not trust charity alone to bring lasting improvements in the lives of the urban poor. Their assumption—increasingly common among the mercantile and professional classes, successful artisan-entrepreneurs, and well-off mechanics alike—was that poverty stemmed from moral turpitude, not merely, or even mainly, from misfortune. With the breakdown of traditional relations of production, households and workshops could no

longer be relied upon to teach the habits of self-discipline and self-reliance necessary for survival in a wage-labor economy. Prudence, decency, sobriety, thrift, punctuality—these and similar virtues would now, more than ever, have to be instilled through what Pintard described as “the slow process of education & religious instruction.”

Ample precedents already existed, in fact, for using schools to provide poor children with the kind of guidance once supplied by households and workshops. By the mid-1790s there were half a dozen so-called “charity schools” in town, plus a dozenodd “pay schools” run by free-lance masters. Together, they enrolled better than half the children in the city between the ages of five and fifteen—girls as well as boys, blacks as well as whites, representing a broad cross-section of social classes. Additional charity schools sprang up around the turn of the century, including one organized by Isabella Graham’s Society for the Relief of Poor Widows. The Female Association, founded in 1798, opened a school to teach poor girls the “principles of piety and virtue.”

In 1806 Mrs. Graham and her daughter, Joanna Bethune (wife of wealthy reformer Divie Bethune), conceived the idea of founding an orphanage where working-class children could be brought up to lead productive lives. Orphanages were unknown in the United States—New Amsterdam’s short-lived orphan asylum was now a dim memory at best—but they had been strongly endorsed by European reformers. When Graham and Bethune unveiled their idea before a meeting of prominent ladies at the City Hotel (one of those in attendance was Elizabeth Hamilton, Alexander’s widow), it won enthusiastic approval and led at once to the formation of the Orphan Asylum Society. In 1807 the cornerstone of its first home was laid at the corner of Barrow and Asylum (now 4th) streets in Greenwich. (Nearby Bethune Street commemorates Joanna Bethune’s long career as a philanthropist and educator.)

It seemed doubtful, though, that these scattered, uncoordinated initiatives could bring about major improvements in the manners and morals of the poor. Thomas Eddy, the wealthy Quaker who served as almshouse commissioner and warden of Newgate, raised this problem in his correspondence with Patrick Colquhoun, a London police magistrate active in the famed British Society for Bettering the Condition of the Poor. In 1803 Colquhoun warned Eddy that if American schools weren’t soon put on

more solid foundations, the country's rapidly expanding population would cause a crisis "manifested by extreme ignorance and immoral conduct, as it respects a considerable proportion of the lower classes of society."

That was enough for Eddy. With the help of Pintard, Golden, Mitchill, Clinton, and other influential friends— and with financial assistance from the Masons—he set about organizing the New York Free School Society (1805). Its purpose, in Pintard's phrase, was to eradicate crime and pauperism in the city by inculcating "habits of cleanliness, subordination, and order" in the children of the lower classes.

To that end, its first school, which opened the following year in rented quarters in the Fourth Ward, adopted the Lancasterian system of instruction. Devised by the English Quaker Joseph Lancaster, this involved the selection of older and better pupils as "monitors," or assistant teachers, who were trained to drill information and biblical precepts into their younger charges. The system was cheap and efficient. To speed the morning roll call, pupils were each assigned a number that was posted on the wall against which they lined up, allowing monitors to see at once who was absent. Learning meant rote memorization, imagination was actively discouraged, and while Lancaster prohibited corporal punishment, pupils in need of additional motivation could be shackled to their desks or made to carry six-pound logs on their shoulders.

Pintard had said that the eradication of poverty required religious instruction as well as education, and here too he and other Manhattan reformers took their cues from abroad. William Wilberforce's *Practical View of the Prevailing Religious System of Pro-fessed Christians* (1797), widely reprinted in the United States, urged the responsible classes to spread Christian virtue among their social inferiors via bipartisan, nonsectarian organizations like his own Society for the Suppression of Vice. During the later 1790s and early 1800s, in accordance with this and similar recommendations, New York clergymen and lay leaders assembled an arsenal of specialized associations for moral uplift and humanitarian reform.

In 1794 John Stanford, an English Baptist who had migrated to the city in 1789, helped establish the New York Society for Promoting Christian Knowledge and Piety Among the Poor. Stanford had no regular pulpit in Manhattan, but he conducted a private school, instructed theological

students, wrote and distributed religious tracts, and preached frequently around the city. Now his New York Society took up the task of distributing Bibles and religious pamphlets to the poor.

In 1796 the Dutch Reformed and Baptist churches jointly established the New York Missionary Society, which initially targeted Long Island Indians and published the *Theological Magazine* (1796-99). There was no mistaking the aims of the Society for Aiding and Assisting the Magistrates in the Suppression of Vice and Immorality on the Lord's Day (1795), of the Society for the Suppression of Vice (1802), of the Society for the Suppression of Vice and Immorality (1810), or of such periodicals as the short-lived *New-York Missionary Magazine and Repository* (1800-1801), which ran articles demonstrating the divinity of Jesus, the coherence of the Bible, and the like. Hamilton's Christian Constitutional Society (1802)—an attempt to tap this impulse on behalf of the Federalist party—went nowhere, as direct political intervention breached the separation of church and state, already a sacrosanct element of American republican thought.

Another British import, the Sunday school, reached New York in 1792, when Isabella Graham founded an evening Sunday school for adults, black as well as white, on Mulberry Street. The following year a former slave named Catherine Ferguson opened a Sunday school for both children and adults: Katy Ferguson's School for the Poor in New York City. After 1800 the Sunday school movement in New York accelerated dramatically. In 1803 Graham, her daughter Joanna Bethune, and her son-in-law Divie Bethune—the Bethunes too were in regular contact with British reformers and followed closely the work of the London Sunday School Society—started a new Sunday school on Mott Street. Using the Bible as a textbook, the school offered reading and writing classes along with religious instruction. A decade later there were fifty Sunday schools in New York with a combined enrollment of six thousand.

As the campaign for popular religious instruction gained momentum, evangelical Protestant clergymen began to preach among the poor (more and more of them immigrant Catholics) confined in municipal institutions. The Rev. John Stanford became the semiofficial chaplain to the almshouse in 1807. He was soon preaching to the inmates of the hospital, debtors' prison, insane asylum, and penitentiary as well, and in 1810 was joined by Ezra Stiles Ely, a young Presbyterian minister. Stanford and Ely published

such shocking details about the physical and moral condition of their charges that Divie Bethune and other prominent reformers resolved to support their work with yet another organization, the interdominational Society for Supporting the Gospel Among the Poor of the City of New-York (1812). Both Stanford and Ely were named New York's first municipal missionaries. For a score more years, Stanford in particular would maintain a herculean schedule of ministerial rounds, reporting annually on his sermons and the number of deathbed conversions among the paupers.

THE PICTURE OF NEW YORK

Never before in the city's history had its upper classes gone to such lengths to rescue the souls and bodies of working and impoverished folk, or to educate their children. To Senator-Doctor-Professor Samuel Latham Mitchill—Friendly Club alumnus, Freemason in good standing, cofounder of the New-York Historical Society, the New-York Society for the Promotion of Agriculture, Arts, and Manufactures, and the New-York Free School Society—the time had therefore come to spread the good news that New York was no longer solely a center of commerce but one of culture and benevolence too. In 1807, accordingly, he published a pocket-sized volume entitled *The Picture of New-York; or The Traveller's Guide, Through the Commercial Metropolis of the United States, By a Gentleman Residing in this City*.

Basically the city's first guidebook, Mitchill's *Picture of New-York* assailed the dearth of knowledge about this "great and growing capital" (even among its own residents) and denounced writers like Jedediah Morse, whose often-reprinted *American Geography* (1784) had ridiculed New York for its artistic, literary, and scientific backwardness. To set the record straight, Mitchill diligently compiled evidence of the city's breathtaking growth over the previous twenty-odd years: the multiplication of banks and insurance companies, the upsurge in overseas and domestic commerce, the expansion of municipal services. What made him proudest, however, were the signs of New York's cultural maturity. Its numerous newspapers, booksellers, reading rooms, theaters, parks, medical and scientific organizations, literary societies, and the new apparatus of reform and benevolence—all of these now put the city far ahead of erstwhile rivals like

Boston or Philadelphia. For the men and women of his class who envisioned New York as something more than an island of benighted shopkeepers, this was praise indeed.

From Crowd to Class

In 1788, New York's African-American community petitioned the City Council to stop medical students from stealing corpses out of the Negro Burial Ground. The petitioners understood "the Necessity of Physicians and Surgeons consulting dead subjects for the benefit of mankind," but they were dismayed that the students, under cover of night, would carry away the bodies of their relatives and friends "without respect to age or sex, mangle their flesh out of a wanton curiosity and then expose it to beasts and birds." Nothing was done, however—not, that is, until the body snatchers or "resurrectionists" began raiding Trinity's whites-only graveyard as well. Digging up blacks was one thing, whites quite another, and indignation ricocheted around town.

On Sunday, April 13, a boy peered in a window at New York Hospital and observed a cadaver being dissected. The medical student at work waved a severed arm at the boy and told him it belonged to his mother, who had in fact recently died. The boy ran off to tell his father, a mason at work on a nearby building. The man gathered some friends, went to the graveyard, and found his wife's coffin empty. Soon an enraged crowd charged into the hospital, wrecking dissection equipment and gathering up bits and pieces of human bodies for respectable reburial. They also captured and abused several medical students, but surrendered them to magistrates when promised that legal action would be taken.

The next day another crowd, perhaps as many as five thousand strong, demanded to reexamine the hospital. Finding no more stolen bodies, they searched the buildings of Columbia College and the residences of city doctors (including that of Sir John Temple, the British consul, mistakenly identified as "Surgeon" Temple). At sunset, their wrath still unappeased, the rioters regrouped and headed for the jail, where a number of doctors and medical students had taken refuge. Governor George Clinton, Chancellor Robert Livingston, John Jay, Baron Friedrich von Steuben, and Mayor James Duane all pleaded for restraint, only to be answered with a hail of bricks and stones. Jay, struck in the head, was carried home unconscious. Duane summoned a troop of militia to disperse the crowd and was met with

another shower of missiles. Baron von Steuben, also struck in the head and bleeding profusely, shouted, “Fire, Duane! Fire!” Duane, or perhaps Clinton, gave the order. The first volley killed three rioters outright and wounded many others. Before a second could be fired, the crowd had scattered.

Spontaneous, short-lived, and aimed at redressing a specific offense against communal sensibilities, the so-called Doctors Riot closely resembled pre-Revolutionary popular disorders in the city. That resemblance was strengthened by the willingness of public authorities to address the rioters’ grievances. Within a year the state legislature passed an act banning “the Odious Practice of Digging up and Removing, for the Purpose of Dissection, Dead Bodies Interred in Cemeteries or Burial Places.” (The law also allowed the bodies of executed criminals to be assigned to the doctors.)

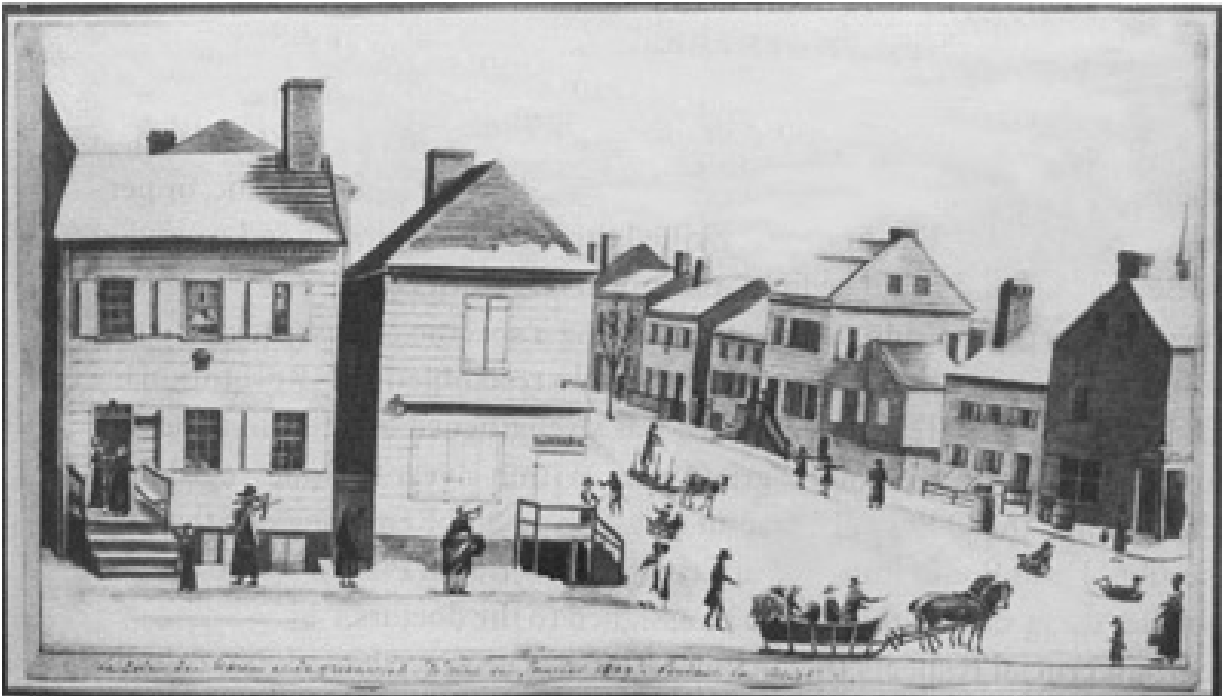

But in certain crucial respects the Doctors Riot was unprecedented. No colonial mayor or governor had ever ordered soldiers to open fire on a crowd. Never before had gentlemen ever proved so ineffectual in controlling the actions of a crowd or (with the possible exception of Leisler’s Rebellion a century earlier) actually come under attack themselves. In retrospect, indeed, that violent clash in front of the jailhouse was an early manifestation of what would become increasingly antagonistic relations between patrician and plebeian residents of the city. For over the next ten or twenty years, even as the rich grew more clannish and disdainful of laboring people, laboring people grew more conscious of themselves as a class with markedly different interests, values, and social practices.

WORKING NEIGHBORHOODS

In the 1790s the streets of the East Ward, hard by the East River waterfront, were home to watchmakers, printers, bookbinders, tailors, hatters, and other skilled craftsmen who catered to an affluent clientele. Typically, they lived and worked under one roof—as did silversmith Daniel van Voorhis, who resided above his workshop and retail store on Hanover Square, along with his wife, Catherine Richards, their children, and some of his journeymen and apprentices. But Van Voorhis and his kind were a vanishing breed. Artisans in the capitalizing and competitive trades, caught between rising rents and declining incomes, found themselves obliged to adopt new living

arrangements. One downtown shoemaker bundled both his family and his workshop into the household's first floor, then rented out the upstairs to a Scotch journeyman carpenter and his family. The carpenter's wife, in turn, took in boarders to meet the rent, and two immigrant nailmakers moved into the attic along with three of the carpenter's sons.

Even with this additional income, the shoemaker found himself squeezed out of the wharf district and pushed uptown. With other priced-out artisans, he trekked to the northern wards, especially the Fifth, Sixth, Seventh, and Tenth, which together formed a broad band across Manhattan. Anchored on the west by Trinity's Church Farm along the Hudson, this plebeian belt ran through the mid-island area dominated by the slowly disappearing Fresh Water Pond and its swampy tributaries, and on into the now parceled-out Rutgers and De Lancey estates, before terminating in Corlear's Hook on the East River. By the turn of the century, migrants had pressed this perimeter of settlement as far north as modern Houston Street.

Sledding at the corner of Greenwich and Warren streets, 1809, by the Baroness Hyde de Neuville. In the one- and two-story frame buildings of this plebeian quarter it was still possible for artisans to maintain their traditional single family house-and-

shop living arrangements. (© Museum of the City of New York)

One of the artisan communities within this zone lay just west of City Hall Park in the blocks bounded by Greenwich, Hudson, Warren, Murray, and Chambers streets. Chambers Street, for one, had been unpaved and largely uninhabited at the end of the Revolution. By 1800 the now cobbled thoroughfare was a neighborhood of independent proprietors, the kind of community no longer sustainable near the docks. Its seventy-six row houses, built on land leased from Trinity, were occupied by the representatives of twenty-five different trades: carpenters, joiners, coachmakers, carters, grocers, stonecutters, and others. These houses employed the neoclassical motifs of Federal architecture, like the residences of wealthy downtown merchants, but were smaller (often only eighteen feet wide) and more cheaply made (some entirely of wood). Signboards on or above their front doors made it clear, too, that their interiors were organized to suit the needs of domestic production. The family lived on the second floor. The first floor (in front) was given over to workbenches, tools, and storage space, along with (in the rear) a kitchen, spinning wheels, bins, and tubs. In the back yard, protected from ambulatory hogs by high fences, were the vegetable garden, fruit trees, privy, woodpile, cistern, smokehouse, and open fires over which the housewife boiled the wash.

The Chambers Street community proved short-lived, however. Merchants and professionals edging their way northward, away from downtown disease and disorder, bid up land prices. After 1806 Trinity demanded that its leaseholders put up only substantial brick houses, driving out small builders. By 1812 most of the artisanal home-and-workshops were gone, along with their occupants. Chambers Street had been gentrified.

Some dislocated building tradesmen, grocers, and cartmen headed farther upisland to Greenwich. The opening of Newgate Prison in 1797 and repeated infusions of fever refugees had transformed the rural hamlet into a booming village in need of their services. “The demand for houses at Greenwich,” noted a Boston paper in 1805, “is scarcely greater than the rapidity with which they are raised.” A Greenwich Market opened in 1808, just below Christopher Street, and quickly filled with wagons and carts. The Greenwich Hotel (1809), established on the prison’s doorstep, became the

terminus for the stagecoach that rumbled back and forth from Federal Hall at least five times a day.

Other artisans headed across town to Bowery Village, the community that had grown up around Petrus Stuyvesant's country house and chapel. Throughout the eighteenth century it had remained sparsely settled—a few houses plus blacksmith, wagon shop, general store, and tavern—partly from fear of highwaymen lurking in the Bayard woods. But now the developmentally minded Petrus Stuyvesant III laid out a street system on his ancestral property, squared with the points of the compass, and he donated land and construction funds for an Episcopal parish church. By 1807 St. Mark's in the Bowery (completed in 1799 at what is now East 10th Street and Second Avenue) attracted as many as seventy worshipers in winter and two hundred in summer, reflecting the village's new popularity as a fever refuge for city folk (the Manhattan Company erected a branch office there for banking during epidemics).

Because Bowery Village lay just outside the city limits, farmers could sell there without paying a market tax. Wagon stands soon flourished along 6th and 7th streets, along with a weigh scale for Westchester hay merchants. Comfortable residences went up along the upper Bowery, still a country road edged with blackberry bushes, drawn perhaps by the continuing presence at Petersfield of Mrs. Stuyvesant, the former Margaret Beekman, who stayed on after Petrus died in 1805. Artisan house-and-shops arrived too; so did grogeries, a brothel, and a post office (in truth an oyster house where the postrider left mail for the village). From 1804 the community even had its own (short-lived) newspaper, the *Bowery Republican*.

Farther down the Bowery Road, just above Chatham Square, the city's meatprocessing industry expanded outward from the Bull's Head Tavern, abattoir, and stockyards, owned since 1785 by Henry Astor. In the early 1800s, as additional butchers herded into the area, slaughterhouses multiplied along Chrystie and Elizabeth streets. With them came a profusion of new taverns—the Gotham Inn, the Duck and Frying Pan, the Pig and Whistle, the Crown and Thistle—and in 1801 the New Circus in the Bowery, whose bill included bullbaiting and bearbaiting. Chatham Square itself featured a horse market, a livery stable (headquarters for the Boston stagecoaches), Hendrick Doyer's distillery (at the present Doyers Street), a watch house, and blocks of stores and workshops.

Chatham Square, in turn, bordered the former Rutgers estate, now the Seventh Ward. Colonel Henry Rutgers, grandson of Harmanus the Second, who remained in residence at the family mansion on the East River, cut up and leased out much of his land on a long-term basis. Strict building covenants required each leaseholder to erect a “workmanlike brick building.” This drew merchants and professionals to the high ground along East Broadway, Rutgers, and Monroe streets. But Rutgers’s terms were reasonable enough, and the area close enough to the Corlear’s Hook shipyards, that his property attracted shipwrights, coopers, chandlers, joiners, sailmakers, and ropemakers as well.

From the shipyards, it was but a short ferry ride to two other outposts of the old artisanal world. In Brooklyn Village, at the foot of the Old Ferry Road (now Fulton Street), lay a clustering of houses, taverns, stables, and shanties, through which the country road straggled on and out through Bedford Corners toward Jamaica. Just to Brooklyn Village’s right—from an arriving horse-ferry passenger’s perspective—rose the bluff generally known as Clover Hill, studded still with farms, orchards, gardens, and pastures.

To its left, a little way up the East River shore, lay the “City of Olympia,” founded by Comfort and Joshua Sands back in the mid-eighties. Since 1795 it had been accessible directly, via the “New” or Catherine Street Ferry that docked at Main Street. This artery, which wandered toward an inland connection with the Old Ferry Road, was lined with wood-frame buildings that housed ex-Manhattanites and settlers from Connecticut (a big contingent of whom had come down after yellow fever devastated New London in the late nineties). Slightly further upriver, between Olympia and Wallabout Bay, shipbuilder-turned-developer John Jackson had laid out yet a third village. Having sold most of his holdings to the government, the savvy promoter now began advertising his remaining lots, on the Navy Yard’s western border, as Vinegar Hill. His intention was to attract fugitives from the ill-fated Irish rebellion, the climactic battle of which had occurred at a place of the same name in 1798.

Between 1790 and 1810 the population of Brooklyn township nearly tripled, rising from sixteen hundred to just over forty-four hundred—a rate of growth only slightly below that of New York City proper—and the influx of Yankees, Irish, Manhattanites, and freed slaves from Kings and Queens

counties engulfed the area's old Dutch inhabitants. The bulk of the town's residents lived within Brooklyn Village, a thriving artisanal community whose growth was marked by the purchase of its first Town Bell in 1796 (it hung in a cupola on top of Buckbee's Hay Scales on Fulton Street), by the advent of its first newspaper, the *Long Island Courier*, in 1799 (also the first in Kings County), and by the construction, in 1802, of its first "cage, or watch-house." Besides numerous shops of coachmakers, pumpmakers, tailors, and cordwainers, the village boasted gristmills that used the East River tides to grind wheat for export as well as for local consumption and manufactories that produced chairs, tobacco, and floorcloth. Throngs of local carpenters, riggers, caulkers, coopers, and other craftsmen were employed in the maritime trades spreading along the waterfront, and the village's many butchers maintained stalls in the old wooden market near the ferry slip, where they sold the meat wheelbarrowed over from nearby slaughterhouses (by black employees) or shipped it across the river to Manhattan's Fly Market.

"Winter Scene in Brooklyn," by Francis Guy, c. 1817-30. Imitating Pieter Brueghel's paintings of peasant life in the Netherlands, Guy meticulously documented the life of what was still a close-knit village from a second floor window of his house on Front Street. This view along Front, ranging from Fulton Street (the old Ferry Road) on the far right to Main

Street on the far left, records a mix of small shops, stores, and private residences (the dark building in the center was a slaughterhouse and butcher shop). Each of the figures is a portrait of one of Guy's neighbors. Much of the area now lies under the approaches to the Brooklyn Bridge. (Eno Collection. Miriam and Ira D. Wallach Division of Art, Prints and Photographs. The New York Public Library. Astor, Lenox and Tilden Foundations)

The more remote farming hamlets that dotted Kings and Queens counties—Bushwick, Flatlands, New Utrecht, Gravesend, Newtown, Flushing, Jamaica—likewise experienced a modest rush of prosperity by supplying the New York market with food for consumption and export. The tiny village of Flat Bush (still often spelled as two words) got itself a new private academy, Erasmus Hall (two hundred students), and a lovely new Reformed church—both of which still stand at the corner of Church and Flatbush avenues.

FIVE POINTS

Back in Manhattan, the negative consequences of economic restructuring were coming to malign fruition in the neighborhood known as Five Points. Ever since the Revolution, artisan proprietors had been colonizing the area east and south of the Fresh Water Pond, raising modest house-and-shops near its breweries, potteries, tanneries, and tobacco manufactories. The neighborhood had always been squalid, situated amid the swampy runoff from the ever more polluted pond. By the early nineteenth century, many of the streets here—Mulberry, Orange, Roosevelt, Bancker (now Madison), James, Oliver, Catherine, and Rutgers—were little better than foul, muddy lanes blocked by refuse-choked pools of slime and silt that washed down from hills around the pond. Some houses were half buried by erosion; when it rained, their cellars and kitchens filled with water, and many back yards were perpetually covered with green, stinking muck.

Sanitationists hoped that filling in the pond would revitalize the area, which many considered a breeding ground for yellow fever. It did, though not in the manner intended. Absentee landlords began to buy up houses once occupied by artisans, subdividing them or replacing them with new wood-frame structures: the dapper Edward Livingston, New York's first

Jeffersonian mayor, owned eight on Orange Street alone. Landlords then packed the buildings with tenants, transforming them into de facto boardinghouses for the wage-laborers now settling the area.

Some of these renters were artisans pushed out of gentrifying neighborhoods and no longer able to establish independent households. Others were the recent Irish immigrants who began settling near the docks in the 1790s, then spread inland after the turn of the century. Still others were African Americans whose ancestors had been in the area since receiving half-freedom plots from the Dutch West India Company. Most of their forebears had long since sold off their little grants to white proprietors; still legally barred (until 1809) from inheriting or bequeathing property, they had rented or squatted near the pond. Now, together with recently freed relatives and friends coming in from the countryside, they settled in the sodden basements of buildings whose upper stories were filled with whites. Certain lanes, however, notably Bancker Street between Pearl and Catherine, became known for their concentration of all-black tenant houses, some of which packed in five men to a room.

As the Fresh Water was filled in, streets and housing crept out across the boggy terrain, followed by grocers, tavern keepers, glue factories, slaughterhouses, and turpentine distilleries. As early as 1798 it was remarked that the area was “generally full of poor and dirty people.” By 1810, though the area was but a scant few blocks from the nearly completed City Hall, it had become a slum known as the Five Points, named for the intersection of five streets: Mulberry, Anthony (now Worth), Cross (now Park), Orange (now Baxter), and Little Water (now gone). The Five Points housed the city’s poorest residents, including the greatest percentage of those receiving public assistance in the form of outdoor relief. For years the neighborhood remained a notorious breeding ground for disease and a source of hefty profits for local landlords.

The emergence of the Five Points slum was only the most tangible sign of the rise of a class of permanent tenants in New York City. Around the city, master artisan householders were rejecting the paternalistic practice of providing year-round room and board to apprentices and journeymen. Instead, just as they hired and fired wage-workers according to seasonal demand, they now rented out household space (along with the domestic services provided by their wives) to boarders on a cash basis.

In an increasingly competitive economy such rental income could well provide the margin that smaller masters needed to preserve their own independence. For the more entrepreneurially inclined, profiting from real estate could become an end in itself. Some masters subdivided their houses into apartments, rented them out to lodgers, and then moved their own families to separate domestic quarters.

Some members of the new tenant class found liberty in mobility. They were free to move when and where they wished, just as they had an unfettered right to sell their skills to the highest bidder. But with housing a commodity rather than a customary right, purchasers could get only what they could pay for. For the majority—the 60 percent who worked in capitalizing trades and faced declining wages—this meant a steady erosion of living standards. Some journeymen formed their own “trade” houses, pooling the incomes of four or five skilled workers and crowding into a single residence. But most had to settle for one- or two-room apartments, wooden rear houses, or, in the case of illpaid laborers and mariners, boardinghouses that squeezed four to six men in a room.

Mobility did increase, but less out of choice than coercion. In a tight, impersonal, and utterly unregulated housing market, where landlords pressed to maximize returns, tenants outbid by competitive renters were compelled to move. The resulting dislocations—voluntary and involuntary—were apparent every year on the first of May, the date on which, by Dutch tradition, all New York City leases expired simultaneously. Of no great consequence in more settled times, Moving Day now became an ever more frenetic affair. Especially in neighborhoods composed primarily of propertyless renters, thousands packed their belongings, hired a cartman (if they could find one), and moved to new quarters. As one commentator noted in 1799, the people “of this city are seized, on the first of May, by a sort of madness, that will not let them rest till they have changed their dwelling.”

TURMOIL IN THE TRADES

For New York journeymen, the degradation of housing in the city was only one element of the crisis they faced after the turn of the century. As capitalist relations of production penetrated one trade after another, fewer and fewer journeymen could look forward to becoming independent

masters. Instead, they had to contemplate a future as permanent “hirelings”—mere wage-workers, thrown into the same proletarian pot as exslaves, former indentured servants, half-trained apprentices, and casual laborers. They knew who to blame, too: entrepreneurial masters whose hot pursuit of personal profit had caused them to betray time-honored principles of craft solidarity and mutual responsibility.

May Day, from H. P. Firm, *Comic-Annual of 1831* (Boston, 1831). New York’s tumultuous “Moving Day” was now nationally famous. (Print Collection. Miriam and Ira D. Wallach Division of Art, Prints and Photographs. The New York Public Library. Astor, Lenox and Tilden Foundations)

In many trades, journeymen attempted to mitigate the loss of personal independence by forming associations for the relief of members in distress. Pooling weekly or monthly dues, they built up common treasuries from which the sick or infirm could draw, thus forging the kind of mutual aid institutions that seemed ever more necessary in a postpaternalistic society. Some of these associations also fought against the growing use of poorly trained labor in the trades. In 1785 “a considerable number of Principal Journeymen Carpenters” criticized the master carpenters for hiring workers

“so very ignorant of their business, that some of them have been at a loss to know the right end of their tools.” Similar concerns led journeyman printers to form the New York Typographical Society in 1794. The Journeyman Shipwright’s Society required members to refuse to labor alongside any other than “fully skilled and trained journeymen.”

The most aggressive journeymen went even further. As early as 1785 journeyman cordwainers banded together and refused to work until paid higher wages—arguably the first authentic “strike” or “turn-out” in the city’s history. (The latter term alluded to soldiers “turning out” for combat, the former to sailors “striking” or lowering a ship’s sails.) In 1802 white sailors and black seamen joined forces to demand that merchants and shipowners raise the basic wage from ten to fourteen dollars per month. For several days the two allied “combinations,” one white and one black, paraded the docks “with drums beating and colors flying,” but the strike collapsed when municipal authorities jailed its leaders.

In 1802 journeymen broadened their repertoire of tactics to include formation of worker-run businesses. When master cabinetmakers announced a 15 percent reduction in wages, eighty journeymen walked off the job and opened their own warehouse on John Street to sell furniture directly to the public. Sales proved disappointing, however, and after a six-month fight the strikers capitulated.

Masters answered the militant journeymen with combinations of their own—none more influential than the General Society of Mechanics and Tradesmen, which while open to all resident artisans had become an organ of the city’s entrepreneurial masters. Its members (488 as of 1798) stoutly defended their right to lock out troublemakers, to import out-of-town labor to break strikes, and to hire ill-trained workmen. Such tactics, they said, were necessary to preserve the very things for which the Revolution had been fought: equality of opportunity, unfettered markets, and the sanctity of private property.

In effect, a kind of ideological mitosis was under way. Artisanal republicanism, reasonably coherent during the 1770s and 1780s, had begun to divide along its main social axis—one version for masters, another for journeymen and apprentices. The effect of this development on political alignments in the city was wrenching. Most artisans had switched from the Federalists to the Democratic-Republicans during the 1790s, believing that

society should be governed by those who engaged in “real” labor—yeoman farmers in the countryside and independent craftsmen in the cities—as opposed to speculators, bankers, and lawyers. But the divisions within the trades gave Federalists no end of opportunities to drive a wedge between the masters of the Democratic Republican leadership and the journeymen who made up the party’s rank and file. Federalists pounced on one Democratic-Republican candidate for advising master tanners not to sell leather to any journeyman shoemaker in the city who attempted to get his wages raised. They likewise denounced the opposition for urging master cordwainers to hire only journeymen who had obtained a regular discharge from their last employer—a “rascally proposal” which put the journeymen on “the same footing with a hired negro wench, that must have a recommendation before she can get a place.”

Democratic-Republican masters parried such thrusts by stirring popular resentment against the poor as well as against the rich. Like riches, poverty implied a whole range of dangers to republican values and institutions—dependency, sloth, ignorance, immorality—and was thus a condition to be feared and despised by free people. The economic dislocations of the 1790s and 1800s, robbing even the most industrious workingman of the certainty that his labors would keep him and his family out of the almshouse, made it all the more urgent to hold the line. By 1800 no one in New York condemned poverty more insistently than those who seemed at greatest risk of winding up poor themselves.

In 1803 Mayor Edward Livingston proposed the creation of municipally owned and operated workshops where immigrants, ex-convicts, widows, and the indigent could learn such crafts as shoemaking or hatmaking. Reducing unemployment, Livingston reasoned, would reduce crime and vagrancy. Outraged mechanics protested that competition from Livingston’s workshops would drive hard-pressed masters as well as journeymen out of business, rewarding “idle and dissolute” elements of society at the expense of the most industrious. After a huge uproar, the state legislature quietly tabled Livingston’s proposal.

The impact of the turmoil in the trades was magnified by the movement of masters and journeymen alike into a wider world of political and social discourse. An upswing in literacy rates during the 1780s and 1790s opened new, assertively artisanal markets for the printed word, and a string of local

papers—the *New York Journal* (1787-1800), the *Argus* (1795—1800), and others—geared their contents toward a politically conscious mechanic readership. Record numbers of artisans were also buying books and magazines, and they accounted for half the initial subscriptions to the *New-York Magazine* (1790-97), among whose contributors were such eminent radicals as Joseph Priestly, William Godwin, Mary Wollstonecraft, and Thomas Erskine.

Equally important was the parade of radical *emigres* that passed through the city in the 1790s, along with numerous representatives of popular societies—United Irishmen, United Englishmen, Friends of the People, Levellers—that blossomed all over the British Isles in the early 1790s, only to be crushed in spasms of official repression and mob violence. Republican France was their inspiration, Thomas Paine their idol, the Rights of Man their creed, and when they reached New York they were still full of fight. Grant Thorburn remembered how he and a party of other young men, members of the Scottish Friends of the People, were rounded up and put on a boat to New York in 1794. “We had some hot characters among us,” Thorburn wrote, “which all the waters of the Atlantic could not cool.”

Like John Daly Burk, editor of the *Time Piece*, and James Cheetham, editor of the *American Citizen*, these firebrands gave a powerful impetus to the militancy of New York artisans by identifying their concerns with an international struggle for political and social justice. Foreign and home-grown radicals likewise rubbed elbows, compared notes, and cemented friendships at Hocquet Caritat’s famous bookstore on Broadway. The energy and excitement they generated there inspired Caritat to found a circulating library from which the principles of the Enlightenment and the ideals of the French Revolution could be disseminated at modest charges to working people throughout the country.

INFIDELS AND EVANGELICALS

By the mid-nineties Jacobin assaults on the French church and Thomas Paine’s attack on the authority of Holy Scripture in *The Age of Reason* (1794) were finding a receptive audience among New York’s book- and newspaper-reading mechanics. Some gravitated toward Elihu Palmer, a blind Baptist preacher devoted to spreading deism among the working classes. Palmer’s association with New York began in 1788 when he was

called to the pulpit of the Presbyterian church of Newtown, Long Island. En route from his native Connecticut, he preached a Thanksgiving Day sermon that proved him “ill adapted for a Presbyterian pulpit,” in the words of his friend John Fellows (Paine’s American publisher and Hocquet Caritat’s sometime business partner). “Instead of expatiating upon the horrid and awful condition of mankind in consequence of the lapse of Adam and his wife, he exhorted his hearers to spend the day joyfully in innocent festivity, and to render themselves as happy as possible.” After six months at Newtown, Palmer moved on to Philadelphia, joined the Baptists, and set up a Universal Society. He lost his sight during the 1793 yellow fever epidemic and was run out of town the following year by “an immense mob” for attacking the divinity of Jesus Christ.

Returning to New York in 1794, Palmer treated the new Democratic Society to a raise-the-roof oration against clerical interference with the revolution in France. The society’s warm response convinced him to remain in the city, and later that same year, in a pamphlet defending Paine’s just-published *Age of Reason*, Palmer denounced Christianity itself as a system of “ignorance and credulity” designed to hold the lower classes in thrall and prop up monarchy. His alternative, the subject of frequent essays and addresses over the next decade, was a “natural morality” or “religion of nature” that acknowledged a divine Creator without violating the dictates of reason or subjecting its adherents to ecclesiastical tyranny.

A tireless organizer as well as publicist, Palmer founded a Deistical Society in the mid-nineties that actively recruited members from the city’s laboring population. He established two newspapers, the *Temple of Reason* (1800-1803) and the *Prospect, or View of the Moral World* (1803-5), that became the foremost vehicles of deistic thought in the country. In 1804 Palmer launched a “Theistic Church” and announced plans to build a Temple of Nature in Manhattan. This buzz of activity attracted other prominent deists to the city, including John Foster, the radical universalist and friend of Paine, and Dennis Driscoll, a defrocked Irish priest who served as editor of the *Temple of Reason*.

Yet Palmer failed to ignite the mass movement he hoped for. Despite the crowds that initially turned out for his public lectures, membership in the New York Deistical Society dwindled to a mere handful of working people too poor even to pay their modest dues on a regular basis. Respectable

mechanics and even hardened skeptics were shocked at his virulent disdain for Christianity. (He once scolded Christians that their “pretended Saviour is nothing more than an illegitimate Jew, and their hopes of salvation through him rest on no better foundation than that of fornication or adultery.”) Not surprisingly, Palmer’s allure soon paled alongside that of more temperate personalities like the Unitarian John Butler, who came to town in 1794, rented a hall on Cortlandt Street, and lectured before “truly alarming” crowds while the mainstream clergy railed against him from their pulpits. So, too, when Dr. Joseph Priestly, renowned both as a chemist and as a Unitarian advocate, visited New York that same year, he got a warm reception from the Tammany, Democratic, and other popular societies.

Neither Unitarians nor deists, however, were able to keep up with the itinerant evangelists who began trolling for souls among New York’s laborers, sailors, apprentices, and journeymen during the later 1790s and early 1800s. Prominent among these were Dominic van Velsor, known as the stove-fence preacher; Amos Broad, an upholsterer often at odds with the law; Johny Edwards, a Welsh scale-beam maker who harangued sinners from the back of his wagon and once stood in Wall Street, shouting through a three-foot tin trumpet for the moneylenders to repent; John Leland, the Baptist abolitionist, who came to town with a twelve-hundred-pound “Mammoth Cheese” inscribed “Rebellion to Tyrants is Obedience to God”; and the Methodist circuit-rider Lorenzo Dow, who looked and talked like an Old Testament prophet.

Their open identification with the poor, their scorn for fancy educations and fine clothes and high-toned manners, their biblical literalism, millennialism, and mysticism—all of these qualities located the evangelicals in a tradition of charismatic “mechanick preachers” going back to the days of Cromwell. Dow in particular employed a “colloquial vulgarity” to which Palmer, much less Priestly, never stooped even though it purportedly attracted “large multitudes” of the city’s laboring poor whenever he preached. Dow “understood common life,” admitted a contemporary, “and especially vulgar life—its tastes, prejudices and weaknesses; and he possessed a cunning knack of adapting his discourses to such audiences.” At the same time, their frequent appeals to reason, science, natural justice, and the Rights of Man—Dow often began his sermons with quotations from Paine—linked the evangelicals to the radical republicanism

let loose by the revolutions in America and France. Unlike George Whitefield a half century earlier, Dow and his fellow revivalists made it a point to steer newborn Christians away from the suffocating metaphysics and imposed authority of the established denominations. Theirs was to be a democratized Christianity—a religion of, for, and by the people in which the individual conscience blazed its own, independent trail toward salvation, free at last of sectarian organization, inherited theological systems, and clerical oppression.

Respectable people, inevitably, stressed the connection between this disdain for conventional forms of piety and the tenets of mechanic republicanism. In 1785 the Synod of the Dutch Reformed Church in New York and New Jersey pointed to the burgeoning interest of working people in universalism, rationalism, freethinking, deism, and other newfangled theologies closely identified with the international republican movement—a “mighty flood of errors,” in their words, that threatened the very foundations of the faith.

Nothing, however, concentrated attention on republican religion in the city quite so effectively as Tom Paine, who had returned to the United States from France in 1802. His first destination was Washington, D.C., where the resumption of his old friendship with President Jefferson caused such an uproar in the Federalist press that he decided to settle on the farm in New Rochelle that the State of New York had given him in recognition of his services to the nation. When he reached Manhattan in March 1803, his supporters, including many radical immigrants from England, Scotland, and Ireland, hailed him with a dinner at the City Hotel. Over the next year or two Paine often came down from New Rochelle to visit with freethinkers and republicans, stroll the streets, and attend parties (one evening he dined and jousted good-humoredly with John Pintard). In 1804 Elihu Palmer, who had proclaimed Paine “probably the most useful man that ever existed on the face of the earth,” drafted him to write articles on religion for the *Prospect*. Paine obliged with a series of forceful essays that reiterated his belief in God but emphasized that a narrow-minded, dogmatic, bigoted Christianity was inconsistent with a pluralistic and democratic republic.

Paine’s enemies retaliated with scurrilous personal attacks, he ran out of money, and his erstwhile admirers began to desert him, embarrassed now by his aspersions on Christianity, his increasingly unkempt appearance, and his

unpaid bills. Mrs. Elihu Palmer, the young portraitist John Wesley Jarvis, Thomas Addis Emmet, and a few other steadfast friends struggled to keep Paine clean and well fed, and though he rallied briefly after taking up permanent residence in the city, his health deteriorated rapidly. For a while he lived with a baker's family on Broome Street, then found quarters above a squalid tavern on Partition (now Fulton) Street, then moved again to lodgings in Greenwich Village on Herring Street (at what is now 293 Bleecker), where he was cared for by his old friend Madame Marguerite Bonneville. In 1809 she moved the ailing revolutionary into the back room of a small frame dwelling on the site of what is now 59 Grove Street.

There, in the last month of life, Paine was harried by devout visitors, determined to save his soul with an eleventh-hour conversion. Once two Presbyterian ministers pushed their way in, only to be rebuffed. "Let me have none of your popish stuff," the invalid declared. "Get away with you, good morning, good morning." He would be badgered one last time, in his final waking moments on June 8, 1809, when the attending doctor asked: "Do you wish to believe that Jesus Christ is the son of God?" "I have no wish to believe on that subject," he replied, and died peacefully in his unfaith. Paine's theological and political adversaries did not give up, however, and spread rumors that he had undergone a deathbed conversion. When New York's street commissioners, shortly after Paine's death, named an adjacent lane Reason Street in his honor, Trinity Church managed to get it renamed Barrow Street, honoring a minor watercolorist who had done a drawing of their new building.

OUT FROM THE BACK OF THE CHURCH

Although the rapid pace of European immigration after 1800 made New York whiter than at any time since the mid-seventeenth century, the continued growth of its black population made African Americans an important element of the city's new wageearning class—and made the city in turn the largest center of African-American life and culture in the United States. Black impatience with slavery and racism became an increasingly visible part of the city's public life, as in 1807, when a "numerous and respectable meeting of the Africans" was held at the African Free School on Cliff Street to celebrate the new federal ban on slave imports. Similarly, emancipated men and women quickly abandoned the surnames of their

former Dutch or English masters, choosing replacements that affirmed their release from bondage (Freeman) or advertised their artisanal skills (Cooper, Mason, Carpenter). For their children, they rejected the derisive and comical given names bestowed by slaveowners (Pompey, Caesar, Cato), often preferring those of biblical origin—not surprisingly, for black churches were anchors of the emerging African-American community.

Most New York denominations had long routinely segregated their black worshipers, confining them (as visiting Englishman William Strickland reported) to so-called Negro Pews—“usually the back rows in the Galleries”—whose occupants “are not permitted or never presume to mix among the whites.” Methodists were different. From 1787 the Methodist Episcopal Church condemned slavery and welcomed blacks as full participants.

The number of black congregants at the Wesley Chapel on John Street increased rapidly in the mid-1780s, and in 1800 the denomination provided for the ordination of deacons among its “African brethren.” This initial enthusiasm for integration soon peaked, however. Whites grew uneasy with integrated worship, fearful that blacks might yet exercise leadership authority, and worried that antislavery sentiments were dividing northern Methodists from their southern coreligionists. Blacks, pushed to the fringe where other white churches consigned them, asserted their autonomy and pushed to form an independent church.

The mainstay of this movement was sexton Peter Williams. Born of slave parents in a cowshed adjacent to their masters’ Beekman Street town house, Williams had been purchased as a young man by tobacco merchant James Aymar and become an expert cigar maker. He also became a Methodist. In 1778 the Wesley Chapel purchased Williams, for forty pounds, and made him its sexton. He left the city during the British occupation, returned in 1780, bought his freedom out of his earnings, and became a successful tobacconist while retaining his position with the church.

In 1796 Williams joined with James Varick and other Methodists of color to establish the Zion Chapel in a cabinetmaker’s shop on Cross Street between Orange (Baxter) and Mulberry. The Zionites didn’t intend to withdraw from the John Street congregation, merely to worship together in an atmosphere free of racial animosity, but by 1799 they had concluded that

they would be better off on their own. Encouraged by the example of Richard Allen, who had just founded the African Methodist Episcopal Church in Philadelphia, they obtained permission from Bishop Francis Asbury to form a new congregation.

Methodist Church on John Street, c. 1817. The figure in the doorway may be Peter Williams, the sexton. (I. N. Phelps Stokes Collection. Miriam and Ira D. Wallach Division of Art, Prints and Photographs. The New York Public Library. Astor, Lenox and Tilden Foundations)

York Public Library. Astor, Lenox and Tilden Foundations)

In 1801 the dissidents incorporated as the African Methodist Episcopal Zion Church and raised a house of worship on the corner of Leonard and Church streets. In remembrance of the little Cross Street chapel, it would be known as “Mother Zion.” Williams didn’t join Zion; though he supported and shepherded the separatist project, he stayed at John Street out of gratitude. By decade’s end, Zion had attracted many blacks to settle nearby, and it had become the nucleus of a mini-community within the larger Five Points neighborhood.

Brooklyn blacks traveled a similar road. In 1794 a small integrated congregation built the Sands Street Church on the same location where in 1766 Captain Thomas Webb had first conducted outdoor services. Blacks, who constituted a third to half of the communicants, were relegated to an “end gallery.” As friction with whites increased, they broke away to form the Bridge Street African Methodist Episcopal Wesleyan Church (1818), the oldest black church in Brooklyn. In 1809, meanwhile, nineteen African-American men and women, unwilling to accept racially segregated seating, had withdrawn from Manhattan’s First Baptist Church on Gold Street and established the Abyssinian Baptist Church in a building on Anthony, between Church and Chapel streets.

At Trinity too African Americans moved toward greater autonomy. Black Episcopalians had been worshiping apart from whites since the revolution, and they had been buried apart since 1696. Now Trinity acceded to their request for a separate chapel, the germ of what would later emerge as St. Philip's Church. In 1794, moreover, a group of blacks, possibly these same Episcopalians, noted that the Negro Burial Ground was slated for development and petitioned the Common Council for a new cemetery. The city granted the request, set aside four lots on Chrystie Street, and contributed funds (as did Trinity) toward establishing a graveyard there.

Blacks organized themselves in secular society as well, in response to gradual emancipation and the rise of systematic prejudice. Most whites simply couldn't imagine blacks as full members of a republican society, and there were plenty of veterans in town who remembered, as one man told a local paper, that area slaves "fought against us by whole regiments" during the Revolution and therefore didn't deserve freedom. Free blacks responded by forming associations for (in the words of a contemporary report) their "mutual support, benefit, and improvement." In 1808, for example, Peter Williams joined with other blacks to form the New York African Society for Mutual Relief. In doing so they followed a now common practice among the city's artisans; indeed, the society's first president was a house carpenter, and six of its founders were bootmakers. In 1810, with the aid of Mayor De Witt Clinton, the society received a charter from the state legislature. That same year the legislature chartered an African Marine Fund and the Brooklyn African Woolman Benevolent Society, named for the eighteenth-century Quaker abolitionist John Woolman.

No black antislavery organization per se emerged, though the community occasionally engaged in direct action. When Madame Jeanne Mathusine Droibillan Volunbrun, an *emigre* slaveholder, tried to ship twenty slaves south in 1801 in violation of state law, hundreds of city blacks, led by "French Negroes," threatened to "burn the said Volunbrun's house, murder all the white people in it and take away a number of Black Slaves." The crowd was dispersed by fifty watchmen, two dozen blacks went to jail, and Madame Volunbrun's slaves went south as planned.

"IRISHTOWN"

In much the same way that racism prompted the black community to circle its wagons, nativism prompted Irish immigrants to coalesce around the Roman Catholic Church. Probably fewer than a thousand Catholics lived in New York at the end of the Revolution. Ferdinand Steenmayer, a Jesuit, had slipped into the city during the war to celebrate the Mass secretly in a house on Wall Street. With the elimination of restrictions on Catholic worship, Steenmayer gathered his flock in a loft over a Barclay Street carpenter's shop. The postwar surge of immigration, virtually doubling the Catholic population overnight, prompted Dominick Lynch, Thomas Stoughton, and other lay leaders, led by Hector St. Jean de Crevecoeur, the French consul in New York, to arrange for the construction of St. Peter's Church, the city's first Roman Catholic house of worship. Lots were purchased on Barclay Street, and the cornerstone was laid in October 1785. Although the founders of St. Peter's had envisioned a multiethnic congregation, the massive influx of Irish immigrants after the 1798 rebellion, boosting the number of Catholics in the city to some 10,000 by 1806, soon gave the new church a distinctly Hibernian orientation.

That was a matter of no small importance, because ethnic hostilities had mounted in tandem with the growing crisis in the trades. The Catholic Irish, abjectly poor, desperate for work, and alarmingly numerous, made a perfect scapegoat for the economic and social pressures rending mechanic republicanism—better even than the city's relatively smaller and more marginal black population. Virulent anti-Irish sentiment spread rapidly among the city's white Protestant laboring population during the 1790s and was further encouraged by the Federalist Alien and Sedition Acts. During the final years of the century, journeymen and apprentices revived the pre-Revolutionary Pope's Day festivities and repeatedly marched about town bearing straw-stuffed effigies designed to mock St. Patrick. These "Paddy processions" met with militant resistance, often terminating in wild brawls and arrests. In 1709, only a year after the French-backed rebellion in Ireland had been crushed, marchers invaded the Irish neighborhood along lower Harman Street (East Broadway), touching off a melee that resulted in one fatality and many serious injuries. Three years later, after another explosion, the Common Council passed an ordinance outlawing the flaunting of Paddies or other insulting effigies.

In the new century, a set of gifted revolutionary leaders arrived from Ireland, among them lawyers Thomas Addis Emmet and William Sampson, physician William MacNeven, and printer John Chambers. Though all were Anglicans except for MacNeven, they helped make the Irish Catholic community a political force in New York. Emmet, perhaps the United Irishmen's most gifted orator, had been arrested for his part in the abortive uprising of 1798. The British proposed deporting him to America, but Ambassador Rufus King persuaded the Adams administration to exclude Emmet and the other Irish "Jacobins." As a result, Emmet spent nearly four years in prison (during which time his brother Robert was hanged and beheaded for conspiring against the British). Finally, with Jefferson in power, Emmet and the other United Irish leaders, like Paine, made their way to New York City.

Taken up by George and De Witt Clinton, themselves of Irish extraction, Emmet gained admission to the bar, over the protests of Federalist attorneys, and soon emerged as one of the city's most popular and successful lawyers as well as a potent force in Democratic-Republican party. Rufus King had bragged of winning the "cordial and distinguished Hatred" of United Irishmen like Emmet. He was right, and in election after election, Emmet's blistering denunciations of King as a British collaborator helped Clintonians win the burgeoning Irish vote.

One thing the Irish vote could not do, however, was elect Catholics to public office. A naturalization clause in the 1777 state constitution had required all new citizens of the state to "abjure and renounce all allegiance and subjection to all and every foreign King, prince, potentate, and state, in all matters ecclesiastical as well as civil." Although this requirement was superseded by the U.S. Constitution ten years later, it had meanwhile been incorporated into a test oath required of all state officeholders—meaning that Catholics could become citizens but were effectively barred from serving in the legislature. They protested in vain until 1806, when Francis Cooper became the first of his faith to be elected to the Assembly. The congregation of St. Peter's rounded up thirteen hundred signatures for a petition protesting the oath, De Witt Clinton won passage of a bill to abolish it, and Cooper took his seat.

Political victories, in turn, exacerbated tensions on the street. On Christmas Eve of 1806, less than a year after Cooper's victory, fifty

members of the Highbinders (or Hide Binders)—a nativist gang of apprentices and propertyless journeyman butchers—gathered outside St. Peter’s to taunt worshipers leaving midnight Mass. The watch prevented a serious disorder, but on Christmas Day, Irishmen fearing a Highbinder attack armed themselves with cudgels, stones, and brickbats. When the watch attempted to disperse a crowd on Augustus Street (now the site of the Municipal Building), a bloody skirmish broke out, and one watchman was killed. The Highbinders and a nativist crowd now invaded “Irishtown,” wreaking havoc until the magistrates managed to restore order.

Tensions on the street encouraged the Irish to greater political exertions. In 1807, when the anti-immigrant Rufus King stood for election to the Assembly, Emmet denounced him as a “royalist” and a “political dupe” of the British. King haughtily announced he would “enter into no explanations, leaving the Public to decide between me and these foreigners.” The voters decided emphatically against him and torpedoed his subsequent bid in 1808 for the governorship as well.

“HONEST FOLKS IN THE PIT”

One of those who took part in the 1806 Christmas riot against Irish Catholics was William Otter, a young plasterer’s apprentice from England, but he was there for pleasure, not principle. Otter was a rowdy, one of a growing number of young men who scorned journeymen’s associations, radical bookshops, and Methodist chapels. They preferred instead to go out on “sprees”—nighttime forays into the city’s brothels, rum holes, and oyster shops that often ended in drunken brawls. As Otter recalled in the careful notes he kept of these adventures, he and his mates once went to Mr. Green’s “for the express purpose of raising a row and were gratified to our heart’s content.” On another, they descended on Mr. Drake’s, where they “broke every glass in the whole house, and cleared it of men, women, and children,” then “scampered off to a grog-shop.”

Among their favorite targets were the city’s now-numerous dancehalls. “The dancing fever began to rage in Harman street,” Otter remembered, and he and his gang began dropping in at places like Mrs. Cunningham’s or the “Negro dancing cellars” on Bancker Street. Horace Lane, a white sailor, also recollected his 1804 visit to one such establishment: a “small room, well filled with human beings of both sexes,” with “a big darkie in one

corner sweating, and sawing away on a violin.” Lane continued, “To increase vigour, and elate the spirit of fun, there stood by his side a tall swarthy female who was rattling and flourishing a tambourine with uncommon skill and dexterity” while in midfloor dancers were “jumping about, twisting and screwing their joints and ankles as if to scour the floor with their feet.”

Interracial camaraderie had shocked Daniel Horsmanden back in 1741, and despite all that had transpired in the intervening sixty years poor whites and poor blacks continued to mingle in gin mills, dance halls, and brothels that catered to both races. Such fraternizing took place, on occasion, in more public spaces, especially on Sundays and holidays like Pinkster. Although the old Dutch celebration of Whitsuntide had disappeared from anglicized New York City during the eighteenth century, it survived among the Dutch villages of Long Island and the Hudson Valley, where it was appropriated as a holiday by slaves, who then brought it back to the city in the 1790s and 1800s. As one resident remembered: “All made it an idle day; boys and negroes might be seen all day standing in the market laughing and joking and cracking eggs. In the afternoon the grown up apprentices and servant girls used to dance on the green in Bayard’s farm [west of Broadway].”

“Negro dancing” was a familiar feature of Pinkster time. Slaves or country free blacks trooped in to the marketplace at Brooklyn Village from Long Island or New Jersey (the former with their hair tied up in a queue with dried eelskin, the latter favoring plaited forelocks fastened with tea leaves). Sometimes as many as two hundred would perform exhibition dances, toot on fish horns, play games, and drink. Others crossed over to Catherine Market or the fish market in front of Burnel Brown’s Ship Chandlery. There they sold roots, berries, herbs, and birds to raise money for the holiday. Some were hired by resident butchers to engage in a jig or “break-down.” This pastime, performed at home on a barn floor, became a competitive display of skill, performed on a springy board, with percussive accompaniment made by beating hands on sides of legs, followed by the taking up of a collection from bystanders.

When white rowdies attended interracial gatherings, however, they were likely as not to indulge in violence: victimizing blacks (like attacking Irish) seemed part of the natural order of things. “A parcel of us lads,” Otter

reminisced, went to John M'Dermot's oyster shop in George's Street, played "patent billiards" for drink and oysters, got loud and obstreperous, and stomped M'Dermot when he tried to stop them; "some of the spare hands fell upon the negroes who were employed by him to shuck oysters, and drove them into the cooking room, and beat them, poor d———Is, into a jelly."

Traditional "blood sports" like cockfighting and bearbaiting remained another popular pastime, and as promoters vied to stage more and more bizarre contests they drew larger and more turbulent crowds. One impresario threw up a two-thousand-seat amphitheater for such spectacles; box seats sold for seventy-five cents, while admission to the pit could be had for as little as a quarter. By the mid-nineties several circus troupes were also competing for public attention. The most successful was led by John Bill Ricketts, whose inventive deployment of clowns, tightrope walkers, tumblers, aerobatic riders, mounted Indians, and fireworks lured sellout crowds to his New Amphitheater on Greenwich Street.

Rowdies turned up as well among theatergoers, the bulk of whom still consisted of working people because only the poorest apprentices and journeymen were unable to scrape together the price of admission. In 1789 ticket prices at Lewis Hallam's John Street Theater ranged from fifty cents for the gallery to seventy-five cents for the pit and a dollar for the boxes. The fancy new Park Theater on Chatham Street, for all its appeal to the Broadway-area gentility, was even cheaper, at twenty-five cents for the gallery and fifty cents for the pit. While some impresarios dreamed of performing only for cultivated audiences, this simply wasn't possible. John Howard Payne, who made his debut on the New York stage in 1809, ruefully observed that the "judicious few" were "always to be found in a Theater, like flowers in a desert, but they are nowhere sufficiently numerous to fill one."

Like the city itself, New York's playhouses were in fact increasingly divided into distinct social zones, their boundaries defined as much by deportment as dress. At John Street, occupants of the pit and gallery—"Blacksmith's apprentices and Canvastown girls," in the words of Grant Thorburn—smoked and drank incessantly, talked loudly, traded punches, besieged the orchestra with calls for their favorite tunes, harangued the players, clambered onto the stage, and consorted with the numerous

prostitutes who worked the halls. Box seats offered no immunity from the commotion: a series of incidents in 1795 prompted Hallam to place an announcement in local papers reassuring boxholders that bolts would be placed inside the door of each box “to prevent any interruption” and that “no persons of notorious ill fame will be suffered to occupy any seat in a box where places are already taken.”

It was the same at the Park. Not long after opening night, the management offered a fifty-dollar reward for information leading to the arrest and conviction of “certain illdisposed persons [who] have made a practice of throwing at the performers in the Orchestra and on the Stage.” It did no good. Several years later, in his *Letters of Jonathan Oldstyle, Gent.* (1802), the youthful Washington Irving described how the “honest folks in the pit” milled about near the Park’s stage, noisily commenting on the play before them, while rowdy “gallery gods,” including platoons of prostitutes, added to the general din by “stamping, hissing, roaring, whistling,” “groaning in cadence,” and flinging “apples, nuts & ginger-bread” at those below. Even some boxholders carried on as if they were in “a coffee house, or fashionable lounge, where [they can] indulge in loud conversation, without any regard for the pain it inflicts on their more attentive neighbors.”

Their more attentive neighbors knew better than to object, too. The theater rules and idioms accorded audiences extensive powers of self-regulation as well as a voice in the content, length, and pacing of performances. Irving’s gallery gods and honest folks in the pit considered themselves, and were considered by others, an integral part of the production, with a right, even a duty, to make their views known.

Managers, accordingly, arranged programs and assembled troupes calculated to appeal to plebeian sensibilities. For the 1789 season at the John Street Theater, Hallam advertised thirty-one comedies, twenty-six farces, nine comic operas, six tragedies, and two pantomimes. Thirty-five different authors were represented, the most frequently produced of whom included David Garrick (*Clandestine Marriage*), Richard Sheridan (*School for Scandal*), and William Shakespeare (*The Tempest*, *The Merry Wives of Windsor*, *Richard III*)—a repertoire that seems remarkable only because (thanks partly to critics like Irving) the behavior of audiences has become confused with the extent of their sophistication. Shakespeare was a perennial favorite at both the John Street and Park theaters (a full-length

statue of the bard stood in the Park's lobby). By day, journeymen recited passages from Shakespeare to their shop mates; by night, they cheered, booed, argued, and whistled in possessive familiarity with the drama unfolding on both sides of the footlights.

Increasingly popular were plays that linked patriotism and republicanism. In 1787 John Street patrons hailed *The Contrast*, a sentimental comedy set in contemporary New York, which demonstrated the superiority of republican honesty and simplicity over European sophistication (at one emotion-charged point in the production, the entire house rose to sing "Yankee Doodle"). When the popular actor John Hodgkinson appeared in the red coat of a British officer, hecklers wouldn't allow him to continue until he had explained, at length, that he was merely playing the part of an unworthy character.

Between 1798 and 1805 the young playwright (and Friendly Club habitue) William Dunlap, manager and part owner of the Park Theater, staged elaborate reenactments of the battles of Bunker Hill and Yorktown Heights. And his own efforts (like *The Glory of Columbia—Her Yeomanry!*) practically invented the "stage-Yankee," a two-fisted patriot who became as recognizable to New York mechanic audiences as any Shakespearean character. Like him, they took pride in being plain people who produced objects of genuine usefulness with their own hands. Like him, they sensed that they had been ennobled by the Revolution—a despised and powerless rabble transformed into free citizencraftsmen. Their best qualities, like his, now seemed the very essence of republicanism: bluntness, self-reliance, unaffected decency, instinctive egalitarianism. They pursued an honest living, not wealth. They scorned privilege, ridiculed ostentation, despised avarice, and stood by their fellows.

As in matters of work, residence, religion, and politics, leisure-time pursuits became a bone of contention between the city's working classes and its elites. In some respects this was nothing new; since the days of Peter Minuit, civic and religious authorities had been trying to impose decorum on the heterogeneous, turbulent inhabitants of Manhattan and to curb the popular predilection for swearing, blasphemy, Sabbath-breaking, alcohol, and blood sports. What gave these concerns a new edge was the desire of entrepreneurial masters to create a more disciplined workforce.

Masters especially were dismayed by the continuing interpenetration of leisure and work. City artisans still observed the practice of “jeffing”—periodic trips to nearby taverns and “groceries” for beer or gin—and they continued to take the frequent breaks for doughnuts, candy, and cakes that were a time-honored prerogative of journeymen and apprentices. They often observed “Saint Monday,” as well, taking the day off for horse races, boxing and shooting matches, drinking bouts, billiards, gambling, semiorganized brawling, and other long-established popular pastimes.

Many masters began challenging such traditions in their shops, promulgating strict work codes, and constructing in the process a new bourgeois standard of order and personal decorum. The General Society of Mechanics and Tradesmen—that bastion of master craftsmen—bore down especially hard on the customary drinking rights of journeymen and apprentices, blaming them for drunkenness, gambling, swearing, and other antisocial evils. Duncan Phyfe, a pillar of the General Society known for his Scotch Calvinist rigor, was said to require that even the members of his own family be in bed by nine o’clock. At least a few mechanics, too, contended that the traditional values and attitudes of working people led only to poverty and misery. As one wrote with heavy sarcasm: “Pursue the gay and jocular companion through his weekly round of pleasures—On Monday evening at the play, Tuesday at Piken’s public dance, Wednesday at Rickett’s Circus, Thursday to see Gibonne and Coco, Friday Seely’s long room, and Saturday’s theater closes the week of mirth— *Sunday*, that long, that tedious heavy day hangs heavy on their heads.”

Some masters and merchants appealed to the authorities for help, at least in keeping the Sabbath holy (as they understood the term). After independence, church attendance failed to keep pace with population growth, and reports of Sabbath violations became standard fare for New York newspapers. As an indignant “Friend to Order” told the *Weekly Museum* in 1792, he had seen “near two hundred Negroes, Boys and *Gentle-men* (I mean those who have the appearance of Gentlemen)” skating on a recent Sunday. State as well as municipal authorities responded by renewing the old colonial prohibitions against profaning the Lord’s Day with work or sport; at one point the Common Council even appointed a special peace officer to go after offenders. It made little or no difference, for

as one “Journeyman Mechanic” with an ear for rhyme declared, the working classes had the right to do as they pleased on Sundays:

Of rich and poor the difference what?—
In working or in working not
Why then on Sunday we’re as great
As those who own some vast estate.

“THE LIFE OF A CITIZEN IN THE HANDS OF A WOMAN”

Although white working-class women in New York led widely divergent lives—hotcorn girls and the wives of Episcopalian master craftsmen had very little in common—the changes sweeping the city during the 1790s and early 1800s left them collectively worse off than ever. Lowered property requirements for the suffrage, for example, boosted the political visibility of working-class men, but they also magnified the powerlessness and dependency of their still-voteless wives. The erosion of household production and the growth of wage-work likewise tended to privilege the labor that brought home the bacon over the unpaid labor that cooked it—along with raising the children, mending clothes, cleaning, and nursing the sick.

As jobs for men in the trades became less secure and wages declined, many working-class women found themselves obliged to shoulder additional responsibilities to supplement the incomes of their husbands: taking in piecework as milliners or seamstresses (black women took in laundry), hiring out as domestic servants in middle- and upper-class households, or renting rooms to boarders. A lucky few may have been able to earn an independent living—by 1800, eighty-eight of the 150 boardinghouses listed in the city directory were run by women—but the income generated by this kind of work was as a rule far too meager for that. For women whose husbands had died or run off, and who proved unable (or unwilling) to support themselves as domestic drudges, prostitution was frequently the only alternative to public assistance.

Indeed, the heightened vulnerability of working-class women to sexual exploitation—above all by upper-class men—became a familiar and explosive topic during the 1790s. Seduction dramas in which unscrupulous

aristocratic cads took advantage of simple but pure working girls were hugely popular on the New York stage. Arguably the most widely read book of the era was Susannah Haswell Rowson's novel *Charlotte Temple*, first published in London in 1791. Set in Revolutionary New York, her tale concerned an innocent fifteen-year-old schoolgirl seduced by a dashing British naval officer named Montraville, who then abandons her to take up with a wealthy local belle. Charlotte dies giving birth to his child, scorned by all except the laboring people, who haven't lost sight of her innate decency and virtue.¹

In 1793 life provided an ugly imitation of art, when a seventeen-year-old girl named Lanah Sawyer alleged that a certain Henry Bedlow had lured her into Mother Carey's bawdy house on Ann Street, where he then raped her. Rape in eighteenth- and early nineteenth-century New York was a crime of the poor: well-to-do women rarely if ever brought formal accusations of rape before the courts, and the men charged with rape were almost invariably mechanics and laborers. Sawyer, a sewing girl whose father was a little-known sea captain, fit the pattern perfectly. "Harry" Bedlow didn't. His family was wealthy, and he had a reputation around town as a rake and libertine.

Bedlow's trial before an all-male jury raised questions of power, privilege, gender, and class in a republican society. To the prosecution, Sawyer was a "poor and unknown" girl victimized by an arrogant rogue "of rich family and connections." Bedlow's attorneys, Richard Harison, Robert Troup, and Brockholst Livingston, admitted that a seduction had occurred. But they denied the charge of rape, arguing that Sawyer's plebeian standards of "discretion and prudence"—why had she been out in the streets without an escort? why had she failed to reject Bedlow's advances at the very outset?—were obviously looser than those observed in respectable society. And because a casual accusation of rape could put "the life of a citizen in the hands of a woman, to be disposed of almost at her will and pleasure," its disposition was thus a matter of grave consequence for the (male) political community.

Bedlow was a "fellow citizen" regardless of his private shortcomings or station in life: to convict him just because Sawyer alleged he raped her was to violate an essential distinction between those who were active, useful members of the republic and those who stood outside it. All the more so in

this case, the lawyers said, because Sawyer came from the most vicious and depraved class of society. Respectable women learned to tame their wanton passions; laboring women, exposed to the coarsest aspects of life, could not. No matter that Sawyer's neighbors described her as modest and polite, Brockholst Livingston told the jury. They seemed "an obscure set of people, perhaps of no character themselves," while she was just another working-class slattern who "had the art to carry a fair outside, while all was foul within."

When the jury acquitted Bedlow after fifteen minutes' deliberation, workingmen went on a rampage. The disorders centered around Greenwich, Warren, and Murray streets on the west side of town, home both to mechanics, shopkeepers, cartmen, and laborers and to "the Holy Ground," the red-light district whose prostitutes and brothels were well known to young men of genteel backgrounds, not least of all those enrolled at nearby Columbia College.

For three days crowds of "Boys, Apprentices, Negroes, and Sailors" roamed through the Holy Ground and its immediate vicinity until chased off by mounted horsemen. The rioters—hundreds strong—focused their attention on Mother Carey's bawdy house as well as two others operated by Mother Giles and Mother Gibbons. (Bawdy houses, like so many of the city's boardinghouses, tended to be run by women, often widows.) All three establishments were looted of their luxurious appointments—"petty-coats, smocks, and silks, together with downy couches, or feather beds"—and then, after their roofs were unshingled, the houses were utterly dismantled. There were doubtless other possible targets in the area, but they escaped unscathed, and for good reason. Mother Carey and her girls had testified on Bedlow's behalf. They were accessories to a system of upper-class sexual exploitation of young working-class women that might yet claim more of the rioters' sisters and daughters. As anchors of that system in the city's poorer communities, their house (and those of Mother Giles and Mother Gibbons) had to come down.

What was finally at issue here was not so much the insult to Lanah Sawyer's honor, or the existence of bawdy houses per se, but whether working-class men or upper-class men would control the bodies of working-class women. The anonymous "Justicia" made this point forcefully, protesting to a local newspaper that the bawdy houses in

question had been patronized over the years by the very magistrates who sprang to Bedlow's defense and scrambled to quell the riots.

Street battles over gender rights thus joined strikes, ethnic tangles, racial tensions, and popular revivals as indications of growing strains in New York society. But the same prosperity that had helped generate these conflicts helped mute their consequences as well. Only a significant downturn in the economy would truly test the depth and degree of civic disaffections, and that was just what onrushing global events were about to provide.

26

War and Peace

One evening toward the end of April 1806, two miles off Sandy Hook, the sixty-gun British frigate *Leander* spied the American schooner *Richard* making her way up the coast to New York from Brandywine Creek in Pennsylvania. *Leander* was searching for deserters from the Royal Navy and fired a shot across *Richard*'s bow as an order to heave to and prepare for boarding. The American promptly complied, but a second shot followed, and then a third—possibly meant for another vessel nearby—which smashed into *Richard*'s stern, decapitating the helmsman, John Pierce.

Pierce's death was a grisly reminder that since the resumption of the Napoleonic Wars in 1803, both Britain and France had redoubled their efforts to curb the lucrative carrying trade of neutral nations, the United States above all. For Britain's Royal Navy, that task had been made immeasurably easier by Admiral Nelson's 1805 destruction of the French fleet at Trafalgar. But the Royal Navy was experiencing severe shortages of manpower. Able seamen were deserting by the thousands—more often than not for the rapidly growing American merchant marine, where conditions and pay were vastly better and captains wouldn't look too closely at a man's documents. So new instructions had gone out for British warships to search neutral vessels with particular vigor and "press" deserters back into service. Since Britain didn't recognize U.S. naturalization laws—and since her captains were also given to a certain carelessness about paperwork—as many as a thousand men every year, the innocent along with the guilty, American as well as British, found themselves serving time before the mast in the Royal Navy.

As the hub of American neutral commerce, New York was an obvious place for His Majesty's forces to ferret out both contraband and deserters (virtually every British vessel that put into the port after the turn of the century was said to leave shorthanded). Since as early as 1804, the Royal Navy had been patrolling nearby waters so relentlessly that the British consul in the port admitted it was as good as under blockade. The *Leander*, one of three frigates on station outside New York in the spring of 1806,

routinely detained a score or more ships at a time. Any seaman suspected of being a British subject was impressed on the spot.

As word of *Leander*'s attack on *Richard* raced through the city, angry crowds converged on the waterfront. One party of volunteers set out in a pilot boat to recover a pair of merchantmen taken by the *Leander* and about to be sent up to the prize courts in Halifax, Nova Scotia. Other parties seized five of the *Leander*'s supply boats, and a "prodigious mob—huzzaing" hauled their contents off to the almshouse for distribution to the poor.

When John Pierce's headless corpse went on display at the Tontine Coffee House a day or so later, the mood in New York turned so ugly that the British consul predicted his house would be burned by a mob and he himself would be taken hostage. Mayor Clinton and the Common Council had Pierce buried at public expense and directed all ships in the harbor to fly their flags at half-mast. President Jefferson barred *Leander* from American ports and issued an unenforceable order for the arrest of her captain (who, to no one's surprise, was afterward exonerated by a Royal Navy court-martial). Newspapers in Philadelphia and Richmond talked of war.

O GRAB ME

But there was to be no war—not yet.

A week before the *Leander* incident, already incensed by British violations of neutral commerce and the impressment of American seamen, Congress had passed a Non Importation Act. Reminiscent of American resistance to parliamentary taxation in the 1760s and 1770s, the measure promised to end the sale of numerous British manufactures in the United States, effective the following November—unless, that is, His Majesty's government mended its ways before then. Secretary of State James Monroe sailed at once for London to open negotiations.

The threat of American economic retaliation could not overcome the momentum of events. In mid-May, with the American public still in a furor over the *Leander*, the British blockaded the European coast from Hamburg to Brest. Napoleon's answer came in the Berlin Decree of December 1806, which demanded that all neutral nations discontinue further trade with

Great Britain. More concerned with bringing pressure to bear on France than avoiding trouble with the United States, His Majesty's government scuttled a treaty just negotiated by Monroe and Ambassador William Pinkney. Nonimportation had failed.

The year 1807 opened with a volley of British orders in council further curtailing neutral trade between France and France's allies. American hostility to the former mother country mounted in June when HMS *Leopard* fired on the USS *Chesapeake* off Norfolk Roads, Virginia, killing three sailors. Jefferson, in a fury, directed all British warships to leave American waters. His Majesty's government replied that it intended to pursue deserters with even greater zeal—and its resolve was stiffened by outrages like the one that occurred in New York the following September, when a crowd of dockworkers and sailors prevented six escaping British seamen from being returned to their ship. In a General Blockade Order of November 1807, the British then prohibited all neutral trade through ports closed to English shipping: if France barred British trade, in other words, France would have *no* trade. Napoleon retaliated in December 1807 by asserting that any vessel that submitted to British inspection, willingly or unwillingly, was subject to seizure. If the Americans didn't make Britain respect their rights as neutrals, the emperor would treat them as Britain's *de facto* allies.

As the probability of American involvement in the Anglo-French struggle increased month by month, "fortification fever" swept New York. The invasions of 1664, 1673, and 1776 left no doubt as to Manhattan's vulnerability to attack by sea, but only Fort Jay on the northern end of Governors Island—thrown up during the war scare of 1794 and rebuilt as Fort Columbus in 1806—afforded the city any protection from enemy warships. Over the spring and summer of 1807, therefore, teams of military engineers got to work on a system of forts and batteries for the Upper Bay that would take four years to complete.

President Jefferson was now coming round to the view that a second war with Great Britain was both inevitable and necessary. In mid-December 1807 the president asked Congress to place a total embargo on vessels leaving American ports—not to bring economic pressure on the belligerents, he explained, but to get American ships and seamen "out of harm's way" and give the nation time to prepare for war. An Embargo Act

quickly passed both houses and was signed into law three days before Christmas.

It was a colossal blunder. Besides causing no appreciable harm to the British economy, the embargo gave Napoleon the opportunity to grab ten million dollars' worth of legitimate American shipping on the grounds that it must perforce be illicit. In a single stroke, moreover, the embargo brought a decade of unprecedented American prosperity to a dead stop. Exports tumbled 80 percent in 1808. Imports fell 60 percent. What this amounted to, one critic charged, was a deranged act of self-mutilation—an attempt “to cure the corns by cutting off the toes.”

In New York the whole leg seemed to have been amputated. John Lambert, who returned to the city in April 1808, was overwhelmed by its “gloomy and forlorn” appearance. “The coffee-house slip, the wharfs and quays along South-street, presented no longer the bustle and activity that had prevailed there five months before,” Lambert wrote. “Not a box, bale, cask, barrel, or package, was to be seen upon the wharfs. Many of the counting-houses were shut up, or advertised to be let; and the few solitary merchants, clerks, porters, and labourers, that were to be seen, were walking about with their hands in their pockets. Instead of sixty or a hundred carts that used to stand in the street for hire, scarcely a dozen appeared, and they were unemployed.”

A few quick-witted merchants managed to stay afloat in the crisis, here slipping through loopholes in the law, there falling back on old-fashioned smuggling. John Jacob Astor got permission from President Jefferson to let an “esteemed citizen” of China named Punqua Wingchong return home on the *Beaver*. No sooner had the *Beaver* cleared port than Punqua Wingchong was rumored to be “a common Chinese dockloafer” conscripted by Astor to hoodwink the government (in fact Wingchong appears to have been a Hong merchant sent to collect some outstanding American debts). When the *Beaver* eventually returned to New York, its cargo netted Astor a profit of two hundred thousand dollars.

Few New Yorkers were so nimble. By the spring of 1808, some 120 firms had already gone out of business, the sheriff held a record twelve hundred debtors in custody (five hundred owing sums less than ten dollars), and a pandemic of unemployment was savaging the city's laboring population. Over the winter of 1807-8 the tally of destitute persons was said

to have grown tenfold. Residents grimly spoke of the crisis as “O Grab Me”—“embargo” spelled backward.

“BREAD OR WORK”

No one suffered more than sailors. There were, Lambert reported, “above 500 vessels in the harbor, which were lying up useless and rotting for want of employment” while thousands of seamen were “destitute of bread.” Unable to find shore jobs, many braved the icy winds to fish for food off the Battery. Early in January 1808 a committee of the Common Council declared that the municipal government should do something “to alleviate the evils which must result from a suspension of the ordinary vocations of the laborious part of the community”—perhaps by hiring “industrious persons” to improve Broadway.

Shortly thereafter, on Saturday, January 9, unemployed Jack Tars rallied in the Park, then paraded through the streets with placards that demanded “bread or work.” They dispersed peacefully after presenting a petition to the mayor that was respectful but laced with hints of menace. If municipal authorities failed “to provide some means for our subsistence during the winter,” they said, “we shall be necessitated to go on board foreign vessels.” What was more, many of them could no longer pay their boardinghouse bills. “By what means shall we discharge these debts? Should we plunder, thief or rob, the State prison will be our certain doom.”

A special session of the Common Council promptly organized relief operations. By Thursday a soup kitchen had been built; by Friday the almshouse was supplying food to over a thousand of the unemployed, five times more than the week before. By early February nearly six thousand were lining up for rations at the almshouse three times a week—receiving a quart of soup, a pound of bread, and three-quarters of a pound of beef. The program was terminated in the spring, then started up again the following fall. All told, between 1807 and 1809 municipal expenditures for relief climbed from forty-six to seventy-eight thousand dollars—a 70 percent increase.

The city also initiated the nation’s first work-relief project for persons “who are capable of labouring and who are destitute of occupation.” The street commissioner hired workers to help fill the Fresh Water Pond, raise

streets and lots near Corlear's Hook, lower Murray Hill, and dig the foundation for City Hall. The Common Council also devised a plan for the Navy Yard to hire unemployed seamen, at city expense, paying them not with money but "victuals, drink, fuel, candles, and accommodation for lodging." Many tars, however, feared being "trepanned"—kidnapped—by the navy, and only fifty-three accepted the offer. They did, on the other hand, flock to a War Department program, initiated at the urging of city authorities, which hired men to work on forts around the city.

Private relief organizations like the Humane Society contributed to the relief effort as well. To coordinate their work, forty civic leaders formed the General Committee of the Benevolent Associates for the Relief of the Poor. In December 1808 it organized a new, broadly based Assistance Society, which promised "to combine moral improvement by the recommendation of religion, with temporal relief distributed in the most economical and cautious manner." In the last week of February 1809, the society provided food, clothing, and fuel to over eight hundred indigent families (after first dispatching visitors to investigate the applicants).

It was beginning to look, however, as if no amount of governmental ingenuity or private charity could save New York from Jefferson's embargo. Not perhaps since the terrible depression of the early 1760s had the city experienced privation and despair on such a scale. Its streets swarmed with beggars, and "thousands of mariners, mechanics, and laborers" remained "destitute of cloathing, food and a lodging." Obviously, wrote the Democratic-Republican newspaper editor James Cheetham, New York faced a crisis of such magnitude that it could only be solved at the federal level. "The NATION," Cheetham insisted, "should provide for the distress which the nation inflicts."

UNLAWFUL COMBINATIONS AND RIOTOUS ASSEMBLIES

While protests against the embargo poured into Washington from every corner of the country, Jefferson defiantly bore down, tightening enforcement of the law until he exercised near-dictatorial powers. By the beginning of 1809, however, Congress was in open revolt. On March 1 it killed the fifteen-month-old embargo, adopting in its place a Non Intercourse Act that permitted trade with all nations *except* Britain and France. It also provided for the resumption of trade with whichever of those

two agreed to respect neutral rights. Jefferson, in one of his last official acts as president, resignedly signed the measure. New York greeted the news with ringing bells, fireworks, and cannonades.

Business picked up a bit in the months to come, but not enough to neutralize anxiety and contentiousness in the city. One symptom of the mood was the increased appeal of the “mechanic preachers” who had been active in New York since the turn of the century. Seasoned evangelists like Jesse Lee and Johny Edwards drew record crowds after 1808—Lee said he “never knew so great a revival of religion in the city before”—while the messianic Amos Broad preached to exuberant throngs of worshipers (mostly apprentices and mechanics) in his new hall on Rose Street. Alarmed municipal authorities tried to crack down on these meetings, so inconsistent with established religious practices, and when Edwards and the female evangelist Dorothy Ripley sponsored an open-air revival in May 1810, a squad of city marshals dragged Ripley off the pulpit while she cried out, over and over, “Lord have mercy upon them; Lord have mercy upon them for Christ’s sake!”

Violent outbreaks against African Americans became common. In 1807, and virtually every year thereafter, the trustees of the AME Zion Church pleaded with the City Council to do something about the gangs of white working-class youths that routinely harassed worshipers on Sundays; the Common Council wondered whether a watch box should be built outside the church. The Abyssinian Baptists faced similar problems.

Paralleling this new eruption of racial hatred were sharply rising tensions between masters and journeymen. As unemployment caromed through the trades after 1807, the bricklayers, printers, carpenters, cordwainers, masons, tailors, and cabinetmakers were plunged into a succession of acrimonious confrontations and strikes. Journeyman printers established a New York Typographical Society, whose 120 members protested that they were “sinking in the estimation of the community” and denounced master printers for employing half-trained apprentices and “full-grown men (foreigners).” Journeyman house carpenters issued an 1809 manifesto asserting that “every class of society ought to be entitled to benefit in proportion to its usefulness.”

The most significant clash took place among the city’s shoemakers. In 1808 the Journeyman Cordwainers’ Society expelled one of their members

for nonpayment of dues and “raising a rumpus” during a meeting. The society’s by-laws required the offender’s employer, the firm of James Corwin and Charles Aimes, to discharge him at once or lose the services of all other members. Corwin and Aimes obliged, which might have ended matters, except they refused to fire the man’s apprentice as well. When the journeymen in their shop awoke to the fact that this apprentice was now doing a journeyman’s work for less than a journeyman’s wages, they walked out. Then, discovering that the city’s master cordwainers had banded together to help Corwin and Aimes by filling the firm’s orders, the journeymen struck them all.

To this the master cordwainers responded by swearing out a complaint charging two dozen leaders of the journeymen’s society with illegal conspiracy. Early in 1809 the journeymen were duly indicted for “perniciously and deceitfully forming an unlawful club and combination”—the first time New Yorkers had been prosecuted for uniting to raise their wages. To represent them at the subsequent trial, they hired William Sampson, the exiled Irish revolutionary and well-known Jeffersonian. The masters, shrewdly, retained Thomas Addis Emmet, whose reputation eclipsed even Sampson’s.

Emmet’s argument before the Mayor’s Court in 1809 played upon the stillwidespread belief that extragovernmental associations had no place in a republic. In banding together to advance their private interests, Emmet contended, the journeymen had breached their sacred duty as citizens to uphold the common good. By the same token, their so-called right to strike violated the right of masters in every trade to dispose of their property as they saw fit. But Sampson too appealed to republican principles. The real problem here, he said, was “the rapacity of the masters.” They, not the journeymen, had put private gain ahead of the public interest, forming their own “sordid combination” to sustain excessive profits while “crowding their shops with more apprentices than they could instruct.” Besides, when merchants could meet to fix prices, politicians to nominate candidates, and sportsmen to wager on horses, why should poor men be indicted for “combining against starvation?”

Judicial hostility, if not Emmet’s oratory, carried the day. Mayor Jacob Radcliff instructed the jury that the accused journeymen had indeed employed “arbitrary and unlawful means,” whereupon the jury found in

favor of the masters. Not all was lost: the journeymen received comparatively mild fines of one dollar apiece, and the court acknowledged their right to “meet and regulate their concerns, and to ask for wages, and to work or refuse” as they saw fit—so long as they didn’t do it together.

Strife continued nevertheless, and in 1810 the city’s “architects and surveyors” issued an unusual appeal for calm, condemning the “increasing evils and the distressing tendency of the disputes between the Master and Journeymen Mechanics.” It did no good. Six months later, several hundred striking journeyman house carpenters converged on Mechanic Hall, headquarters of the General Society, smashing all the windows in what may well have been New York’s first labor dispute involving serious violence.

“MUCH EXULTATION AMONG THE FEDERALISTS”

Political strife also grew as Jefferson’s foreign policy handed New York Federalists one issue after another. They vilified the president for his cautious response to British and French attacks on American shipping. They criticized nonimportation as ineffectual and cited it as further proof of the government’s indifference to the welfare of saltwater ports like New York. When Treasury Secretary Albert Gallatin balanced the budget by cutting back on naval expenditures, they accused the administration of disregarding the safety of American ships and seamen. When work on the new harbor fortifications seemed not to move along briskly enough, they scolded Governor Tompkins and Mayor Clinton.

Nothing, though, gave the Federalists more cause for hope than the outcry against the embargo. During the winter of 1807-8, as the city’s economy croaked to a halt, public opinion swung heavily against the administration. Federalist writers and pamphleteers made a great show of concern for the miseries Jefferson had inflicted on working people and urged them to put their trust, again, in the party of Washington and Hamilton. In the spring 1808 elections, although Democratic-Republicans held on to both the city and state, the Federalists doubled the number of seats they occupied in the legislature. Some began to discern a chance of victory in the upcoming presidential election as well.

Over the spring and summer of 1808, a new Federalist organization, the formidable Washington Benevolent Society, took the field to rally the

faithful. What the Tammany Society did for the Republicans, the Washington Benevolents now set out to do for the suddenly rejuvenated Federalists: mobilize disaffected voters and lead them away from the party in power on election day. Its Tammany-like tactics—secret rituals, colorful parades, public banquets, low dues, inexpensive loans to members—succeeded brilliantly. Before the year was out, thousands of New Yorkers had joined the Washington Benevolents, and chapters of the society were sprouting up all over New England and the mid-Atlantic states.

Toward the end of August 1808, Federalists from eight states gathered secretly in New York to hold what has been called the first national political convention in the country's history. The delegates chose Charles Cotesworth Pinckney of South Carolina for president and Rufus King of New York for vice-president (the same ticket Jefferson and Governor George Clinton had clobbered four years earlier). A caucus of congressional Republicans then nominated Jefferson's Virginia neighbor, James Madison.

Madison won the election handily, a blow to the Federalists that was partly offset by the continuing good news from New York. In the 1809 elections, notwithstanding repeal of the embargo, the Federalists captured the Common Council, the state legislature, and the Council of Appointment and broke the Democratic-Republican hammerlock on the city's congressional delegation. Their revival as a party was celebrated on July fourth of that year when the Washington Benevolents marched through town, two thousand strong in thirteen divisions, to the corner of Broadway and Reade Street, where the cornerstone was laid for the society's new headquarters, Washington Hall.

DIEDRICH KNICKERBOCKER

Since the Revolution, writers and editors from all over the country had been trickling into New York City, drawn by its energy, its wealth, its clubs and theaters, its expanding book and newspaper markets, its contentious public life. Noah Webster arrived in the late eighties, Philip Freneau in the early nineties, Charles Brockden Brown later in the decade. Following them, soon after the turn of the century, came James Kirke Paulding, Samuel Woodworth, Fitz-Greene Halleck, and John Howard Payne, among others—including one southern newspaperman who explained in 1806 that he

moved to New York in order to work “at the confluence of the greatest number of the streams of knowledge.”

None of these out-of-towners, however, held the promise of an easygoing, blueeyed, twenty-year-old native named Washington Irving. The fifth son of an Englishwoman and a Scots hardware merchant who had settled in the city before the Revolution, Washington was born the year the British evacuated New York and was named by his mother in honor of the general. The prosperous William Street household was Federalist and strictly Calvinist, and young Washington began a legal apprenticeship in 1802 with Josiah Hoffman, a prominent Federalist judge. Hoffman introduced him to the cream of city society and affectionately indulged his obvious passions for convivial company, for the theater, and for literature. Irving was still with Hoffman when he wrote the *Letters of Jonathan Oldstyle, Gent.* (1802), a series of high-spirited if callow forays into dramatic criticism that initially appeared in the *Morning Chronicle*, edited by his older brother Peter. In 1804 his brothers William and Ebenezer, worried about Washington’s health, sent him off on a lengthy grand tour of Europe.

On his return to New York in 1806, Irving resumed his man-about-town life and emerged as ringleader of the Lads of Kilkenney, a loosely knit pack of literary-minded young blades out for a good time. They haunted the Park Theater, Dyde’s London Hotel (which stood next to the theater and advertised hospitality “in the true Old English Style”), and Thomas Hodgkinson’s Shakespeare Tavern, which opened in 1808 at the corner of Nassau and Fulton streets and was for the next thirty years the rendezvous of New York literati. None of the Lads lived by pen alone. Like the members of the old Friendly Club, they were men of affairs—lawyers, merchants, physicians—except, that is, for Irving himself, whose adoring brothers actually gave him a share of the family business so he could continue his literary pursuits without having to depend on what he wrote (or indeed the law) for his livelihood.

And write he did, along with his brother William and William’s brother-in-law, the sensitive, bookish James Kirke Paulding. Over the course of 1807 the trio collaborated on *Salmagundi*, a running collection of droll essays on current events in “the thrice renowned and delectable city of GOTHAM” (thereby affixing a nickname to New York). Their irreverent

commentaries—named after a spicy appetizer of chopped meat, pickled herring, and onions—were intended “to present a striking picture of the town; and as every body is anxious to see his own phiz on canvas, however stupid or ugly it may be, we have no doubt but that the whole town will flock to our exhibition.”

Few *Salmagundian* sallies were intended to do serious injury—apart, perhaps, from those ridiculing the American “mobocracy” or mocking Jefferson as “a huge bladder of wind.” Irving and his circle were, after all, gentlemen (or aspiring gentlemen). They knew their way around respectable society, and they knew that no true gentleman would wish to shock, offend, or inflict original ideas upon his readers: light, facile essays, in the knowing and self-ironic tone of the *Spectator* or the *Gentleman’s Magazine* were the objective. As Richard Henry Dana later said, *Salmagundi* made “exceedingly pleasant morning or after-dinner reading, never taking up too much of a gentleman’s time from his business and pleasures, nor so exalted and spiritualized as to seem mystical to his far reaching vision. It was an excellent thing in the rests between cotillions, and pauses between games at cards.”

Salmagundi’s strict adherence to the cultivated standards of eighteenth-century English letters didn’t bother Irving any more than it did Duncan Phyfe or John McComb: “We are,” he would write, “a young people, necessarily an imitative one, and must take our examples and models, in a great degree, from the existing nations of Europe. There is no country more worthy of our study than England.” (The original “Gotham,” immortalized in proverb and nursery rhyme, was of course that old English village whose inhabitants turned aside King John’s wrath by pretending to be fools.)

Yet the denizens of Shakespeare Tavern were poised to transcend the merely provincial. Imbued with a sense of patrician stewardship, they would take on the task of originating a genuinely American tradition of thought and expression—a “National Literature,” in Paulding’s phrase—reflecting the country’s growing cultural as well as political autonomy and bolstering the republican character of its institutions. Paulding, a more ardent nationalist and republican than Irving, was soon building a career out of twisting John Bull’s tail. The passionately anti-British, pro-American essays, poems, and satires that followed *Salmagundi* would make him a

major figure in the “paper war” waged between British and American writers over the next several decades.

Irving himself, for all his aesthetic and political conservatism, had taken a step in that direction as “Jonathan Oldstyle”—“Jonathan” being the current shorthand for an uncouth American—and his contributions to *Salmagundi* rivaled Paulding’s in lampooning British snobbery. But he was soon to go considerably farther and become the first American writer to exploit the full literary potential of local speech, characters, scenery, folkways, and history.

On October 26, 1809, the *Evening Post* carried the following notice: “Left his lodgings some time since, and has not since been heard of, a small elderly gentleman, dressed in an old black coat and cocked hat, by the name of KNICKERBOCKER. As there are some reasons for believing he is not entirely in his right mind and as great anxiety is entertained about him, any information concerning him left either at the Columbian Hotel, Mulberry-street, or at the Office of this paper will be thankfully received.” Two weeks later, a letter writer to the *Post* reported that he had spotted the man, just above Kingsbridge, trudging wearily northward. The proprietor of the Columbian Hotel then announced that he had discovered “a very curious kind of a written book” in Knickerbocker’s room—and that if the vanished lodger didn’t soon pay his bill, the manuscript would be sold off. Finally, on November 28, New York’s cleverest prepublication publicity campaign to date culminated with an announcement of the availability of *A History of New York from the Beginning of the World to the End of the Dutch Dynasty. . . by Diedrich Knickerbocker*.

Irving later explained that the idea for *Knickerbocker’s History* came to him after reading Samuel Latham Mitchill’s *Picture of New-York*. Irving found it shallow and self-important—the Lads had already mocked it in *Salmagundi*—and it seemed a perfect target for a spoof “written in a serio-comic vein, and treating local errors, follies, and abuses with good-humored satire.” Accordingly, with the assistance of his brother Peter, Irving concocted a “crude mass of mock erudition,” brimming with mordant sarcasm, goofy wordplay, and spurious footnotes, jumbling hilarious make-believe events together with bona fida history.

Casting himself as a serious scholar—though admitting that his name probably came from *knicker*, “to nod,” and *boeken*, “books,” hence a great

nodder or dozer over books—Knickerbocker/Irving recounted the story of New York’s origins, doing for it what Virgil had done for Rome but with tongue in cheek. When Hudson first sights Manhattan, for example, he is given the memorably vacuous line: “See! There!”

It helped that in Irving’s day knowledge about the city’s Dutch roots was very skimpy. The New-York Historical Society had only recently issued a plaintive request for information: “Is there any thing known concerning *Wouter Van Twiller*, or *William Kieft*, who preceded Governor *Stuyvesant* in the Chief Magistracy of the *New-Nether-lands*? How long did each remain in office? What stations or offices did they fill prior to their appointment here? Were they removed by death or resignation, or for ill behaviour?” William Smith’s *History of the Province of New York* (1757) didn’t have the answers: it gave only nine pages to the entire half century of Dutch rule. Small wonder, then, that readers often couldn’t tell when Irving was pulling their leg, and in later editions he had to warn that the *History* was a “whimsical and satirical work, in which the peculiarities and follies of the present day are humorously depicted in the persons, and arrayed . . . in the grotesque costume of the ancient Dutch colonist.”

Knickerbocker’s History was certainly in part a sendup of contemporary politics, particularly Jefferson’s foreign policy. It portrays Kieft (“William the Testy,” Knickerbocker calls him) as an intellectual who lacks the ability or patience to run a government and whose notions of defense against foreign aggression are limited to empty proclamations and self-defeating limitations on trade—an unmistakable allusion to the recently retired president. Stuyvesant, by contrast, was an ur-Federalist who believed that “to render a country respected abroad, it was necessary to make it formidable at home.”

Irving/Knickerbocker also took a jaundiced view of contemporary cobblers, blacksmiths, and tailors—the “swinish multitude,” the “enlightened mob”—who, believing themselves competent in “matters above their comprehensions,” attempted to “attend to the measures of government.” He ridiculed modern “hoydens” who, unlike the domestic *goede vrouwen* of yore, were “very fond of meddling with matters that did not appertain to their sex.” He bemoaned the “pride of family and ostentation of wealth, that has since grown to such a height in this city,” and heaped scorn on the “satisfied struttings of wealthy gentlemen with their

brains in their pockets” and on “smart young gentlemen, with no brains at all.” Indeed Irving’s *History* can be read as one long screed, tempered somewhat by self-irony, that denegrates the “degenerate days” in which he lived, by comparing them to a fictive Dutch Golden Age “when every thing was better than it has ever been since.”

The *History* was also an exercise in literary nationalism. For all its obeisance to Sterne and Swift, Knickerbocker’s earthy irreverence, extravagant bombast, and blustery tall tales would soon be considered hallmarks of American humor. Walter Scott claimed that reading it made his sides “absolutely sore with laughter,” Dickens wore out his copy with repeated reading, and Coleridge, who picked up a copy at an English inn (a remarkable fact in itself), couldn’t put it down until he’d finished. Irving’s was the first American book so favorably received abroad. It put the United States—and New York City—on Europe’s cultural map.

And Irving really had provided Manhattan with a past, of sorts. “*Cities of themselves*” Knickerbocker told his readers, tongue only partly in cheek, “are nothing without an historian,” and Irving believed that creating his book had been an act of the highest civic patriotism. Although his version of colonial New Amsterdam was a burlesque, and deeply resented by New Yorkers of Dutch descent (Gulian Verplanck excoriated it as “coarse caricature”), Irving had done some real research, rummaging in documents and collecting family legends and lore from those same Dutch New Yorkers—who like it or not were soon known as Knickerbockers. Through Diedrich Knickerbocker, Irving wrote, “I hailed my native city, as fortunate above all other American cities, in having an antiquity . . . extending back into the regions of doubt and fable.” And he credited Knickerbocker’s flights of fancy with provoking serious research into that antiquity: “It is only since this work appeared that the forgotten archives of the province have been rummaged, and the facts and personages of the olden time been rescued from the dust of oblivion.”

Irving would recall, in the preface to a much later edition, that he had set out to give the Manhattan cityscape historical depth and texture—“to clothe home scenes and places with imaginative and whimsical associations, which live like charms about the cities of the old world.” He believed that he’d succeeded, too, claiming that the “popular traditions of our city” now

formed a “convivial currency” and “link[ed] our whole community together in good-humor and good fellowship.”

Too good, perhaps, for Irving’s “community” was devoid of slavery, Indian wars, poverty, and other unpleasantness—and too many New Yorkers would for too long accept his affectionate mythmaking as authentic history. He had accomplished something remarkable, nevertheless. In inventing a past for his city, he chose not to revel in “gunpowder and carnage” but rather to detail the amiable everyday life of a contented and pleasure-loving people. Virgil he wasn’t, but New York could have done worse.

INTERNAL IMPROVEMENTS

While Irving was imagining a past for New York, some of his fellow citizens were busily imagining its future. Their vision, however, would be inscribed on the landscape itself.

In the spring of 1810 De Witt Clinton threw his influence behind the efforts of Gouverneur Morris, Thomas Eddy, Philip Schuyler, and Jonas Platt—Federalist land developers and empire builders—to drive a canal between the Hudson River and the Great Lakes, a distance of some 360 miles. That summer, named by the legislature to a new Board of Canal Commissioners, Clinton accompanied a team of engineers and surveyors up the Mohawk, through the Finger Lakes, and on to a rude little frontier village called Buffalo. Their report, issued in March 1811, proposed construction of a single continuous waterway from Albany to Lake Erie at a cost of five million dollars.

It was an idea—a dream—of pharaonic proportions. This great “national work,” the commissioners proclaimed, was the “key to the commerce of our western world,” a conduit through which thousands of tons of lumber, furs, flour, and other products of the Great Lakes would pour down to New York every year, enriching the city as well as hastening the conquest of the frontier. Generations to come would stand in awe of it.

Clinton and Morris went down to Washington to lobby for the plan, but Madison refused: federal aid for “internal improvements,” the president said, was probably unconstitutional. Clinton didn’t lose heart, however, and

over the next fifteen years he crusaded so zealously for the canal's completion that it would come to be known as "Clinton's ditch."

Other momentous changes, more local in scope, lay closer to realization. In the spring of 1811, as workmen were finishing the facade of City Hall, New Yorkers got their first glimpse of a remarkable new plan—intricately engraved on an eight-foot-long map—for the city's future expansion up the island of Manhattan. Some four years in preparation, the plan was the work of a state-appointed Streets Commission made up of Gouverneur Morris, Simeon De Witt (the state surveyor), and John Rutherford (a respected city businessman and former New Jersey senator). After a decade of yellow fever epidemics, the Assembly had charged the commissioners with laying out "streets, roads, and public squares" in such a manner "as to unite regularity and order with the Public convenience and benefit, and in particular to promote the health of the city," by allowing for the "free and abundant circulation of air."

The commissioners had hired John Randel Jr., a young man in his early twenties, for the herculean task of surveying all 11,400 acres of Manhattan Island. He began in the spring of 1808, hiking each day from his residence in lower Manhattan to field headquarters at the corner of Christopher and Herring streets (passing Tom Paine's house, where "frequently in fair weather [I] saw him sitting at the south window"). From there Randel and his men tramped on to distant parts of the island, often so thickly wooded as to be "impassable without the aid of an ax." Additional obstacles included hostile property owners and squatters, who unleashed dogs on any who approached with measuring instruments, or barraged them with cabbages and artichokes.

Randel had worked (he later said) "with a view to ascertain the most eligible grounds for the intended streets and avenues, with reference to sites least obstructed by rocks, precipices, steep grades, and other obstacles." But by the time he'd finished, in the fall of 1810, the commissioners had settled on an overlay pattern that brooked no such obstacles. Inasmuch as Morris (like Clinton) was also an active member of the Erie Canal Commission, it comes as no surprise that their vision of the streets of Manhattan had much in common with their vision of a great canal plowing across the state.

Several years before, the Salmagundians had playfully credited the right-angled, logical temperament of Philadelphians to the right-angled, logical

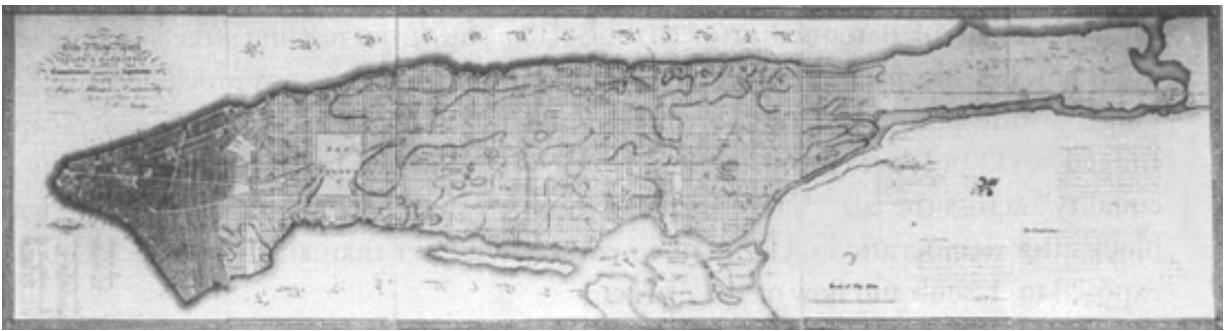

pattern of their streets. “Whereas the people of New York—God help them—tossed about over hills and dales, through lanes and alleys, crooked streets—continually mounting and descending, turning and twisting—whisking off at tangents, and left-angle-triangles, just like their own queer, odd, topsyturvy rantipole city, are the most irregular, crazyheaded, quicksilver, eccentric, whim-whamsical set of mortals that ever were jumbled together in this uneven, villainous revolving globe, and are the very antipodeans to the Philadelphians.”

Now all that was about to end. In the Commissioners’ Plan, twelve avenues, each a hundred feet in width, would slice north, canal-like, from the edge of town (then roughly Houston Street), paralleling Manhattan’s central axis. Every two hundred feet, crossing these avenues at right angles, were fifty- or sixty-foot-wide streets (one of which, every half mile or so, widened to one hundred feet). The resulting grid appealed to the same republican predilection for control and balance, the same distrust of sinuous nature, that shaped the neoclassical architecture of John McComb and the furniture of Duncan Phyfe. It combined “beauty, order, and convenience,” the commissioners boasted.

There was nothing new about grids. City planners had relied on them for thousands of years, and they were deployed throughout the American colonies, from small New England towns to larger urban centers like Philadelphia, Savannah, Charleston, and New Orleans. When Lady Deborah Moody founded Gravesend in the midseventeenth century, she laid out a grid adapted from the town plan of New Haven. What was new about the Manhattan grid was its ruthless utilitarianism.

In 1803 Joseph François Mangin and Casimir Goerck had come up with a plan for the future of Manhattan that served varying needs (health, recreation, commerce, community) with variable means: small blocks with streets close together in commercial areas, spacious and more separated blocks in residential districts, and plenty of parks. But the Commissioners’ Plan of 1811 would have none of this. Like the proposed Erie Canal, it was an “internal improvement” that gloried in the supremacy of technique over topography. Manhattan’s ancient hills, dales, swamps, springs, streams, ponds, forests, and meadows—none would be permitted to interrupt its fearful symmetry. The commissioners admitted that it “may be a matter of surprise that so few vacant spaces have been left, and those so small, for the

benefit of fresh air and consequent preservation of health.” Certainly, if New York had been situated alongside a small stream, “such as the Seine or Thames,” it might have needed more ample public places. “But those large arms of the sea which embrace Manhattan Island render its situation, in regard to health and pleasure, as well as to the convenience of commerce, peculiarly felicitous.”

The Commissioners' Plan of 1811. (I. N. Phelps Stokes Collection. Miriam and Ira D. Wallach Division of Art, Prints and Photographs. The New York Public Library. Astor, Lenox and Tilden Foundations)

The commissioners hastened to add that they had indeed incorporated *some* open spaces into the grid. A huge 240-acre tract bounded by Third Avenue, Seventh Avenue, 23rd Street, and 34th Street was set aside for a “Grand Parade”—big enough, they said, “for Military Exercise, as also to assemble, in case of need, the force destined to defend the City.” Above the Grand Parade, four smaller squares—Harlem, Hamilton, Bloomingdale, and Manhattan—afforded further relief from the grid’s rectilinear monotony. Two final squares were set aside, one for a reservoir on an elevated bluff, another for a fifty-four-acre wholesale “Market Place” between 7th and 10th Streets from First Avenue to the East River.

Of “circles, ovals, and stars” there were to be none, however. Such “supposed improvements,” the commissioners argued—sniping at features incorporated by L’Enfant in his plan for Washington—not only obstructed traffic but violated “the principles of economy.” Cities are “composed principally of the habitations of men,” and it is self-evident that “strait-sided and right-angled houses are the most cheap to build, and the most convenient to live in.” Carving Manhattan up to 155th Street into roughly two thousand long, narrow blocks, each further subdivided into

standardized lots (usually twenty-five by one hundred feet), each of which was easily located in reference to numbered streets and avenues, would also make land easier to market: Randel later pointed with pride to the way his handiwork heightened opportunities for “buying, selling, and improving real estate.”

The grid enshrined republican as well as realtor values, in its refusal to privilege particular places or parcels. All plots were equal under the commissioners’ regime, and the network of parallels and perpendiculars provided a democratic alternative to the royalist avenues of Baroque European cities. The shift from naming streets to numbering them, beyond promoting efficiency, also embodied a lexicographical leveling; no longer would families of rank or fortune memorialize themselves in the cityscape. Indeed William Duer complained that the commissioners had swung “the scythe of equality” across the island, replacing the country estates of the privileged classes with block after democratic block, no one necessarily better than any other, each equally exposed to the ebb and flow of the market.

In a remarkable assertion of public authority over large estate owners, moreover, the city decided to shut up any previously laid-out streets that were not retroactively accepted by the Common Council. Petrus Stuyvesant’s Bowery Village grid, devised twenty-odd years before, ran afoul of the Commissioners’ Plan, as it had been laid out on a true north-to-south and east-to-west basis, rather than adopting Manhattan’s skewed axis. When the city began opening streets and avenues in the area—Third Avenue was cut through Stuyvesant property as early as 1812—the old roads were closed and the houses on them demolished or moved. After much bitter fighting with city officials, the powerful family was able to salvage several residences on Stuyvesant Street; it still survives, cutting diagonally between Second and Third avenues, a ghost of defunct ambitions.

Yet it was really the commissioners who were most ambitious of all. Their system of streets, which started at 1st and swept grandly and numerically up-island, was an implicitly imperial blueprint with no logical stopping point. Indeed the commissioners felt compelled to apologize for having halted at 155th Street. The reason “the whole island has not been laid out as a city,” they explained, was not from any lack of expansionary

will; they had, after all, already provided space enough “for a greater population than is collected at any spot on this side of China.” Going farther would simply have been pointless for the time being, both because “it is improbable that (for centuries to come) the grounds north of Harlem Flat will be covered with houses,” and because extending the grid higher “might have furnished materials for the pernicious spirit of speculation.” For—like the Erie Canal in yet another sense—their grid was intended to hasten the real development of the city’s hinterlands, not to encourage unproductive shenanigans. And no sooner were map and plan approved than Randel and his crew were set to work on staking out the actual landscape. Over the next decade they would place 1,549 yard-high white-marble markers at imagined intersections, each engraved with the number of its street-to-be, and wherever rocks barred the way, half-foot iron bolts, ninety-eight in all, were driven in to mark the spot.

New York’s dominant commercial classes thus engraved their vision on the city, reshaping it to meet their evolving needs, unhindered by the presence of powerful national or state officials who, following a different urbanist calculus, might have imposed corridors of power and display. In Manhattan—a city of capital, not a capital city—considerations of efficiency and economy came first.¹

THE MAYOR WHO WOULD BE PRESIDENT

In the spring of 1811, while the streets commissioners staked out the Manhattan grid, President Madison’s fumbling attempts to protect the rights of neutral carriers moved the United States and Great Britain ever closer to open conflict. The idea of a second war of independence with the former mother country had become popular in many parts of the country, but not in New York, still reeling from the havoc wrought by the embargo. With a notable lack of enthusiasm, the city prepared for the worst by completing the construction of four forts designed to protect it from naval attack.

The circular West Battery, built on a rocky outcropping about two hundred feet off the tip of Manhattan, had been designed by John J. McComb. Its eight-foot-thick walls were pierced with embrasures for twenty-eight cannon to sweep the Upper Bay and the mouth of the Hudson River. Only a few hundred yards away, on the shore of Governors Island, stood Castle Williams, designed by the Army’s chief engineer, Lieutenant

Colonel Jonathan Williams (later the first superintendent of West Point and namesake of Williamsburgh). Three stories high, Castle Williams bristled with a hundred heavy guns that could lay down a deadly crossfire with both the West Battery and Fort Columbus (formerly Fort Jay), which commanded the north shore of Governors Island, facing the East River.

The West Battery was also designed to crossfire with the North Battery, which stood on the Hudson shore at the foot of Hubert Street (and whose walls of red Newark sandstone caused it to be nicknamed the Red Fort.) The North Battery, in turn, could crossfire with Fort Gansevoort, located further upriver near the foot of Gansevoort Street (and dubbed the White Fort because of its whitewashed brownstone walls).

All told, these installations, plus numerous mortar batteries and smaller forts sprinkled around on Bedloe's, Ellis, and Staten islands, could train more than three hundred guns on enemy ships daring to enter the Upper Bay through the Narrows.

The day was fast approaching when they might be called upon to do so. In February 1812 Madison restored nonimportation against Great Britain. Two months later, on his recommendation, Congress adopted a ninety-day embargo that everyone knew to be the last step prior to an actual declaration of war. Everyone, that is, except the British government, which was just then preoccupied with rampant inflation, massive unemployment, labor unrest, and, early in May, the assassination of Prime Minister Spencer Perceval.

On June 16 Perceval's successor, Lord Castlereagh, finally got around to repealing all restrictions on neutral trade offensive to the United States. But Madison had already asked Congress for a formal declaration of war. On June 18, unaware of Castlereagh's action, Congress obliged him. Southern and western members tended as a rule to vote aye; northerners generally voted nay.

Well-to-do New York received the news sullenly. The state's congressional delegation had overwhelmingly opposed the declaration of war, and as one woman wrote, it came "like an Electric shock upon the great part of the people who have been too sanguine, in regard to peace Measures." Some feared that the city's defenses remained inadequate. In Broadway dining rooms and at the bar of the City Hotel, the greater concern

was that a second conflict with Britain would inflict irreparable damage on the city's wounded economy. As Gouverneur Morris would remind the New-York Historical Society, "war with the greatest naval power is no happy condition for a commercial people." Four days before the declaration was finalized, the *Evening Post* published a memorial of protest signed by fifty-six of the city's principal merchants.

The man who took the helm of national opposition to Madison's war policy was the mayor of New York, De Witt Clinton. Clinton had been thinking for some time about a run for the presidency in 1812. Knowing he couldn't expect much encouragement from Republicans, the bulk of whom would surely remain loyal to Madison, Clinton had been making himself attractive to the Federalists, and they in turn had expanded their popular base by presenting themselves as the party of order, prosperity, and peace. In the spring of 1812 the Federalists put his name into nomination against Madison. Antiadministration Democratic-Republicans in the state followed suit. When war broke out only weeks later, Clinton was positioned as the candidate of bipartisan moderation and prosperity—willing to defend the nation's honor yet unwilling to put its commerce at risk in an ill-advised struggle with the former mother country.

New York City Democrats (as the urban Democratic-Republicans had begun calling themselves) rallied patriotically around President Madison. Indeed Tammany Hall—the party headquarters maintained by the Society of St. Tammany—and the Long Room of Bram Martling's Tavern on Chatham Street (Park Row) became bastions of the "Martling Men" or "Bucktails" (terms soon synonymous with "Tammanyite"), whose efforts to wrest the party away from Clinton would torment him for years to come.

Tammany belligerency reflected sentiment in the city's plebeian quarters. Down by the East River docks, in taverns and seamen's boardinghouses, or along the alleys that converged on the filled-in Fresh Water Pond, the prospect of war with Britain elicited significant enthusiasm. Many hundreds of workingmen signed on with regiments hastily formed for the defense of the city. One, the aptly named Old Butcher Troop, paraded through town behind banners proclaiming "Free Trade and Butcher's Rights / From Brooklyn's Fields to Harlem's Heights," and "Skin me well and Dress me neat / And Send me on board the Federal Fleet." Another unit, the Irish Greens, was a reminder that in 1812 as in 1775, New York harbored

numerous and vengeful victims of His Majesty's attempts to pacify the Emerald Isle.

At the end of June, gangs of sailors roamed the waterfront attacking crewmen from Spanish and Portuguese vessels, on the theory that because their nations were allies of Britain, they were now enemies of the United States. Mayor Clinton moved swiftly to crush the disorders, however. Warning that “anarchy and tyranny” went hand in hand, he put the city's constables, firemen, and militia on alert; at the next sign of trouble, he announced, they would be called out by signal rockets launched from the cupola of City Hall. The sailors grumbled and cursed—whose side was the mayor on, anyway?—but Clinton remained presidentially firm.

Although senior New York Federalists like Rufus King and John Jay still weren't quite sure about Clinton, they proved to be in the minority. John Pintard and Gouverneur Morris, Clinton's de facto managers, summoned Federalists throughout the Northeast to support the mayor as the party's best hope of political resurrection and the only chance for maritime states to escape a ruinous war. In mid-August, at a meeting of the Friends of Liberty, Peace, and Commerce in Washington Hall, Morris went so far as to advocate secession of the northern states from the Union if Madison could not be stopped. A month later, when the Federalists gathered for a three-day national convention at Kent's Tavern on Broad Street, Morris played a key role in persuading the delegates to endorse Clinton.

When election day came, however, even with the Federalists on his side, Clinton could muster only eighty-nine electoral votes to Madison's 131. Besides New York, which he held thanks to the labors of a thirty-year-old upstate legislator named Martin Van Buren, Clinton carried New Jersey, all of New England except Vermont, and Maryland. Although the race was tighter than the final tally suggests—had he carried Pennsylvania, the mayor would have become president—the outcome was a clear warning to Clinton and his friends that if respectable New York didn't approve of the war, much of the rest of the United States did.

THE WAR OF 1812

The war effort required two things above all else from New York City, money and skilled manpower; it got the first reluctantly, the second with

enthusiasm.

For Secretary of the Treasury Albert Gallatin, financing the war proved to be a hellish task. As military expenditures ballooned, a British naval blockade cut deeply into tariff revenues that remained the federal government's main source of income. In the past, Washington might have borrowed from the Bank of the United States, but in 1811 the Democratic-Republican Congress refused to renew its twenty-year charter. Opponents charged that much BUS stock was held in England and that the national bank had been hobbling boom-era venture capitalists by restricting the availability of credit. Proponents of development urged that federal deposits be transferred to the growing number of state banks, to use as a basis for expanding loans. In New York State, the legislature incorporated ten new banks between 1810 and 1812, including the chiefly Federalist Bank of America, the primarily Democratic-Republican City Bank of New York, and the Mechanics' Bank, dedicated to supplying artisan entrepreneurs with capital.

After the demise of the BUS, the federal government was forced to borrow from private lenders. In 1813 Congress authorized a loan of sixteen million dollars, but selling the bonds proved hard going with so many New York merchants opposed to the war. Secretary Gallatin therefore turned to a small syndicate organized by the country's two wealthiest capitalists, John Jacob Astor (an old friend of Gallatin's) and Stephen Girard of Philadelphia. They invented the practice of American loan contracting by purchasing the bonds wholesale (at enormous discounts), then selling them retail to friends in the States and associates in Europe. In 1814 the syndicate agreed to grant the government an additional eight to ten million dollars—if it gave them generous discounts, and if it created a second national bank. They wanted a new bank on the theory that it would stabilize the economy by curbing reckless speculation; they also expected to make tidy profits for themselves by purchasing bank stock with depreciated federal bonds, at full face value. In the final desperate months of the war, with the treasury bare, congressional resistance crumpled. Presented with an ultimatum from a “deliberate concert among the Capitalists,” the government agreed to charter a new bank in exchange for emergency loans, chiefly from New Yorkers and Philadelphians.

Manhattan shipbuilders were less grudging in their contributions to the war effort. Henry Eckford, Christian Bergh, and Noah Brown led teams of ship's carpenters from Corlear's Hook to the shores of Lakes Erie and Ontario. There, over the winter of 1812—13, the New York artisans helped build the brigs and gunboats with which Captains Isaac Chauncey and Oliver Hazard Perry would defend the Niagara frontier with Canada. When Perry smashed a British squadron in the Battle of Lake Erie in September 1813, the city celebrated with abandon. It subsequently accorded Perry a hero's welcome, gave him the keys to the city, and named a street in his honor.

Eckford, Bergh, Brown, and other New York shipbuilders had plenty to do in Manhattan as well. In 1814 Adam and Noah Brown built for the U.S. Navy the world's first steam-driven vessel of war— *Fulton the First*, or *Demologos*. The New York yards also constructed, outfitted, and repaired privateers. Enemy warships blocked the Narrows, but Long Island Sound remained open, and hastily armed merchant vessels of every description were soon streaming out to prey on British commerce. In the first year or so of the war, some 125 privateers operated out of New York alone, employing nearly six thousand men and returning with seven hundred prizes.

As in past wars, however, the profits of privateering were elusive. The typical privateer was fitted out and owned on shares, and if she returned with a prize, there were court costs, fees, and duties to be paid even before her shareholders, officers, and crew took their cuts. So few investors came out ahead, much less struck it rich, that New York merchants petitioned Congress to make the business more lucrative. Offer a twenty-five-dollar bounty for every enemy national captured or killed, they asked; give pensions to disabled privateersmen and their widows. Congress agreed, but it made no difference. By the end of 1813 the Royal Navy had extended its blockade along the entire New England coast, including the entrance to Long Island Sound. For the remainder of the war nothing under sail could get in or out of the port.

Importers of finished wares coped with the blockade by moving cargoes up the Delaware River to South Trenton, overland to the Raritan River, and thence across the Hudson to the city. The volume of traffic was considerable—in November 1813 some fifteen hundred wagon teams reportedly worked the South Trenton-Raritan leg of the journey—but it was

no substitute for direct access to the port's wharves and warehouses. Nor did it appeal to exporters of bulky agricultural products, increasing numbers of whom found it easier (and a lot more profitable) to sell their goods to the British forces poised just across the Canadian border. New York's business with the enemy would in fact grow so rapidly in the course of 1813 that President Madison was compelled, at the very end of the year, to slap another embargo on all American exports.

As the second winter of war approached, New York was once again like a city under siege. As during the embargo crisis of 1807-9, hundreds of vessels lay idle along the waterfront. Shuttered shops and stores lined every street, and on Broadway the cacophonous traffic of carts and wagons and carriages subsided to a mere rumble. Because profiteers had diverted so much of the city's essential supplies to the British in Canada, food and fuel were almost prohibitively expensive. Unemployed working people deluged municipal authorities with appeals for relief, and in December a committee of gentlemen, including Thomas Eddy and John Pintard, organized the Fuel Association to provide the "meritorious" poor with firewood; over the next several months the association distributed wood to three thousand addresses in the city. "The times are very hard," said one resident. "Money almost an impossibility. The necessities of life are very high. . . . We are obliged to use beans steeped in hot molasses. Many are living on black butter-pears, apples and quinces stewed together—the poverty in the city is very great."

Militarily, moreover, the first eighteen months of war had gone badly. Except for Captain Perry and a young frontier general named William Henry Harrison, American field commanders committed one blunder after another, allowing the enemy to capture Detroit, repulse two assaults on Montreal, and burn Buffalo. When Napoleon abdicated in April 1814, further humiliations seemed certain. His Majesty's government, able at last to concentrate on the American theater, immediately shifted fourteen thousand veterans across the Atlantic and began massing naval forces off Sandy Hook and Gardiner's Bay. As the summer began, New York braced for another British invasion.

Mayor Clinton and his Federalist allies extracted every ounce of political capital they could from the situation. They assailed Madison for getting the country into the war, and they assailed him for failing to wage it with vigor and dispatch. Time and again, they reminded the city's mechanics of the

years just after independence, when “industrious laborers had work, and having work they had money; and having money their wives and children were well clothed and well fed and well warmed. These were Federal times.”

Maybe so. But as in the mid-1770s and the mid-1790s, that sort of argument could not overcome the combination of nationalist pride and hatred of Great Britain that was integral to popular culture in New York. With every British victory, every new hardship, Clinton and the Federalists lost rather than gained credibility. In the charter elections at the end of 1813, branded by Republicans as the “*Peace Faction*—or to use a more correct term—the enemy,” their majority on the Common Council evaporated. The following spring, they lost control of the state legislature as well. Many a mechanic, it was observed, had come to the conclusion that “his children can freeze, but he must not let the Tories in.”

Over the summer of 1814, with the war’s opponents now effectively silenced, New Yorkers made ready for the expected British invasion. By the beginning of August, if not before, it was known that the enemy intended to strike down through Lake Champlain while diversionary forces harassed the Atlantic ports—meaning that the fortifications erected in the city between 1807 and 1812 were not likely to be of much use. On August 11, with the blessings of the City Council, thousands of residents turned out for a meeting to consider what ought to be done. After an impassioned speech by an aged Marinus Willett recalling popular resistance to British tyranny forty years earlier, it was agreed to form a Committee of Defense consisting of representatives from every ward. Like its Revolutionary predecessors, the committee was empowered by direct popular consent to form new military companies through the “voluntary enrollments” of able-bodied citizens, to organize citizens for “voluntary labor” on additional defense works, and to apprehend “all persons who shall be concerned in any illicit commerce or improper intercourse with the enemy.”

New York boiled with activity. Marshaled by the Committee of Defense, its residents rallied to construct additional forts, breastworks, and blockhouses on Brooklyn Heights, upper Manhattan, and other newly defined danger points. City artisans, organized by trade, contributed over a hundred thousand days’ worth of free labor. Patriotic ladies, lawyers, cartmen, merchants, and shopkeepers felled trees, dug trenches, and hauled

artillery. The “free people of color” offered their collective services to the Committee of Defense and assisted in the erection of fortifications on Brooklyn Heights. In response to a congressional appeal for volunteers to defend New York, some 23,000 militiamen meanwhile flocked in from the surrounding countryside. From dawn to dusk they drilled and paraded, and the City Council appropriated money to pay them until they could be officially mustered into the regular service.

At the end of August, an enemy column burned Washington. The tension in New York became excruciating. “Your capital is taken!” cried one newspaper. “In six days the same enemy may be at the Hook. . . . Arise from your slumbers!. . . This is no time to talk!” Even Federalists professed their willingness to bear arms. “The enemy is at our doors,” Rufus King announced, “and it is now useless to enquire how he came there.” Gouverneur Morris, though, testily informed King that “anything like a Pledge by Federalists to carry on this wicked War, strikes me like a Dagger to my Heart.” When Morris learned that antiwar Federalists in New England planned a secret convention in Hartford at the end of the year, he rejoiced at the possibility of a New York-New England confederation. The Hartford Convention, he declared, was “a star in the East . . . the dayspring of freedom and glory. The traitors and madmen assembled at Hartford will, I believe, if not too tame and timid, be hailed hereafter as the patriots and sages of their day and generation.” (This wasn’t the first time Morris flirted with sedition, but it was the last: he died less than a year later, having attempted to relieve a urinary obstruction by forcing a whalebone through his penis.)

Inside of two weeks, however, the sense of crisis in New York subsided. The British were turned back at the gates of Baltimore. Captain Thomas Macdonough’s victory in the Battle of Lake Champlain removed the threat of an attack from Canada. Militiamen who had come to fight for the city soon started for home, and the Committee of Defense began to plan its final report to the Common Council.

PEACE! PEACE! PEACE!

One frigid evening in mid-February 1815, in the middle of a concert at the City Hotel (a witness recalled), “the door of the concert-room was thrown open and in rushed a man breathless with excitement. He mounted on a

table and, swinging a white handkerchief aloft, cried out ‘Peace! Peace! Peace!’ The music ceased, the hall was speedily vacated, I rushed into the street, and oh, what a scene! In a few minutes thousands and tens of thousands of people were marching about with candles, lamps, torches, making the jubilant street appear like a gay and gorgeous procession.” Over the next several days, in the wake of word that American and British commissioners had agreed to a treaty of peace, the still-rejoicing residents were treated to a spectacular display of fireworks from Governors Island and the erection of elaborate transparencies on public buildings and private houses depicting the long-awaited return of prosperity.

No one worried about the actual terms of the treaty: it was enough that the war had ended and that life could begin to return to normal. But what did “normal” mean—and how, exactly, was the city going to prosper now that the strife in Europe, the foundation of its expansion following independence, had ended as well?

The Canal Era

New York's postwar recovery proved to be quick and convincing, though not quite problem-free. Annoyingly enough, Britain and France once again closed down the West Indies to American trade, and British exporters began using the Pearl Street auction houses to dump a huge backlog of cheap manufactures on the American market. But if local importers and retailers suffered for a time, deep-water merchants and shipbuilders adjusted without serious difficulty—partly because the success of anticolonial revolutions in Latin America cracked open markets once monopolized by the Spanish and Portuguese, but mainly because industrializing and urbanizing Europeans remained willing to pay high prices for American cotton and wheat.

Whether or not New York would continue to dominate the trade in those lucrative commodities was an open question, however. Thousands of settlers were flooding into the Ohio and Mississippi valleys every year, shifting the heartland of American agricultural production ever westward, ever farther from Manhattan. Every year, too, increased the likelihood that the output of these myriad farms and plantations would be siphoned off by rival ports—New Orleans, for example, or Philadelphia (now linked to Pittsburgh by turnpike), or Baltimore (eastern terminus of the new National Road, which ran to Wheeling on its way toward Columbus and Indianapolis).

It was the heightened urgency of maintaining New York's connections to the West that enabled De Witt Clinton to bring his campaign for the Erie Canal to fruition. At the end of December 1815, he assured a conclave of businessmen at the City Hotel that the canal would make New York "the greatest commercial emporium in the world" and easily persuaded them to sign a memorial to the legislature calling for construction to begin as quickly as possible. Although his Tammany opponents denounced the "big ditch" as a costly folly and depicted it—not incorrectly—as a vehicle for Clinton's political ambitions, the legislature established a Canal Commission to consider costs and routes. When the Madison administration refused federal aid, an action some saw as a Virginiabased effort to forestall New York's ascendancy, Clinton persuaded the state to proceed on its own.

In April 1817 Albany formally authorized the project. Two months later Clinton was elected governor. On July 4, three days after he assumed office, construction commenced on the state-owned, state-financed, state-run enterprise.

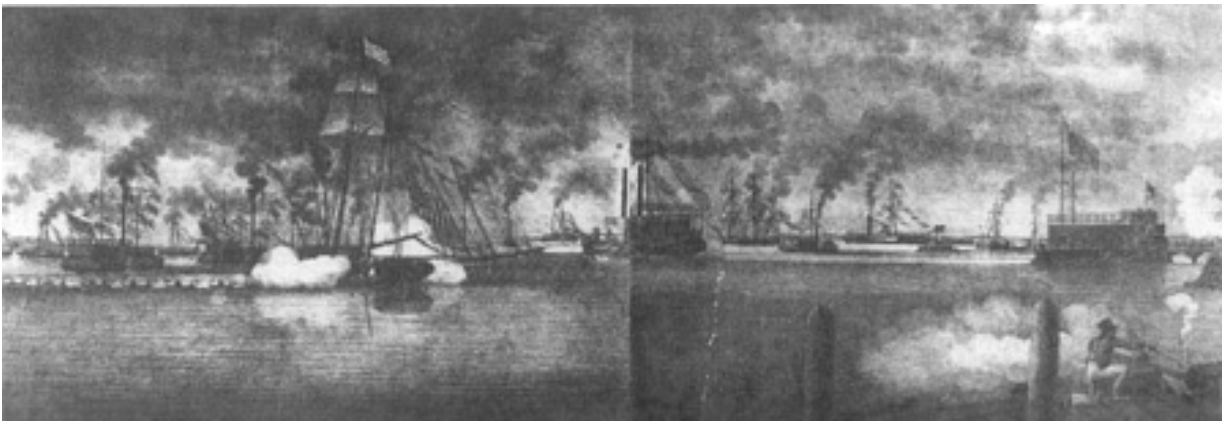

THE WEDDING OF THE WATERS

Work on the canal advanced swiftly, despite the carping of skeptics, daunting natural obstacles, and a financial crisis that shook the country in 1819, when—in part reflecting a severe postwar depression in England—the price of American cotton in Europe fell off sharply, dragging down western land values and triggering an avalanche of bank failures and foreclosures. Eight years after the first spade went into the ground and an amazing two years ahead of schedule, the great project was finally done—a marvel of human ingenuity and sacrifice by its engineers, who learned their trade on the job, and its laborers, many of them Irish and Welsh. Three hundred sixty-three miles long, forty feet wide, and four feet deep, the canal rose and descended a distance of 660 feet through eighty-three massive stone locks and passed over eighteen stately aqueducts.

On October 26, 1825, in Buffalo, Governor Clinton and assorted dignitaries boarded a flat-bottomed canal boat, the *Seneca Chief*, to begin a triumphal “aquatic procession” east to Albany and down the Hudson to New York harbor. Their arrival ten days later touched off one of the most spectacular celebrations in the city’s history—a grand Festival of Connection. On November 4—one of those brilliant autumn days for which the city is famous—the *Seneca Chief* drew near the Battery and was hailed by city officials on an elegantly appointed steamboat: “Whence come you and where are you bound?” “From Lake Erie,” came the reply, “bound for Sandy Hook!” Crossing the Upper Bay, the procession wound its way through an “Aquatic Display” of gaily decorated vessels while bands played, the Battery’s guns fired salutes, and dense masses of cheering spectators packed the wharves and rooftops of Manhattan and Brooklyn. When it reached the Narrows, the *Seneca Chief* was met by the U.S. schooner *Porpoise*—a “Deputation from Neptune”—and Governor Clinton solemnized the “wedding of the waters” by pouring two casks of Erie water into the sea.

Everyone then returned to the Battery for a “Grand Procession” through the streets of Manhattan. As in the Federal Procession of 1788, the seven thousand marchers lined up in ranks, each “bearing their respective standards and the implements of their arts”—lawyers, physicians, militia officers, firemen, and artisans of every description—tangible affirmation that all elements of the social order endorsed the canal and understood its significance for the city’s future. (Only the presence of some journeymen’s societies, marching apart from the master craftsmen, hinted at the ongoing conflict in the shops.) Up Greenwich Street they marched, six abreast, to Canal and over to Broadway, up to Broome and across to the Bowery, and down Pearl to the Battery again, whence they rolled up Broadway to City Hall. As they marched they passed through a throng estimated at over one hundred thousand people—nearly two-thirds of the city’s entire population. It was the largest such gathering ever witnessed in North America.

As night fell, New York came ablaze. Private houses and public buildings, theaters and hotels, coffeehouses and museums, all were brilliantly illuminated. Most impressive was City Hall, lit up with 1,542 wax candles and 764 oil lamps and covered with glowing transparencies depicting the canal. At ten P.M. ten thousand people elbowed into the Park for a dazzling display of fireworks.

Grand Canal Celebration, drawn by Archibald Robertson and lithographed by Anthony Imbert, 1826. The building in the background, called Castle Clinton when built as a harbor fortification in 1808, was now a theater known as Castle Garden. (I. N. Phelps Stokes Collection. Miriam and Ira D.

Cadwallader Golden (grandson of the colonial governor and one of the Erie Canal's most energetic promoters) boasted that "this extensive channel" would make New York "one of the greatest commercial cities in the world" before the end of the century. But even he underestimated the speed and scope of the canal's impact. Within the year, Erie boatmen were steering forty-two barges a day through Utica, bearing a thousand passengers, 221,000 barrels of flour, 435,000 gallons of whiskey, and 562,000 bushels of wheat. Shipping costs from Lake Erie to Manhattan plummeted from a hundred dollars a ton to under nine dollars. A few more years of this brought the annual value of freight transported along the canal up to fifteen million dollars, double that reaching New Orleans via the Mississippi; by mid-century the figure would approach two hundred million. Enough money would be collected in tolls—nearly half a million dollars the first year alone—to repay the cost of construction and help subsidize an additional six hundred miles of canals in the state over the next fifteen years.

At first, most of the goods cascading down the Erie Canal toward New York came from farms and villages along the canal's route. Its success inspired a frenzy of digging elsewhere in the country, however, and a burgeoning network of canals between western waterways and the Great Lakes soon drew more distant agricultural regions into the city's orbit: Ohio by 1830, Indiana by 1835, Michigan by 1836. Produce and timber that once rafted southward along the Ohio River now reversed course and headed east toward Manhattan. One collateral consequence was the transformation of agriculture on Long Island: when local wheat, barley, corn, and rye proved unable to compete with cereal grains from the West, Queens farmers switched to market gardening, raising potatoes, cabbage, peas, beans, asparagus, and tomatoes for booming Manhattan and Brooklyn.

The growing power of the New York market to pull commodities out of distant regions was confirmed by a trio of "anthracite canals" that funneled coal from the mines of northeastern Pennsylvania to Manhattan: the Delaware and Hudson Canal (1828), which linked the Lackawanna Valley to Kingston; the Morris Canal (1832), which connected the Lehigh Valley

to Newark and Jersey City; and the Delaware and Raritan Canal (1834), which ran from Bordentown to New Brunswick.

UNDER STEAM AND SAIL

When Robert Fulton died in 1815, his fame as inventor of the steamboat earned him a hero's funeral in Trinity Church and the rare distinction of having his name attached to the streets that ran down to the Brooklyn Ferry terminals on both sides of the East River. Not everyone mourned his passing, however. A charter from the state legislature had given him and his partner, Robert Livingston, a monopoly of the steamboat business in New York. With the help of eminent lawyers like Thomas Addis Emmet and Cadwallader Golden, the duo had ruthlessly suppressed one competitor after another. Even Livingston's brother-in-law, Colonel John L. Stevens, couldn't get permission to operate a steamboat of his own design across the Hudson to develop his property near Hoboken. After both partners died, their company continued to swat down rivals, forcing them to settle for the use of horse ferries—a much slower form of transport that employed eight draft animals to drive a central water wheel. By 1820 many New Yorkers considered the Fulton-Livingston monopoly as annoying an obstacle to the city's growth as the swamps and escarpments that confronted engineers on the Erie Canal. But in this case it would be the United States Supreme Court, not pick and shovel, that would solve the problem.

Aaron Ogden, onetime governor of New Jersey, had purchased a franchise from the monopoly to operate a steamboat between Manhattan and Elizabethport, New Jersey. From there, passengers could continue to New Brunswick on a steamboat run by Thomas Gibbons, a tough and irascible lawyer from Savannah. Gibbons didn't need a New York franchise, because his route lay entirely within New Jersey. But in 1818 Gibbons and Ogden had a falling out. The Georgian decided to steam all the way to New York, in direct competition with Ogden and in open defiance of the monopoly. To pilot his vessel into these lawyer-infested waters, Gibbons turned to a lanky, quick-fisted young Staten Islander named Cornelius Vanderbilt.

Vanderbilt's family traced its New York origins to Jan Aertsens van der Bilt, who had arrived in Flatbush from Holland somewhere around 1650. In 1715 Jan's grandson established a farm near New Dorp, Staten Island, from

where he and his descendants carried their produce to Manhattan markets in their own small boats. Cornelius, born in 1794 at Port Richmond on Kill van Kull, loathed farming, however. He escaped it by hauling freight and passengers in a flat-bottomed, two-masted periauger that the brawny six-footer poled through the marshes rimming the island. During the War of 1812 the sandy-haired young Dutchman made great profits delivering beef and firewood to blockaded Manhattan and also won a lucrative military contract to ferry supplies to the harbor's six forts. He gained a reputation for reliability, pugnacity, thriftiness (some said meanness), and world-class profanity. After the war, it was obvious to Vanderbilt that "b'ilers"—steamboats—were the wave of the future, and when Gibbons offered him command of his *Mouse of the Mountain*, he leapt at the chance. He dodged writs brandished by the monopoly's lawyers with such skill that Gibbons gave him the helm of a much larger boat, the 142-ton *Bellona*. Again, Vanderbilt successfully evaded sheriffs and process servers, darting into different Manhattan landings to offload passengers and hiding in secret onboard compartments to avoid the law.

When the enraged Ogden won an injunction against Gibbons and Vanderbilt from the New York courts, Gibbons hired Daniel Webster and appealed the case to the Supreme Court. A powerful current then running through American jurisprudence favored eliminating legal constraints on capitalist enterprise, and Chief Justice John Marshall was also eager to assert greater national authority over the states. Accordingly, in *Gibbons v. Ogden* (1824), the court ruled the monopoly unconstitutional on the grounds that only Congress could impose constraints on interstate commerce.

New York greeted the decision with enthusiasm, and within a year the number of steamboats serving the city jumped from six to forty-three. Steamer traffic on the East River, the Hudson River, and Long Island Sound grew so rapidly that competition between rival operators often degenerated into brawling and boat-ramming. It was a game Cornelius Vanderbilt soon proved he could play better than anyone else. By the end of the 1830s he had reestablished a degree of order in the business and was worth half a million dollars, making him one of the richest men in New York. People called him "the Commodore."

Steamboats, like the Erie Canal, ensured that the sprawling interior of the United States would remain within the economic orbit of New York. But no steam-powered vessel was yet capable of crossing the open sea, which meant that corresponding improvements in the city's ties to foreign markets—its ability to find buyers for huge quantities of Ohio wheat or Mississippi cotton while keeping up with the domestic demand for imports—would have to come by less conventional means.

One snowy day in January 1818, a small crowd gathered at the East River docks. Notices in local newspapers had promised that at an appointed date every month the new Black Ball Line would dispatch one of its four ships to Liverpool. “The regularity of their times of sailing, and the excellent condition in which they deliver their cargoes,” it was said, “will make them very desirable opportunities for the conveyance of goods.”

This innovation, the brainchild of Jeremiah Thompson, a transplanted English merchant, met with considerable skepticism. Traditionally, ships sailed only when their holds were full, and only in reasonably fair weather, so people turned out on the appointed day to see if the firm would make good. Despite the snow squall and a light cargo of passengers, mail, and fine freight, the square-rigged *James Monroe* weighed anchor precisely as St. Paul's clock struck ten. It reached Liverpool twenty-five days later. Battling in the opposite direction through westerly winter gales, its sister ship took forty-nine days to make New York.

The Black Ball's punctuality impressed Manchester magnates, who, with their capital tied up in plants and labor, could ill afford cotton shortages. It also attracted competitors. An eccentric Connecticut whaling captain named Preserved Fish and his cousin-partner Joseph Grinnell shifted from hawking New Bedford whale oil to running the Swallowtail line. Others followed, and within two decades fifty-two packets would be traveling regularly from New York to Liverpool and Le Havre, an average of three sailings weekly, with an average transit time of thirty-nine days.

The packets also carried human cargoes. At first, the lines sought only wealthy passengers; those with more limited means had to find a captain willing to take them in “steerage”—between decks, near the rudder. In 1815, however, Belfast merchants started a full-time passenger trade, and after 1820 merchants in Liverpool began buying space on New York-bound packets, into which they stuffed the maximum number of immigrants (an art

they had perfected in the slave trade). The result was that as more and more people left for the United States, more and more of them followed existing trade routes to New York. Between 1820 and 1832 the number of immigrants entering the port rose from thirty-eight hundred to some thirty thousand; in 1837 it swelled to nearly sixty thousand—almost 75 percent of the national total. Fed by this stream of humanity as well as internal migration, Manhattan's population climbed from 124,000 in 1820 to 166,000 in 1825 and 197,000 in 1830. By 1835 it exceeded 270,000. No other place in the country was growing so fast.

Joining the packets on the Atlantic run were ships flying the distinctive pennants of the city's principal commercial houses. Some of these, like LeRoy, Bayard, and Company, were venerable Knickerbocker establishments. But in the 1820s mercantile supremacy passed to New England Yankees: the Grinnells, Griswolds, Howlands, and Goodhues who had come down in the Napoleonic boom and a swarm of newcomers that now followed them.

The newcomers tended to specialize in particular commodities. Anson G. Phelps and Elisha Peck, originally from Hartford, opened a metal import firm in 1818. Phelps, in New York, shipped southern cotton to England. Peck, in Liverpool, used the proceeds from cotton sales to purchase tin plate, sheet copper, and brass wire, which he sent over to New York. Phelps then shipped the metal goods south by packet or, via the Erie Canal, upstate and out west to thousands of country stores. When Peck retired in 1832, Phelps partnered with another Connecticut Yankee, his son-in-law William Earl Dodge. Like Phelps, Dodge, and Company, the Tappan Brothers carved out a specialty niche in the European trade. Arthur Tappan moved from Boston to New York City in 1815. By 1827, when his brother Lewis came down to join him, he had built up the nation's largest silk-importing house, drawing on suppliers in England and Italy.

Other New York firms broke into new Latin American markets. Spain and Portugal's South American colonies had long been off limits to American traders, but now the Creole revolutions were in full swing. John Jacob Astor ran guns and flour past Spanish blockades to revolutionary governments, a profitable if dangerous enterprise. With *independista* victories, a steadier and more sedate trade emerged: between 1816 and 1822 the number of ships returning to Manhattan from Central and South

America rose from nine to fifty-two; by 1825 it had climbed to in. In their holds were Brazilian coffee, hides from Argentina (a specialty of the De Forests), and Mexican silver (a speciality of Edward K. Collins). In exchange, the New Yorkers sent flour, domestic textiles, furniture, carriages, horses, and machinery for sugar mills. In manufactures, however, they were at a disadvantage because the British could better tailor their products to local markets. Despite President Monroe's insistence that Europeans should clear out of the hemisphere, British finance, British industry, British diplomacy, and the British navy remained paramount in the region.

In the Caribbean, however, British policy backfired. By stubbornly blocking American trade to Jamaica, as it had done since the Revolution, Britain succeeded only in destroying the island's economy while New York merchants moved on to new opportunities in Cuba and Puerto Rico. Though the islands were still Spanish possessions, the mother country had opened them up to free trade, lest they join South America in revolt. Proximity gave New Yorkers an advantage over their British rivals, and the city finally reestablished its old Caribbean lifeline. South Street commission merchants took up residence in Havana, Cuban planters fell into chronic debt, and Spain's former ward became an economic dependency of the United States in general, and of New York in particular.

In the 1820s the city also assumed the lead in trade between China and the United States. The Chinese preferred to be paid in silver or gold for their wares—those teas, silks, furniture, fabrics, and blue porcelain tureens, platters, and punch bowls so beloved by well-to-do New Yorkers. With no American mines to supply precious metals in quantity, merchants had to rely on expensive silver imports from Mexico, and they were always on the lookout for cheaper alternatives. Fur was one—which was why John Jacob Astor dominated the China trade in the postwar years. His American Fur Company shipped skins from Mackinac and St. Louis to company warehouses in New York, where clerks repacked them for shipment to Canton.

Another alternative to specie was opium, and in 1816 Astor became America's first large-scale drug dealer, smuggling five thousand pounds of Turkish opium from Smyrna to Canton. In the 1820s Astor shifted into other ventures and was replaced by Thomas H. Smith, a speculator who in

1826 brought in so much tea that he glutted the market and went bankrupt. By the early 1830s great firms like Griswold, Goodhue, Grinnell-Minturn, and Rowland and Aspinwall were preeminent in the Pacific. These in turn gave way to the House of Low, launched in 1829 when Seth Low moved his business from Salem to New York. It would be brought to fruition by Abiel Abbot Low, the eldest of Seth's twelve children, who went out to Canton in 1833, spent seven years learning the business, and returned with enough contacts and market knowledge to dominate the industry. Yet here too the British remained the primary power, not least because the Empire controlled access to the opium of Bengal, while Astor and his successors were relegated to supplying an inferior Levantine product.

EMPORIUM

The web of canals, steamboats, and packets that New York flung out across the world in the 1820s and 1830s captured a wider and wider share of the nation's import business—from 38 percent in 1821 to 62 percent in 1836. It also brought an unprecedented multitude of ships into the harbor. One day in 1824 there were 324 at anchor off Manhattan, a huge number by comparison with prior years, but nothing in light of those to come. On a single day in 1836, 921 vessels lined the East River bulkhead, their bowsprits and carved figureheads looming over South Street, while another 320 bobbed along the Hudson (still known to sailors as the North River).

With this increased traffic came important changes in the scale, organization, and tempo of the city's commercial life. Dozens of new wharves, hastily constructed of hewn log frames filled with loose stone and earth, sprouted out from the shores of both the East River and the Hudson River, all tidily numbered (a practice that began in 1815, when the municipality began to rationalize the waterfront as it had the streets).¹ The auction system created a new breed of businessman, the wholesale merchant or "jobber," who bought, say, cheap imported British manufactured goods at auction and shipped them, on commission, to far-off country storekeepers via coastal packets and the Erie Canal. The low cost and abundance of these goods further spurred rural demand, inducing farmers to concentrate more and more heavily on the production of food and fuel for the Manhattan market—which in turn drew still more city merchants into the business. By 1840, in addition to the 417 commercial

houses active in foreign trade, New York had 918 commission firms that consigned goods to domestic markets in every region of the country.

South Street from Maiden Lane, by William J. Bennett, c. 1828. Only a few years after the opening of the Erie Canal, activity along the East River waterfront had increased dramatically. That well-dressed family in the center appears ready to board the *Leeds*, one of the Swallowtail packets. (The Metropolitan Museum of Art, Bequest of Edward W.C. Arnold, 1964. The Edward W.C. Arnold Collection of New York Prints, Maps and Pictures)

Every spring and fall, moreover, thousands of the most prosperous and adventuresome storekeepers converged on the city in person, prowling its countinghouses and auction rooms in search of bargains. The clamor for space in boardinghouses, inns, and the city's few hotels (only eight in 1818) attracted the attention of builders and investors, who flung up a score of new hotels during the 1820s and 1830s. Grandest of the lot was the six-

story, three-hundred-room Park Hotel that John Jacob Astor opened on Broadway, directly west of City Hall Park, in 1836. Eventually renamed Astor House, it remained the nation's most prestigious hostelry for decades.

In 1827 two brothers from Switzerland named Giovanni and Pietro Del-Monico—the one a wine importer, the other a pastry chef—opened a shop on William Street with a half-dozen pine tables where customers could sample fine French pastries, coffee, chocolate, wine, and liquor. Three years later, the Delmonicos (as John and Peter now called themselves) opened a “Restaurant Francais” next door that was among the first in town to let diners order from a menu of choices, at any time they pleased, and sit at their own cloth-covered tables. This was a sharp break from the fixed fare and simultaneous searings at common hotel tables—so crowded (one guidebook warned) that your elbows were “pinned down to your sides like the wings of a trussed fowl.” New Yorkers were a bit unsure about fancy foreign customs at first, and the earliest patrons tended to be resident European agents of export houses, who felt themselves marooned among a people with barbarous eating habits. The idea soon caught on, however; more restaurants appeared, and harried businessmen abandoned the ancient practice of going home for lunch.

Visitors and native New Yorkers alike shopped in retail outlets, another new and specialized institution. Previously, importers had sold off their ships, and artisans from their workshops. As importers withdrew from retail and artisans concentrated on production, the gap was filled by independent stores clustered on streets behind the waterfront and along fashionable Broadway, which sold sugar, coffee, hardware, and other commodities harvested by the city's merchants. After 1827 well-to-do consumers could stroll though the New York Arcade, a skylight-covered corridor shared by forty stores, which ran parallel to Broadway between Maiden Lane and John Street. Display methods too grew more sophisticated. Where an 1817 Broadway clothier simply hung samples of his ready-mades outside the door, leaving “the coat-tails and pantaloons” (one visitor warned) to “flap around the face of the pedestrian, like the low branches in a woodpath,” by the 1830s, as another traveler observed, “plates of the newest London Fashions” were “displayed in the shop windows of every tailor in New York.”

But it was a clutch of dry-goods stores that made the most lasting impression on the city's commercial history. In 1818 Connecticut-born Henry Sands Brooks founded a men's clothing store on Cherry Street, a waterfront location that he described as convenient to "the Gentry and Seafaring Men alike." (His sons, who inherited the concern on his death in 1833, would later adopt the name Brooks Brothers.) In 1825 Englishman Aaron Arnold opened a small Pine Street establishment dealing in "silks, woolens, laces, shawls, and novelties from Europe and the Orient." By the 1830s, when he took on James Mansell Constable as a partner, his thriving firm had relocated to Canal Street near Mercer. In 1826 another English immigrant, Samuel Lord, went partners with George Washington Taylor, his wife's cousin, to sell "plaid silks for misses' wear," hosiery, and "elegant Cashmere long shawls" at their Catherine Street store.

The proliferation of mercantile firms multiplied the number of clerks, bookkeepers, copiers, and errand boys: the Tappans alone had a clerical staff of more than twenty. Virtually all were males, many were sons of the merchant's kin or associates, and most were, in effect, merchants-in-training. Some labored over manifests and correspondence, seated on high stools and supervised by a chief clerk ensconced on a raised platform in the rear, rather like a ship's quarterdeck. Others were deployed as salesmen or dispatched to lodging houses to "drum up" sales from visiting storekeepers.

Manual as well as mental labor was required of these early white-collar workers. Before William Earl Dodge joined Anson Phelps as a partner, his clerical duties had included fetching water from the pump at Peck and Pearl with which to sweep the sidewalk, putting out refuse to be collected by the city's "dirt-carts," taking letters to the post office, delivering goods, stocking shelves, and distributing handbills in the streets. Still heavier labor could be demanded. When longshoremen hauled barrels, bales, crates, or sacks out of ships' holds, they lugged them across the wharves to South Street. There cartmen set them on horse-drawn wagons and rumbled them through crowded cobbled streets to the warehouses, where the clerks winched them up and in, using a thick hemp cable strung over a hoisting wheel.

The mercantile firms that housed all this activity bulked ever larger on the cityscape, growing in size as well as complexity. By the 1820s three- to five-story office buildings and warehouses cost as much as a brig. By the

late 1830s some cost as much as a full-rigged ship. Their style changed too, from Georgian brick to granite-faced Greek Revival (the earliest example of which, designed by Ithiel Town for Arthur and Lewis Tappan, went up on Pearl Street at Hanover Square in 1829). In 1832 Phelps and Peck built a new store and warehouse that towered six stories over the corner of Cliff and Fulton. It was one of the wonders of the city—until it collapsed under the weight of cotton bales within, killing seven clerks.

Similarly, because the mounting volume and complexity of commercial transactions made it inefficient to conduct business in coffeehouses, city merchants responded eagerly when William Backhouse Astor (John Jacob's son) and Stephen Whitney proposed construction of a building where they might "transact in a few minutes, the business, which, if each were to seek the other at his counting-house, would require as many hours to accomplish." By 1827 the two had raised a hundred thousand dollars for a new Merchants' Exchange on Wall Street. Faced in Westchester marble, the neoclassical building boasted a fifteen-foot-high statue of Alexander Hamilton in its grand rotunda and a cavernous Exchange Room, as well as rooms for auction sales of real estate and stocks, a post office, and the Chamber of Commerce.

Bowne & Co.'s stationery shop on Pearl Street, c. 1830. As in other retail establishments, its clerks not only dealt with customers but hoisted wares for storage on the building's upper floors. (Bowne & Co. Stationers, South Street Seaport Museum)

New York's attractiveness as a marketplace was further enhanced by the adoption of gas lighting in the mid-twenties. Nobody liked the smoky oil lamps—few in number and not much brighter than lightning bugs—that had provided unreliable illumination on Manhattan thoroughfares since the 1760s. When Baltimore became the first American city to install gas lights, following the example of London, the Common Council decided to try an experiment. In 1816 a crude gasworks was set up near City Hall and tin pipes run down to several street lamps and store windows on Broadway. Merchants loved the new system, but opposition from tallow interests and a dispute over the merits of public versus private development delayed further action. Finally, in 1823, the city awarded a franchise to the New York Gas-Light Company, a private firm organized by banker Samuel Leggett and others. By early 1825 the company had a gasworks up and running at Hester and Rhynder—one of the largest edifices in the city—and over the next couple of years it ran cast-iron lines into the principal commercial streets. First to be lit was Broadway from the Battery up to Grand Street, soon followed by Wall, Pearl, Broad, William, Nassau, and Maiden Lane. The city paid for installing the street lamps, for “fitting” them up to the mains, and for gas consumed. Office buildings, fine stores, and plush hotels arranged their own connections, and printed warnings—“Don't Blow Out the Gas!”—began appearing on the bedroom walls of up-to-date hostelryes.

By the early 1830s, as Frances Trollope noted, many of the city's retail shops, now brilliantly illuminated, stayed open as late as those of London and Paris, giving New York a lively nighttime appearance in marked contrast to Philadelphia's. The contrast with other parts of New York City was equally striking. The gas company did lay mains under residential streets, but only fashionable (hence profitable) ones, leaving most neighborhoods, especially the working-class wards on the east side, blanketed in a darkness punctured only feebly by oil lamps.

THE WORD FROM MANHATTAN

In 1815 New York newspapers still closely resembled their colonial predecessors in form and function. Aimed primarily at merchants, their pages featured lists of ship arrivals and departures, current wholesale prices, money conversion rates, stock and bond quotations, real estate transactions, and—in long columns of minute type—“advertisements” placed by wholesalers, retailers, patent medicine vendors, and transport companies. Many, though not all, contained accounts of events in Albany or Washington or Europe (often clipped from papers elsewhere and typically well out of date), extracts from congressional speeches, and political editorials. None could claim to have many readers. In 1820 the two largest papers in New York were the *Commercial Advertiser*, edited by Colonel William Leete Stone, and the *Evening Post*, Alexander Hamilton’s old sheet, still edited by William Coleman. Neither sold more than two thousand copies daily.

Over the next decade, however, publishers awoke to the fact that no other city in the country was receiving better information about distant markets and conditions, or getting it faster—or making more money from it. In 1824 the price of cotton in Liverpool shot up unexpectedly. When the news reached New York a few weeks later via the Black Ball Line, its owner, Jeremiah Thompson, dispatched agents by fast pilot boat to New Orleans, where they turned a quick profit buying cotton at the old price from unsuspecting suppliers. Stories like this, repeated over and over as canals and steamboats quickened the flow of intelligence toward Manhattan, whetted the entrepreneurial imaginations of a new generation of publishers. By 1830 New York had forty-seven newspapers, eleven of them dailies, each determined to bring the news to its readers ahead of the others.

Semaphore or “telegraph” poles on Staten Island, visible by telescope from the Battery, already signaled the arrival of packets from Europe off Sandy Hook, and another semaphore, atop the Exchange, was adjusted accordingly, relaying the information to all interested parties. Impatient and aggressive editors now dispatched swift news boats to dart out and retrieve the latest overseas intelligence in time for an extra edition; some even ordered construction of schooners that could range a hundred miles into the open sea to intercept incoming vessels. For domestic news, they arranged

teams of relay riders and steamboats that could make the trip up from Washington, Baltimore, and Philadelphia in a couple of days or less.

Most influential of the new papers was the *Courier and Enquirer* (1829), the offspring of a strange political marriage between James Watson Webb, editor of the *Morning Courier*, and Mordecai M. Noah, editor of the *Enquirer*. Bellicose and supercilious, Webb, a West Point graduate, had fought in the War of 1812, fought Indians in the Northwest, and fought duels with fellow officers. He also loathed blacks, Irish immigrants, and Jews—especially, among the latter category, Mordecai Noah. Noah had moved to New York after a brief diplomatic career and established himself as a journalist, playwright, and Tammany influential. Appointed interim high sheriff of New York in 1821, he failed to win reelection the following year when opponents raised a rumpus about having a Jew supervise the hanging of Christians. (“Pretty Christians to need hanging at all” was Noah’s tart retort.) In 1825 Noah proposed to found a refuge for Jews of the world on an island in the Niagara River and proclaimed himself “high sheriff of the Jews.” When that project failed, he turned to editing the *Enquirer*, with the aid of a squint-eyed Scotsman named James Gordon Bennett. After Noah supported Andrew Jackson for president in 1828, the victorious Jackson appointed him “surveyor and inspector of the New York Port,” a sinecure that allowed him to continue editing the *Enquirer*. But Webb too had backed Jackson, and in 1829 party pressure forced the two editors to combine their papers.

The new *Courier and Enquirer* became the largest and most powerful paper in the United States, famous for the lengths to which Webb would go to scoop his rivals. In 1830 he contrived to get his hands on the text of President Jackson’s annual message to Congress in twenty-seven and a half hours. But this coup failed to discourage Arthur Tappan’s *Journal of Commerce* (1827), which retaliated with an express system of twenty-four horses that covered the distance from Washington to New York in twenty hours flat. *The Journal*’s readers were often privy to the proceedings of Congress and news from the South as much as two days ahead of everyone else.

New York’s hegemony as a clearinghouse for foreign and domestic news pulled in subscribers from every part of the country and compelled editors elsewhere to cannibalize Manhattan papers for stories. By 1828 160,000

newspapers were shipped out monthly through the New York post office; by 1833 nearly a million. In 1838 some two tons of mail left each day for the South alone, three-fourths of it printed matter.

Not surprisingly, and for many similar reasons, it was during these same years that Manhattan became the center of book publishing in the United States. New York's leading authors—Irving, Paulding, Halleck, and two newcomers in the 1820s, James Fenimore Cooper and William Cullen Bryant—now commanded national audiences, and the printers who brought out their books were handsomely rewarded; one, Charles Wiley, did so well that he became a full-time publisher. The big money, however, came from pirated editions of English authors (who didn't have to be paid royalties because the United States government refused as yet to recognize foreign copyrights). Printers and book dealers in New York and Philadelphia competed furiously to bring out the first American editions of new English novels. Some sent agents to England with orders to grab volumes from bookstalls, or sheets from printshops, and ship them west by fast packet. Copy was then rushed from the dock to the composing room, presses run night and day, and books hurried to the stores or hawked in the streets like hot corn.

No one was better at this than the Harper brothers of New York. Their firm began as a printshop in 1817 and evolved over the next decade into a full-time publishing house that kept popular titles in circulation (birthing the backlist). On one celebrated occasion, borrowing techniques from the newspaper trade, the Harpers retrieved the third volume of Walter Scott's *Peperil of the Peak* from a packet before it docked. Working nonstop, they got the finished product to the bookstalls twenty-one hours later, well in advance of the edition issued in Philadelphia by Mathew Carey. It was the Harpers, too, who became the first American commercial publishers to make effective use of stereotyping, a printing process brought to the United States from England in 1811 that was ideal for books frequently reprinted in large editions.

What really assured New York of an unassailable lead in the book trade was cheap and easy access to western readers via the Erie Canal. Every fall, just before the onset of winter, and then again in the spring—a seasonal pattern that still rules the industry—city publishers dispatched crate after crate of books via the canal to retailers scattered across upstate New York,

around the Great Lakes, and along the Ohio and Mississippi rivers. Like small-town newspaper editors, local book printers were hard-pressed to compete with the low prices and big-name authors offered by their Manhattan counterparts. The canal helped make it clear, indeed, that selling books wasn't so very different from peddling hats or chamber pots, and the business soon attracted men who knew nothing about printing but had a talent for marketing. Daniel Appleton, for one, was a Massachusetts storekeeper who moved to New York in 1825 and began to sell books along with groceries. He prospered and by 1831 had decided to become a publisher.

INDUSTRIAL REVOLUTIONS

After 1815, if not earlier, the greatest concentration of shipbuilding facilities in the United States lay along the shores of the East River, two or three miles above the Battery. On the Manhattan side, circling around Corlear's Hook, were the yards of Foreman Cheeseman, Charles Brownne, Henry Eckford, Christian Bergh, Adam and Noah Brown, and other principal builders—piled high with stacks of fresh-cut white oak, live oak, locust, and cedar (some now brought down the canal), the air fragrant with the smells of pitch, tar, and burning coke in the blacksmiths' forges. Directly across the river, at the mouth of Wallabout Creek, sprawled the rapidly growing Brooklyn Navy Yard, which in 1815 launched the *Fulton* (the inventor's war frigate) and in 1820 the *Ohio*, the country's first ship of the line and its largest vessel yet. All told, they would send a prodigious number and variety of vessels down the ways over the next couple of decades—sturdy packets for the Black Ball Line, sharp brigs and schooners for the China trade, swift slavers that could outrun naval patrols, warships for the navies of several different nations, and steamboats by the score.

At first glance, the basic processes of shipbuilding hadn't changed much over the previous century or more. Vessels of every description were still constructed by teams of leather-aproned axmen, carpenters, riggers, caulkers, and other craftsmen, employing tools and materials and techniques known to their trades for generations. To control costs and keep pace with demand, however, leading builders had already taken the first steps toward a more factory-like organization of their yards. Where smaller firms made hulls and subcontracted out the final stages of construction—

making and raising masts, painting hulls, finishing cabins—to the city's host of independent specialists, the bigger yards hired the necessary workmen directly, in some cases boosting the number of their employees to several hundred or more. They added specialized buildings, covered the ways with sheds, and embraced the use of steam power to drive saws, derricks, and pumps. The Browns even built a boardinghouse for two hundred apprentices. In 1824 several of the biggest builders banded together to form the New York Dry Dock Company, which was incorporated, given banking privileges, and capitalized at seven hundred thousand dollars the following year. By 1826 trials had begun on a three-hundred-foot-long inclined marine railway, installed at the foot of East 10th Street, capable of pulling vessels out of the water for repairs and application of copper sheathing to their hulls.

The transformation of shipbuilding on the East River owed much to the vision and diligence of James Allaire, a gifted mechanic who had worked on Fulton's first steamboat. Allaire proved so adept at assembling engines shipped from England that he began to build them himself. When Fulton died, Allaire purchased the Fulton-Livingston engine shop in Jersey City and moved it to his ironworks on Cherry Street, close to the Corlear's Hook shipyards. The yards awarded him contract after contract (in 1818 he turned out the *Bellona* for Gibbons and Vanderbilt), his designs became larger and more elaborate, and by 1829, with hundreds of employees, Allaire had become the premier manufacturer of engines and boilers in the country.

Nor was shipbuilding the only industry in New York to be transformed by the introduction of steam power or the reorganization of production into larger and larger units. Ropewalks and sugar refineries experienced comparable changes, as did the leather-making business, aided by an influx of hides from Argentina (Gideon Lee's New York Tannery Company was capitalized at sixty thousand dollars). Printing too was transformed: in 1823 Jonas Booth printed an *Abridgment of Murray's English Grammar*, the first American book manufactured by steam power; in 1830 Robert Hoe imported the country's first Napier cylinder press, then improved it, and soon Harpers was using the new machine in a four-story plant on Cliff Street. By 1824 a sixteen-acre site on the north shore of Staten Island was occupied by a textile dye and printing works that employed 150 hands and had become the center of a growing community named Factoryville (later

West New Brighton). Visiting dignitaries hailed it with a toast to “the Ladies and Gentlemen of New York and its vicinity—may they all resolve to dye on Staten Island.”

But the industrial revolution in New York wasn’t primarily about big machinery and factories. The great bulk of manufacturing after 1815 took place in small frame or brick houses near the waterfront, without steam power or other elaborate equipment, and typically involved the production of light consumer goods—shoes, furniture, and clothing—for wholesalers or auction houses. After 1815 Brooklyn was a beehive of small shops that churned out playing cards, pocketbooks, combs, tinware, patent leather, iron chests, marble mantles, mustard, writing ink, pencil cases, white lead, paint, glass, and more. It was exactly in places such as these, moreover, that the decay of artisanal skills and traditions advanced most quickly as masters-turned-employers—among them Duncan Phyfe, now a wealthy furniture manufacturer—struggled to get ahead at the expense of their employees. Ambitious shoemakers, for example, coped with competition from New England factory towns by packing their workrooms with low-paid apprentices, distributing cheap leather to journeyman outworkers, and hiring women and girls as binders.

The process was particularly quick and brutal in the men’s clothing trade. Before 1820 the bulk of the male population wore clothes made at home by their wives, mothers, and daughters or made to order by custom tailors. Only poor seamen, laborers, apprentices, and hapless bachelors wore the cheap ready-made clothing known as “slops.” Between 1825 and 1835, however, New York wholesalers, auctioneers, and jobbers presided over the creation of a huge new national market in men’s ready-mades. Local retailers and country storekeepers received generous credit to stock up on “negro cottons” for slaves and dungarees for farmers and miners, as well as slops for the urban working classes. Manufacturers, who were likewise given easy terms for the purchase of raw materials, stepped up production by expanding the number of women employed. As they worked in their own households, “outwork” saved on overhead (no small consideration at a time when real estate was becoming more and more expensive), and it avoided the managerial and disciplinary problems presented by a large, concentrated workforce. Female outwork was particularly attractive because it saved on wages—the wages of women

were less than half those of men—while reinforcing the conventional wisdom that a woman’s place was in the home. By the 1830s some New York shops had five hundred women on the payroll, and men’s garment making had become one of the city’s (and the nation’s) most important industries.

WALL STREET

Western farmers and southern planters, notoriously cash-poor, usually bought goods from country storekeepers on credit—who in turn acquired their stock from wholesale jobbers in New York, also on credit. Although this chain of indebtedness was good for business, it also left New York creditors waiting for payment, usually until harvest time. Commercial banks solved the problem by turning accounts payable into cash. A Pearl Street jobber, for example, might send a thousand dollars’ worth of goods to an Ohio storekeeper. He would include a bill requesting payment in ninety days, which the Ohioan would sign and return to New York. The jobber could now wait three months and (hopefully) collect his full thousand. Or he could take the storekeeper’s promissory note to a bank and get, say, \$950 immediately—his thousand less the percentage (or “discount”) charged by the bank—thereby gaining immediate access to most of his capital. When necessary, the jobber could also borrow from the bank to replenish his stock, or even purchase goods with a bank draft or “check” drawn against his account (a service that was becoming quite common in the early decades of the nineteenth century).

In 1815 there were only five banks in the city—among them Hamilton’s Bank of New York and Burr’s Bank of the Manhattan Company—and their boards were top-heavy with old-stock Knickerbocker merchants who preferred loaning money only among themselves. The relentless expansion of domestic and international trade created a demand for new banks, however, and within the next two decades eighteen more would extract charters from the legislature (including one created in 1824 by the directors of a Hudson River chemical plant, who dubbed it the Chemical Bank).

In theory, these institutions kept their credit under tight control, following the conservative precepts of a banker and banking philosopher named Isaac Bronson. Bronson had come down from Connecticut after the Revolution, made a fortune speculating in securities, and become one of

New York's ten wealthiest men. To his way of thinking, banks should provide only short-term credit (no longer than ninety days) and accept only the best collateral (actual goods in transit). Nor should banks give their money to farmers, manufacturers, and other high-risk borrowers: that was a job for independent investors.

Because their counterparts elsewhere tended to be less cautious with their assets, New York bankers wanted Congress to create a new national bank that could rein in irresponsible lenders and stabilize the country's financial system. John Jacob Astor, having invested heavily in federal securities during the War of 1812, helped secure the legislation that established the second Bank of the United States in 1816.

Headquartered in Philadelphia, the BUS was to be the fiscal agent of the federal government—holding its revenues, paying its bills, and ensuring a uniform currency. As a central bank, it would restrain state banks' lending by refusing to accept their notes if not adequately backed with specie and by demanding payment as soon as it did accept them. It also had the authority to open offices in other parts of the country. Astor, a director of the parent body, became the first president of the Manhattan branch.

Disaster struck the national bank almost immediately. In the get-rich-quick climate of 1817—18, Astor and his friend Stephen Girard of Philadelphia, the two most conservative members of its board, lost control to incompetent and corrupt plungers who issued loans far in excess of reserves. When swooning cotton prices on the European market brought sudden ruin to thousands of unwary land and commodity speculators, the BUS called in its loans to overextended state banks—which then demanded payment from their customers. A financial panic swept the nation in 1819, followed by two or three years of deflation and stagnation that caused great suffering in the South and West. Although the BUS survived, it was widely blamed for the crisis; some casualties, among them a planter named Andrew Jackson, vowed revenge.

In the meantime, a new kind of bank was making its New York debut, summoned into existence to help finance the Erie Canal. The legislature had resolved to pay for the project by selling bonds, but commercial banks as well as wealthy individual investors hung back, unconvinced they would get their money back if the canal failed (all the more so once the panic started). To solve this problem, William Bayard, John Pintard, Thomas

Eddy, and other canal men proposed creation of a savings bank. Its capital would consist entirely of deposits made by working people, and it would be allowed to invest only in government securities—thus encouraging thrift among the improvident classes and having them bear risks that the rich considered unacceptable. In 1819, impressed by the ingenuity of this scheme, the legislature chartered the Bank for Savings in the City of New York; within five years it boasted thirty thousand depositors and assets of \$1.5 million and was the single largest holder of Erie bonds. More savings banks weren't far behind—the Seamen's Bank for Savings (1829), Greenwich Savings Bank (1833), and Bowery Savings Bank (1834), among others.

Concurrent with the appearance of savings banks was the advent of a second new institution, the investment bank. Its story centers on the stout, short figure of Nathaniel Prime. A onetime coachman to a Boston merchant, Prime had arrived in New York in 1795. He made money buying and selling bank stocks; married Cornelia Sands, daughter of a wealthy merchant; and became a private banker, holding customers' funds on deposit and loaning them money. As the business grew, he took in partners—first Samuel Ward, scion of an aristocratic New England family, then the commission merchant James Gore King. In the early twenties the firm moved into loan contracting, a field that Astor's syndicate had pioneered during the war when it bought government bonds wholesale and sold them retail (a radical departure from the previous practice of selling new issues of stocks or bonds directly to purchasers). Prime, Ward, and King applied the same technique to Erie Canal bonds, buying up large quantities for resale to their clients.

Among their best clients was the highly respected Baring Brothers firm of London. Britain's leading "American house," the Barings had sold the bonds of the young republic since its foundation, helped it finance the purchase of Louisiana, and acted on its behalf even during the War of 1812. In 1823 the Barings bought their first Erie Canal bonds from Prime, Ward, and King. Eager British investors snapped them up, and the Barings began to buy more. Other financial houses jumped in, and by 1829 a majority of Erie Canal debt was owned overseas.

Prime, Ward, and King moved on to underwrite internal improvements in the American West. The firm purchased bond issues offered by Ohio,

Louisiana, and Mississippi and retailed them to London banking houses. The Bank for Savings too looked west, financing a canal that connected Cleveland, on Lake Erie, with Portsmouth, on the Ohio River. These initiatives were not only fabulously profitable in themselves, but they also ensured the diversion of more and more commerce toward the Erie Canal.

New York's prominence in national and international banking was enhanced by yet another canal-related phenomenon: the quickening tempo of trade on the floor of the Tontine Coffee House stock exchange. In 1817, no longer content with the old "Buttonwood Agreement" of 1792, the city's several dozen brokers had formed the New York Stock and Exchange Board, tapping Nathaniel Prime to serve as its first president. The ability of the reorganized market to attract capital was confirmed by the millions of dollars that soon poured through the doors of the Coffee House in pursuit of canal stocks—not only those of the Erie but of private ventures like the Delaware and Hudson (whose promoters set up a grate in the Coffee House to demonstrate the value of anthracite coal as a fuel). The profitable and regular trading in canal securities gave new vitality to Manhattan's capital markets, but the Exchange also proved a source of instability. In 1825 unscrupulous dealers whipsawed the stocks of the Morris Canal and Banking Company, driving the price up and down until the entire market broke under the strain and required several years to recover fully.

Rampant speculation could be good for the banks, however. Speculators borrowed heavily from bankers, who were happy to make "call" loans—payable whenever the bank "called" or demanded repayment—because the stocks that served as collateral could be sold without difficulty. It was a wonderfully profitable business, and it enabled New York banks to pay higher rates of interest than those in other cities. This in turn induced out-of-town "correspondent" banks to leave their excess funds in Manhattan, swelling the amount available for loans to speculators.

By 1830—less than two decades after construction began on the Erie Canal—New York had overtaken Philadelphia as the nation's premier money market. Its banks controlled significantly more capital (and were safer too, because the state had just established an insurance fund to guarantee notes issued by member banks). The New York Stock and Exchange Board handled a greater volume of stocks, and its prices, quoted in newspapers throughout the country, were now the norm everywhere. So,

too, the collective assets of the city's insurance companies exceeded those of Philadelphia, Boston, and Baltimore combined.

New York's ascendancy in finance inspired a burst of architectural assertiveness along Wall Street, which like Pearl Street got a facelift during the 1820s. No longer satisfied with quarters in renovated private residences, some dating from before the Revolution, prosperous bankers and brokers now demanded proper offices of suitable scale and grandeur. In 1825 Martin Euclin Thompson, a carpenter turned architect-builder, finished a monumental Federal-style building for the Branch of the Bank of the United States (its sixty-foot facade now stands in the American Wing of the Metropolitan Museum of Art). Two years later, in 1827, the Stock and Exchange Board moved into Thompson's new Merchants' Exchange, and he completed a new home for the Phoenix Bank that was the city's first taste of the new Greek Revival style in architecture, rivaling the BUS headquarters on Chestnut Street in Philadelphia.

It was the latter institution, in fact, that presented the only obstacle to New York's complete domination of the nation's finances. Although conservative New York bankers applauded BUS commitment to a stable currency, they chafed at regulations constraining their own freedom of action and squirmed when the giant bank undercut their interest rates, putting downward pressure on profits. Most galling of all was the knowledge that the BUS continued to serve as the depository for the revenues of the federal government, although the great bulk of these came from customs receipts collected at the Port of New York. Like Andrew Jackson, the New Yorkers watched and waited for a chance to strike back.

LAND LORDS

Speculation in western lands was an old game for Manhattan merchants with extra money in their pockets, and the very thought of the Erie Canal, lancing toward the Great Lakes through mile after mile of prime real estate, had them quivering with temptation. Every year the canal advanced, tens of thousands of acres along its route were feverishly bought, sold, and sold again by many of the same men who at first shunned canal stock as too risky an investment. The mercantile house of LeRoy and Bayard acquired over three hundred thousand acres; De Witt Clinton himself bought up

choice parcels he expected to rise in value with the completion of his big ditch.

None did more than banker Isaac Bronson to make an exact science of the business. Going beyond mere speculation, Bronson employed local businessmen, judges, and politicians to steer him toward the best land. He then resold it to farmers, granting five-year mortgages at 6 percent to those whose financial standing his agents had scrutinized and certified. By the early 1820s Bronson owned or held mortgages on property in over half the counties of the state. His enterprise was so solid that conservative bankers like Prime, Ward, and King invested substantial sums with him.

For the adventurous speculator, though, there was still no place like home. Manhattan land values had risen 750 percent between the Revolution and the War of 1812, and with the Erie Canal in place the future looked even more promising. Plenty of land awaited development in the rolling countryside north of 14th Street. But much of it was tightly held—either by assorted Stuyvesants and Brevoorts and Dyckmans, descendants of seventeenth- and eighteenth-century landowners, or by merchants and artisans who had acquired their estates in the Revolutionary era and fiercely clung to them as talismans of gentility. Although a few speculators got their hands on parcels here and there during the 1820s, new purchasers often hung on to their lands for rural retreats. Scottish merchant Robert Lenox, for one, bought thirty uptown acres between 68th and 74th streets, put up a country house, and refused to sell or develop his new estate.

Downtown was a different story. Astor, who before the war had amassed substantial holdings just above the settled city, now prepared for new arrivals. In 1820 he had Aaron Burr's old Richmond Hill mansion rolled downhill on logs to a site on the corner of Charlton and Varick streets. In 1822, to lend tone to the neighborhood, he reopened it as a "public house, with a Music Room, Reading Room, newspapers, gardens, wines, liquores, etc." He then leveled the hill, opened streets Burr had previously charted, and sold or leased lots to carpenters and masons, who erected row after row of houses on speculation. By the mid-twenties this once remote neighborhood was full of people, and Astor had multiplied his initial investment many times over.

Astor's prescience seemed about to be rewarded again in the village of Greenwich, where he had been amassing real estate ever since 1805, until

planned development touched off a vigorous backlash, led by a most unlikely agitator. Clement Clarke Moore was a conservative Knickerbocker whose father had been Episcopal bishop of the Diocese of New York for thirty-five years. Clement too was deeply involved in church affairs, and a classical scholar as well. He was also proprietor of Chelsea, the largest estate in the area, which consisted mainly of open countryside. When the city, obedient to the commissioners' 1811 grid plan, thrust Ninth Avenue through the middle of his property in 1818, Moore penned an indignant pamphlet. Addressing his fellow "Proprietors of Real Estate," he decried urban development as a destructive conspiracy by patronage-hungry and politically well connected "cartmen, carpenters, masons, pavers and all their host of attendant laborers." More galling still, the city was taxing Moore to pay for this and other street openings, in effect compelling him "to become a capitalist for the public"—a tyranny "no monarch in Europe would dare to exercise."

The Common Council backed down in 1818, agreeing not to extend the grid into the area west of Sixth Avenue from Houston Street up to 14th—a corner of Manhattan still famed for the eccentric and baffling pattern of its streets. Two years later the victorious Moore helped Trinity organize a parish church on Hudson Street. Its name—St. Luke's in the Fields—evoked the pastoral nature of the area and, by association with the physician-apostle, Greenwich's role as haven for the multitudes fleeing disease in the city. It proved all too apt a name.

In 1822 yellow fever again broke out in New York, this time on the stylish streets west of Broadway and near the Battery, supposedly the healthiest part of town. The municipal government declared everything below City Hall an "infected district" and established a picket-fence barricade along Chambers Street. Thousands of residents fled north. "From daybreak till night one line of carts, containing boxes, merchandise, and effects, were seen moving towards Greenwich Village," one paper reported. The city pitched tents for refugees, and carpenters hastily erected hundreds of wooden houses.

Although many refugees went home when the fever broke, enough stayed on that local builders had their hands full trying to keep up with the demand for housing. St. Luke's trustees had carpenter James Wells flank the church with brick row houses, which it maintained as rental property, while

Hudson Street filled with residences equipped with such middle-class conveniences as brass grates for burning the new anthracite coal, brick cisterns with pumps, and servants' apartments. Smaller houses went up on other streets to accommodate a burgeoning number of artisans, especially the carpenters, masons, painters, and stonecutters employed in the booming construction trades. Christopher Street was paved and its sidewalks flagged by 1825, and the blocks around Newgate Prison became so residential that no one complained when the state shut it down in 1829 (having just opened a new facility, Sing Sing, up the river at Ossining).

North of 14th Street, meanwhile, even Clement Clark Moore had begun to play the landlord, carving out lots along Ninth Avenue and promoting them to genteel purchasers. To provide a community anchor, Moore gave the Episcopal diocese an apple orchard lying west of Ninth between 20th and 21st streets, where construction of the General Theological Seminary got under way in 1827; a second Moore-donated parcel, along 20th Street east of Ninth, became the site of the elegant St. Peter's Episcopal Church a decade later.

Astor's successes at Richmond Hill and Greenwich would be duplicated a mile or so to the east, where in 1804 he had purchased a large garden farm near what is now Astor Place. A Frenchman named Delacroix then leased the site from Astor to build Vauxhall Gardens, a resort for fashionable New Yorkers that offered leafy walks, pavilions serving juleps and ice cream, bands, theatrical entertainments, and fireworks. By 1809 the city had extended and paved Broadway all the way up to Vauxhall, and by 1820 streets just to the south—Bleecker, Bond, and Great Jones—were rapidly filling up with genteel residents. In 1825, when the Vauxhall lease expired, Astor cut a broad street through the gardens that he named Lafayette Place, in honor of the Revolutionary War hero (who had just paid a return visit to the city.) Lots along both sides of Lafayette Place sold briskly, earning Astor many times what he had paid for the property twenty-one years before.

By 1830, now in his late sixties, Astor had become the richest man in the United States—almost as rich, according to certain estimates, as European magnates like the duke of Bedford, Sir Francis Baring, and Nathan Rothschild. He had also created something akin to a perpetual moneymaking machine. Between 1800 and 1820 he invested \$715,000 in

Manhattan real estate, roughly two-thirds of which had come out of the profits of his fur and tea businesses. Between 1820 and 1835 he purchased another \$445,000 worth of land on the island, but most of this sum derived from the sale, lease, or rental of property he already owned. By 1830 he had pulled out of the China trade entirely, sold his interest in the American Fur Company, and was running a real estate operation that employed a sizable staff of rental agents, contractors, accountants, bookkeepers, and lawyers—all overseen by his son, the colorless but meticulous William Backhouse Astor, who could recite the family's rent rolls by heart. Between 1835 and his death in 1848, Astor and his son would put another \$832,000 into New York real estate, a sum generated entirely from rents on existing properties. Small wonder that he is supposed to have said, just before he died: "Could I begin life again, knowing what I now know, and had money to invest, I would buy every foot of land on the Island of Manhattan."

ON THE HEIGHTS OF BROOKLYN

Across the East River, another speculative drama was unfolding on Brooklyn Heights. Hezekiah Beers Pierrepont, grandson of a minister-founder of Yale, had come south from New England, made good money speculating in the national debt, founded a mercantile firm in 1793 that exported provisions to Paris, and in 1802 married Anna Marie Constable, whose father, William Constable, one of the largest landowners in the state, gave the couple half a million acres as a wedding present. Abandoning commerce for manufacturing, Pierrepont bought Philip Livingston's gin distillery at the foot of modern Joralemon Street and added a large wharf, a windmill, and storehouses. His Anchor Gin proved successful, but in 1819, after competitors diluted his profits, he abandoned the business. By then he had discovered his true calling, land development.

Pierrepont began purchasing property on Clover Hill, the bluff overlooking Brooklyn Village, eventually amassing sixty acres, including an eight-hundred-foot stretch overlooking the harbor. His plan was to subdivide the property into large plots on which wealthy merchants and professionals could build substantial houses. But Pierrepont knew that (unlike Astor) he couldn't expect the right kinds of buyer to appear unless they were pulled in from across the river. His realtor rivals John and Jacob Hicks, descendants of a Dutch artisanal family, faced no such problem.

They too had been acquiring property on Brooklyn Heights, to the north of Pierrepont's holdings, but their intention was to create numerous small lots, cheap enough for the tradesmen and artisans who already lived down by the ferry landing.

Pierrepont's vision of the future began to look more promising in 1814, when his good friend Robert Fulton formed the New York and Brooklyn Steam Ferry Boat Company. Pierrepont eagerly contributed money and influence, knowing that improved transportation to New York would do wonders for Brooklyn real estate values, and after Fulton's death he became a part owner and director of the operation. Soon the *Nassau*—the East River's first steam ferry—was shuttling people, carriages, and wagons back and forth to Brooklyn forty times a day, each trip lasting a mere four to eight minutes.

In 1816 Pierrepont and a committee of prominent Brooklyn residents successfully petitioned the state legislature for a village charter, which authorized a new board of trustees to open streets, build sidewalks, install water pumps, and establish a watch—much-needed improvements that would enhance Brooklyn's image among affluent New Yorkers. When the trustees received a street plan that favored the Hickses' vision of development, Pierrepont hired his own surveyor, worked up an alternative proposal, and got it adopted for the area south of Clark Street, leaving the Hickses predominant above that line. Pierrepont likewise blocked the powerful Schermerhorns from establishing a ropewalk in his part of the Heights, forcing them (and their workers) over to what is now Schermerhorn Street.

Pierrepont's readiness to combine the roles of land speculator, local politician, and community booster—so unlike Astor, who preferred to work behind the scenes—began to pay off during the yellow fever epidemic that struck New York in 1822. Like Greenwich, Brooklyn received an influx of well-to-do refugees (the steam ferry *Nassau* skipped downtown Manhattan and plied back and forth between the two locations), and Pierrepont began at once to advertise his lots on the Heights. They were “elevated and perfectly healthy at all seasons,” he wrote—ideal for “Families who may desire to associate in forming *a select neighborhood and circle of society*” and especially convenient for “Gentlemen whose business or profession requires daily attendance into the city.” These and similar claims by Hoyts,

Boerums, and other landowners stimulated a construction boom that raised nine hundred new buildings on and around the Heights over the next half-dozen years. By 1830 Brooklyn had become the country's first commuter suburb, and Hezekiah Pierrepont a very rich man.

“THE LONDON OF THE NEW WORLD”

As the Erie Canal neared completion, the *Times* of London predicted it would make New York “the London of the New World.” The city's meteoric growth over the next ten or fifteen years largely bore out that prediction. Though the Hudson River town could hardly be compared with the colossus of the Thames, it had established itself as America's preeminent seaport, emporium, and financial center. After an 1831 visit, even the hard-to-please Mrs. Trollope found herself gushing about New York that, “situated on an island, which I think it will one day cover, it rises, like Venice, from the sea, and like that fairest of cities in the days of her glory, receives into its lap tribute of all the riches of the earth.”

New York's success owed much to the entrepreneurial daring of its businessmen, who had proven themselves more willing than counterparts in other cities to take risks in pursuit of profit. Immigrant Yankee and European capitalists, having demonstrated their feistiness in the very act of relocating, seemed more flexible, less bound by tradition. They didn't always succeed—New York firms failed more often than did the dynastic enterprises of Boston—but their collective ambition stoked the city's economic furnace.

Yet if New Yorkers were willing to hustle in the marketplace, it was a marketplace both cosseted and regulated by the state. Public enterprise was as much a part of New York's civic culture as private ambition, and a raft of governmental initiatives helped the city embrace and enhance its natural advantages.

Above all, it was the state-run Erie Canal that secured New York City's position as the nation's entrepôt, galvanizing its commerce, its banking, its stock market, and its manufacturing sectors: in 1825, the year the Erie commenced operation, five hundred new mercantile operations opened their doors in the city. Government aided entrepreneurs in many other ways as well. Fulton and Livingston perfected their steamboat under the aegis of a

state monopoly without which they would not likely have spent the time, money, and energy it took to bring the project to completion. A similar monopoly encouraged the New York Gas-Light Company to illuminate the streets—by warding off competitors, subsidizing construction, and guaranteeing an initial market. State law also undergirded the monopolistic auction system, which generated some of the largest fortunes of the era, and its Safety Fund assured local bankers of the most stable operating environment in the nation. Finally—the ultimate boon—the New York legislature dispensed, in ever-increasing numbers, the privileges of incorporation, a grant of limited liability originally intended to achieve public purposes, which now became a device to undergird private profitability.

Federal initiatives, too, provided an extensive support system for Manhattan's risktakers. Washington dispensed shipbuilding contracts, dispatched the navy to protect city merchants in hostile waters, maintained forts to safeguard the harbor, banned foreign vessels from the American coastal trade, and, by charging the same postage for long- as for short-haul mailings, helped New York publishers undersell their regional competitors.

Municipal government continued to serve as custodian of the economic order by exercising a broad regulatory authority. In 1828 the Common Council licensed or appointed nearly seven thousand people—including the cartmen, porters, longshoremen, dray carriers, and hackney-coach drivers who moved commodities and people around the port—and municipal regulations had an impact on 255 occupations. Manhattan also maintained an expanding public market system. Though the old Fly Market closed in 1821, the Franklin Market opened that same year at Old Slip, the Fulton Market arrived in 1822, and in 1828 Washington Market was expanded by filling in adjacent wetlands, becoming by the end of the 1830s the leading revenue producer of the city's twelve venues.

The city corporation, moreover, while continuing to run its own "estate" (with some ancient franchises, notably the ferries, now more lucrative than ever), focused more attention on providing a planned and predictable public environment within which market actors could operate and invest. Waterfront improvements and mandated low wharfage rates kept the docks competitive. The grid underwrote real estate development by making clear where property-enhancing roads would run. The new administrative

agencies created back at the turn of the century worked to abate public nuisances and speed the flow of commerce. And tax policies favored capital accumulation: real and personal property were flagrantly underassessed, while bank stocks, bonds, and mortgages were not taxed at all until 1823.

Laissez-faire rumblings did emerge from several quarters. The Rev. John McVickar, professor of moral philosophy at Columbia and scion of a leading mercantile family, was a disciple of David Ricardo and a stout opponent of government intervention in the economy. “I cannot but reverence the claims of free commerce as something holy,” he declared. Yet even McVickar, in his *Outlines of Political Economy* (1825), admitted there was a role for government in executing expensive infrastructure projects, and he specifically praised the Erie Canal.

It was easier for most Manhattan businessmen to hew to mercantilist convictions inasmuch as, given their continuing hold on political power, public projects were in effect overseen by the merchants themselves. Beyond that, the commercial elite’s belief that they were entitled to direct the workings of the municipal economy was rooted in a still deeper sense of stewardship—a conviction, bolstered by their ongoing preeminence in a wide array of civic arenas, that New York City remained a little republic, over which it was their right, indeed their duty, to exercise a collective oversight.

The Medici of the Republic

When Frances Trollope wrote about New York in her *Domestic Manners of the Americans* (1832), she praised the city's upper class as a "small patrician band"—"the Medici of the Republic"—whose refined manners and genteel way of life met the highest European standards. The Medici were flattered, not least of all because Mrs. Trollope had endorsed their belief that they were better than everyone else, yet had remained true to the nation's republican heritage. What she didn't relay to her readers were the conflicting denominational sensibilities and ethnic allegiances that divided the snug little patriciate into at times competing factions.

One camp consisted of the recent arrivals from New England, who were inclined toward evangelical reform and found the Presbyterian Church an acceptable substitute for the Congregationalism of their native region. The other comprised old-stock Anglo-Dutch and Huguenot bluebloods—dubbed Knickerbockers after the character in Irving's history—who tended to think of religious zeal as fanaticism and felt most comfortable in the Episcopal fold. As one of them would tartly put it: "Our graceless Knickerbockers danced around the May-Pole in the Bowery, while the Puritan Anglo Saxons burned witches at Salem."

A characteristic point of conflict between Yankees and Knickerbockers was their attitude to the theater. Knickerbockers loved the stage, and a performance at the Park Theater—which Mrs. Trollope identified as the only house in town "licensed by fashion"—was certain to bring out an abundance of Beekmans, De Lanceys, Kents, LeRoys, Bayards, Livingstons, and Van Renssalaers. More than eighty can be identified in the painting that John Searle made of the Park's audience one night in 1822. Pious Yankees, however, are conspicuously absent from Searle's canvas, having no doubt heeded the admonition of the Rev. Gardiner Spring, pastor of the Brick Presbyterian Church (just up the street from the Park), that playgoing encouraged licentious habits, especially among the young. Spring's views were shared by Arthur Tappan, a successful silk merchant and evangelical who felt about vice (according to his younger brother, Lewis) as he would about a toad in his pocket. Although his annual income

reached as high as thirty thousand dollars during the 1820s, Tappan pointedly poured his money into charity rather than preening display or self-indulgence. His usual lunch consisted of a cracker and a tumbler of cold water. He held his clerks to equally strict standards, insisting that they attend divine service regularly (twice on Sundays), get home by ten each night, and never, ever, visit a theater or consort with actresses.

Interior of the new Park Theatre, 1822, watercolor by John Searle. Fire destroyed the original Park Theatre in 1820, but its replacement, which opened the following year, was no less fashionable. Searle's portraits of the audience comprise a visual directory of the Knickerbocker elite. William Bayard, the wealthy merchant who commissioned the work, is standing in the first tier, behind the lady who has draped her shawl over the rail. Yankees likewise vilified horse racing, another Knickerbocker enthusiasm that enjoyed wide popular support. Although the state banned the sport in 1802 as a vestige of aristocratic dissipation, Long Island gentry

got the ban reversed, though only for Queens County, on the ground that it impeded the improvement of breeds. The Union Course, out on the plains of Jamaica, soon became one of the premier tracks in the country, famous for its huge purses and the multitudes who came out from the city to watch, gamble, and carouse. In May 1823 the track tapped sectional rivalries by hosting a match race between the fastest mount in the North, Eclipse, and a southern challenger, Henry. Some twenty thousand spectators showed up, a million dollars in wagers allegedly changed hands, and the *Evening Post* brought out a special edition to announce that Eclipse had carried the day. The victory did nothing to dispel Yankee convictions that racing was wicked, and when the Union Course was later bought and refurbished by Cadwallader Colden, the eminent Knickerbocker, they knew who to blame for encouraging it.

Waltzing too was in disfavor. Exclusive, meticulously arranged dancing “assemblies” were no less a feature of upper-class socializing than they had been before the Revolution, but the younger and more adventuresome set now regarded the cotillion or quadrille (ancestor of the modern square dance) as unbearably old-fashioned. They preferred the “valse,” which came to New York via Paris in the 1820s and was thought quite daring because dancers whirled around the ballroom in couples. Yankees and Presbyterian ministers denounced it as the devil’s work. Knickerbockers and Episcopalians seemed less concerned, even tolerant.

Nothing raised Yankee hackles like Sabbath-breaking, however. True, the bustle and frivolity of Sundays in New York had been a sore subject among devout residents for nearly two hundred years now. But newcomers from Connecticut and Massachusetts had still-warm memories of communities where families observed the Sabbath by abstaining from all forms of recreation, dining on cold collations of Saturday-baked meats, and attending multiple church services. They could see, too, that the city’s recent growth had spawned alluring new opportunities for diversion on Sunday—pleasure gardens serving punch and wine, even to unescorted single women, and steam-powered pleasure boats providing musical excursions around Manhattan (“a refinement, a luxury of pleasure unknown to the old world,” their proponents preened)—all apparently aided and abetted, and some owned as well, by easygoing Knickerbockers.

In 1821 the Rev. Spring and the Sabbatarians launched a boycott of newspapers that advertised Sunday excursions and won the support of Mayor Stephen Allen. Then they got up a petition asking the city to enforce biblical injunctions to keep the Sabbath holy by closing down pleasure gardens, markets, livery stables, newspapers, and the post office. In time, they meant to sweep the Hudson free of sloops and steamboats “filled with profaners of the Lord’s day.”

The reaction was swift and overwhelmingly negative. Most newspapers defended steamboat excursions as innocent amusement. The *Evening Post* justified keeping markets open on Sunday as necessary for the poor, who went unpaid until late Saturday and couldn’t afford iceboxes to keep fish, meat, and milk fresh during hot weather. Thousands of residents signed a rival petition denouncing clerical interference in public affairs as “highly improper,” while handbills and placards went up around town attacking Spring and his ministerial allies as bigots. When Spring’s forces announced a public rally at City Hall, the *Mercantile Advertiser* urged anti-Sabbatarians to show up en masse. They did so, seized control of the meeting, and adopted a resolution stating that the citizens of New York wanted the clergy to mind their own business. (“The excited multitude looked daggers at us,” Spring recalled.) The Sabbatarians retreated, and the Knickerbockers congratulated themselves on their stand for tolerance and bonhomie.

What the Knickerbockers lacked was an organization comparable to the New England Society, whose annual dinner to commemorate the landing of the Pilgrims generated endless bragging about Yankee virtues and Yankee achievements. More than a few Knickerbockers took up Freemasonry, which combined fraternalism with a commitment to religious toleration and rationalism. By 1827 there were forty-five Masonic Lodges in New York, each of which met twice monthly, either at old St. John’s Hall or at the imposing new Gothic-style Masonic Hall on the east side of Broadway, between Duane and Pearl, nearly opposite the New York Hospital.

Eventually, in 1835—after two years of prodding by Washington Irving—the Knickerbocracy gave birth to a club all its own, the St. Nicholas Society. One of its declared purposes was to gather information on the history of the city, a subject that seemed to particularly interest old-guard New Yorkers. What mattered to the wealthy merchant and former mayor

Philip Hone, though, was the promise “to promote social intercourse among native citizens”—meaning men of “respectable standing in society” whose families had resided in New York for at least fifty years. A “regular Knickerbocker Society,” Hone noted in his diary, would serve “as a sort of setoff against St. Patrick’s, St. George’s, and more particularly the New England [societies].” Peter Gerard Stuyvesant, great-great-grandson of Petrus, was elected first president, and three hundred men with names conspicuous in the city’s history—De Peysters and Duers, LeRoys and Roosevelts, Lows and Fishes—signed up at once. A second St. Nicholas Society soon sprang up across the East River, rallying Sandses, Leffertses, Bergens, Suydams, Strykers, and Boerums to the defense of Brooklyn against insolent and upstart Yankees.

E PLURIBUS UNUM

But not every question that roiled upper-class New York followed this pattern: partisan political alignments cut across the Yankee-Knickerbocker boundary, as did controversies over such economic issues as the tariff. More important still, none of these clashes of style, principle, or interest provoked permanent rifts in New York’s upper registers. Numerous circumstances allowed old-timers to fashion a detente with newcomers and construct a common class identity, rather as the wealthy Dutch and English had worked out a rapprochement a century earlier.

The city’s galloping prosperity, for one thing, enabled Yankees and Knickerbockers alike to make so much money so fast that their differences paled alongside their combined riches. In the buoyant economy, profits rose to the top like cream: by 1828 the top 4 percent of taxpayers possessed roughly half the city’s assessed wealth—more than the top 10 percent had owned a half century earlier. Then, too, although New Englanders now ruled the wholesale and retail mercantile trade—LeRoy and Bayard, the last great Knickerbocker firm, folded in 1826—their rivals hadn’t died out. Rather, they moved nimbly into banking, lawyering, transportation, shipbuilding, insurance, the stock market, and, above all, real estate. As ever, money begat money, and if the son of a rich man didn’t stay in the family business, the family could get him off to a fast start in some other line of work. In fact, nine out of ten affluent New Yorkers in the 1820s and 1830s were wealthy before they embarked on their careers.

Besides money there was style, and nowhere were the commonalities among well-to-do gentlemen and ladies in New York more plainly visible than in their evolving sense of fashion. Beginning in the 1790s the peacock regalia of eighteenth-century males—cocked hats, greatcoats with turned-up cuffs and gilt buttons, embroidered waistcoats, snowy cravats, lace ruffles, buckskin knee breeches, silk stockings, and shoes with silver buckles—had fallen rapidly out of favor. Well-dressed men now favored trousers or close-fitting pantaloons (“pants”), along with double-breasted frock coats, preferably in a circumspect black (a color once reserved for mourners and the clergy). They wore their own hair, unpowdered, closed their shirts at the collar with the simple white neckcloths known as “stocks,” and covered their heads with high-crowned top hats. Dandies affected tighter pants, flashy vests, bright green gloves, and an eyeglass for inspecting curiosities—and were scorned by etiquette advisers as effeminate. The trend was unmistakable. Aristocratic plumage had succumbed to republican simplicity and bourgeois restraint: a gentleman conveyed social superiority through consummate tailoring and impeccable grooming, not color and ornamentation.

Female fashion followed a similar trajectory. Heavy brocaded skirts with whaleboned bodices and hooped petticoats, all the rage in the mid-eighteenth century, yielded during the first two decades of the nineteenth to lighter, neoclassical designs inspired by the French empire and then the Greek struggle for independence. Their objective was a free and natural silhouette: high-waisted dresses of sheer white muslin, featuring low rounded necklines and a bandeau (precursor of the bra) that emphasized the bosom, typically worn with a shawl and with the hair piled up in reckless masses of curls. After 1830, however, the prevailing taste retreated to more constrained, less revealing styles. Waistlines became lower and narrower, necklines rose, and the natural contours of the body were concealed with boned corsets, voluminous skirts, layers of petticoats, padded bustles, and enormous leg-of-mutton sleeves. Modesty now required that hair be pulled back, drawn into a demure knot, and covered with a frilly bonnet.

Shared tastes in costume were accompanied by a similar determination to settle in neighborhoods where the better sort of people, Yankees and Knickerbockers alike, could insulate themselves from the seamier elements of urban life. In 1820 the choicest addresses in town still lay on the lower

west side of Manhattan, along Broadway (from Bowling Green up to Chambers), Greenwich Street (which paralleled the Hudson), and the quiet, tree-shaded blocks in between. From here gentlemen could easily walk to their places of business on Wall Street or Hanover Square, and their families could walk to one of the many houses of worship nearby—the great Episcopal bastions of Trinity and St. Paul’s on Broadway, say, or perhaps the First Presbyterian Church on Wall, Brick Presbyterian on Beekman Street, St. Peter’s Roman Catholic Church on Barclay Street, John Street Methodist, the Dutch Reform triplets (Old South on Exchange Place, Middle on Liberty Street, and Old North on William Street), South Baptist on Nassau Street, or Shearith Israel on Mill Street, still the only synagogue for New York’s four hundred Jews. Also within easy walking distance was the Battery. Spruced up in the early 1820s with lawns, shade trees, and an ornamental iron railing, it remained the city’s premier park and promenade. Its appeal was further enhanced in 1824, when the city acquired Castle Clinton from the federal government and leased it out as a “place of resort,” tethered to the Battery by a wooden bridge ninety paces long and illuminated by gas lamps. Two years later, refurbished as a theater, it became Castle Garden. The high price of tickets to the Garden’s varied performances guaranteed respectable audiences.

Throughout the 1820s some of New York’s most prominent Yankees and Knicker-bockers nestled around the Battery and its adjacent blocks, so many that Bowling Green was irreverently dubbed Nobs’ Row. Other affluent families settled along Broadway itself. In 1828 over one hundred of the city’s five hundred richest men lived there.

Broadway between Park Place and Barclay Street, 1831 (now the site of the Woolworth Building), directly opposite City Hall. The private house on the right was occupied by Philip Hone, who had settled there a decade earlier, when Broadway was still lined with fashionable private residences. Only a half-dozen years later, surging commercial growth—marked by the expansion of the adjacent American Hotel and construction of Astor House one block to the south—would transform the neighborhood. (© Museum of the City of New York)

Among them was Philip Hone, who had retired in 1821 at the age of forty from the auctioneer business with money enough to purchase a house directly across from City Hall (making for an effortless commute during his 1825 term as mayor). Even the censorious Mrs. Trollope loved Broadway, that “noble street.” Though lacking “the gorgeous fronted palaces of Regent-street,” it was nevertheless “magnificent in its extent.” Its “neat awnings, excellent *trottoir* [sidewalk], and well-dressed pedestrians” were so appealing that she might have moved there herself, she confessed, “were it not so very far from all the old-world things which cling about the heart of an European.” Roosevelts, Astors, Grinnells, and Aspinwalls were

nonetheless quite content to occupy the elegant three-story row houses that fronted blocks running west from the strip of Broadway adjacent to City Hall Park down to the Hudson shore.

Yet for all its charms, lower Broadway was losing its exclusivity in these years. Clerks, shopkeepers, and laborers trod its excellent *trottoir* on their way to and from work. Pigs wandered over from all-too-near poor neighborhoods. Commerce and the business district expanded rapidly northward. Old private homes were converted to boardinghouses for young merchants, clerks, and out-of-towners. The growing number of shops, hotels, restaurants, and theaters produced, said the *Mirror*, a “confused assemblage,” mixing people of high and low degree.

More and more wealthy residents thus began a long, reluctant march uptown in search of more hospitable enclaves. One destination was Hudson Square, also known as St. John’s Park, which had been opened by Trinity twenty years earlier but had failed to attract residents. In 1827, however, the vestry decided to sell rather than lease lots and deeded the square itself to purchasers. They poured in by the score, threw up a tall iron fence around the square, and landscaped it with catalpas, cottonwoods, horse chestnuts, silver birches, flowerbeds, and gravel paths. The neighborhood for blocks around soon bristled with Hamiltons, Schuylers, Delafields, Tappans, and other prominent families whose elegant brick town houses afforded refuge from the sweaty commotion of the city below. Nothing else in New York so closely approximated the beauty and exclusiveness of the great squares of London’s West End. It was, according to one contemporary report, “the fairest interior portion of this city.”

Battery Park, 1830. A field of fashionable bonnets and top hats, well-behaved children, carefully maintained grounds—everything in this scene of the Battery conveys its continuing prominence as a hub of respectable New York. (© Collection of The New-York Historical Society)

A second destination for rich urban refugees lay even further uptown, where Broadway sliced through Bleeker, Bond, Great Jones, and East 4th streets, just below John Jacob Astor's Vauxhall Gardens. Building sites on this northern frontier of the city were ample enough for patrician-sized dwellings with commodious yards, gardens, and stables; one guidebook announced that they “may vie, for beauty and taste, with European palaces.” Arguably the most desirable addresses lay along Bond Street, where Jonas Minturn built the first house in 1820. Its white marble facade set the pattern for the expensive three- and four-story residences that stretched the length of the street, from Broadway to the Bowery, by the mid-thirties.

Bond Street's principal rival was the wide nine-block sweep of Bleeker Street from the Bowery to Sixth Avenue, and in 1828 the portion of Bleeker between Mercer and Greene streets became the site of New York's first experiment with terraces—grand residential blockfronts of the kind seen in the most fashionable London neighborhoods. Christened LeRoy Place in honor of the Knickerbocker merchant Jacob LeRoy, its Federal-style row houses sold for a hefty twelve thousand dollars. But LeRoy Place was promptly eclipsed by the resplendent La Grange Terrace, completed in 1833 on the west side of Lafayette Place (itself opened by the canny Astor only half a dozen years earlier). Also known as Colonnade Row, for its magisterial procession of two-story Corinthian columns, La Grange Terrace consisted of nine residences that sold for as much as thirty thousand dollars apiece. They were reportedly “the most imposing and magnificent in the city.”

St. John's Chapel and Hudson Square, from the New York Mirror, April n, 1829. This genteel bastion bounded by Hudson, Varick, Ericsson, and Laight streets—fell abruptly out of fashion after 1850 and was sold to Commodore

Vanderbilt, who built a four-acre freight depot on the site in 1866. It is now overrun by automobiles exiting the Holland Tunnel, and the memory of McComb's chapel is recalled only by St. John's Lane, a block east. {© Museum of the City of New York)

The exodus of well-to-do New Yorkers out of lower Manhattan took a toll on many downtown churches—even Gardiner Spring moved up to Bond Street—and their denominations, Yankee and Knickerbocker alike, moved quickly to establish new congregations uptown. A Dutch Reformed church opened on the corner of Houston and Greene streets in 1825; the Bleecker Street Presbyterian Church, just east of Broadway, in 1826. The Episcopalians consecrated the stately, Gothic-style St. Thomas's at Houston and Broadway in 1826, followed ten years later by the sumptuous St. Bartholomew's, at Lafayette and Great Jones.

Even these houses of worship were inaccessible to affluent New Yorkers who fled still farther away from the city, all the way up Third Avenue until it dwindled to a country lane in the higher latitudes of northern Manhattan. In May 1831 their mansions caught the eye of Alexis de Tocqueville and Gustave Beaumont, two Frenchmen who had come to explore America's jails and America's democracy. As their steamboat from Providence cruised past the East River shore, the two marveled at the "unbelievable multitude of country houses, big as boxes of candy," whose grassy lawns and orchards sloped down to the water. More and more of these bucolic summer retreats had become full-time residences, from the Stuyvesant estate just below 14th Street (where boys still filched pears from trees planted by old Petrus), and the thirty-acre Phelps estate at Kip's Bay between 29th and 31st streets, all the way up to Archibald Gracie's lovely Federal-style mansion between 86th and 90th streets. By the 1820s these regions had so many permanent inhabitants that St. James's Church—a wooden Trinity outpost at 69th and Lexington—began year-round worship.

The isolation that wealthy New Yorkers sought in their uptown encampments made travel into the city something of an ordeal. Bond Street merchants and bankers occasionally walked the two miles down to Wall or Pearl. Yet daily commuting required swifter, less tiresome transportation, and absent the use of a private carriage or cabriolet (a two-wheeled vehicle drawn by a single horse), the alternatives proved sadly limited. One option

was to suffer through an uncomfortable ride atop one of the stagecoaches that ran downtown from the corner of Broadway and Houston Street. Another was to hail one of the licensed hackney carriages that congregated at stands by the Park, Bowling Green, Trinity Church, and Hanover Square. Hacks weren't plentiful, though (only 180 served the entire city in 1828); they weren't cheap; and as Mrs. Trollope discovered, "it is necessary to be on the *qui vive* in making your bargain with the driver; if you do not, he has the power of charging immoderately." At the least, a Bond Street gentleman might spend two hundred dollars a year getting to and from work.

The demand for better transportation between the downtown business district and elite uptown neighborhoods inspired New York coachmakers to introduce the omnibus, an innovation that had recently appeared in London and Paris. Seating a dozen or more passengers, and drawn by huffing teams of two or four horses, the first of these boatlike vehicles began rumbling along Broadway from Bowling Green to Bond Street in 1829. The idea caught on quickly. Within a decade there were over a hundred omnibuses in operation along the city's principal thoroughfares, gaily painted and sporting heroic names like the *General Washington*, the *Benjamin Franklin*, and the *Thomas Jefferson*. Philip Hone, who himself had moved uptown to the corner of Broadway and Great Jones Street, reveled in the ease with which they allowed him to get downtown. "I can always get an omnibus in a minute or two by going out of the door and holding up my finger," he said.

Although *omnibus* means "for all" in Latin, this was class, not mass, transit. It cost twelve and a half cents for a one-way trip down to Wall Street, which was cheaper than the hacks but well beyond the reach of common laborers earning a dollar a day. Even well-to-do passengers found things to complain about, to be sure: grime, unpadded benches, poor ventilation in the summer, no heat in the winter, an often maddeningly slow pace through downtown traffic, and frequent overcrowding. For people living on their estates north of town, omnibuses were no use at all.

SPHERES OF INFLUENCE

Nor were the omnibuses generally able to get gentlemen back uptown in time for dinner. Until 1830 or so, dinner had been the main meal of the day for upper-class New Yorkers, served *enfamille* at two or three in the

afternoon, followed by a light and informal supper in the early evening. As the distance between home and office increased, however, men of affairs found it more convenient to make a quick midday snack of oysters or clams bought from street vendors (“Here’s your fine clams, as white as snow, on Rockaway these clams do grow”) or to have “lunch” together at business-district restaurants like Dyde’s on Park Row or the Porter House on John Street. Back home, meanwhile, wives and small children made do on cold meat, soup, bread, cheese, and other breakfast leftovers. “Dinner” now waited until Father returned in the early evening, while supper was pushed back to nine or ten o’clock or abandoned altogether.

The rescheduling of dinner was accompanied by changes in the consumption and presentation of food that would make the meal as much an emblem of gentility as restraint in fashion or a choice address. Guests no longer arrived to find the table already laden with dishes, which the genial host would dispense, amid much communal passing of plates. Instead, servants (who no longer ate with the family) distributed dishes in a carefully specified order: first soup and fish, then meat and vegetables, finally pies and puddings, which Americans had begun to call “dessert.” The new manners did encounter some opposition—“This French influence must be resisted,” Philip Hone declared—but the more ceremonial and “refined” mode eventually prevailed.

Food preparation too changed in upper-class households. Breads, hoecakes, and johnny cakes, once made in an open hearth, were baked in new cast-iron cookstoves, using the new “refined” white flour that came down the Erie Canal from the new Rochester mills. Meat wasn’t boiled in a pot or spitted over a fire, as in the past, but oven-roasted and served with fancy sauces. The mistress crafted ornate pastries and compotes from recipes gleaned out of increasingly complex domestic manuals like Lydia Maria Child’s *Frugal Housewife* (1829). Costly imported porcelain and silverware, once reserved for guests or special occasions, were now considered de rigueur for everyday use.

Changes in the dinner ritual were further evidence that for upper-class New York households “work” and “home” increasingly occupied distinct social spaces, one ruled by men, the other by women. By the 1820s the downtown commercial district was well on its way to becoming a separate male preserve—virtually empty of respectable families, and scrupulously

avoided by respectable women except for shopping expeditions to lower Broadway or visits to the Ladies' Dining Room of the City Hotel. John Pintard, then living over the offices of the Mutual Insurance Company on Wall Street, realized that his wife and daughter were "nearly prisoners during the hours of business in Wall Street." In 1832 a popular guide to the city advised "distant readers" that no women appeared in its pictures of the area because women rarely went there. So, too, the *Mirror* reported a few years later that "the sight of a female in that isolated quarter is so extraordinary, that, the moment a petticoat appears, the groups of brokers, intent on calculating the value of stocks, break suddenly off, and gaze at the phenomenon."

This was as it should be. Decent women didn't belong in the heartless, bare-knuckled free-for-all that raged downtown, for according to the conventional wisdom, proclaimed over and over again in the pulpit and in the press, nature designed the female of the species to be pacific, nurturing, and cooperative. Her proper sphere was the Home, and her duty—essentially a refinement of the ideal of republican motherhood—was to make the Home a haven for her weary husband and a nest where she imbued her children with Christian love and humility. A genteel household was thus the very antithesis of the marketplace yet indispensable to it, a place where men returned at the end of the day to be refreshed for battle the next and where the young acquired the moral armor they would need as adults.

THE DOMESTICATION OF CHRISTMAS

Wealthy New Yorkers didn't invent this new cult of domesticity, which was a characteristic of emerging bourgeois culture throughout the Atlantic world. They did, however, give it Christmas—a holiday that became synonymous with genteel family life and a quintessential expression of its central values.

For 150-odd years, probably since the English conquest, the favorite winter holiday of the city's propertied classes was New Year's Day (as distinct from the night before, which was an occasion for revelry and mischief among common folk). Families exchanged small gifts, and gentlemen went around the town to call on friends and relations, nibbling cookies and drinking raspberry brandy served by the women of the house.

Sadly, according to John Pintard, the city's physical expansion after 1800 rendered this "joyous older fashion" so impractical that it was rapidly dying out.

As an alternative Pintard proposed St. Nicholas Day, December 6, as a family-oriented winter holiday for polite society. In *Knickerbocker's History*, Pintard's good friend Washington Irving had identified Nicholas as the patron saint of New Amsterdam, describing him as a jolly old Dutchman, nicknamed Sancte Claus, who parked his wagon on rooftops and slid down chimneys with gifts for sleeping children on his feast day. It was *Salmagundi*-style fun, of course: although seventeenth-century Netherlanders had celebrated St. Nicholas Day, the earliest evidence of anyone doing so on Manhattan dates from 1773, when a group of "descendents of the ancient Dutch families" celebrated the sixth of December "with great joy and festivity." Certainly nothing remotely like the Sancte Claus portrayed by Irving had ever been known on either side of the Atlantic.

Mere details were no obstacle to Pintard. On December 6, 1810—one year to the day after the publication of Irving's *History*—he launched his revival of St. Nicholas Day with a grand banquet at City Hall for members of the New-York Historical Society. Their first toast was to "Sancte Claus, goed heylig man!" and Pintard distributed a specially engraved picture that showed Nicholas with two children (one good, one bad) and two stockings hung by a hearth (one full, one empty)—the point being that December 6 was a kind of Judgment Day for the young, with the saint distributing rewards and punishments as required. St. Nicholas Day never quite won the support Pintard wanted, and he eventually ran out of enthusiasm for the project. Sancte Claus, on the other hand, took off like a rocket. Only a few years later, in a book for juveniles entitled *False Stories Corrected*, he was already under attack as "Old Santaclaw, of whom so often little children hear such foolish stories."

Other New Yorkers of Pintard's ilk were meanwhile taking a second look at Christmas as a substitute for New Year's Day. Since the Reformation, Protestants had dismissed Christmas as another artifact of Catholic ignorance and deception: not only was the New Testament silent on the date of Christ's birth, they noted, but the Church had picked December 25 to coincide with the beginning of the winter solstice, an event traditionally

associated with wild plebeian bacchanals and challenges to authority. Wellbred New Yorkers in the early nineteenth century weren't so vehemently opposed to Christmas as Petrus Stuyvesant had been, and often marked the day with private family devotions, dinners, and "Christmas logs." Patricians with New England roots knew that churches there had recently begun a movement for public worship on December 25 to counteract the spread of popular rowdyism. Then came Washington Irving's *Sketch Book* (1819), a collection of short stories that not only gave to American literature the characters of Ichabod Crane and Rip Van Winkle but sparked widespread interest in Christmas as a cozy domestic ritual.

It remained only to get Sancte Claus into the picture, and that was the achievement of another of Pintard's friends, Clement Clarke Moore (still fuming over the intrusion of Ninth Avenue into his beloved country estate, Chelsea). During the winter of 1822, Moore wrote a poem for his children entitled "A Visit from St. Nicholas," arguably the best-known verses ever written by an American. Moore's saint was an obvious derivative of Irving's—"a right jolly old elf" who sneaks down the chimney of a gentleman's house in the dead of night, not to rob him but to put toys in the stockings hung up by his children. Moore had him arrive on December 24, however, a small revision that deftly shifted the focus away from Christmas Day with its still-problematic religious associations.

A friend sent "Visit" to an upstate newspaper for publication, other papers picked it up, and within a decade it was known throughout the country (though Moore didn't acknowledge writing it until some years later). In the meantime, genteel New Yorkers embraced Moore's homey, child-centered version of Christmas as if it they had been doing it all their lives. "A festival sacred to domestic enjoyments," the papers called it; a time when men "make glad upon one day, the domestic hearth, the virtuous wife, the innocent, smiling merry-hearted children, and the blessed mother." In 1831, his earlier promotion of December 6 long since forgotten, Pintard asserted that the new rituals of Christmas were of "ancient usage" and that "St. Claas is too firmly riveted in this city ever to be forgotten." (Christmas trees reached New York in the mid-thirties, courtesy of German Brooklynites; they were popularized by Catharine Maria Sedgwick, the novelist, who wrote the first American fiction including a Christmas tree in 1835.)

PARLOR BUSINESS

Despite its prominence in the consciousness of upper-class New Yorkers, the ideal of a genteel household—quarantined from the rough-and-tumble of commerce by distance, nurturing mothers, and yuletide cheer—often collided with the day-to-day realities of household affairs. Only the very wealthiest women, for example, had enough servants to relieve them entirely of cooking, cleaning, laundering, and other menial chores. John Pintard employed an all-purpose maid, but his wife and younger daughter were responsible for sewing, tailoring, preserving food, baking, liming the basement, whitewashing fences, clearing the yard, and basic carpentry. Increasingly, moreover, even rich families were replacing lifetime African-American retainers with part-time or seasonal help, typically Irish, and the mistress of the house needed to be as adept as her husband in recruiting and managing a wage-labor force. Everyone had stories of servants who stalked out in a dispute over their duties or pay or were lured away by promises of better accommodations. When John Pintard's "unfaithful, ungrateful" maid left without notice, he found it "vexatious in the extreme" and (as was his wont) formed an organization in 1825 to deal with the entire "problem"—the Society for the Encouragement of Faithful Domestic Servants.

Business and public affairs were no more absent from the genteel home than labor. If the back parlor remained a family sanctum, the dining room and front parlor, where children were allowed only on Sunday mornings, hosted a good deal of work-related socializing. New York gentlemen often entertained one another at home and although Mrs. Trollope deplored the exclusion of women from these male affairs as "a great defect in the society" that "certainly does not conduce to refinement," they were nonetheless a vital forum for the private exchange of views about economics and politics.

Mr. and Mrs. Ernest Fiedler and family at their home on Bond Street, painting by F. Heinrich, 1850. “The houses of the higher classes,” Frances Trollope wrote, were “extremely handsome, and very richly furnished” with the chandeliers, mirrors, carpets, and upholstered furniture that here attest to the Fiedlers’ respectability. Note also the pianoforte and—partially concealed by the Greek Revival ionic columns in the background—a Christmas tree. Not depicted, almost inevitably, are the servants whose labor was essential to maintaining these cozy domestic sanctuaries. (Photograph courtesy of Mr. Nicholas L. Bruen)

Women too utilized the parlor, for Bible readings, charity meetings, after-church teas, and the formal “morning calls” that maintained class boundaries by defining the people to whom one was, or was not, “at home.” For both sexes, moreover, every room accessible to outsiders was a stage for displaying the family’s wealth and sophistication. The most refined

houses boasted pianofortes, which cost as much as six hundred dollars (more than a year's wages for a carpenter or cabinetmaker) and were the basis for fashionable "at home" musical performances. Technologically advanced households also had coal-burning stoves, iceboxes, and gas lights, whose installation and upkeep exceeded the annual rent bill of many poor families.

The genteel parlor was likewise an important adjunct to the upper-class marriage market. Well-bred young men and women took note of one another during the annual cycle of assemblies, balls, and concerts, but a proper courtship didn't begin until a "beau" gained the privilege of an "at home" visit. Such occasions were closely chaperoned and, as James Fenimore Cooper observed, governed by taboos so strict that a young woman would assume "a chilling gravity at the slightest trespass." And not without reason, for much hung in the balance: a careless match could plunge an entire family into dishonor and ruin; a good one would bring money and connections sufficient for generations of preeminence. Here, too, Yankees and Knickerbockers saw eye to eye, and many a Yankee entrepreneur won his future in the parlor of a genteel Knickerbocker girl.

The permeability of the membrane separating the spheres of family and business was no less apparent at Christmas, the holiday dedicated to domesticity. By 1830, if not earlier, the week before Santa arrived had become a time for heavy shopping at toy shops, confectionery stores, jewelers, and booksellers. Shopkeepers flogged luxury goods few people purchased at other times of the year, and indeed the season helped legitimate indulgence for a culture that was still consumption-shy. In this context as well, genteel households managed both to lock out commerce and simultaneously contribute to its relentless advance.

TRUE REPUBLICANS

August 16, 1824, a fine summer day: thousands of New Yorkers jammed the Battery to greet the flotilla of steamboats escorting the marquis de Lafayette to Manhattan for the start of a year-long tour of the United States. Stepping ashore at two P.M., the aging Revolutionary hero was swept in magnificent procession out the Battery's Greenwich Street gate, through Bowling Green, and up Broadway toward City Hall, preceded by mounted buglers. The route was thick with tens of thousands of cheering men and

ladies waving handkerchiefs, while a rain of flowers fell from the upper windows of nearby buildings. After a reception at City Hall, Lafayette was settled at the City Hotel and feted at a state banquet that concluded with a balloon ascension.

Any resemblance to an ancient Roman triumph was completely intentional. Conscious of the hoary canard that republics were ungrateful to their benefactors, the Corporation of the City of New York had set out to arrange a reception that, while avoiding unrepublican “pomp” and “ostentatious ceremonies,” would nevertheless pay magnificent homage to one who had labored selflessly for the common weal. A committee chaired by the civic patriarch William Bayard (assisted, inevitably, by John Pintard) devised a schedule that honored Lafayette and showed off the city to best advantage. Before setting out on his U.S. tour, he took in a gala performance of *Twelfth Night*, endured another state dinner at the City Hotel, and attended a reception at the Rutgers mansion. He visited the Navy Yard. He met with clergymen, officers of the militia, and delegates from the French Society and the New-York Historical Society.

Lafayette swung through New York again the following July on his way south. Speaking at the city’s Independence Day celebrations, he assured his listeners that of all the wondrous improvements he had seen on his journey thus far, “Nowhere can they be more conspicuous than in the state of New York, in the prodigious progress of this city.” Another busy week ensued, including a trip to Brooklyn, where he picked up and kissed six-year-old Walter Whitman (or so the poet insisted in later life). Lafayette returned to New York a third and final time in early September for another round of sightseeing (Columbia College, the Academy of Arts, the hospital, the almshouse) and a spectacular sendoff that was soon to become the talk of the country: a grand fete at Castle Garden on the evening of September 14, at which six thousand guests danced until two in the morning.

For upper-class New Yorkers, Lafayette’s three visits, each carefully staged-managed, constituted a running advertisement for the legitimacy of the municipal social system. They demonstrated that huge crowds of citizens could assemble peacefully to honor a national hero—or, as Cadwallader Colden forthrightly put it, that an “exhibition of bayonets is not essential to the preservation of order in New York.” They affirmed, too, that even the city’s wealthiest residents hadn’t forgotten their Revolutionary

antecedents and remained fully committed to the cause of constitutional republicanism around the world.

Not coincidentally, rich New Yorkers were already deeply involved in marshaling popular support for the Greek War of Independence from the Ottoman empire. Since raising the standard of revolt in 1821, the Greeks had won support from radicals and reformers throughout Europe by presenting themselves both as heirs of Athenian democracy and as Christian crusaders against the heathen Turks. In 1823 a meeting of sympathetic New Yorkers set up a Greek Committee, chaired by William Bayard, to raise money for the rebels, while another group, headed by Chancellor James Kent, appealed to Congress to recognize Greece as an independent nation. They were soon joined by a long line of wealthy Yankees and Knickerbockers.

By the mid-twenties, even as Lafayette made his triumphant rounds of the city, New York was in the grip of a Greek mania. The Greek Ladies of Brooklyn and New York erected a twenty-foot Grecian Cross on Brooklyn Heights. Churches and schools took up collections, theaters gave benefit performances, and tickets were sold for a military ball (“as exclusive an affair as was practicable”). Politicians made speeches, and poets churned out verses on Greek themes; Mordecai Noah wrote a play, *The Grecian Captive or the Fall of Athens*, in support of “the present struggle for liberty in Greece.”

There was money to be made as well as raised. In 1824 Greek agents in London asked LeRoy, Bayard, and Company to arrange manufacture of two fifty-gun frigates in New York. The firm placed the order with Eckford and with Smith and Dimon, two local yards, and once again a fund-raising frenzy swept the city. In October 1825, with the ships ready to sail, the Greeks discovered the final bill was twice as high as the price they’d been quoted, having been inflated by fat commissions and brokerage fees, and the builders refused to release the vessels until the sum was paid. The rebels were forced to sell one of the frigates to the U.S. Navy in order to redeem the other. Both purchasers soon discovered that the vessels had been constructed using cheap green timber rather than the expensive live oak stipulated in the contract. The ensuing scandal embarrassed old Bayard, head of the Greek Committee, though his sons appear to have been the ones

at fault. When the old man died in 1826, the business failed almost immediately.

None of this dampened the enthusiasm of the propertied classes for international republicanism. In 1830, when the July Revolution in France toppled the regime of Charles X, a committee chaired by Philip Hone chose Evacuation Day, November 25, for a massive show of solidarity. Thousands of merchants, manufacturers, and tradesmen, many accompanied by elaborately decorated floats, turned out to march from the Battery up to a rally at the Washington parade-ground. Several old Revolutionary soldiers were present as well, among them John Van Arsdale, who had pulled down the last British flag in 1783 and now carried the banner he had hoisted in its place.

The clamor for Greek independence (nudged along by a recent British fad for Greek antiquities) had meanwhile sparked a demand among wealthy New Yorkers for buildings designed to look as if they belonged on the Acropolis in ancient Athens. Greek Revival architecture, as it came to be known, seemed particularly well suited to the United States. Its basic elements—massive fluted columns, triangular pediments, heavy cornices—created a highly satisfying sense of kinship with the Athenian citystate famed as the birthplace of Western democracy. The first full-blown example of Greek Revival architecture in America was the headquarters of the Bank of the United States in Philadelphia, a Parthenon-like edifice completed in 1824. Only a few years later, New York's booming financial district got its first taste of the new style in Martin Euclin Thompson's Phoenix Bank.

The spread of Greek Revival architecture in the city quickened with the arrival of a Yankee engineer-architect named Ithiel Town. Town moved down from New Haven in the mid-twenties, certain that New York was about to become the pivot of the republic—and that its rich patricians would pay generously for the new style. His first commission, a Greek Doric design for the New York [later renamed Bowery] Theater, came in 1826. The following year he went into partnership with Thompson to form the city's first professional architectural firm, Town and Thompson, which quickly produced the Church of the Ascension on Canal Street (1827-29), among other notable structures, as well as renovations to St. Mark's in the Bouwerie (1828).

Thompson left Town in 1829 and went on to fame as the architect of the gracefully proportioned row houses on Washington Square North (1829-33) and, with another newcomer named Minard Lefever, of Sailors' Snug Harbor on Staten Island (1831-33)—both still among the best surviving examples of Greek Revival building in the country. Town had meanwhile teamed up with Alexander Jackson Davis, a native New Yorker nineteen years his junior. Davis was a skilled architectural draftsman who had thrived by furnishing plans and elevations to the burgeoning ranks of speculative builders. After Davis won a commission to remodel the old almshouse—New York's first civic building in the new style—Town took him on as a partner and opened an office in the Merchants' Exchange. The two soon made Greek Revival architecture as prevalent a symbol of genteel New York as Santa Claus. Their temple-fronted churches and columned town houses sprang up throughout Greenwich Village, Chelsea, and other fashionable new neighborhoods. The Greek Revival facade that Town designed for Arthur Tappan's store at Pearl and Hanover streets in 1829 was the first to make use of post-and-lintel construction, so obvious an improvement for displaying as well as storing wares that it quickly became the norm for downtown commercial buildings.

CIVIC PATRONS

Ever since the 1790s, De Witt Clinton and a small handful of like-minded gentlemen had been urging more systematic support for the arts and sciences—equally to encourage republican virtue among the people and to counter the city's reputation for benighted money-grubbing. Culture was as much an “internal improvement” as the Erie Canal, they argued, and equally the responsibility of government. In 1816 the Common Council agreed. New York had “too long been stigmatized as phlegmatic, money making & plodding,” the aldermen admitted, and they determined to “speedily retrieve the reputation of our City,” by providing “municipal aid” to cultural institutions as Edinburgh, London, Paris, and Amsterdam, and other European capitals did. Moving inmates of the Chambers Street almshouse up to a new facility near Bellevue, they gave McComb's three-story 1797 building a new name: the New York Institution of Learned and Scientific Establishments. The idea, as Pintard put it, was that “by concentrating all our resources we may give a greater impulse and elevation to our intellectual character.”

Seven prominent “establishments” agreed to take up quarters in the Institution: the recently reorganized American Academy of Fine Arts, the New-York Historical Society, the new Literary and Philosophical Society, the New York Society Library, John Scudder’s Museum (successor to the old Tammany Museum), the U.S. Military and Philosophical Society, and John Griscom’s Chemistry Laboratory. (Not all of them actually moved in. The Society Library, for one, kept its formidable collection of twenty thousand volumes down on Nassau Street.)

The leadership of the institution’s member organizations was drawn from a small, frequently overlapping group of affluent merchants and lawyers. As they understood matters, elevating the city’s intellectual character required them not simply to patronize creativity but to ordain and enforce standards for it as well. So in 1816, when John Vanderlyn asked the academy for space to exhibit a reclining nude entitled *Ariadne Asleep on the Island of Naxos*, the horrified members turned him down on the grounds that the painting offended public decency. Their notions of good art ran to the inspiring historical canvases of John Trumbull, whose full-length portraits of Washington, Hamilton, Jay, and other worthies already graced City Hall—and who, as it happened, had just been elected president of the academy. In 1819, when Trumbull finally completed his *Declaration of Independence*, destined for the Capitol in Washington, the academicians proudly let the public in for a preview (at twenty-five cents a head).

Vanderlyn, in the meantime, had taken his revenge by soliciting money from Astor and a hundred other gentlemen to build his own gallery on Chambers Street, directly east of the institution. This was the Rotunda, a Pantheon-like building, fifty-six feet in diameter and capped by a thirty-foot dome. Its main attraction, which went on display in the summer of 1819, was Vanderlyn’s own *Panoramic View of the Palace and Gardens of Versailles*, twelve feet high and 165 feet long. The public wasn’t impressed, and critics advised him to depict American rather than European scenes in the future.

In 1824 the effort to improve the intellectual climate of New York took a new turn when Pintard and a number of its “wealthiest and most learned” citizens met at the City Hotel for the purpose of creating an athenaeum. Modeled on similar organizations in Liverpool (1798), Boston (1807), and Philadelphia (1814), the New York Athenaeum was to be a “genteel place

of resort” for the perusal of books, magazines, and newspapers. It would also sponsor lectures, which would be open to women as well as men, by prominent artists, writers, and scientists. The lecture series started up almost immediately in the chapel of Columbia College: Gulian Verplanck speaking on political economy, Professor John McVickar on the philosophy of mind, Professor James Renwick on applied mechanics, and the Rev. Jonathan Wainright on oratory, among others, drawing audiences “distinguished for fashion, beauty, and accomplishments.” As intended, the athenaeum subsequently opened a public reading room at the corner of Broadway and Pine that became quite popular (Tocqueville and Beaumont dropped by almost every day during their visit to the city).

The machinery of genteel cultural legislation and patronage made its most enduring contribution to the city, however, by launching the artistic careers of newcomers like Samuel Finley Breese Morse and Thomas Cole. Morse, an itinerant painter from New England, moved down to the city in 1823 because he believed that the “influx of wealth from the Western canal” would soon make it a good place to look for commissions (and because he hoped to succeed the aging Trumbull as president of the academy). It was slow going at first. “This city seems given wholly to commerce,” Morse grumbled. “Every man is driving at one object, the *making of money*, not the spending of it.” But in 1825, thanks to Philip Hone, Morse was tapped to paint a portrait of Lafayette for City Hall. His dynamic rendering catapulted him to fame, and commissions poured in. Dr. David Hosack of the academy asked Morse to do anatomical paintings for his medical classes. The athenaeum made him its secretary and invited him to lecture on the arts. By 1831 Morse had come round to the view that “New York is the capital of our country and here artists should have their rallying point.”

Cole’s was a similar story. Born in 1801 in Lancashire, England, where his father was a failed woollens manufacturer, Cole came to the United States in 1818 and became an itinerant painter of landscapes and portraits. In 1824 he came to roost in a Greenwich Street garret and began to exhibit scenes of upstate New York in local shops. Three of his works, displayed in the window of William Colman’s bookstore, caught the eye of Trumbull, who reported his discovery to engraver Asher B. Durand and the playwright-painter William Dunlap. Each bought one, and they exhibited their acquisitions at an academy show in the New York Institution, where

they caused considerable excitement. Philip Hone, William Gracie, Gulian Verplanck, and David Hosack ordered paintings from Cole for themselves, and Cole headed back upstate to produce more. He returned with a new batch, sold them at the academy, and left again for the mountains—a cycle that would be repeated over the next four or five years.

Like Morse and Cole, writers William Cullen Bryant and James Fenimore Cooper found the support of New York patricians crucial at the beginning of their literary careers. Bryant, originally from the Berkshire town of Cummington, Massachusetts, had been practicing law unhappily in Great Barrington before he came to Manhattan in 1825 to promote a book of poems and start life over as a journalist. The athenaeum hired him to edit its *New-York Review and Athenaeum Magazine*; the venture didn't flourish, and Bryant (echoing Vanderlyn and Morse) began to complain that “nobody cares anything for literature” in New York, where the only man considered a genius was “the man who has made himself rich.” Then William Coleman, editor of the *Evening Post*, took Bryant on as his assistant. In 1829 Coleman died, and the thirty-four-year-old succeeded him as editor, giving “America's First Poet” a secure base of employment.

Cooper had grown up on his family's extensive Cooperstown estate, got himself kicked out of Yale, and drifted into the navy. When his father died he inherited an ample fortune and seemed destined for the life of an Episcopal squire in Westchester. But in 1821, now thirty-one, Cooper walked into the New York office of publisher Charles Wiley, carrying the manuscript of a novel about the Revolution entitled *The Spy*. Its publication made him famous and prompted him to move to the city to be near his publisher. Over the next six years he churned out *The Pioneers* (1823), *The Pilot* (1823), *The Last of the Mohicans* (1826), and *The Prairie* (1827). Meanwhile, in 1822, he began a series of midday get-togethers for writers, artists, and interested gentlemen in the back room of Wiley's New Street bookstore. First known as Cooper's Lunch, the conclave soon became the Bread and Cheese Club, named after the formalized balloting system for electing new members (a bit of bread signified acceptance, a piece of cheese rejection).

In one sense, Bread and Cheese was only the latest in a long line of fraternities organized in the city by dabbling amateurs and self-taught connoisseurs among the elite—most recently, the Knickerbocker wits who

had held court at the Shakespeare Tavern and preserved their repartee in print, as much for their own amusement as for the public's. Yet it also contained the germ of something quite new. Among its members were artists and writers who regarded their crafts as full-time vocations, not hobbies to be pursued in moments snatched from law or commerce, and the club helped them forge a new kind of professional identity. Morse, Cole, Bryant, Durand, John Wesley Jarvis, and Dunlap cemented friendships there, as did Fitz-Greene Halleck, versifier and man about town; Gulian Verplanck, writer on law and theology, editor of *Shakespeare*, and spokesman of the *New York Dutch*; and James Kirke Paulding, still grinding out material for *Salmagundi*, his old venture with Washington Irving (who, now abroad, was a Bread and Cheese man in absentia).

Although the club failed to survive Cooper's departure for a long European sojourn in 1826, the growing sense of solidarity it bred among professional artists had already laid the foundation for a confrontation with Trumbull's Academy of Fine Arts. When some young painters sought access to the academy's collections to practice their drawing, Trumbull, full of patrician hauteur, barred the way and advised them to "remember that beggars are not to be choosers." Late in 1825 the painters struck back by founding their own organization, the New York Drawing Association, with Morse as president and Cole and Ithiel Town among the founding members. The following year it became the National Academy of Design, which unlike the Fine Arts Academy was to be run strictly by and for artists—"on the commonsense principle," Morse wrote, "that every profession in a society knows what measures are necessary for its own improvement." Artists all over the country came to think of the National Academy's annual exhibition as the most desirable place to show their latest work. In a similar spirit, Morse, Bryant, Cole, Durand, and Verplanck, with other professional writers and artists, came together in 1829 to form the Sketch Club.

All this was a frontal assault on the notion—an article of faith for men like Pintard and Clinton—that the propertied classes were competent to steer artistic and literary production for the greater municipal good, and it marked the beginning of a decline in genteel cultural authority. Artists had effectively shifted relations with the Hones and Hosacks, Gracies and Griswolds to a less paternalistic, more market-mediated footing, which in turn summoned professional "critics" into being. Before 1825 literary

magazines hadn't covered the negligible fine arts world; now the weekly *New-York Mirror* began reviewing the annual exhibitions at the National Academy and reproducing some of the artwork via engravings and woodcuts.

The older model of patrician patronage, having helped foster a cultural community, now began to fade away. As early as 1828 the athenaeum abandoned its lecture program because too many well-to-do families were moving too far uptown (the reading room was eventually absorbed by the Society Library). The New-York Institution collapsed when the Common Council, on the recommendation of councilman James Roosevelt in 1830, refused to renew its lease on the almshouse and took the building over for municipal offices (after renovations by Alexander Jackson Davis). The Literary and Philosophical Society dissolved shortly thereafter, followed by the Academy of Fine Arts itself.

NATURE AND NOSTALGIA

For all their differences, patricians and artists had in common a lack of interest in New York City as a literary and artistic subject. Instead, they echoed the pastoral romanticism currently in vogue among European intellectuals (neither Wordsworth, Coleridge, Byron, Shelley, nor Keats located most of a major poem in contemporary London). Addressing the Academy of Fine Arts in 1816, Governor Clinton suggested that exposure to the “wild, romantic, and awful scenery” of the American wilderness had the power “to elevate all the faculties of the mind, and to exalt all the feelings of the heart” (both of which, by implication, suffered in the nation's cities). Within a decade, thanks less to Clinton's oratory than to canny steamboat operators and the appearance of fashionable rustic “resorts” far removed from Manhattan, hundreds of affluent New Yorkers left town every summer to experience the restorative powers of uncontaminated Nature. Their favorite destination was the Catskill Mountain House (1824), the first successful hilltop hotel in the United States and a must-see stop for Europeans on the American Grand Tour. Ladies and gentlemen disposed to visit the seashore went to Coney Island House (1824), a retreat famed for its first-class accommodations, wellprepared meals, and up-to-date bathing facilities.

New York writers fostered the new sensibility with a widening stream of novels and poems that depicted the American wilderness as an antidote to alienated urban life (rather as the refined home was held up as a sanctuary from city hurly-burly). Cooper's frontier romances were an extended paean to the nobility of the Catskills, while Irving, who had never been closer to the forest primeval than the deck of a river sloop, wrote lovingly of the supernal beauty of the Hudson highlands and their quaint inhabitants, who, like Rip Van Winkle, belonged to an earlier, less complicated time. Bryant, having fled the countryside for the big city, built an entire career on poetry that taught respectable merchants and bankers to yearn for woods, pastures, and streams.

Cole and his many disciples would convey the same message with even greater force in landscapes where all evidence of human presence was dwarfed by scenery so majestic and inspiring as to seem almost other-worldly—a point of view that garnered princely commissions from the very land speculators, canal boosters, and manufacturers who were doing their best to tame that scenery in the name of trade and commerce. What was more, some of Cole's earliest and best-known paintings—*Falls of Kaaterskill* (1826); *The Clove, Catskills* (1827); *Scene from "The Last of the Mohicans"* (1827)—were of subjects already immortalized, or soon to be, by Irving, Cooper, and Bryant. Though Cole's representations carefully deleted all signs of the new tourism, Catskill resort operators drew on his panegyrics, and those of Irving and Cooper, for use in advertisements. James Kirke Paulding, in his *The New Mirror for Travellers; and Guide to the Springs* (1828), urged "the picturesque tourist" not only to stay at the Mountain House but also to buy paintings from Cole and other landscape artists.

One of the few ways in which New York's artists were willing to appreciate the city was by turning to its past—or a sentimentalized nostalgic version thereof. Like Home and Nature, History seemed a sanctuary from the hurried present. In 1827 the *New-York Mirror* began a series called "Antiquities of New York" that combined wistful, Irvingesque stories of New Amsterdam with engravings of old Dutch buildings by Alexander Jackson Davis.

Bryant often escaped from downtown to explore groves along the Hudson or ramble past old Dutch farms in Brooklyn, looking for traces of

history. In 1829-30, he and Gulian Verplanck wrote “The Reminiscences of New York,” published in two successive issues of their annual, *The Talisman*. The fictive narrator of the piece fretted about the lack of “chivalric” associations common in Virginia or South Carolina: “I do not know whether any romance actually remains in New-York at the present moment,” because “the progress of continual alteration is so rapid” that a few years can “sweep away both the memory and the external vestiges of the generation that precedes us.” European cities changed little from decade to decade, but the narrator, having returned to Manhattan after an absence of just two years, found “every thing was strange, new and perplexing, and I lost my way in streets which had been laid out since I left the city.”

Worse still was the prevailing antihistoric sensibility, evidenced by even so distinguished a citizen as Cadwallader Colden. In 1825, when hailing the opening of the Erie Canal, Golden had remarked: “We delight in the promised sunshine of the future, and leave to those who are conscious that they have passed their grand climacteric to console themselves with the splendors of the past.” Bryant and Verplanck suspected that “New-Yorkers seem to take a pleasure in defacing the monuments of the good old times, and of depriving themselves of all venerable and patriotic associations.” All the more imperative, therefore, to preserve any remaining “fragments of tradition and biography,” and the authors accordingly chronicled the little church where Whitefield used to preach, the site of Washington’s inauguration, Jefferson’s home on Cedar Street.

Cooper too cherished the few Dutch dwellings that remained—“angular, sidelong edifices, that resemble broken fragments of prismatic ice”—regretting a growth rate that forced old buildings “out of existence before they have had time to decay.” Asher Durand would try to conjure them back into existence by painting picturesque tableaux of New Amsterdam’s past—as interpreted by Washington Irving—in works such as *The Wrath of Peter Stuyvesant*.

In the end, however, the ties that bound many Knickerbocker artists to the city would prove tenuous indeed. When Cooper returned from Europe, he withdrew to the old family manor at Otsego Lake. Irving would establish himself as a country squire at an old Dutch farmhouse near Tarrytown. And Cole retreated to a country home just north of Catskill. Nevertheless, New York’s merchants, financiers, and lawyers were delighted with their artists’

achievements. Given “the growing Fame” acquired by Irving and Cooper, Philip Hone believed, in time the city would “become as celebrated for taste and refinement, as it already is for Enterprise and public spirit.”

Indeed, the Manhattan Medici had every reason to feel proud about the direction the civic ship was taking under their collective captaincy. They felt secure in their position as patrons of the arts and sciences, directors of economic enterprise, chief celebrants at municipal pageants, leaders in the political arena, and owners of most of the city’s terrain. True, there were intramural debates between Knickerbockers and Evangelicals, but none had proved sufficiently divisive to override their common republican conviction that they could and should assume responsibility for the common good. But this serene self-confidence in their ability to speak for the city as a whole, without rebuke from below, was at the same time being called into question in a series of confrontations with obstreperous lower orders, who, day by day, were developing opinions and judgments considerably at variance with their own.

Working Quarters

On New Year's Eve, as the city bade farewell to 1827, several thousand workingmen—laborers, apprentices, butcher boys, chimney sweeps—set out from the Bowery on a raucous march through the darkened downtown streets, drinking, beating drums and tin kettles, shaking rattles, blowing horns. The crowd headed down Pearl Street into the heart of the city's commercial district, smashing crates and barrels and making what one account described as "the most hideous noises." From there the marchers wheeled across town to the Battery, where they knocked out the windows of genteel residences and attempted to tear down the iron railing around the park. At two in the morning they tromped up Broadway, just in time to harass revelers leaving a fancy-dress ball at the City Hotel. A contingent of watchmen appeared but, after a tense confrontation, gave way, and "the multitude passed noisily and triumphantly up Broadway."

During the seventeenth and eighteenth centuries, New York's propertied classes had more or less tolerated such instances of plebeian revelry because they were relatively harmless and (as Petrus Stuyvesant found out) difficult to uproot. Even after the Revolution, "Callithumpian bands"—echoing ancient European traditions—had continued to parade about, beating on pans, shouting and groaning, mocking the powerful and overly dignified. Respectable opinion had grown steadily less tolerant of self-organized plebeian frolics, however, partly because they affronted genteel notions of correct behavior, and partly because every year they became more truculent, more defiant of authority. It was one thing for great throngs of working people to rejoice noisily at Lafayette's visit or the opening of the Erie Canal, civic ceremonies orchestrated by gentlemen; it was quite another for rowdies to take over the streets, wantonly destroying property and terrorizing law-abiding citizens.

The very next year, accordingly, Mayor Walter Bowne ordered the watch to disperse all crowds on New Year's Eve, and there was no Callithumpian procession. But such street confrontations would not fade away, in part because they were rooted in widening divisions between working-class wards and gentry precincts over the proper canons of public and private behavior.

WORKING QUARTERS

On point of divergence concerned the seemliness of living where one worked. While some prosperous entrepreneurial artisans had joined the gentility in commuting to their place of business from uptown bedroom communities, few master craftsmen, journeymen, or unskilled laborers could afford the expensive new omnibuses. They stayed, accordingly, in craft-based communities, within which they could walk to work.

Greenwich Village remained one such house-and-shop stronghold. Especially after the Christopher Street pier (1828) became the main point of entry for building materials used in transforming the uptown cityscape, the area grew dense with carpenters, masons, painters, turners, stonecutters, dock builders, and street pavers. Brooklyn Village too continued as a working community based on agricultural processing and transport, its streets lined with household-shops of coachmakers and coopers, saddlers and blacksmiths. Butchers remained prominent: one was elected first village president. By the mid-1820s the booming hamlet had more than tripled its prewar population, creating additional jobs for resident carpenters and masons.

Corlear's Hook still hosted the shipwrights, sailmakers, coopers, and chandlers whose livelihoods depended on the nearby shipyards—along with sailors, including a group of Chinese tars on Market Street who constituted the first significant Asian presence in New York. The Five Points also housed a great array of trades: breweries, potteries, and tobacco manufactories; tailoring, shoemaking, and printing establishments.

Bowery Village remained notorious for the stomach-turning stench of its slaughterhouses and lanyards. As late as 1825, upstate drovers like Daniel Drew were herding an estimated two hundred thousand head of cattle across King's Bridge each year and making their way, accompanied by hordes of

pigs, horses, and bleating spring lambs, down Manhattan to Henry Astor's Bull's Head Tavern and adjacent abattoirs. A butcher who acquired an exceptionally fine cow would then parade it through the streets, preceded by a band and followed by fellow butchers in aprons and shirtsleeves, stopping before homes of wealthy customers, who were expected to step out and order part of the animal.

Some of those customers, bolstered by gentry families filtering in from the lower wards, wanted to transform the Bowery into a more genteel neighborhood. Taking aim at the stink, the endless whinnying, lowing, and grunting, and the occasional steer running amok and goring passers-by, they set about driving the Bull's Head from the area. In the mid-1820s, an association of socially prominent businessmen bought out Henry Astor and dismantled his enterprise. (A new Bull's Head opened in semirural surroundings at Third Avenue and 24th Street and soon attracted cattle yards, slaughterhouses, pig and sheep pens, and a weekly market; the area became known as Bull's Head Village, the city's northern frontier.) Meanwhile, in place of the old tavern, the consortium set about erecting Ithiel Town's splendid Greek Revival playhouse—the New York (soon to be Bowery) Theater. Mayor Philip Hone hailed the transformation as marking “the rapid progress of improvement in our City.” But neither theater nor street was destined for gentility, and the Bowery would soon evolve into an entertainment strip for surrounding communities.

Within such working-class neighborhoods, the families of small masters, journeymen, and laborers lived in housing far different from the spacious abodes rising along Bond Street. Some speculative builders did raise modest but decent worker residences along streets carved out of the old De Lancey estate—many of them, including Eldridge, Ludlow, Forsyth, and Chrystie, named for military and naval heroes of the late war—or along 1st to 6th streets, the newly opened first fruits of the grid, which ran down to the East River.

However, with low incomes and expensive transportation tethering working people downtown, it proved equally profitable to exploit the captive market by cramming renters into preexisting spaces. In these aging structures, conditions varied from decent to squalid, but even at their best, the coal stoves, gas lights, iceboxes, and other improvements on display in the residences of the uptown gentry were unheard of. People made do with

candles and oil lamps or scavenged winter wood along upper Manhattan's roadsides. Few households had a sufficient number of privies. Many laborers relied on cheap ceramic chamber pots from England, except for the very poor, who, in the phrase of the day, were "without a pot to piss in." Better-off families might have bedsteads or display clocks and prints on the wall. The poorest lived together in a single room, furnished with little more than a straw mattress, a few cast-off chairs, and a sawed-off barrel top for a table.

The plebeian quarters grew steadily more crowded, and the Sixth Ward's Five Points became the most densely packed neighborhood in the city. Its two- and threestory buildings, designed originally as one-family houses, housed an average of thirteen people as early as 1819, and by some estimates, building density doubled by the early 1830s. On Mulberry Street, homes with thirty-five occupants were not unknown; 122 Anthony housed eighty-three residents; 10 Hester Street contained 103; later in the decade, a brewery erected back in 1797 on the shores of the Fresh Water was transformed into a boardinghouse (known to all as the Old Brewery) that housed several hundred people. The mushrooming number of tenants in the area became overwhelmingly evident each Moving Day—by 1820 a scene of utter pandemonium, with thousands of people relocating at once, clogging the streets with wagons full of household possessions. It looked, Mrs. Trollope observed, as if the population were "flying from the plague."

WOMEN AT WORK

Within working-class neighborhoods, in further contrast to the more "refined" parts of town, women's labor was deemed indispensable. Given the declining fortunes of proletarianized males, and employer calculations of a "living wage" that implicitly included the value of women's unpaid domestic labor, many families were unable to make ends meet without the contributions of wives and children. A skilled wife whittled down the family's cash expenditures. She hauled in water and firewood, lugged out waste and garbage, washed, mended, and made clothes, tended the sick, and raised the children, passing on values of hard work, honesty, loyalty to family, and neighborliness.

Laboring women did not dress up and pay each other formal parlor visits—they had no parlors—but they socialized through open windows and

dropped in at one another's kitchens, children in tow, to exchange gossip and information. Neighbors intervened in quarrels, sat up with sick infants, swapped news of market bargains, and helped out in crises (removing goods and furniture in case of fire, or rallying to block evictions). They also bickered and brawled in public, often engaging in extravagant donnybrooks that attracted crowds of cheering female onlookers.

Poorer women spent much of their time on the streets. Rather than retreat to domestic sanctuaries, they pawned and redeemed possessions, bargained with shopkeepers and peddlers for goods and credit, and scavenged for such discarded items as wood to burn, scraps of old clothing, and bits of food: one could scoop a week's worth of flour from a broken barrel on the docks. Children were dispatched to forage for manufacturing wastes—nails and screws, old rope, broken glass, shreds of cotton plucked from wharves where southern packets docked. These could be sold to waterfront junk dealers, who in turn recycled them to iron founders, shipwrights, glassmakers, or makers of shoddy (the cheap cloth used in producing “slop” apparel for the poor).

Women worked hard to supplement a diet that consisted largely of bread and potatoes, corn and peas, beans and cabbage, and milk from cows fed on “swill”—byproducts of the city's distilleries. In good times, they might add salt meat and cheese, a little butter, some sugar, coffee, and tea. But meat and poultry, though widely available in city markets, were expensive, even when purchased for a reduced price at the end of the market day. Many working-class wives therefore kept their own animals, notably pigs; lacking the space to board them, they let the hogs run free to scavenge for themselves. New York had long been infamous for its thousands of porcine prowlers, and when city fathers once again tried to sweep them from the streets, they touched off a raucous confrontation with poor mothers.

In 1818 Mayor Cadwallader Golden regretted that “our wives and daughters cannot walk abroad through the streets of the city without encountering the most disgusting spectacles of these animals indulging the propensities of nature.” Copulating and defecating porkers were a decidedly ungenteel sight, and their “grunting ferocity” could be dangerous to children. Golden empaneled a grand jury, which indicted a butcher, Christian Harriet, as a public nuisance for keeping hogs on the streets. He hired a lawyer, who contended that customary social practices, especially

those “of immemorial duration,” could not be declared a public nuisance unless they violated standards held in common by the entire population. Pigs might offend ladies and dandies, “who are too delicate to endure the sight, or even the idea of so odious a creature.” But “many poor families might experience far different sensations, and be driven to beggary or the Alms House,” if deprived of this source of sustenance. Mayor Golden, in charging the jury, ruled the food factor irrelevant, and Harriet was convicted, establishing the absence of a legal right to keep pigs in the street. In 1821 the Common Council ordered a roundup of the swinish multitudes, but when pig-owning Irish and African-American women discovered city officials seizing their property, they mobilized, hundreds strong, and forcibly liberated the animals. Further hog riots broke out in 1825, 1826, 1830, and 1832, invariably ending with the women saving their bacon.

Women also earned hard cash for their households. They took in laundry, catered for boarders, or sewed pantaloons and vests as outworkers. Some worked as neighborhood midwives; others assisted their artisanal or shopkeeping husbands (butchers’ wives cut meat for market, junk-shop owners’ spouses took care of customers). Still others roamed the city streets as hucksters, hawking roots and herbs they had dug up, clams collected from beaches, muffins purchased cheap at the end of the previous day’s market, or berries and apples bought from country women at the edge of town. African American hot-corn girls were famed for their street cry: “Hot corn, hot corn, here’s your lily white hot corn / Hot corn all hot, just come out of the boiling pot.”

If a huckster could afford the fee, she rented a stall at a city market; if not, she circulated among the market’s customers. Those whose husbands could afford a backyard garden vended their own fruit and vegetables alongside the farmers’ wives selling pot cheese, curds, and buttermilk. Others opened small shops and sold cookies, pies, and sweetmeats of their own manufacture or retailed sundries, needles, and pins. The most destitute became ragpickers, perambulating the streets with hooks and baskets, poking into gutters.

The most common way for a woman to earn money, however, was to work as a domestic servant. The expanding number of upper-class dwellings and artisanal boardinghouses generated a huge demand for household help. Most white American women considered the job

degrading. Apart from the harsh conditions, heavy work load, low pay, and often antagonistic relations with employers, the position was tainted by its associations with slavery and aristocracy. As a European visitor noted in 1819, “if you call them servants they leave you without notice.” When one domestic was asked to tell “your mistress” something, she exploded: “My mistress, Sir! I tell you I have no mistress, nor master either. . . . In this country there is no mistresses nor masters; I guess, I am a woman citizen.” Poor immigrant women, of necessity, were more willing to put up with the job; by 1826 a survey found that 60 percent of New York’s servants were Irish.

On the whole, however, while a woman’s wages might well be instrumental in keeping her household afloat, she could seldom earn enough to support herself on her own. This was particularly evident from the condition of wage-earning widows, who often lived closeted in tiny garrets or huddled in cellars or half-finished buildings, at the edge of destitution.

“THE VILEST RABBLE, BLACK & WHITE, MIXT TOGETHER”

Working wards were different from genteel quarters, too, in their social composition. The Five Points in particular, as the *Evening Post* observed, was “inhabited by a race of beings of all colours, ages, sexes, and nations.”

Immigration boosted and diversified the population throughout the city, of course. The number of people living in what are today the five boroughs rose from 119,734 in 1810 to 152,056 in 1820 (an increase of 27 percent), and by 1830 it had jumped to 242,278 (up another 59 percent). The immigrant percentage of this growing populace rose steadily (6.3 percent in 1806 to 9.8 percent in 1819) until by 1825 over a fifth of the city’s residents were foreign-born.

Affluent arrivals might settle in the westside or uptown gentry wards, but relatively few were in a position to do so. Irish immigrants were getting steadily poorer. Ireland’s cotton and linen industries had collapsed with the end of wartime demand, generating widespread unemployment and destitution. Agriculture too sagged badly, once Britain’s wartime dependence on Irish foodstuffs slumped, cutting grain prices in half. Landlords responded by squeezing tenants, upping evictions, and

consolidating lands, exacerbating a universal depression that led many to consider emigration to America “a Joyful deliverance.”

In 1818 alone, some twenty thousand Irish crossed to America. Most, as in colonial days, were Presbyterian and Anglican Scotch-Irish migrants from Ulster, many lured by jobs on roads and canals (especially the Erie). The Panic of 1819 slowed the rate of arrival, and emigration remained modest through the early 1820s. When packet ships between Liverpool and New York began providing cheaper passage, poorer Catholics from Ireland’s southern provinces began coming in growing numbers. Responding to intractable hard times at home and employment opportunities abroad, artisans, laborers, and single young women struck out on their own: passenger lists of vessels landing in New York in 1826 reveal that 62 percent of the Irish on board were traveling solo, and two-thirds of them were male. Many of those disembarking had exhausted their slender resources and were drawn—by its cheap rents and available jobs—to the Five Points’ soggy terrain, moving, as it were, from bog to bog.

The Points was home as well to many newly freed blacks. As the emancipation clock ticked toward its scheduled rendezvous with freedom on July 4, 1827, New York’s slave system collapsed. With immigration augmenting the supply of cheap free labor, manumissions mounted. The slave population of 2,369 in 1790 dwindled to 518 by 1820. African Americans declined as a percentage of New York’s total population (from 8.8 percent to 6.9 percent over the 1820s), reflecting the quickening pace of European immigration. But the absolute number of blacks in the city grew substantially, from 3,262 in 1790 to 13,976 by 1830, as freedpeople flocked in from surrounding rural regions.

Slavery’s grip had lasted longest in outlying farm country; as late as 1820 slaves constituted one-sixth the population of the agricultural communities of Kings County. When liberated, blacks relocated to nearby towns, flowing into Brooklyn Village, Jamaica, and Flushing’s Crow Hill. They were also drawn to Manhattan, by the availability of jobs as domestics, barbers, caterers, launderers, hucksters, wood sawyers, whitewashes, swill gatherers, ragpickers, chimney sweeps, and day laborers.

The Five Points, 1827 (from *Valentine's Manual*, 1855). A cartoonish rendering of Paradise Square, heart of the Points—now the southwest corner of Columbus Park. Anthony Street (now Worth) heads diagonally off to the left while Orange Street (now Baxter) angles off to the right; Cross Street (later Park) runs left to right. The emphasis is on liquor, brawling, and pigs—all of which no doubt scandalized the dandyish outsider in the foreground. (© Collection of The New-York Historical Society)

In Manhattan, some blacks settled in the northern countryside: in 1825 members of the African Methodist Episcopal Zion church purchased parcels of farmland between 83rd and 88th streets and Seventh and Eighth avenues and erected several one-story unpainted cabins, forming the core of what would emerge as Seneca Village. A larger number moved to Greenwich Village, especially near Minetta Creek, where blacks had lived since Dutch days. Coachmen settled along a stable alleyway (it would evolve into Gay Street), but most took rooms in cramped and segregated boardinghouses. A bit farther south, still more blacks were drawn to the sunken Fifth Ward lots of the filled-in Lispenard Meadows, just behind New York Hospital. Others situated themselves along the strip of land spearing east along Chambers and Anthony (atop the Negro Burial Ground) or in the Five Points itself,

where they occupied houses perched on insecurely reclaimed swampland, often in cellars, a scant few feet above water level, which flooded routinely.

Many of New York's African Americans thus lived in close proximity to the newly arrived Irish and longer-established Anglo-Dutch working people—creating a *mélange* one genteel observer characterized as “the vilest rabble, black & white, mixt together.” There was no black ghetto, though some blocks were more single-hued than others. Bancker Street was notably black, overcrowded, and susceptible to disease. Of the 296 people killed by fever in the latter half of 1820, 138 were African Americans, and half of these died in the vicinity of Bancker Street. So bad was its reputation that the Bancker family (Rutgers relatives) demanded their name be struck off, and in 1826 Bancker was renamed Madison.

THEY GATHERED AT THE RIVER

The broad-spectrum quality of the working-class quarters extended to their religious institutions. Though the plebeian wards were theologically underserved in comparison to the thickly steeped gentry precincts, new houses of worship did arise, usually Catholic, Jewish, or evangelical Protestant, rather than Episcopal, Presbyterian, or Dutch Reformed (the dominant patrician denominations).

Even before the war, Father Kohlmann, Jesuit rector of St. Peter's on Barclay Street, believed that many of his sixteen thousand parishioners were “so neglected in all respects that it goes beyond conception.” A second building was needed, especially for the growing number of Catholics “outside the city.” As New York had been made a see in 1808, Kohlmann decided to provide the forthcoming new bishop with a cathedral. A site was selected on the corner of Prince and Mott streets, north of the settled town, in an area of country villas and scattered farm dwellings. Joseph Mangin (coarchitect of City Hall) provided a design; wealthy laymen, among them Dominick Lynch and Cornelius Heeney, helped raise the funds; and in 1815, the same year in which Irish Dominican John Connolly arrived to serve as bishop of New York, St. Patrick's Cathedral was dedicated. What is now referred to as Old St. Pat's was, moreover, the largest church in the city.

Bishop Connolly also presided over the Church's expansion into Brooklyn. In 1823 St. James Church, at the corner of Jay and Chapel streets, became the first Roman Catholic edifice in a community exclusively Protestant for two centuries. In that same year, Connolly invited Félix Varela y Morales to New York to begin a pastoral ministry among the Irish. They liked the Havana-born priest, an advocate of self-government and the abolition of slavery in Cuba, who published a bristling political magazine, *El Haberno*, and smuggled it down to Havana. Varela visited the sick and poor at all hours and purchased an old Episcopal church at Ann Street near the Five Points as a base of operations. By the time Connolly died in 1825, New York had thirty-five thousand Catholics, the great bulk of them poor Irish immigrants, and Gaelic working people dominated St. Patrick's. The Irish had begun to be possessive of the ethnically mixed St. Peter's too. When the Rev. John Dubois was installed as New York's new bishop, Irish parishioners angrily opposed the move, stirring irate French Catholics to describe their Irish confreres as "an ignorant and savage lot."

The House of Israel in New York City also fissured along ethnic, theological, class, and spatial lines. As of 1817 most of the city's four hundred Jews still lived by the Battery, and Shearith Israel on Mill Street was the only synagogue in town. There was talk of relocating farther north: the edifice was showing its age; some wealthy members, including copper manufacturer Harmon Hendricks, had moved uptown, a long Sabbath walk away; and commercial development was making the area less desirable. Nevertheless, in 1818 the community rebuilt and enlarged the synagogue on its original site.

During the 1820s, however, Jews definitively migrated uptown, sorting themselves out geographically on class lines. The richer families generally stayed west of Broadway, the modestly well off settled between Broadway and the Bowery, and the poorest repaired to Centre, White, and Pearl streets, in or near the Five Points. When German immigration picked up—7,729 Germans arrived in the United States in the 1820s, and 152,454 in the 1830s—it included (beginning in the late 1820s) a substantial number of Jews. As most of these were working class or poor, they too headed for the laboring quarters.

The Germans, along with Jewish migrants of Polish, Dutch, and English descent, were accustomed to Ashkenazic rites, but the established city Jews

who ran Shearith Israel insisted on Sephardic ritual, alienating newcomers. The Mill Street temple was also far away, overcrowded, and required a payment of two shillings (for charity) before one could read from the Torah. In 1825, after protesting the latter practice (at the same time poorer Protestants and Catholics were attacking pew rents), the Ashkenazim split away from the parent body. Forming a new congregation, B'nai Jeshurun, they purchased a church on Elm Street, close to where less affluent Jews had settled, and adopted Ashkenazic ritual. In 1828 another split produced Anshe Chesed; more secessions followed as national groups sought their own synagogues. Finally, in 1833, the old Mill Street synagogue was sold off, and Shearith Israel erected an imposing gas-lit edifice on Crosby Street; its consecration in 1834 was attended by the mayor, several Christian clergymen, and many "of the most distinguished gentlemen of the city."

In working-class Protestant ranks, the Methodist and Baptist "mechanick preachers" of the turn of the century were followed by revivalists energized by the Second Great Awakening, then rolling into Manhattan from the frontier. Making use of successful camp-meeting techniques, they got urban congregants clapping, jumping, and screaming in holy ecstasy. Those seeking salvation were coaxed from their pews and "called to the altar," where they were prayed over until the spirit struck. Baptists gathered outdoors at the shoreline point of Corlear's Hook and performed rites of immersion in the East River. Between 1816 and 1826, at least ten Baptist churches were enlarged, rebuilt, or constructed in working-class wards, and shopfront chapels became a common sight along the Bowery. Though popular evangelicalism would remain predominantly a western and rural phenomenon, by 1825 New York City had nevertheless become one of its three leading centers.

Baptising Scene, lithograph by Endicott and Swett, 1884.

Immersion was a common sight along the Hudson as well as the East River. This one took place near the foot of modern Horatio Street in Greenwich Village, just below the White Fort erected during the War of 1812. (I. N. Phelps Stokes Collection. Miriam and Ira D. Wallach Division of Art, Prints and Photographs. The New York Public Library. Astor, Lenox and Tilden Foundations)

Methodists won working-class male and female converts by offering “free churches” that did not charge pew rents, allowing prayer in mixed-gender assemblies, and teaching that possession of earthly riches did not signify grace and might even suggest sin. On July 4, 1826, at Potter’s field, a gardener and lay preacher named David Whitehead invoked divine wrath against the “pretty set” who lived in luxury. Also in the mid-1820s, a group including Sarah Stanford, Baptist and daughter of almshouse chaplain John

Stanford, began denouncing elite Presbyterians for their luxurious diets, clothing, and home furnishings.

Not all evangelicals were pleased with this turn of events. Nathan Bangs, “preacher in charge” of the Methodist Circuit of New York City since 1810, believed that the revivals had “degenerated into extravagant excitements.” A severe, self-educated son of a Connecticut blacksmith, Bangs denounced the “impatience of scriptural restraint and moderation, clapping of the hands, screaming, and even jumping, which marred and disgraced the work of God.” Bangs also demolished the old John Street chapel in 1817 and replaced it the following year with a much grander edifice. Gradually he marginalized the more enthusiastic preachers, curtailed the singing of spirituals, and imposed order, efficiency, and method. Bangs’s emphasis on disciplined self-repression appealed to some Methodists, especially second-generation members who sought to combine spiritual salvation with dignified respectability. But others were distressed at Bangs’s restrictions and the imposing new John Street Church. They broke away in 1820, formed their own “Methodist Society,” and erected three more modest structures in the uptown wards.

African Methodists too were roused to new assertiveness. In 1821 Mother Zion broke from its parent body and, with two other black churches, formed its own denomination, the African Methodist Episcopal Church (later the African Methodist Episcopal Zion Church). African Zion became the largest black congregation in the city; its recruits included Isabella Van Wagenen, a newly arrived (1828), recently freed, Hudson Valley slave who would later rename herself Sojourner Truth.

Black Episcopalians also established a presence in the Five Points area. Peter Williams Jr., son of the sexton at John Street Methodist, studied for the Episcopal priesthood and in 1818 supervised the emergence of Saint Philip’s Episcopal Church. With encouragement and financial aid from the parent denomination, members of St. Philip’s, some of them skilled mechanics, constructed their own wooden church on Collect Street between Anthony and Leonard, right in the middle of the Fresh Water Pond landfill. In 1820 Williams was ordained a deacon; in 1826, elevated to the priesthood, he became rector.

ON THE TOWN

The spread of piety proved no barrier to a simultaneous expansion of prostitution throughout the city, but especially in working-class districts. Before the war, fee-for-service sex had been largely restricted to the old Holy Ground (just behind St. Paul's Chapel) and to a few blocks near the East River docks. Here streetwalkers and brothel strumpets made carnal connection with visitors, sailors, shipyard workers, and (according to various complainants) "idle Negroes," "dissolute persons," and "droves of youth." Outside these clearly defined waterfront districts, commercial sex in the early republican city—certainly by European standards—had a decidedly low profile.

In the 1820s, however, the sex trade boomed. Heightened demand came from the surging influx of single young male immigrants, sailors on shore leave, out-of-town businessmen, and the growing numbers of proletarianized journeymen who, facing an uncertain future, postponed marriage until their late twenties.

Heightened supply came from a pool of female migrants, deserted and widowed wives, and the expanding ranks of the working poor. When "respectable" employment garnered women one or two dollars a week and even low-end whoring fetched twenty to thirty dollars, some turned to part-time prostitution to supplement abysmal wages. Others abandoned miserable jobs as servants or seamstresses only when lashed by hard times—"going on the town" temporarily until conditions improved. (Some estimates suggest that perhaps 5 to 10 percent of all women between the ages of fifteen and thirty prostituted themselves at some point, with the figure rising above 10 percent during depressions.) Still others actively embraced the trade on a full-time basis. It paid well, allowed (indeed required) the purchase of fancy clothes, and offered entree into fashionable worlds from which their poverty-scarred mothers were forever barred. Allfemale brothels, moreover, offered a heady freedom from surveillance by male employers and from subjection to parental authority (or abuse).

The number of brothels in the city rose rapidly in the 1820s. By decade's end there were probably more than two hundred. Though the docks remained a haven for the coarsest bawdy houses, the riverfronts lost their monopoly on the business. Brothels thrived almost everywhere, their form varying with the local clientele. Elegant and expensive "parlor houses"—so called for their genteel furnishings and fashionably dressed residents—

could be found just west of Broadway, a short walk from imposing elite homes, the big hotels, and the theatrical district by City Hall Park. Here native- or New England-born women held sway, many of them well spoken and well educated, some of them accomplished musicians. Parlor house girls could fetch fifty to a hundred dollars a week, working only afternoons and early evenings.

At Corlear's Hook, adjacent to the shipyards, coal dumps, and ironworks, droves of streetwalkers brazenly solicited industrial workers, sailors, and Brooklyn ferry commuters. So notorious was the Hook's reputation as a site for prostitution that (according to one theory) the local sex workers were nicknamed "Hookers," generating a new moniker for the entire trade.

It was the Five Points, however, that emerged as the summit of public sexuality. Prostitutes walked the streets day and night and worked out of saloons and "houses of bad fame" strewn along Anthony Street and the Bowery. Whoring here was famous for its interracial character. African-American New Yorkers, barred from all but service trades, assumed a significant role in the illicit economy. Some of their establishments catered exclusively to other blacks, but numerous Points saloons and brothels accommodated a mixed clientele with a mixed staff. Some haunts featured miscegenational sex; Cow Bay Alley's black-and-tan cabarets attracted venturesome young gentlemen from the proper west side to what municipal authorities in 1830 called the "hovels of negroes."

Some madams did extremely well. Maria Williamson, who by 1820 was already running what one contemporary called "one of the greatest Hoar Houses in America," reinvested her profits in additional brothels and soon owned over half a dozen. But the people who did best in the business were slum landlords. Rentiers delighted in housing madams, who paid hefty rents, and paid them right on time, unlike most tenants in poor neighborhoods, who paid late or not at all.

One of the most enterprising de facto whoremasters was John R. Livingston, brother of Chancellor (and steamboat financier) Robert Livingston. By 1828 he controlled at least five brothels near Paradise Square and a score more elsewhere in the city, with a tenant roster that included some of the best-known madams in New York. His involvement was well known, and when irate neighbors complained, he simply

reshuffled the offending women to another of his buildings. Tobacco entrepreneur George Lorillard and Matthew Davis, a founder of Tammany Hall, were also among the ranks of patrician sex profiteers.

Theater owners, including John Jacob Astor (who had purchased the Park back in 1806), encouraged erotic third tiers as drawing cards, providing special entrances from which *the femmes dupave* could reach the upper house. There assignments were struck and rendezvous arranged at nearby brothels (in the 1820s there were bordellos within easy walking distance of every major theater). Nor were hoteliers (Astor again chief among them) overly chagrined when whorehouses set up shop near their lobbies. The tourist-boosting potential of brothels was one of many reasons they were seldom bothered by the police, nor their landlords punished. Besides, prostitutes who did not solicit openly on the streets violated no law, and few men in positions of power were in any hurry to criminalize their activities. Police did occasionally raid low-life brothels, notorious for robbing patrons, but the arrested women were usually booked on charges of vagrancy or disorderly conduct.

If the sex trades flourished with the not-so-covert acquiescence of the town's male elite, genteel women upheld strict social sanctions against its female participants, no matter how much money they accumulated. Eliza Bowen Jumel, daughter of a Providence, Rhode Island, prostitute and herself a professional of some standing in her youth, had married French-born wine merchant Stephen Jumel, who in 1810 gave her the old Roger Morris mansion above Harlem. For all her wealth, she was barred from Knickerbocker society. Even after 1826, when she returned from a decade in France, where she'd won social acceptance, she was unable to crack the wall of disapproval and lived in splendid manorial isolation at 160th Street. (She did, however, manage a shortlived marriage in 1833 with the equally notorious Aaron Burr, who had returned to New York eight years after the duel with Hamilton and resumed the practice of law.)

“LET’S LIQUOR”

The eruption of commercial sex was accompanied by a surge in commercial drink—again, a phenomenon that suffused New York society but flourished particularly in the laboring quarters. Drinking was a long-established component of male working-class life. On the job, frequent drams fortified

tiring workers: shipyard bosses would pass a pail of brandy, then suggest raising another timber. In hot weather, iced beer helped make steamy workshops bearable. Swigging was a preindustrial work habit, to which laborers clung all the more stubbornly in the face of drives for efficiency and punctuality launched by employers. Alcohol also lubricated rites of civic and communal solidarity—from militia musters to elections—and bouts of social drinking fueled unofficial holidays, such as boisterous wakes. The first words two just-met strangers might likely utter were “Let’s liquor.”

What changed in this era was the nature and availability of that liquor. After the Revolution, declining West Indian sugar imports, along with duties on rum and molasses, forced importers and distillers to hike prices. Western whiskey filled the breach, as farmers, using improved still technology, sent ever greater quantities of more potent liquor coursing eastward. Rampant overproduction hammered the price down to twenty-five cents a gallon, less per drink than tea or coffee. Urban outlets competed briskly to dispense the cheaper and higher-proof spirits. In 1819 thirteen hundred groceries and 160 taverns were licensed to sell “strong drink,” with the Sixth Ward home to 238 of them. By 1827 there were more than three thousand approved outlets, and on some Five Points blocks over half the houses accommodated a grogshop or grocery. Brooklyn did its best to keep up: in 1821, of the village’s 867 buildings, ninety-six were groceries or taverns.

Taverns were particularly popular with the vast numbers of young men stacked in dreary boardinghouses. Saloons became workingmen’s parlors—places to eat, play, and affirm one’s generosity by treating comrades. Saloons and groceries also served as informal labor exchanges; out-of-state employers set up temporary hiring halls there. In addition, publicans and grocers offered loans and lines of credit, posted bail bond, and provided workers a cushion in difficult times—while further encouraging consumption of booze.

Like commercial sex, commercial drink had powerful patrician supporters, including the city fathers, as a group of outraged petitioners discovered in 1829. Some twenty-four hundred memorialists from outside the Five Points urged the Common Council to tear down a triangle of the section filled with tenants, taverns, and “horrors too awful to mention” and build a new jail on the site. The Street Committee backed the proposal,

noting that the buildings in question were “in ruinous Condition” and occupied only by the “most degraded and abandoned of the human species.” Others in government responded that the area produced great income for the Corporation “on account of its being a good location for small retailers of liquor who have located themselves in the vicinity. What may be considered a nuisance,” they concluded, “has in reality increased the value of the property.”

ON THE BOWERY

Men played as hard as they drank in the working-class wards. Though official opposition had almost eliminated the baiting of bulls and bears by 1820, cockfighting continued to thrive, as did ratbaiting, a blood sport even more suitably scaled for urban life. Patsy Hearn’s Five Points grogshop, across from the Old Brewery, had a “Men’s Sporting Parlor” famous for its ratfights. Seated on pine planks around a railed-in sunken pit, fifteen feet square, two hundred men at a time watched while an escaped slave named Dusty Dustmoor released packs of rats collected by neighborhood youths. While the rodents engaged in losing combat with trained terriers, spectators wagered furiously on the number of rats the dogs would kill.

Trotting flourished too, as plebeian drivers ran informal matches along Third Avenue from after work to dusk or on Sunday afternoons, after which they repaired with their panting steeds to one of the taverns dotting the high road. Eventually a track for harness racing was built in Harlem, and, in the winter of 1824-5, the New York Trotting Club was formed, dominated by prosperous butchers.

New circus theaters arrived as well. The Lafayette (on Laurens near Canal), the Broadway (in a large wooden building between Canal and Grand), and the Mount Pitt (on Grand Street nearer to Corlear’s Hook) featured dancing girls, equestrian displays and races, and shows by traveling musicians and acrobats.

The most novel development in popular amusements was the transformation of the Bowery itself into a full-blown working-class entertainment strip. On Saturday night, after weekly wages were paid, pleasure seekers headed for its lamp-lit sidewalks. Bowery taverns, brothels, porter houses, oyster houses, dance halls, and gambling dens filled

up with sailors, young butchers, day laborers, small employers, journeymen and apprentices from nearby furniture shops and shipyards, and smartly dressed young women as well.

The street's premier institution was the Bowery Theater. For a few years after it replaced the Bull's Head Tavern, Ithiel Town's faux-marble Greek temple had, as planned, attracted genteel patrons. They liked its sumptuous crimson curtains, its gasilluminated globes (the nation's first), its boxes painted gold in front and apple blossom in back—a color, the *Mirror* noted, that showed off the occupants “to best advantage.” And the Bowery charmed the fashionable with fare similar to that offered by its Park and Chatham rivals: Shakespeare, sentimental dramas, farces, French dances, English operas, and Italian singers.

But the Bowery was far bigger than its competitors. It could hold a thousand more spectators than the Park. Usually it didn't, as patrician fare didn't lure plebeian audiences. So the management adjusted the entertainment mix to include more spectacular offerings. It ran equestrian events. (One paper noted that though the Bull's Head had been evicted only recently, “now horses are again prancing where they were formerly.”) Tubes transported water to center stage for aquatic displays. Novelty acts abounded, including one in 1828 during which sixteen Indian warriors did the Pipe Dance on stage. The narrator-chief was shockingly nude from the waist up, but one newspaper assured New Yorkers that the “difference in color removes all the idea of indelicacy, which a similar exposure of white men would occasion.”

Charles Gilfert, the Bowery's manager, also found that tragedies seldom drew audiences sizable enough to cover the large salaries required to win top actors—already known as “stars”—away from rival theaters. So he turned to melodramas, a recent British import that provided blood-and-thunder action, spectacular mechanical enhancements, and starkly moralistic plots. Melodramatic heroes and villains—their characters written all over their faces—battled to an invariably happy ending, in which the forces of evil were overcome.

The Bowery nurtured America's first master of the form, the Manhattan-born Shakespearean actor Edwin Forrest. Though he made his debut at the Park in 1826, Gilfert won him away to the Bowery for the next several years. Forrest's bombastic, muscular style matched the demands of

melodrama and the proclivities of the workingclass portion of the Bowery's audience. Their roars of approval lofted him to heights of fame unmatched by any contemporary American actor.

Gilfert tried to keep his elite attendees happy too, with English dramas and English stars, who worked in the British style featured at the Park, but the balancing act proved difficult to sustain. Gilfert died suddenly in 1829 and was succeeded in 1830 by Thomas Hamblin, who wholeheartedly cast his lot with the Anglo- and Irish-American artisans and laborers who peopled the surrounding neighborhoods. The Bowery ostentatiously promoted "native talent," and its hyperpatriotism, lower prices, stage pyrotechnics, and shrewd choice of plays (Hamblin immediately doubled the number of melodramas) garnered an intensely loyal and vociferous audience of shopkeepers, small masters, wage-earners, and prostitutes. The elite decamped. By the time Mrs. Trollope arrived, it was evident that although the Bowery was "as pretty a theater as I ever entered," it was decidedly "not the fashion."

JUMP JIM CROW

New York's theaters and working-class communities nurtured into vigorous life a peculiarly American cultural product: the minstrel show, a racially charged entertainment form that would eventually sweep the nation and much of Europe. Minstrelsy had many seedbeds, but one of the most important lay in black Manhattan.

In the summer of 1821 William Henry Brown opened a pleasure garden in his back yard. Brown, a West Indian black, had served as a steward on Liverpool packets before giving up the sea and buying a house at 38 Thomas (between Chapel and Hudson), a street well known for its brothels. Now he dispensed brandy and gin toddies, porter and ale, ice cream and cakes to black patrons, who were barred from the other private gardens in town. The African Grove, as Brown called it, was a smashing success. As the *National Advocate* noted, "black dandies and dandizettes" gathered in their finest (the men particularly resplendent in their fashionably cut blue coats, cravats, white pantaloons, and shining boots) to saunter and flirt, listen to music from a "big drum and clarionet," and, occasionally, hear songs sung by James Hewlett, a waiter at the City Hotel.

In the fall of 1821 Brown moved his entertainments inside, a shift hastened by complaints from white neighbors about the noise, and launched his African Theater. Brown offered mostly Shakespeare—Hewlett, who proved a gifted thespian, opened as Richard III—and modern plays as well. As in white theaters, hornpipes were danced and comic songs sung between acts. The African Theater was a great success with black men and women. More remarkable, white patrons began showing up in substantial numbers, allowing Brown to move to a thrice weekly schedule, and he replaced “African” with “American” in the company’s name.

The entrepreneurial Brown decided to expand still further. He rented a house way uptown, on the southeast corner of Mercer and Bleecker, and again whites turned out, especially “laughter loving young clerks,” though some were more interested in heckling than listening. The *National Advocate* noted in October 1821 (with conventional condescension) that the troupe had “graciously made a partition at the back of their house, for the accommodation of the whites” who, the group’s handbill said, “do not know how to conduct themselves at entertainments for ladies and gentlemen of color.”

Giddy with success, Brown now overreached. He audaciously rented space in a hotel right next door to the Park Theater and put on three performances a week during January 1822. The Park’s manager hated the competition and hired ruffians who cracked jokes, threw crackers onto the stage, and started a riot. The watch responded but, rather than ejecting the provocateurs, arrested the cast, with Hewlett wittily tossing off Shakespearean lines as he was hauled away.

Brown set up shop again at his former quarters, and his patrons, now predominantly white, followed him. For a brief time, audiences could watch the earliest work of one of the era’s great actors, Ira Aldridge, until the teenager’s father, a deacon at Mother Zion, made him quit to pursue a ministerial career. (To no avail: Aldridge, aware he had no chance to develop his talents in race-bound New York, fled to London, where he would play Othello at the Royal Theatre, and become the rage of Europe for a quarter century.)

Brown’s troupe carried on through the summer of 1823, surviving a nasty assault in August 1822, when fifteen members of a nearby circus, camped above Canal Street, attacked the theater, beat Brown severely,

stripped the actors and actresses, and demolished the furniture and scenery. Whether the company fell victim to further white violence, a yellow fever epidemic, or limited financial resources is unknown, but Brown closed on a militant note, offering a drama of his own creation, *The Drama of King Shotaway, Founded on facts taken from the Insurrection of the Caribs in the Island of St. Vincent*.

Apart from a final attempt to establish a black theater later in the 1820s, African Americans would not again stride the boards in New York City for many decades. What replaced genuine black performance was “blackface minstrelsy,” in which white men, painted up as black men, mimicked what they alleged to be Negro culture.

Blackface “masking” had been familiar to colonial Americans, in the form of rioters blacking up to hide their identity and in onstage portrayals of Negroes by Caucasians. But probably the first white person to deliberately appropriate elements of black culture for the purpose of performance was Charles Mathews, an English actor who toured the United States in 1822-23. Mathews, known for his benignly humorous renderings of Scots, Yorkshiremen, and other regional British “types,” quickly added a “Yankee” characterization for local audiences. He also began assembling scraps of song and dialect from black preachers, stagecoach drivers, and the actors at William Brown’s African Theater. From this body of transcribed lore, speeches, and sermons, Mathews built up a “black” characterization, which became a staple of his new act, *A Trip to America*. Mathews later claimed he’d seen the audience at the African Theater demand that Aldridge, playing Hamlet, stop his soliloquy and sing the popular freedom song “Possum up a Gum Tree.” Aldridge denied Mathews’s story, though claiming not to mind, as Mathews was a fictional humorist. But Mathews’s use of the song appears to be the first certain example of a white borrowing black material for a blackface act.

Others followed Mathews—in 1823 Edwin Forrest took the boards as a plantation black, and in 1828 George Washington Dixon sang “negro melodies” such as “The Coal-Black Rose”—but the man who created blackface minstrelsy was a New Yorker named Thomas Dartmouth “Daddy” Rice.

Rice, born in the Seventh Ward in 1808, apprenticed as a woodworker but abandoned the artisanal life for a theatrical one (he was not alone in

segueing from a collapsing craft into the flourishing world of commercial culture). Drifting west, Rice worked as a stagehand and bit player throughout the Mississippi Valley. In 1828, according to one version of the story, he came across a crippled old slave named Jim Crow who did an odd shuffling dance. Rice borrowed the man's style, his persona, even his clothes, and fashioned a song-and-dance routine that became an instant sensation. Dressed in a dilapidated, ill-fitting costume, with patched breeches, a broad-brimmed hat, and holes in his shoes, Rice would roll his body lazily from one side to the other while singing his waggish signature ditty in exaggerated dialect. Audiences used to the high-stepping tapping of Irish jigs thrilled to the black-derived shuffle (ancestor of the soft shoe), in which the feet remained close to the ground and upper-body movements carried the action.

By the late 1820s Rice was serving up his alleged Negro songs and dances as brief burlesques and bits of comic relief in circuses, theaters, museums, and pleasure gardens throughout the West. In November 1832 he brought his routine back home. Spectacularly successful, Rice regularly "jumped Jim Crow" at the Bowery Theater, sandwiched between plays as an entr'acte. In January 1833 he staged a full "Ethiopian Opera"—*Long Island Juba, or, Love by the Bushel*—featuring a group of "blacks." And in May 1834 he put his character to topical use as a participant in a play called *Life in New York, or, the Major's Come*, in which Rice tunefully discussed a ride in an omnibus, a trip to Harlem, and life in the Five Points.

Guised in blackface, the artist could also safely mock elites, snobs, and condescending moralists. But if Rice's Ethiopian operas skewered upper-class manners and pretensions, they mainly lampooned blacks. Jim Crow, the slow-witted, irrepressibly comic "plantation darky," was soon joined by Zip Coon, the second essential stereotype of the nascent minstrel tradition. Where Jim Crow evoked the rural South, Zip Coon, a fancied creature of the urban North, was a foolish, foppish, self-satisfied dandy. An ultramodish dresser, he was given to skintight pantaloons, a lacy jabot, a silk hat, a lorgnon held with effeminate affectation, and his beloved "Long Tail Blue," an indigo coat with padded shoulders and long swishing tails.

T.D. Rice as Jim Crow, 1833. During Rice's performances at the Bowery Theater, enthusiastic audiences routinely clambered onto the stage, leaving him little room to perform. (© Collection of The New-York Historical Society)

Rice and other minstrels assembled the Zip Coon image from fact and fiction. There were blacks who thrived on imitating (or parodying) white dandies—who enjoyed wearing flamboyant, brightly colored, occasionally mismatched articles of clothing, purchased cheaply in urban markets. White minstrels gained familiarity with black manners, games, and dances in the racially integrated streets, taverns, and brothels of the Five Points or waterfront.

Crow and Coon were paradoxical creations. Their primary import was racist ridicule. Slavery was presented as right and natural; slaves as contented, lazy, and stupid; northern blacks as larcenous, immoral, and ludicrous. At the same time, Rice's act (like those of his colleagues) was laced with envy. At a time when employers, ministers, and civic authorities were demanding productivity, frugality, and self-discipline, Crow and Coon shamelessly indulged in sensual pleasures. Minstrelsy projected unbuttoned

modes of behavior onto “blacks,” allowing spectators to simultaneously condemn and relish them.

Minstrelsy was an exercise in creative cultural amalgamation, something for which New York would become famous. It blended black lore with white humor, black banjo with Irish fiddle, African-based dance with British reels. Rice’s act embraced the promiscuous racial reality of America—nowhere more dramatically evident than in the Five Points—yet it was received with greatest enthusiasm by white Boweryites, who were increasingly concerned to demarcate their culture from that of blacks. By constructing a spurious image of “blackness,” it helped develop a category of “whiteness.” At the Bowery Theater, Anglo- and Irish-Americans, in laughing together at “niggers,” forged a common class identity built on a sense of white supremacy.

RUNNING WITH THE MACHINE

Whiteness, however, was far too broad a social category to be serviceable as an everyday identity marker, especially given the diminishing percentage of African Americans in the city. Working-class communities spawned numerous social organizations, keyed to work or neighborhood, within which working-class males gained a sense of participation and belonging.

With bucket brigades obsolete—the department formally abandoned them in 1820—refighting became ever less a civic enterprise, ever more the private prerogative of the (as of 1825) fifty volunteer fire companies. These groups were changing, getting younger, and drawing in far more journeymen and laborers than masters and merchants. They were evolving into a species of workingmen’s fraternal order, replete with mottoes, ornate insignias, and names that honored heroes and heroines of the republic, the theater, or the turf. After work, mechanics would rendezvous at their engine house, socializing while they polished their elaborately painted machines, or they would repair to the particular bar or oyster house their company had adopted as a haunt. The volunteers developed tremendous esprit de corps and marched together, with their gleaming machines and colorful banners, in every municipal celebration.

Rivalry between these fiercely proud and intensely macho companies led to regular scuffles, ranging from prankish raids on rival firehouses to

capture their regalia right on up to battles over who had the rights to a particular fire. At first alarm, some companies would send out an advance guard to put a barrel over the nearest hydrant, sit atop it, and defend it until his comrades arrived. This precipitated fierce fights for possession of the water supply, rather than conjoint concentration on wetting down the flames.

Such combat drew in others. Most fire companies attracted a set of hangers-on, usually boys (over half the school-age population was not in school). The youths were drawn by the excitement and physicality of firefighting: nothing else in urban life could match it. There were also large numbers of men—temporarily or seasonally or permanently unemployed—who enlisted as informal volunteers, helping to drag the engines. In 1824 the Common Council, complaining of the number of boys, idlers, and vagabonds hanging about the firehouses, ordered the companies to dispense with their services, but soon they were back again.

Clusters of young workingmen also formed themselves into gangs. These groups swaggered about the city after work and on Sundays, staking out territories, picking fights, defending the honor of their street or their trade. Butcher's-boy gangs like the Highbinders were particularly obstreperous, hardened as they were by the bloody work of dispatching cattle, but watermen brawled as well, taking on bookbinders and printers.

Religion too became a rallying ground and point of contention. On July 12, 1824, the anniversary of the Battle of the Boyne, Irish Presbyterian laborers took up fife, drum, and Orange flag and commenced a celebratory parade through Greenwich Village. Awaiting them were a grim assembly of Irish Catholics, mostly weavers, who demanded the Orangemen lower their colors. Someone threw a punch, out came clubs and brickbats, and a furious donnybrook got underway. After countless rioters had fallen, the watch arrived and arrested thirty-three participants, all Catholics.

At the ensuing trial, Emmet and Sampson got their compatriots off by recounting to the judge, Recorder Richard Riker, the long history of Irish mistreatment. Riker responded evenhandedly, chastising the Orangemen for introducing to the United States the “dangerous and unbecoming practices, which had caused so much disorder and misery in their own [country],” and blaming the Catholics for letting themselves be provoked. He then lauded all the combatants as valuable accessions to the nation and urged them to

set aside ancient quarrels and forge amicable relationships in their adopted homeland.

Like the Callithumpian bands, bumptious volunteers and fractious gangs, as emblems of disorder, would draw increasing attention from civic authorities concerned over what appeared to be growing numbers of masterless men.

Reforms and Revivals

In the spring of 1817 a New York charitable agency announced, with mingled pride and dismay, that during the previous winter “fifteen thousand, men, women, and children, equal to one-seventh of the whole population of our city, have been supported by public or private bounty and munificence!” Already the alarming size of this dependent population had prompted New Yorkers active in benevolent work to begin reemphasizing the centuries-old distinction between the “deserving” and “undeserving” poor—or, as such leading British political economists as Thomas Malthus, David Ricardo, and Jeremy Bentham were now putting it, between poverty and pauperism.

These were held to be very different conditions, meriting very different responses. Poverty was providential. The sick and crippled, the old and orphaned, the widowed and deserted, the victims of epidemics and casualties of war were poor through no fault of their own, and their plight warranted at least a minimalist benevolence. Pauperism, however, stemmed from laziness, fraud, and assorted moral degeneracies, and it called for chastisement and correction, not charity.

Thomas Eddy, one of New York’s most influential reformers and sometime warden of Newgate Prison, agreed. As he explained to De Witt Clinton, he had grown “tired assisting them in their distress, and it appears to me more wise, to fix on every profitable plan to *prevent* their poverty and misery.” His decades-long correspondence with Patrick Colquhoun had kept him well informed about the work of the London Society for Bettering the Condition of the Poor, and he had decided that the time was ripe for a similar body in New York. In December 1817, together with master organizer John Pintard and the Quaker chemist John Griscom, Eddy called a meeting out of which emerged the Society for the Prevention of Pauperism (SPP).

The SPP membership was top-heavy with prominent merchants, lawyers, and clergy, representing a cross-section of political and denominational loyalties, Yankees as well as Knickerbockers. These were essentially the

same men who for the past two or three decades had led the Humane Society, the Free School Society, New York Hospital, the New-York Historical Society, the Literary and Philosophical Society, and other cultural and benevolent organizations in the city. Many were also deeply involved in promoting the Erie Canal.

They now threw their collective weight behind the view that pauperism stemmed from ignorance, idleness, intemperance, extravagance, imprudent marriages, and deficient childrearing practices—what Griscom called the lack of “correct moral principle.” Willy-nilly benevolence only made it worse. Giving alms to the undeserving poor not only undermined their independence but also drove up taxes and sapped the prosperity of the entire community. For their good as well as everyone else’s, therefore, the SPP recommended that all paupers in the city be cut off from all public assistance forthwith.

Not all the elite subscribed to the new sink-or-swim wisdom. Mayor Cadwallader Golden, for one, expressed doubts that the multiplication of New York’s poor was “justly to be imputed to either her public or private charities.” He blamed it, instead, on a wave of unemployment triggered after 1815 by Britain’s “reduction of great naval and military establishments, the abridgment of her commerce, the curtailment of her manufactures, and the astonishing operations of her labor-saving machines.” Almshouse chaplain Stanford was another holdout, arguing that since the poor had helped “multiply the treasures of the rich” through their labor, the rich were “morally obligated to relieve a necessitous person.” These dissenters made no headway against the massed prestige of the SPP, and both municipal and state governments began to implement its recommendations. The Common Council halted contributions to all charitable enterprises except for the Humane Society and the City Dispensary. Governor De Witt Clinton proclaimed his intention to wipe out pauperism “by rendering it a greater evil to live by charity than by industry.” In 1823 the legislature charged Secretary of State John Van Ness Yates to report on the condition of the poor and the administration of relief throughout the state. Echoing the SPP, Yates’s committee attributed pauperism to “vice of all kind”—especially in New York City, which attracted the “idle and dissolute of every description.” Subsequent legislation ended outdoor relief throughout New York State, except (to the

SPP's annoyance) in New York City, where the dramatic fluctuations of the economy made it as yet impracticable and impolitic to do so.

Private benevolence slacked off as well. The ad hoc ward committees that had helped the victims of hard times during the embargo and war years now vanished, nowhere more abruptly than in Brooklyn. In the terrible winter of 1817, when the thermometer plummeted to twenty-six below zero and Buttermilk Channel iced over so thickly that horse-drawn sleighs crossed to Governors Island, the Brooklyn Humane Society had set up a soup house for the distressed poor. But as the new maxims of British political economy made their way across the East River, the society announced that its benevolence had been misguided. Alms-giving, it now realized, had "a direct tendency to beget, among a large portion of their fellow citizens, habits of imprudence, indolence, dissipation and consequent pauperism." Accordingly, the Humane Society announced that no food or firewood would be forthcoming the following winter, and to hammer the point home, the group disbanded.

The efficacy of charity likewise fell under suspicion among the genteel women who led the Society for the Relief of Poor Widows with Small Children. As recently as 1815 the ladies had rejected the lazy-poor line and indeed reported that "an attentive observation has thoroughly convinced us that it is an impossibility for a widow, with the labor of her own hands, to support her infant family . . . even if work abound." Then, however, the men of the SPP denounced the Relief Society's work on the grounds that giving charity to widows with children incited those without to become pregnant, "which is highly immoral, and ought not be tolerated in a Christian land." Despite the best of intentions, in other words, the women had been "encouraging population among the poor, and increasing the number of paupers," a line of reasoning that won converts.

So how did the SPP propose to prevent pauperism in New York, beyond shutting down the flow of ill-advised charity? The answer was to inculcate the undeserving poor with the values that would make them useful and productive members of society: sobriety, cleanliness, industriousness, frugality, punctuality, good manners, and the like. European precedents suggested a host of tactics, among them savings banks, workhouses, Sunday schools, and a ban on street begging, all of which the SPP advocated. Another possibility, currently underway in Glasgow and Hamburg, was the

“moral superintendence of neighborhoods.” The idea was to divide the city into districts, each of which would be assigned to two or three well-bred visitors who could advise the poor on such matters as domestic management, childrearing, and proper conduct. For several years SPP “visitors” fanned out through the city, diligently compiling information on the background and character of every resident. By 1821, though, the project had foundered. Only one district had a visitation system fully in place, and that was a fashionable neighborhood where 90 percent of the householders were found to be of “good” character and there wasn’t a pauper in sight.

URBAN MISSIONARIES

Evangelicals in the city had meanwhile discerned a connection between pauperism and religious absenteeism. It was no secret that many poor New Yorkers were still unchurched—according to the SPP itself, some fifteen thousand of the city’s twentyfive thousand families rarely if ever took part in worship services—at least in part because poor neighborhoods had too few churches and their residents weren’t often welcomed by congregations in well-to-do parts of town. Until it became linked with the genteel revolt against charity, however, urban irreligion had aroused only fitful interest among mainstream Christian denominations. The New-York Missionary Society, founded back in 1796, targeted Indians and settlers on the frontier. The Society for Supporting the Gospel Among the Poor of the City of New-York had been formed back in 1812, but its primary concern remained the underwriting of John Stanford’s preaching to hospital, prison, and almshouse inmates.

All this changed after 1815, when a new generation of evangelicals began work “among the destitute of our own city.” In 1818 the Female Missionary Society for the Poor of the City of New-York established a free church in African-American Bancker Street—the very “seat of Satan.” The following year they planted another chapel on Allen Street, near Corlear’s Hook. The ladies retained ministers to garrison these outposts but also took the field themselves, visiting the poor, praying with them in their homes, and coaxing destitute mothers to church. Clerics found such female initiatives alarming, and in 1821 the Rev. William Gray told the women that because they “had engaged in an enterprise beyond your appropriate

sphere,” active management had “been wholly transferred from the hands of the Ladies into those of the Gentlemen.” Ministers applauded when the Presbyterian Young Men’s Missionary Society of New York built a church near Corlear’s Hook and staffed it with eager young preachers, and when the Presbyterian New-York Evangelical Missionary Society of Young Men set up mission stations in the Hook and on Bancker Street, where they conducted services, visited families, and held prayer meetings.

Like the SPP, evangelicals believed in “moral superintendence.” The Rev. Ward Stafford, Female Missionary Society preacher-at-large, argued in his *New Missionary Field* (1817) that “the very sight of the moral and pious is a check to the wicked.” Because New York wasn’t a “well-regulated village,” where the “character, and circumstances of every family are almost necessarily known,” it was imperative for godly men and women to make their presence felt, dispensing not charity but their own righteousness. Stafford also accepted the reigning orthodoxy: “If people believe, that they shall be relieved when in distress,” he asserted, “they will not generally make exertions, will not labour when they are able and have the opportunity.” But “let it be known that death or extreme suffering will be the consequence of idleness, or profligacy, and the number of the idle and the profligate will soon be diminished.”

The urban mission movement expanded steadily in the next few years, with the waterfront and its “vastly wicked” sailors drawing particular attention. Stafford helped organize both the New-York Marine Missionary Society (1817) and the Port of New York Society for Promoting the Gospel Among Seamen (1818). Together they erected the interdenominational Mariner’s Church (1819) on Cherry Street near the East River docks. In 1821, even more aggressively, the New-York Bethel Union began holding nightly prayer meetings aboard wharfed ships and in sailors’ boardinghouses and offering comfort to families whose breadwinners had been lost at sea. In 1822 many of the new missions came together in the United Domestic Missionary Society, which four years later took the lead in founding the nationwide American Home Missionary Society.

SPREADING THE GOOD NEWS

In 1816 a group of prominent reformers—Henry Rutgers, David Low Dodge, Divie Bethune, Gardiner Spring, Richard Varick, and Governor De

Witt Clinton, among others—founded the American Bible Society (ABS) for the purpose of printing and distributing Bibles throughout the United States. New York was deemed the appropriate headquarters city for such an organization—indeed, the ABS constitution required that twenty-four of its thirty-six managers reside in Manhattan or vicinity—because of the advanced state of its printing industry. In particular, New York printers had been the first in the country to adopt a revolutionary new British technique called stereotyping.

Formerly, a printer set a page by locking movable type into a form that would be disassembled once the required number of impressions for a given press run had been taken. In stereotyping, however, the printer made a mold of the page before disassembling the form, then cast a metal plate that could be inserted in the press over and over again, whenever a new printing was wanted, so the page would never have to be reset. (The plate was the stereotype itself, from the Greek *stereo*, or solid; thus “stereotype” would come to mean any often-repeated concept or image.) It was an expensive process but made good economic sense with books destined for massive and repeated print runs. Not surprisingly, one of the first objectives of the ABS was to acquire a full set of “well-executed stereotype plates” of the Bible, and within a few years the presses in its sumptuous Nassau Street headquarters, nicknamed Bible House, were producing tens of thousands of Bibles every year. Completion of the Erie Canal in 1825 ensured that the reach of Bible House would extend into every corner of the developing West.

Nor did the ABS neglect the widening war on irreligion in the city itself. It too believed that pauperism could be defeated by the Word, and it helped organize an expanding network of local groups—including the New-York Female Auxiliary Bible Society (1816), the Female Juvenile Auxiliary Bible Society (1816), the New-York Union Bible Society (1816), the New-York African Bible Society (1817), and the New York Marine Bible Society (1817)—whose members distributed Bibles in slums, brothels, grogshops, gambling dens, hospitals, and jails. Sometimes they ran into trouble. “A respectable man, not long since, who was distributing Bibles,” the Rev. Stafford reported in 1817, “was attacked, knocked down, and had his clothes literally torn off, and was so beaten as to lose considerable blood.” Sometimes they were laughed at by sailors brandishing books by “Hume,

Gibbon, Paine,” and other infidels. Nor did Jews appreciate being the target of conversion drives: printer Solomon H. Jackson’s *The Jen* (1823-25), the first Jewish periodical published in the United States, consisted mainly of monthly diatribes against Christian missionaries.

Their biggest problem, however, often proved to be the Bible itself—too big, too long, too complex to be a convenient instrument of urban evangelism. Not so the pamphlets and booklets distributed by the New York Religious Tract Society, founded back in 1807 by many of the same men who subsequently created the American Bible Society. Initially, the Tract Society had been content with British imports—such inspirational tales as “The Duties and Encouragements of the Poor,” “Destructive Consequences of Dissipation and Luxury,” “Happy Poverty,” and the like—which it forwarded in bulk to frontier missionaries. After 1815, however, it joined the evangelical crusade against urban pauperism and gave rise to a pair of auxiliaries that dispensed tracts among the city’s poor: the Young Men’s Tract Society (1821) and a special Female Branch (1822) organized by Mrs. Divie Bethune (the former Joanna Graham), which enlisted the support of several hundred prominent women.

In 1825 the New York Tract Society combined forces with the New England Tract Society to form the American Tract Society (ATS). Like their counterparts in the ABS, the directors of the new group readily agreed to set up headquarters in New York, knowing that the Erie Canal would ensure them easy access to western settlements—and because the city was home to wealthy benefactors like textile importer Arthur Tappan, banker Moses Allen, and merchants David Low Dodge, Anson Phelps, and Thomas Stokes. Tappan and Allen paid for the construction of Tract House on Nassau Street, which, like the ABS’s nearby Bible House, held the organization’s offices, foundry, bindery, and stereotype-finishing functions. (The availability of stereotyping in Manhattan, the directors said, had been “a powerful argument in favor of union.”) It was likewise Arthur Tappan’s gift of five thousand dollars that led, in 1826, to the installation of New York’s first steam-powered press on the fourth floor of Tract House. By 1829, four years before Harper Brothers became the first commercial publisher to install one, the Tract Society had sixteen of the machines, all built by Robert Hoe, soon the country’s leading manufacturer of printing presses.

The offspring of this marriage of technology and evangelism was an unprecedented outpouring of printed matter—six million tracts (61 million pages in all) in 1829 alone, plus better than three hundred thousand Bibles. No less impressive was the invention of marketing and distribution techniques, later the norm in American business, by which the evangelicals moved their wares from New York to the rest of the country. Corps of agents in every state, organized into hundreds of local branches, handed out Bibles and tracts door to door, founded circulating libraries, advertised in newspapers, and even made special deliveries to sailors and boatmen aboard whalers, packets, ferries, canal barges, and steamboats. There was even a Tract of the Month program that offered “book dividends” to subscribers.

In New York itself, the American Tract Society considered the systematic distribution of its publications to be “the lever which shall move the foundation of Satan’s empire in this city” (and in Brooklyn too, which got its own auxiliary Tract Society). In 1829 the ATS launched a “General Supply” campaign whose goal was to place in the hands of every resident a copy of a different tract every month. Each ward had a committee and a chairman and was divided into districts encompassing sixty families each. Each district (over five hundred in all) was assigned a team of distributors who received printed instruction cards, forms for reporting back to the central committee, and a supply of the tract of the month. By March 1829 the ATS had visited all 28,771 families in the city. Only 388 declined to take a tract. Evidently, as the secretary of the ATS put it, “The concentration of tract work in New York was what God designed.”

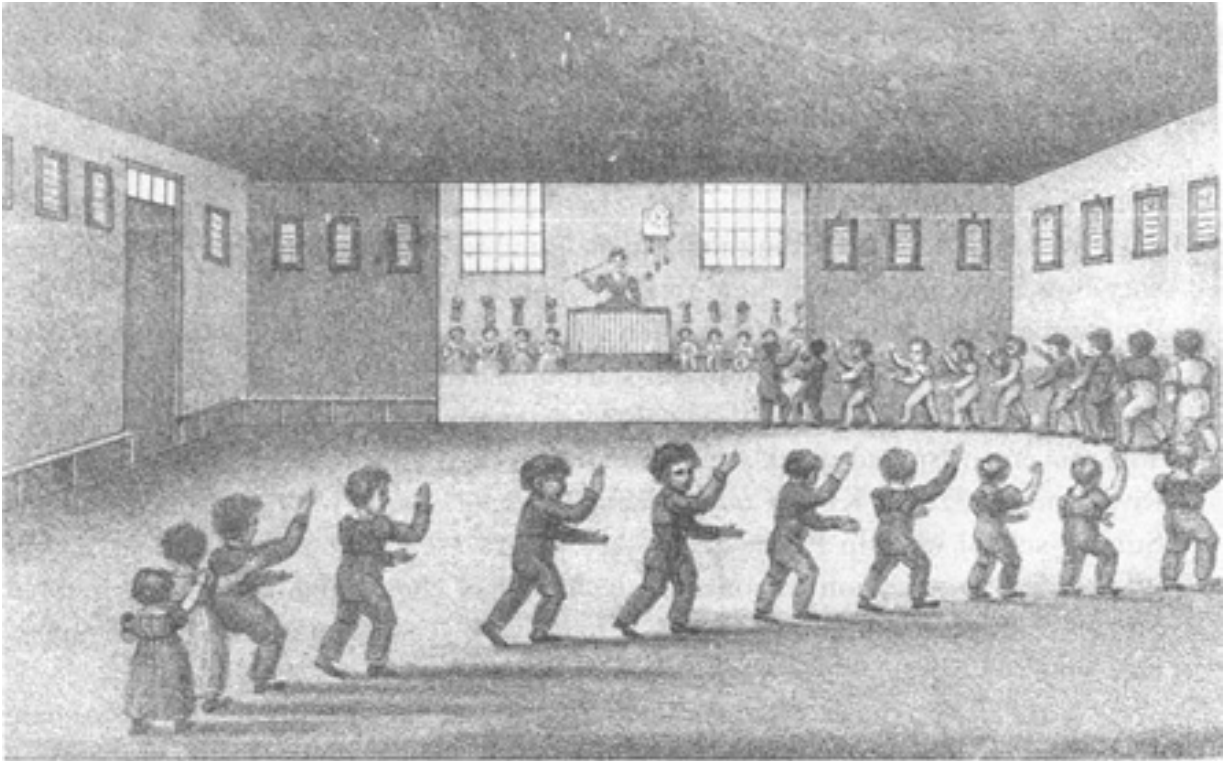

OFF TO SCHOOL

Complementing the labors of missionaries and tractarians came a new burst of interest in the use of schools to combat pauperism and licentiousness: children who acquired good moral training at an early age (it was said) would become productive, law-abiding, self-supporting adults. The difficulty—as Eddy, Pintard, Clinton, and other reformers began to appreciate soon after the turn of the century—was that New York still had no system of public education that could be mobilized to provide such training to the people who needed it the most. Affluent residents sent their sons and daughters to private day schools or boarding schools; artisans and

journeymen, if they could afford it, relied on a small number of “pay schools” that taught the rudiments of reading, writing, and arithmetic.

Some merchants and entrepreneurs had begun to experiment with educational institutions targeted at specific elements of the laboring population. In 1820, for example, the Chamber of Commerce established the Mercantile Library Association to impart commercial skills and sober habits to the city’s growing number of clerks—too many of whom, surrounded by “excitements to pleasure,” had “become the votaries of vice and depravity.” The association’s hope was that its mammoth book collection (eventually comprising thirty-seven thousand volumes, second largest in town), supplemented with regular lectures by leading business, professional, and public men, would help the clerks resist “these moral foes.” That same year, prompted by John Pintard and the Society for the Prevention of Pauperism, the General Society of Mechanics and Tradesmen—dominated by wealthy former mechanics like bankers Jacob Lorillard and Stephen Allen—established an Apprentices Library, a lecture series, and a school for the sons of poorer or deceased members. Their goal too was to teach good habits and skills. In 1826 the General Society opened a school for girls as well.

For the vast majority of children, however, so-called charity schools remained the only chance for an education. By 1825 city churches sponsored fourteen such schools, with a combined enrollment of nearly thirty-four hundred pupils, virtually all from poor families. The African Free School, founded by the Manumission Society in 1786, drew nearly nine hundred pupils in 1823—more than half the African-American youths of school age in the city. Another eleven charity schools were operated by the nondenominational Free School Society (FSS), which Eddy, Clinton, and other gentlemen had founded back in 1805 to educate poor children “who do not belong to or are not provided for by any religious society.” After 1815, against the background of mounting concern over pauperism and lawlessness, the FSS strenuously promoted its Lancasterian approach to education—a combination of Bible study, rote memorization, and rigorous discipline—as “the main instrument by which extreme poverty & grovelling vice, & high-handed crime are to be banished from society.” In 1825 John Griscom boasted that over the years some twenty thousand children, “taken from the most indigent classes,” had passed through FSS schools.

First Infant School in Green Street New York, by Archibald Robertson, 0.1827. Located in the basement of the Presbyterian Church on the corner of Canal and Green streets, the school was run by the newly founded Infant School Society. Like many “charity schools,” it used the monitorial system devised by the English reformer Joseph Lancaster. (The Metropolitan Museum of Art, Bequest of Edward W.C. Arnold, 1964. The Edward W.C. Arnold Collection of New York Prints, Maps and Pictures)

More successful still were the scores of Sunday schools that sprang up in the city during the twenties. The Sunday school movement, launched just after the turn of the century, really took off in 1816, when merchants Divie Bethune and Eleazer Lord founded the New York Sunday School Union. The purpose of Sunday schools, said the union, was “to arrest the progress of vice and to promote the moral and religious instruction of the depraved and uneducated part of the community.” Thousands of students were quickly recruited by handbills offering an “education free of expense” and promising that those who attended regularly, read their Bibles, and behaved well would be recommended for admission to an FSS school. The two

hundred-odd volunteers who signed up as teachers (many, like Melissa Phelps, from genteel families) were pointedly charged to help their pupils become honest and useful citizens: “While you instill in their young minds the duty of contentment in the stations allotted to them by Providence, you will of course embrace the occasion to point out to them the self-degradation which attend idleness and vice; and the certain rewards which await industry and a virtuous life.”

By 1823 better than seven thousand male and female students were attending seventy-four Sunday schools in New York. Roughly a quarter of the pupils were African Americans—half of them adults, women as well as men. The Episcopal Church refused to join the Sunday School Union but started its own program, which over the next decade grew to some two dozen schools with a combined enrollment of six thousand. The movement spread quickly to communities on the Long Island side of the East River, and in 1829 the Kings County Sabbath School Society was formed to coordinate Sunday school work in Flatbush, Flatlands, Gravesend, New Lots, Brooklyn, and Bushwick. Memorization remained the technique of choice, and its results were toted up meticulously. (Some students were paid for each verse memorized—with coupons redeemable in Bibles).

All of this convinced evangelicals that they were at last beginning to make some inroads on pauperism and related social evils. Even “Bancker-Street Sabbath-breakers of the vilest class [i.e., blacks],” exulted Eleazer Lord, had become “decent in their dress, orderly in their behavior, industrious in their calling, *and punctual at school and church!*” In 1829, to celebrate the “mighty machinery of Sunday schools,” twelve thousand scholars were paraded down Broadway in orderly rows to Battery Park, where they sang songs and heard congratulatory speeches.

But the apparent success of the Sunday School Union was clouded by an acrimonious fight over public support among the city’s charity schools. Since 1812 the state government had provided financial assistance to the charity schools (funneled through the Common Council after 1824) in proportion to their enrollments. As the number and size of church-run schools increased, however, the Free School Society’s share of the pie dwindled alarmingly, and it began to attack all aid to “sectarian” schools as a violation of the separation of church and state. In 1825 the FSS called for the creation of a single public school system, under its management, that

would be open to all city children, “not as a charity, but as a matter of common right.” New York, it declared, needed classrooms where “the rich and the poor may meet together; where the wall of partition, which now seems to be raised between them, may be removed; where kindlier feelings between the children of these respective classes may be begotten; where the indigent may be excited to emulate the cleanliness, decorum and mental improvement of those in better circumstances.” The Common Council agreed and, despite bitter opposition, cut off aid to denominational schools. In 1826 the Free School Society renamed itself the Public School Society, though it remained in fact a privately run institution.

Over the next several years, although the society’s schools did manage to attract somewhat more students from what it called “the middle walks of life,” the effectiveness of free common education as a cure for pauperism and immorality remained largely hypothetical. New public schools were opened only in neighborhoods of “a quiet and orderly cast”—there were none in the Five Points throughout the 1820s—and they tended to expel pupils who didn’t readily conform to their values. By 1829, of the roughly forty-three thousand children in New York between the ages of five and fifteen, as many as twenty thousand—overwhelmingly from the city’s most indigent households—still attended no school whatever. Of the remainder, about fourteen thousand went to private schools, as against the five thousand in public schools and the four thousand or so served by church-run charity schools (which coped with the loss of public support by scaling back enrollments). Many working-class youths withdrew once they were old enough to help support their families; few stayed past fourteen, the traditional age for beginning an apprenticeship. What was more, the manifestly genteel and Protestant leadership of the new system proved unattractive to Roman Catholics, who now began to construct their own network of parochial schools.

Sunday schools reacted to the new climate by cutting back on the three R’s and giving more emphasis to formal religious instruction, the effect of which was to discourage enrollment outside their own congregations—most notably by African-American adults. Although the Manumission Society expanded the number of African Free Schools from two to seven, the Public School Society absorbed them all in 1834. Renamed Colored Free Schools,

they experienced a precipitous decline in quality that soon drove away many students.

JUVENILE DELINQUENTS

With only half of the city's children in school and the old apprenticeship system in disarray, it was almost inevitable that thousands of ragamuffins would become a fixture of the city scene—looming along the wharves, begging on the streets, thronging the shipyards, hanging about Brooklyn ropewalks on the Sabbath, playing cards and spouting profanity. Some edged into criminality. Groups of girls stole sugar, coffee, or tea from the docks and sold them to market women. Boys pilfered brass rods, rope, or sheets of copper and sold them to junk dealers. Marauding bands robbed grocery stores and vandalized houses. Boys became accomplished pickpockets. Girls as young as twelve drifted in and out of prostitution.

The conventional response to errant or merely “vagrant” children was to put them in jail, but chaplain John Stanford began to argue as early as 1815 that incarcerating youthful offenders with adult criminals merely trained a new generation of professional outlaws. Stanford thought that these children should be placed in an “Asylum for Vagrant Youth” where they could be instructed in moral and religious principles and apprenticed to a trade. Stanford's idea languished until the Society for the Prevention of Pauperism fastened on the notion that wayward youths formed the true “core of pauperism.” In the fall of 1819, just back from one of his visits with British reformers, John Griscom spoke to a packed City Hotel meeting about the work with delinquent children currently underway in London. Over the next several years the SPP became so enthusiastic about the youth-oriented solution to poverty that in 1823 it reconstituted itself as the Society for the Reformation of Juvenile Delinquents. Convinced that they could smother pauperism in its cradle, the society's spokesmen lobbied city and state officials to incorporate and fund the country's first juvenile reformatory.

The New York House of Refuge opened on January 1, 1825, in an abandoned federal arsenal on the Bloomingdale Road between 22nd and 23rd streets, amid farms and orchards on the outskirts of town. The Refuge's charges were children under sixteen, committed by the courts for indefinite terms (not to exceed the age of twenty-one for boys or eighteen

for girls). Their “indolent and worthless” parents, in the Rev. Stanford’s phrase, had allowed them to roam the streets, frequenting theaters and taverns until ensnared by alcohol, immorality, and crime. Stanford didn’t believe that they were beyond redemption, on the other hand, for as the directors of the Refuge put it, it was necessary only to put them through “a vigorous course of moral and corporal discipline” to make them “able and obedient.”

Upon entering the Refuge, accordingly, the children were stripped and washed and given uniforms, their hair was cut to a standard length, and they were placed in windowless five-by-eight-foot cells. Day after day they followed the same lockstep routine, parsed by bells. Bells rang at sunrise and fifteen minutes later, when guards unlocked their cells. Bells herded them to the washroom, to the chapel, to school, and to breakfast by 7:00 A.M. They worked from 7:30 till noon (boys making brass nails or cane seats; girls washing, cooking, or mending clothes), when bells called them again to the dining room for dinner. Back-to-work bells sounded at 1:00 P.M., wash-and-eat bells at 5:00, work bells again at 5:30, school bells at 8:00. Bells summoned everyone to evening prayers, then for the march back to the cells, where absolute silence was enforced all night.

But Joseph Curtis, the Refuge’s first manager—chosen for his experience in superintending workers at James Allaire’s ironworks—soon discovered that the young reprobates had minds of their own. They used “improper language,” talked during silent periods, played during work sessions, and ran away. When reprimands proved useless, Curtis resolved to be “as harsh as any other father.” The infractions and punishments recorded in his daily journal for 1825-26 included:

E. D. paddled, with his feet tied to one side of a barrel, his hands to the other.

J. M. . . . neglects her work for play in the yard, leg iron and confined to House.

Joseph R.: Disregarded order to stop speaking, given a bit of the cat [i.e., the whip].

John B.: A few strokes of the cat to help him remember that he must not speak when confined to a prison cell.

Ann M.: Refractory, does not bend to punishment, put in solitary.

William C.: Questioned guard's authority, whipped.

Amid some uneasiness at his methods on the part of the overseers, Curtis was replaced by a new manager, Nathaniel C. Hart. Hart proved an even more thoroughgoing disciplinarian, and he ringed the Refuge with a two-foot-thick wall to prevent escapes. Nevertheless, the institution was pronounced a great success. In its first ten years 1,120 boys and girls were admitted, and those "reformed" to the satisfaction of the authorities were released to parents, friends, or masters for apprenticeship; the more refractory were bound over to captains of whaling ships or sent into service as domestics.

THE BELLEVUE INSTITUTION

Almost due east of the House of Refuge, on a twenty-six-acre site overlooking the East River, stood a complex of buildings, likewise enclosed by a wall, known as the Bellevue Institution. Dedicated in 1816, by the mid-twenties Bellevue comprised—in addition to the pesthouse opened during the yellow fever epidemic of 1794—the city's new almshouse, Bellevue Hospital, and a penitentiary, plus a school, a morgue, a bakehouse, a washhouse, a soap factory, a greenhouse, an icehouse, and a shop for carpenters and blacksmiths. It was here that New York reformers faced, even more directly than at the House of Refuge, the task of holding the line they had drawn between the deserving and undeserving poor.

The three-story, blue stone almshouse paralleled the water; 325 feet long, with wings at either end, it was the largest structure in the city. Nevertheless, within a decade of its opening, it was overflowing with people too old, too young, or too sick to heed the summons to greater self-reliance. During the year ending September 30, 1825, when the annual cost of running the almshouse had climbed to \$81,500—better than 10 percent of the total city budget of \$780,400—the number of its inmates fluctuated from a high of 1,867 to a low of 1437 (with deaths totaling 495). Ninety-

five percent of the inmates were white and were more or less equally divided between men and women (with genders, like races, segregated in their own quarters). The number of those whom guidebook writer James Hardie referred to as “wretched emigrants from Europe” had multiplied, but they were still outnumbered, three to two, by “needy adventurers from most parts of our own country.”

Jews were conspicuously absent from the almshouse rolls as, ever since New Amsterdam had made Jewish settlement contingent on their poor not becoming a burden to the Dutch West India Company, the tiny community had been taking care of its own. Suddenly faced with large numbers of poor immigrants in the 1820s, but determined that no Jew would beg on the streets, Shearith Israel (spurred by its president Harmon Hendricks) dispensed aid to the needy. In 1822 Ashkenazic members formed the Hebrew Benevolent Society, which affiliated with B’nai Jeshurun after it seceded.

Catholics too formed their own institutions. In 1817 the Roman Catholic Orphan Asylum was founded by the Sisters of Charity, an out-of-town order organized by ex-New Yorker Elizabeth Ann Seton (who in 1797 had cofounded the Society for the Relief of Poor Widows). In 1805, two years after her husband died, Seton had converted to Catholicism and been baptized at St. Peter’s. Ostracized by her Episcopalian family and friends, she had moved with her five children to Baltimore in 1808, taken vows before the bishop, and formed the American Sisters of Charity in 1809 in Emmitsburg, Maryland; it was the first Catholic religious order in the United States. Seton never returned to New York, but four years before she died in 1821, she dispatched three sisters to open the city’s first Catholic orphanage, a small wooden structure on Prince Street near the new cathedral. The ranks of its charges grew steadily, swollen by the hard lives and piety of immigrants like Bridget McGlone, who in 1820 left her infant daughter on the steps of Bishop Connolly’s house, with a note saying she hadn’t taken it to the almshouse as she didn’t want it exposed to Protestant teachings. In 1826 the diocese erected a three-story brick building for the sisters’ now 150 orphans; a second followed in 1830 for half orphans (children with one surviving parent).

Like the almshouse, the new Bellevue Hospital was soon overcrowded, thanks both to the epidemics that swept the city in the early 1820s and to an

influx of patients turned away from the New York Hospital downtown. That old charitable establishment, though it still served the respectable poor, had begun to exclude dangerous or morally reprehensible cases. It now sent the contagiously ill up to Bellevue's pesthouse, the chronically ill to Bellevue's hospitals and infirmaries, and the wicked ill—sailors with syphilis—to Bellevue's almshouse, where they could be “made to work.” This policy at once lowered the downtown institution's patient load and diminished its mortality rate by whisking away terminally ill patients before they could blemish the hospital's good name.

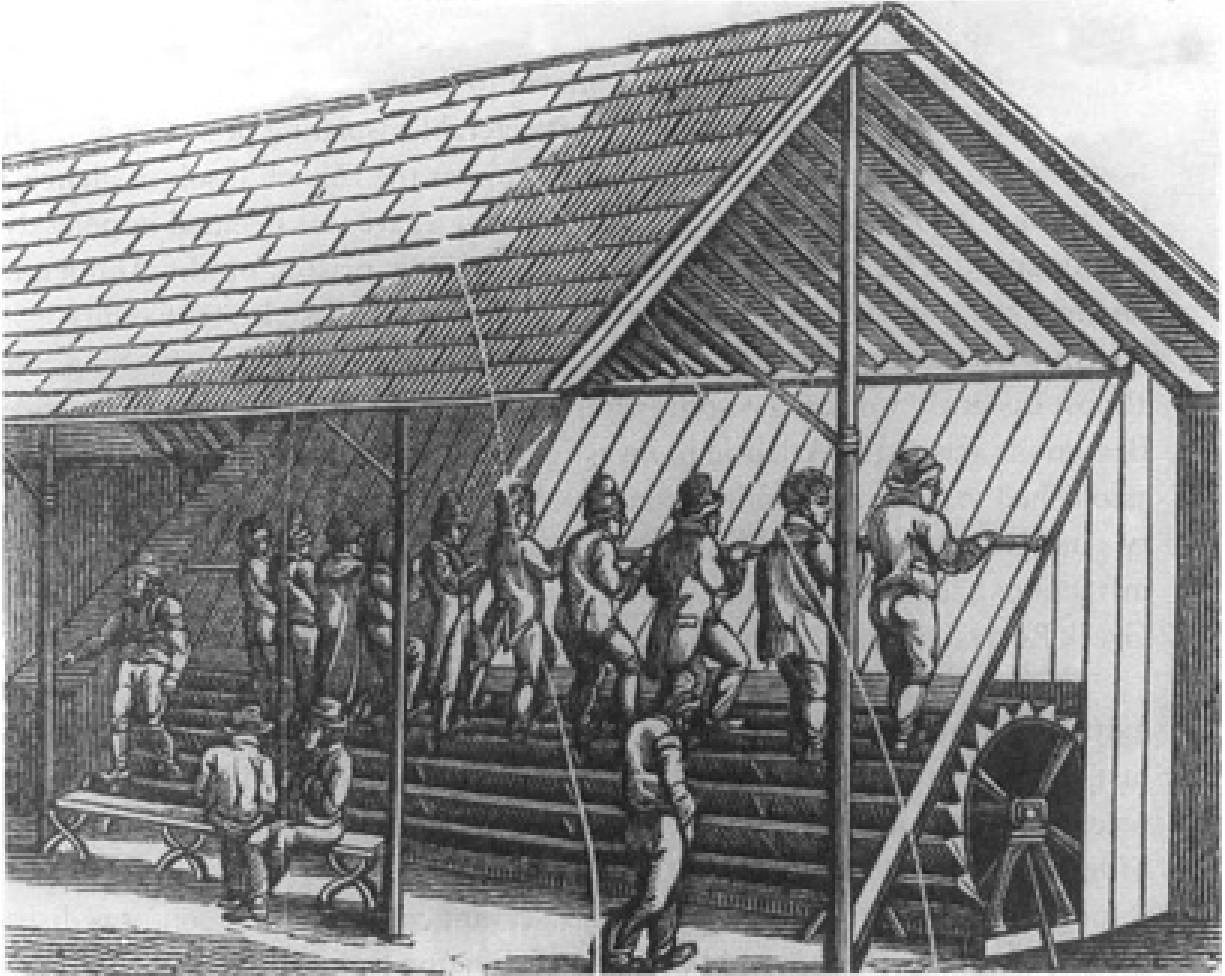

The pressure on Bellevue Hospital and the almshouse was somewhat alleviated by the appearance of specialized institutions for indigent New Yorkers of good character, among them the New York Eye Infirmary (1820), the New York Infirmary for the Treatment of Diseases of the Lungs (1823), a Deaf and Dumb Asylum (1817), and the New York Asylum for Lying-in Women (1823). Similarly, in 1821 “maniacs” and “lunatics” were shifted from city hospitals to the new Bloomingdale Insane Asylum, located on a rustic seventy-seven-acre plot several miles north of town (now occupied by Columbia University). Besides removing a source of constant disruption in the hospitals, its construction was a victory for Eddy, who had been urging for years that New York adopt Europe's humane new system of “moral management” for mental illness, which all but eliminated chains and straitjackets.

That both the almshouse and Bellevue Hospital ran out of room so quickly suggests the extent to which genteel reformers had underestimated the population of deserving poor in the city. It was in the penitentiary, moreover, where the consequences of their drawing such a thin line between pauperism and criminality became increasingly apparent. The penitentiary, a three-story stone structure situated just to the rear of the new almshouse, housed criminals and poor alike. It took those convicted at the Court of Sessions of relatively minor offenses—petty larceny (theft of goods valued under twenty-five dollars), fraud, misdemeanors, disorderly conduct, assault—and set them to hard labor for terms up to three years. It also received those convicted of vagrancy—the offense of being unemployed, poor, and on the streets during one of the occasional sweeps by city marshals. These roundups came at the behest of merchants and shopkeepers determined to improve New York's business climate by

scouring away peddlers, scavengers, beggars, and potential criminals. In 1826 the 210 vagrants (fifty-nine white men, ninety-three white women, sixteen black men, forty-two black women) substantially outnumbered the eighty-four criminals (fifty-two white men, two white women, twenty-seven black men, three black women), in part because prostitutes were charged as vagrants.

Vagrants too were set to hard labor, for up to six months, which took various forms. Some prisoners worked alongside almshouse inmates, making shoes or mending clothes, further blurring the line between poverty and criminality. Others were set to opening and improving city streets. Still others were assigned to the treadmill, or “stepping wheel,” another English import beloved by reformers, which was installed at Bellevue in 1822 at the urging of Mayor Stephen Allen. Housed in a two-story stone building erected for the purpose, the wheel was a cylinder, twenty feet long and six feet in diameter, attached to a grain-grinding millstone. Sixteen prisoners would mount the wheel and start it turning, trudge for eight minutes, then give way to another set of sixteen, their alternations paced by the inevitable bell. Mayor Allen—who preferred the term “discipline mill”—applauded it as a device for terrorizing “sturdy beggars,” those outside the walls as well as in.

New York City’s more serious offenders—those convicted of highway robbery, burglary, forgery, counterfeiting, or rape—were subject to terms ranging from three to twenty-one years (arson and murder were capital crimes). Such miscreants, overwhelmingly male, were sent not to Bellevue but to the state-run Newgate Prison, hulking on the Hudson’s edge at Greenwich. By the 1820s, however, Newgate’s viability was in serious question. Even dedicated supporters like Eddy conceded that the old prison had been an almost total failure. The place was appallingly overcrowded, stuffed to twice its capacity. After prisoners rioted in 1818, nearly destroying the jail, the legislature responded in 1819 by legalizing flogging—up to thirty-nine lashes per occasion—as well as reviving stocks and irons. In prereform days, a thief would have been whipped and then set free; now he could be held for years and flogged repeatedly if he didn’t conform to prison discipline.

Lengthy internments were the exception, however, as the state issued pardons to alleviate the crush. At the end of 1821 Newgate held 817 inmates, but it would have held over two thousand had it not been for repeated mass releases, sometimes of fifty convicts a day, which petrified the now burgeoning community of Greenwich Village. By 1826 the inmate population was down to 448—more than half of whom, sniffed James Hardie in his *Description of the City of New York* (1827), were miscreants from foreign countries or other states, many of them no doubt “attracted by the hopes of getting more abundant plunder in this metropolis than they could expect in any other place.”

Critics also condemned Newgate’s design because it allowed convicts almost unlimited interaction, letting them pool their experiences. As one

Society for the Prevention of Pauperism lawyer pointed out, the place operated “with alarming efficacy to increase, diffuse, and extend the love of vice, and a knowledge of the arts and practices of criminality.” Some thought it might be worth trying to immure prisoners in silent isolation, as did Philadelphia’s celebrated Eastern State Penitentiary. Others thought that as stretches in solitary had been shown to drive many to madness and suicide, the system used upstate at Auburn might be preferable: isolating prisoners at night but setting them to (profitable) gang labor by day, under the rule of absolute silence, enforced by summary flogging. In the end, however, Newgate was deemed hopelessly beyond repair, and the legislature authorized a brand-new prison, on the Auburn model, at Ossining, near the large marble deposits discovered in Westchester County.

In 1828 the state closed Newgate and transferred its prisoners to Sing Sing, which almost instantly won an awesome reputation, potent enough to draw Tocqueville and Beaumont across the Atlantic to investigate its workings three years later. They were astonished to find nine hundred completely unfettered prisoners, overseen by only thirty guards (who meted out merciless floggings with cat-o’-nine-tails for the tiniest infractions), laboring assiduously in open-air quarries, digging up marble to grace the Greek Revival homes, banks, and churches of New York City.

In 1835 the Bellevue Institution took on one last function, that of serving as Manhattan’s execution ground. This represented a major change for New York’s criminal justice system, which had relied for centuries on highly public hangings, staged, in recent years, at sites around the city. In 1816 Ishmael Frazer, a colored man, and Diana Silleck, a white woman, were hanged at Bleecker and Mercer, for arson and murder respectively. In 1820 Rose Butler, a black servant convicted of arson, was dispatched in the potter’s field at what would become Washington Square.

Until the 1820s these public executions had remained sober communal rituals, in which the condemned, the crowd, and the civic authorities all played their respective roles: the first contrite, the second awed, the third magisterial. One of the last executions to follow the traditional script came in 1825, with the hanging of James Reynolds, a twenty-two-year-old seaman convicted of murdering his ship’s captain with an ax. A vast crowd had already assembled at the old prison near City Hall when, at ten A.M., the high constable and the sheriff, the marshals and ministers, and a battalion of

infantry and company of dragoons took their places. At 10:30 the prisoner, wearing white trousers, a white frock, and a white cap trimmed with black, was led out from his cell and seated on a small stage. The Rev. John Stanford (as the *Commercial Advertiser* recounted) gave a “very solemn and affecting” sermon, which “caused the tear to flow from many an eye.”

Then the procession rumbled off, led by the sheriff on horseback, with Reynolds in an open carriage preceded by a wagon carrying his coffin, the entire convoy surrounded by the military and trailed by the crowd. At the scaffold, two miles out of town, the sheriff read the death warrant, and Reynolds addressed the assembled. He had led a moral life, he explained, until corrupted by drink and the brothels of Corlear’s Hook, and he exhorted youthful onlookers “to take warning by the awful spectacle, and shun the paths of vice.” Finally Reynolds sang a psalm with the minister, the cap was drawn over his eyes, and he was hanged at 12:45 while “earnestly praying to God for pardon.”

Prompted in part by a new delicacy of feeling, however, elites were beginning to turn against such spectacles. Essayists, editors, ministers, and legislators began to denounce them as “disgusting exhibitions,” finding them revolting rather than uplifting. It was not executions that troubled them—few of the critics sought an end to capital punishment—but rather their public character. Hangings summoned up mammoth crowds at a time when crowds (like the Callithumpians) were falling out of favor with the gentry. At a minimum, they clogged public space, wasted time, and were bad for business. Worse, these affairs—increasingly festivals of disorder plagued by drunks and pickpockets—seemed to excite base and brutal passions among the populace, to blunt rather than cultivate moral sensibilities. Formerly awe-inspiring drama was turning into counterproductive farce, more blood sport than solemn ceremony.

Lingering republican convictions that private executions smacked of star-chamber despotism led authorities to seek a compromise by keeping them public but limiting popular access. For the 1829 double execution of convicted murderers Richard Johnson (white) and Catharine Cashier (black), the authorities selected Blackwell’s Island as venue. At eight A.M. the two were whisked from the Bridewell, in separate carriages, “with such rapidity [said the *Post*] as to prevent the rabble from keeping pace with the cavalcade.” But when the entourage reached Penitentiary Wharf, where a

steamboat waited, it was accompanied by several thousand men, women, and boys “eager to witness the dying struggles of two of their fellow beings.” Worse, when the boat carrying the condemned left the dock, the assembled thousands piled into hundreds of small vessels, which tagged along, then ringed Blackwell’s shore. In addition, four or five steamboats cruised back and forth, crammed with passengers “animated by the strange, savage, and fierce desire to see the disgusting spectacle.” In the aquatic jostling, one boat was upset, and several spectators drowned.

Finally a New York legislative committee recommended that public executions, being “of a positively injurious and demoralizing tendency,” should henceforth be conducted in private, where they could not excite “animal feelings.” The legislature concurred in May 1835 and, to forestall objections to “private assassinations,” required that executions be witnessed by at least “twelve reputable citizens.” In 1835 the first such execution was held behind the walls of Bellevue: the hanging of Manuel Fernandez, a Portuguese seaman, went off with satisfying solemnity.

ON TO BLACKWELL’S ISLAND

The New York gentry were proud of the array of institutions they had created. On the day before Tocqueville and Beaumont sailed back to France, the mayor and aldermen, some thirty notables in all, conducted them, as Tocqueville recalled, “with great ceremony to all the prisons or houses of charity of the city.” A cortege of five carriages departed City Hall at ten A.M., headed up to the House of Refuge, where they inspected the premises (at the northwest corner of today’s Madison Square), carried on to the Bloomingdale Asylum for the Insane (on today’s Columbia University campus); swung over to the Deaf and Dumb Asylum on Fifth Avenue, and then, after an aquatic excursion to Blackwell’s Island, they repaired to Bellevue’s almshouse for a banquet. Tocqueville was appalled by the dinner, which “represented the infancy of art: the vegetables and fish before the meat, the oysters for dessert. In a word,” he sniffed, “complete barbarism.” But on the whole he found the postprandial toasts, given with great solemnity by speakers enveloped in clouds of cigar smoke, accurate enough in their self-congratulatory assessments.

The present, moreover, was clearly mere prologue. So pleased were the city fathers with their various walled compounds that they had decided to

expand their initiative. Three years earlier, in July 1828, the Common Council had purchased from James Blackwell the island around which the visiting Frenchmen had just “made two or three charming promenades.” Here the magistrates planned to erect a city of asylums. Many of the recently constructed institutions, for all their worthiness, were already crammed full; Manhattan was surging north toward once bucolic Bellevue; and the success of colossal projects like Sing Sing had led Manhattan officialdom into thinking big. Surveyors had already selected a southerly site for a new penitentiary, to be modeled on Ossining’s pride. Plans were afoot to shift the almshouse to bigger quarters on the island, perhaps in company with a workhouse. A new smallpox hospital was in the offing. And a mammoth lunatic asylum, an intricately designed complex of centers, octagons, and wings, was being discussed. The city’s disordered and disorderly of tomorrow would be transported to Blackwell’s and be aided if worthy, punished if found wanting.

Captivated by this vision of the unruly, ruled, the city’s elite were ill prepared for the emergence of some sharply different diagnoses of New York’s social ills—and some startlingly different proposals for how to cure them.

The Press of Democracy

On January 3, 1829, Frances (Fanny) Wright began a series of lectures at Masonic Hall before a capacity crowd of more than fifteen hundred. In her hour-and-a-half-long speech, the rousing orator, garbed in a white muslin tunic, denounced evangelical clergymen for raising tremendous sums for tracts and missions while opposing reasonable efforts to improve people's living conditions. Such ministers, she said, were intent on reconciling Americans to an unjust status quo, especially by working on "the minds of weak and deluded women" who had been "humbugged from their cradles." Virtue was not something to be dictated by the clergy; it would follow naturally when people were happy and secure and free.

Using the class-conscious European feminism of Mary Wollstonecraft, with which the gentry had flirted in the 1790s, to denounce the cult of domesticity the bourgeoisie had more recently adopted, Wright shockingly demanded sexual equality for women. Sexual passion was among "the noblest of the human passions," yet "ignorant laws, ignorant prejudices, ignorant codes of morals," Wright argued, "condemn one portion of the female sex to vicious excess, another to as vicious restraint, and all to defenseless helplessness and slavery, and generally the whole of the male sex to debasing licentiousness, if not to loathsome brutality." A marriage, she said, should last only as long as a couple's emotional attachment. Addressing herself to plebeian males as well as gentlemen, she cried: "Fathers and husbands! Do you not see how, in the mental bondage of your wives and fair companions, ye yourselves are bound?"

Wright also weighed in on the debate over the educational system. As did the Public School Society (PSS), she favored inculcating republican virtue in pupils. She also agreed that schools had to counteract the time children spent on the streets "learning rudeness, impertinent language, vulgar manners, and vicious habits." But Wright wanted schooling to produce egalitarian-minded citizens who would struggle against economic and social injustice. Such education was impossible in New York so long as the wealthy sent their children to private schools while the rest attended charity institutions run by the PSS.

The PSS gentry, Wright charged, condescendingly called working-class parents who kept their children at home ignorant, intemperate, and improvident. They refused to recognize that poor families could not dispense with their children's earnings, especially with artisans' wages being pummeled downward, nor could they even afford to clothe the youngsters decently enough to send to school. America had to live up to the promise of its revolution by providing full and equal education to all—including the poor, and slaves, and women. This required more than free day schools. Rather the state should provide free boarding schools to which all citizens would go and be treated equally, wearing the same plain clothing, eating the same food, receiving the same instruction. In the "State Guardianship Plan of Education" formulated by her comrade Robert Dale Owen, the state would assume educational responsibility for children starting at age two.

As Wright laid out these ideas, the crowds and the applause grew. At each lecture working-class freethinkers crushed into Masonic Hall to hear and hail the "female Tom Paine." Paine's ideas had undergone quite a revival since his death in Greenwich Village back in 1809 and its disturbing aftermath, when Paine's body had been carried back to New Rochelle and no Christian graveyard would bury him. He had finally been laid to rest on his farm under a walnut tree, where he had remained until 1819, when William Cobbett got permission to dig him up and take his remains to a place where they would be more honored.

Cobbett, a radical English journalist, had fled to New York City in 1817 when the British government, responding to riots in depressed industrial and agricultural regions, suspended habeas corpus and drastically curbed the press. Facing incarceration, Cobbett chose exile, and for the next two years issued his paper from a basement in Wall Street. When he sailed back home, he took Paine's bones with him, hoping to get English democrats to build a mausoleum for them. The project never came to pass, and Paine's remains eventually went missing. His ideas, however, helped fuel a renaissance of deism and anticlericalism in 1820s England. Radical urban artisans argued that religion bolstered authoritarian regimes, crippled freedom of thought, and undermined the independent rationality essential to citizens of the republican society they longed to create. English radicals took to celebrating Paine's birthday each year, and when many of them fled

depression and repression in the late 1820s, they transplanted the custom to New York City. Joining forces with local freethinkers, they gathered at Harmony Hall on each anniversary and raised their glasses in toasts such as “Christianity and the Banks, on their last legs.” In 1827 a weekly lecture series on deism was regularly drawing three hundred people, and George Henry Evans, a journeyman printer of English parentage, had begun bringing out fresh editions of Paine, Elihu Palmer, and other freethought advocates.

Radicals hoped thus to inoculate New York’s workers against the tractarians who, they believed, threatened the separation of church and state, and thus reason and republicanism itself. When Sabbatarians tried in 1828 to prohibit mail deliveries on Sunday, radicals denounced them as a would-be Christian party in politics, intent on compelling the citizenry to their standards. Proving themselves as disciplined as the evangelicals, the freethinkers, aided by a still-widespread anticlericalism, helped beat back the Sabbatarian offensive. Not surprisingly, when Fanny Wright arrived, they hailed her as a spectacular champion of their cause.

At first, however, distinguished elites, men like Cadwallader Golden and Philip Hone, also came to hear Wright speak, in part because for all her radicalism Fanny had impeccable social credentials and was no stranger to Manhattan’s upper class. Wright’s father was a linen merchant who admired Tom Paine, and her mother a child of the British aristocracy. Born in Scotland in 1795, she had first visited New York in 1818, aged twenty-three, with her sister Camilla, to meet liberal thinkers and political exiles. Back in Europe in 1820, she published her *Views of Society and Manners in America*, an enthusiastic, prorepublican book that won her the attention and affection of Lafayette. With characteristic boldness, Wright suggested he either marry or adopt her.

In 1824 she followed Lafayette to the United States, and in New York her special relationship to the hero won her special attention. She returned yet again in 1828, to undertake a speaking tour of U.S. cities, and quickly became the most notorious orator of her age. In January 1829 Wright decided to “pitch [her] tent” in New York City. “All things considered,” she wrote, New York “is the most central spot both with respect to Europe and this country,” and whatever worked on the Hudson would soon “spread far and wide.”

Wright's support from the likes of Golden evaporated even before her six-lecture series ended. Not only were the gentry unsettled that a woman was speaking to large sexually mixed audiences, they were appalled by what she was saying. William Leete Stone, editor of the *Commercial Advertiser*, championed many of the same causes Fanny stood for—he admired Lafayette and supported Greek independence—but Wright's attacks on clergymen and Christianity drove him to near-pathological rage. Declaring that she had “unsexed herself,” he denounced “her pestilent doctrines” and labeled her a “bold blasphemer, and a voluptuous preacher of licentiousness.” Newspapers attacked her boarding-school idea as an infringement of parental rights and an assault on the family and refused to print letters written on her behalf. Old friends denounced her. Society refused to receive her. “Fanny Wrightism” became an epithet in gentry circles and would remain one for decades.

By the time Wright's fifth lecture got underway, opponents had moved from words to deeds, setting a barrel full of oil of turpentine afire at the entrance door. Suffocating smoke billowed up the staircase into the hall above, touching off a panic-stricken race to escape. None of this daunted her followers, including a young Brooklyn carpenter and follower of the radical Quaker Elias Hicks, Walter Whitman. Heartened by this support, Wright dug in. She began publication of the *Free Enquirer*, printed by George Henry Evans, aimed at the city's working class (Whitman became a subscriber). The *Free Enquirer* declared war on “priestcraft,” fought the Sabbatarians, attacked legal disabilities of women, and wrote respectfully of birth control.

In April 1829, for seven thousand dollars, Wright bought the old Ebenezer Baptist Church on Broome Street near the Bowery, in the heart of an artisanal neighborhood. She remodeled it to include a Greek-columned facade and rechristened it the Hall of Science; its front window, which faced a Bible repository across the street, was cheekily festooned with pictures of radical heroes (Paine, Shelley, Godwin). On April 26 Wright gave an opening address dedicating the hall to promulgating “universal knowledge” and to helping working people apply rational standards to the problems of the age.

The Hall of Science, a radical counterpart of the gentry's athenaeum and the evangelicals' missions, offered a day school and a deist Sunday school

where working-class youngsters could learn reading, writing, and arithmetic using texts shorn of biblical reference. Its main focus, however, was adult education. The Hall of Science had a bookstore and a circulating library, well stocked with editions of Wright's pamphlets. It offered speeches and debates every Sunday—admission ten cents—and the twelvehundred-seat hall was regularly filled. Free lectures were offered as well on mathematics, anatomy, geometry, chemistry, natural history, and debating, all aimed at preparing workingmen to think, speak, and legislate for themselves.

ARISTOCRATS AND DEMOCRATS

Political activism was the more attractive to crowds at the Hall of Science because in the late 1820s remaining constraints on popular participation had just been dismantled. Even after the 1804 law had lowered suffrage requirements for city dwellers, large numbers of tenants, clerks, journeymen, and laborers had still lacked sufficient property to vote. Indeed the growth of propertylessness worsened the situation. As of 1821 threequarters of New York City's male population could not vote for governor or state senator (women couldn't vote at all), and even the less rigorous requirements for casting a ballot for assemblyman or congressman still barred roughly a third of the electorate. Popular participation was further circumscribed by the fact that power to select most state, county, and municipal officials—nearly fifteen thousand in all as of 1821, including the mayor of New York City—was still vested in the Council of Appointment consisting of the governor and four senators. The Council of Revision, yet another undemocratic body, retained the right to veto any act of the legislature.

The 1819 recession had quickened demands for political reform. Debtors petitioned the state legislature for assistance but were refused. Many believed this disregard for their interests was a function of the property qualifications that disfranchised them. A clamor went up for ending electoral restrictions, now characterized as undemocratic holdovers from the colonial era.

What finally battered down the old constraints was the thrust and parry of electoral politics. The Federalists' opposition to the War of 1812 had been their undoing, and they did not long survive the truce. Their Democratic-Republican antagonists, however, soon divided into two

factions: those who backed De Witt Clinton, and those who followed Tammany Hall and the upstate Bucktails led by Martin Van Buren, a successful country lawyer who had defended tenants and small landowners against the Hudson River manor lords.

Tammanyites and Bucktails denounced Clinton as an aristocrat. With his autocratic style and ruthless wielding of the Council of Appointment's patronage power, Clinton, his enemies charged, was bent on perpetuating the eighteenth-century patrician system of family and personal factions. The Democrats, on the other hand, proclaimed themselves a modern political party whose very structure, which relied on open-to-all caucuses to select candidates and policies by majority vote, was responsive to the popular will.

Clintonians and Tammanyites competed for popular support. The governor focused on wooing the Irish, with the aid of his good friend Thomas Addis Emmet. Clinton had successfully sponsored the bill abolishing the Test Oath (something Catholics in Ireland would struggle for another two decades to achieve) and had let it be known, through the Shamrock Friendly Association, that jobs in canal construction awaited Irish immigrants.

Tammanyites' initial response to the Clinton-Irish alliance was a knee-jerk nativism. Not only did they refuse to court the Irishmen crowding into the Sixth Ward, but in 1817 the Wigwam's General Committee flatly refused to nominate Emmet for an Assembly position. On the night of April 24, two hundred Irishmen expressed their displeasure by breaking into Tammany Hall, destroying most of the furniture in the Long Room, and sending several Tammanyites to the hospital before the arrival of the mayor and police ended the brawl. Forcibly alerted to their self-destructive chauvinism, Tammany now began to woo the Protestant Irish. Eldad Holmes, prominent banker and sachem, gave a toast at the St. Patrick's Day dinner of the Hibernian Provident Society, hitherto a Clintonian hotbed, and slowly the party began to make some inroads.

When the surge of popular sentiment for electoral reform came along, moreover, Tammanyites and Bucktails rushed to head it. They initiated and won a referendum—over Clinton's ill-advised resistance—that decreed the holding of a constitutional convention in 1821. The convention laid an ax to the hated Council of Revision. It also abolished the Council of Appointment

and transferred the choice of most local officials to local voters—though reserving selection of the mayor of New York to that city’s Common Council. These decisions were relatively easy. The suffrage issue proved more contentious.

The most radically democratic delegates demanded an immediate end to all constraints on white male suffrage. In response, the upstate landed gentry, led by Chancellor James Kent, mobilized forthrightly against the “evil genius of democracy.” In particular they pointed to “the growth of the city of New York,” which in itself should have been sufficient, Kent declared, to “startle and awaken those who are pursuing the *ignis fatuus* of universal suffrage.” New York, after all, was home both to “men of no property” and to “the crowds of dependents connected with great manufacturing and commercial establishments.” If the poor were enfranchised, they would seek to plunder the rich, debtors would try “to relax or avoid the obligation of contracts,” and factory workers would become the electoral adjutants of industrialists.

Many New York City delegates had their own reservations about total enfranchisement, given the rising numbers of impoverished residents against whom the Society for the Prevention of Pauperism was then inveighing. In the end, moderate forces led by Van Buren conferred the suffrage on all twenty-one-year-old white males who had lived in their district for six months and had either paid taxes, served in the militia, or worked on the roads.

The proposed constitution was impressively endorsed at the polls. In 1822 De Witt Clinton, facing clear defeat, retired from the governorship rather than run again. His good friend John Pintard reflected sourly that power had passed to those with “no stake in society” and that New York City would “hereafter be governed by a rank democracy.” In fact, Clinton would have one last hurrah. His triumphant opponents, unable to resist kicking him when down, removed him from the Canal Board, a patent injustice that won him instant martyrship and, in 1824, reelection as governor. By 1826, nevertheless, calls for total eradication of the remaining restrictions on voting had become irresistible, and a constitutional amendment completed the democratization of New York’s political system.

For white men. Suffrage for women was not on the agenda, and the same convention that emancipated poor whites disfranchised most blacks. Indeed

ardent Democrats took the lead in drawing the color line, because African-American voters had long supported the Federalists. This was hardly surprising, given that the 1799 abolition law had been enacted by a Federalist legislature and signed by a Federalist governor, but Democrats chose to assume that Federalists (or their Clintonian successors) would continue to command black votes because the freedmen were dependent, illiterate, and easily manipulated by their former masters. “If we may judge of the future by the past,” one Democratic militant cautioned the 1821 convention, “I should suppose that there was some cause for alarm, when a few hundred Negroes of the city of New York, following the train of those who ride in their coaches, and whose shoes and boots they had so often blacked shall go to the polls of the election and change the political condition of the whole state.” Northern Democrats, moreover, had been moving toward an alliance with slaveholding southerners, a strategy that only enhanced their desire to bar blacks from the polls.

In the end, Peter A. Jay, an abolitionist like his father, John Jay, prevailed on the convention’s majority not to exclude all black men but only those who didn’t pay taxes on \$250 worth of property. This proved acceptable, as Democrats were quite confident that the provision would effectively exclude African Americans. They were right. In 1826, of a total black population of 12,499 in New York County, only sixty were taxed at all, and of these only sixteen qualified to vote. New York was to remain a republic—or a democracy, as it was now increasingly called—of white males.

TAMMANY DEMOCRACY

The Democratic Party, which now unequivocally defined all European immigrants as “white,” vigorously cultivated newcomers. It established a “naturalization bureau” to hurry new voters into being; held special meetings for Irish, French, and German immigrants; placed influential Irishmen on local tickets, and dispensed patronage to ethnic supporters. Within a few years, an estimated one-third of Democratic voters would be of foreign birth, and Philip Hone would be complaining that Irishmen “decide the elections in the city of New York.”

In 1828 Tammany solidified its position by helping make Andrew Jackson president. Jackson had received the largest number of electoral votes for the presidency in 1824. However, failing of a majority, he had

been defeated in the House of Representatives, which elected John Quincy Adams in what Democrats charged was a “corrupt bargain.” Tammanyites itched to support the popular war hero in the 1828 rematch but were at first dissuaded by the fact that his biggest supporter in New York was De Witt Clinton. Eventually Martin Van Buren, his eyes on national prizes, made peace with Clinton and swung the Democrats behind Jackson. Clinton’s unexpected death that year removed any remaining reservations.

During the campaign, Tammanyites sponsored elaborate dinners to commemorate the Battle of New Orleans—packing sixteen hundred into the Long Room and holding smaller affairs in all the wards. They established Hickory Clubs throughout the city, which ceremonially planted hickory trees (Jackson was known as Old Hickory) and then retired to local taverns to toast the general’s health. They reminded Irish audiences that Jackson was their compatriot and had humiliated their British oppressors. New York (city and state) went for Jackson and also sent Martin Van Buren to the governor’s mansion, a position he soon resigned to become Jackson’s secretary of state.

Though Tammany trumpeted Jackson’s election as the triumph of democracy, some of the demos thought otherwise, pointing to the fact that the commanding heights of the Democratic Party were occupied by the mercantile elite itself. In truth, the Tammany Society, the party’s inner sanctum, embraced many well-connected attorneys, merchants, bankers, and entrepreneurial craftsmen. Such men often effectively dominated as well the ward committees and caucuses that chose candidates for the Common Council, as only they, or career politicians, could afford to undertake such time-consuming, unpaid political activity. Rich men remained vigorously involved in the electoral arena because they were determined to keep a firm hand on the public tiller. In 1829, when a convention to draw up a new city charter was proposed, Philip Hone and a large number of civic notables ran for delegate, lest others, as Hone put it, adopt “indiscreet measures”; 60 percent of those elected were wealthy men, many of them from prominent families.

As a result, in 1826 two-thirds of the Common Council were well-off or extremely wealthy men. (Across the river, 75 percent of Brooklyn’s identifiable trustees and aldermen hailed from rich families through most of the 1830s.) The mayors, when the council appointed—among them

Cadwallader Golden, Walter Bowne, Philip Hone, and Gideon Lee—tended to be affluent as well.

The strong presence of elite gentlemen in the party's leadership was one reason that, for all the Democrats' rhetorical populism, when a nascent labor movement emerged in New York during the late 1820s, it insisted quite forcefully that Tammany did not speak for or address the issues about which its membership was concerned. Within a year of the Jacksonian Democrats' victory, therefore, the city's workingmen launched an independent political party that advanced a very different vision of New York's future.

WORKERS AND "BOSSES"

During the 1820s the transformation of the trades had accelerated. Craft work had grown more subdivided, less respected. In printing, entrepreneurs bought presses and hired "halfway journeymen" who had not completed full apprenticeship. In marine construction, nearly all shipwrights now worked as wage-earners for boatyard owners. In the building trades, speculative developers let out competitive bids to contractor-entrepreneurs who agreed to erect structures for a package price; they in turn subcontracted the actual work to builders, who subdivided the labor among crews of semiskilled carpenters and masons, thus circumventing experienced journeymen, whose status and pay eroded further.

Journeymen, recognizing that their employers were more often antagonists than craft-partners, began to draw sharper lines of demarcation within the trades. In 1816 journeyman printers banned employers from their meetings. Masons followed suit in 1819. Cabinetmakers, chair makers, ship carpenters, caulkers, cordwainers, coopers, house carpenters, and tailors—all established journeymen's societies. Like the groups formed at the turn of the century, these remained primarily fraternal associations, which provided benefits to sick and elderly members, arranged recreational outings, and marched together in civic parades. Increasingly, however, they also operated as labor unions and began appealing to the public for support against capitalizing masters, whom they branded as self-seekers whose "only object is to accumulate money."

Before 1825 journeymen's associations rarely engaged in strikes. One reason for such caution was that the press uniformly and vehemently condemned such actions as unrepugnant and cast participants as criminals consorting against the public interest, rather than as aggrieved members of the larger community. In addition, the state refused to grant such organizations charters unless they explicitly included provisions disavowing any intention of regulating work or wages.

Nor was it always clear who the enemy was. Many small masters were as badly squeezed as their journeymen. Many upheld the leather-aproned camaraderie of the Trades, refused to sweat more out of their workers, balked at hiring cheaper unskilled labor, and marched with their employees on civic occasions. But they faced sharp competition and grim choices. Either they struggled on as principled but ever poorer independents; or they became subcontractors to merchants and/or large manufacturers and thus accomplices in the degradation of their trade; or they themselves tumbled into permanent wage work. With the distinction between small master and journeyman fast disintegrating, New York's working people began, as early as 1817, to employ a new term to describe their entrepreneur-employers: "boss," derived from *baas*, the Dutch word for master.

In the 1820s laborers were more aggressive than skilled artisans, in part because wage differentials between unskilled and skilled workers kept rising sharply, in part because working conditions were particularly hard. The riggers and stevedores who fitted ships for sea and loaded or unloaded goods, for instance, faced long hours, low pay, and intermittent employment (winters were slack time, and the waterfront instantly registered any curtailment of trade).

In March 1825, accordingly, these waterfront workers (both white and black) marched along the wharves nearly a thousand strong, chanting, "Leave off work, leave off work." Forcing all dockworkers to join them, they effectively shut down the port. Police arrested the leaders and dispersed the strikers. But 1828 brought additional protests; shipowners reduced wages during a trade slump, and hundreds of strikers rolled along the East River wharves, knocking down and beating up nonstriking workers, then crossed to the Hudson River docks, where they showered a Le Havre packet with ballast stones. The merchant community was not about to put up with anything that threatened its port's new reputation for

regularity and efficiency, and in short order the mayor, several magistrates, a posse of constables, and a troop of cavalry put the strikers down.

Labor violence also broke out that year in Greenwich Village, where handloom weavers, most of them British and Irish immigrants, struck for higher wages. In late June, employing a tactic used hundreds of times in England during that period, one anonymous weaver threw a note through the window of Alexander Knox, the city's leading textile employer. Addressed to "Boss Nox," the crudely lettered warning from "the Black Cat" advised him to "either Quit the Business Or else pay the price you ought to for if you don't you will be fixed." When several weavers continued to work for Knox at a lower wage, scores of angry journeymen stormed the shop and cut webs off looms.

Such outbursts received no support from skilled workers. Nor did the country's first all-female strike, in 1825, when tailoresses turned out. Indeed male tailors refused to allow women in their organization and sought to drive them out of the trade altogether. Seamstresses had been garnering much of the slop work on which many tailors depended, and already in 1819 one journeyman had expostulated in print: "Is it reasonable that the best of workmen should be unemployed half of the year" because "mercenary" employers knew that "women work cheaper than men?" Ignoring women's own survival needs, the men demanded a "family wage" for themselves—the "natural" breadwinners—which would enable them to keep their women at home, thus restricting labor competition while reaping the benefits of a wife's housework. Faced with lack of male support, and possibly inspired by Fanny Wright's Jacobin feminism, an independent Tailoresses Society emerged in 1831, asserting in a startling departure from conventional wisdom about female dependency: "Long have the poor tailoresses of this city borne their oppression in silence," but "*patience* is no longer a virtue." The women embarked on a months-long strike—"If we do not come forth in our own defence," unionist Sarah Monroe asked, "what will become of us?"—but, cut off from male support, their effort withered and their group disbanded. Master and merchant tailors continued to hire ever larger numbers, for ever lower wages, until by the 1830s some employers had as many as five hundred women outworkers sewing coarse "Negro cottons" for export to the slave South.

The quiescence of New York's skilled craftsmen was misleading, however, for their growing resentments were about to explode, but in the world of politics, not production. They would be galvanized, in part, by analyses advanced by two self-taught mechanic-intellectuals, which set workplace developments in the context of a larger and more menacing threat to the city, and to the republic itself.

In 1826 Langton Byllesby, a thirty-seven-year-old printer of English ancestry who had failed as an independent master, was doing wage-work as a proofreader at Harper Brothers, New York's largest shop. In that same year he brought out *Observations on the Sources and Effects of Unequal Wealth*, a book in which he predicted that New York City would soon match London's levels of crime, pauperism, and spending on prisons and welfare. Where Byllesby's analysis differed from the equally gloomy reports of the gentry-run Society for the Prevention of Pauperism was in refusing to put the blame on working-class slatterns and slackards.

Instead Byllesby faulted the rich. It was they, he said, who were plunging the producing majority into "resourceless distress, and intense misery." Merchant capitalists fostered rampant speculation. Auctioneers like Philip Hone got rich by drowning local industry in a flood of cheap British imports. The wealthy deployed new labor-saving machinery but harvested its benefits for themselves. Bankers monopolized credit and manipulated money for private gain. Landlords, having seized far more than their fair share of the soil in the old days, were now able to wax fat on levied rent-tribute.

Hard work, thrift, and the other practices recommended in the gentry's book of virtues would never offset such class advantages, Byllesby said. Instead, city tradesmen should supplant the competitive production system with a cooperative one, by pooling their shops and tools, then offering equal pay for equal labor. Producers, moreover, should use their newly expanded political power to tackle the privileged position of parasitic merchants, bankers, lawyers, and bureaucrats. In particular, speculative uses of land should be forbidden, and land ownership restricted by need and use.

Thomas Skidmore had an even more incendiary analysis. The Connecticut-born Skidmore had been a peripatetic teacher up and down the eastern seaboard, then a tinkerer-inventor seeking ways to improve the manufacture of gunpowder and paper. When he moved to New York City in

1819, he labored as a machinist, worked on an improved telescope, and read widely in radical political philosophy and political economy, including Byllesby and Robert Owen.

In 1829 Skidmore issued *The Rights of Man to Property!* This tract not only lengthened Paine's title but also deepened his argument. Skidmore attacked existing property relations as the ill-gotten fruits of a corrupt, colonial-era disposition of vast grants to a few landed proprietors and the ensuing failure to recycle this property over time to the wider community. As long as property remained "so enormously unequal" in its distribution, Skidmore argued, "those who possess it *will* live on the labor of others." In addition to private property, Skidmore said, private banks, privately owned factories, and private educational institutions also worked to replenish the wealthy while depleting the workers. The solution was not education, *pace* Wright and Owen. Maldistribution of wealth was not the effect of knowledge inequality but its cause. Instead, journeymen and small masters—the backbone of the producing class—should use their political power to force an equal division of property, achieving redistribution by changing inheritance practices. Banks and manufactories should be publicly run. Land, the basis of republican independence, should no longer be treated as a commodity. "Why not sell the winds of heaven," Skidmore asked, "that man might not breathe without price?"

Skidmore's goal was a patriarchal utopia of free and independent producers in which there would be "no lenders, no borrowers; no landlords, no tenants; no masters, no journeymen; no Wealth, no Want." To achieve this, men of modest fortunes had to combine with the propertyless poor and take electoral control of the government.

Both Skidmore and Byllesby believed something had gone terribly wrong in city and country, that social inequality and privilege were on the rise, that the republic was being undermined from within, that the new industrial system was immoral in its promotion of a lust for quick riches, individualism over community, and speculation, gambling, and usury. Such propositions had deep roots in the republican tradition. So did the argument that nonproducing parasites were able to appropriate the wealth labor created because government had granted them monopolistic rights. This diagnosis came bundled with its own prescription: the producing classes should elect men who would abolish the monopolies that bred aristocrats.

WORKINGMEN'S ADVOCATES

In April 1829 a crowd of more than five thousand mechanics turned out for a meeting in the Bowery to protest a rumored scheme by employers to lengthen the ten-hour day. After resolving to fight any such move, the gathering appointed a Committee of Fifty and instructed it to prepare a report on “the causes of the present condition of the poor.” In setting up this counterpart of the Society for the Prevention of Pauperism “great care was taken to have no ‘Boss’ on the committee,” recalled George Henry Evans, one of the workingmen’s leaders and the party’s first historian. The committee labored over summer and fall, under the influence of member Thomas Skidmore.

On October 19 another mass meeting of “Mechanics and other Working Men” assembled, heard the Fifty’s report, and invited “all those of our fellow-citizens who live on their own labor, AND NONE OTHER,” to join them in supporting an independent slate of candidates in the upcoming November elections for the state assembly. The meeting also adopted a platform for what soon would be called the Workingmen’s Party (Brooklyn would form its own such organization). They unanimously endorsed the essence of Skidmore’s program, calling for “equal property to all adults.” They also backed Fanny Wright and Robert Dale Owen’s demand for equal educational opportunity and elected Owen himself secretary. Signaling their anticlerical bent, they called for an end to tax exemptions on ministers and church properties. They also briskly denounced government-created “chartered monopolies,” urging the wider community to “destroy banks altogether.” Banks flooded society with “rag money”—depreciated banknotes—that were often bought at steep discount by employers and used at face value to pay employees’ wages. The Workingmen advocated a purely metallic currency—so-called hard money—employing the sophisticated argument that bank-created inflation led to a rise in prices, a rise in imports, a fall in exports, an outflow of specie, and then an inevitable contraction and depression.

The Workingmen also advocated a mechanic’s lien law, a plank that appealed greatly to the carpenters, masons, and stonecutters who were major supporters of the new party. In the 1820s boom, contractors bid low to get a job, then gave workmen only part of their pay (perhaps 25 percent), promising the balance later. Later never came. Instead, the contractor

pocketed the remainder and declared insolvency, making it impossible to collect monies due. The Workingmen proposed a law giving a lien on the building to all those who had been employed in erecting it. The propertied fought this vigorously, saying it would discourage investment.

Proclaiming that “we have nothing to hope from the aristocratic orders of society” and that “our only course to pursue is, to send men of our own description, if we can, to the Legislature at Albany,” the Workingmen, using an elaborately democratic procedure, nominated eleven candidates: two carpenters, two machinists, a painter, a whitesmith, a brassfounder, a printer, a cooper, a grocer, and a physician.

The new party decided it needed a newspaper. George Henry Evans, who had brought out Wright and Owens’s *Free Enquirer*, now launched the *Workingman’s Advocate* from his office on Thames Street, where he served as editor, compiler, and printer. The first issue, on October 31, 1829, carried the slogan “All children are entitled to equal education; all adults to equal property; and all mankind, to equal privileges.” Only the second labor paper in the United States (the first having been started in Philadelphia the year before), the *Workingman’s Advocate* would be the voice of New York’s artisanal radicalism for the next fifteen years.

A brief but frenzied campaign followed. Bosses and the established mercantile press branded the Workies a “Fanny Wright ticket,” with editor Stone in the *Commercial Advertiser* calling them “poor and deluded followers of a crazy atheistical woman.” Tammany’s General Society disavowed any connection with the ticket, belittled its program, and called on “all sober, respectable mechanics of New York” to shun it.

The Workingmen lost, but they lost well. In an impressive debut they elected one candidate to the Assembly, placed a narrow second in six other races (including Skidmore’s), and won nearly one-third the total vote. The Democrats prevailed, but there was consternation in the Tammany camp.

As the Workingmen’s Party girded for the following year’s contest, however, it experienced tremendous internal upheavals. New recruits poured in, including many whose politics were quite different from those of the progenitors. One was Noah Cook. A commission agent for an Erie Canal boat line, Cook sold items ranging from cordwood to country real estate. He had also been an active Adams supporter in 1828 and was an

editor of the *Evening Journal*. Cook's faction, which included employers, evangelicals, large-scale manufacturers, and residents of the "aristocratic" First Ward, hoped to transform the Workingmen into an anti-Jackson vehicle. Cook allied with Owen and Evans to drive Skidmore out of the party he had started, then turned on the Owen faction and ejected it too, denouncing its education plan as a plot to break up families and undermine religion. Some journeymen, too, including the New York Typographical Society, attacked the state guardianship plan as dangerously visionary, though the Workingmen still demanded education for all and wondered aloud "if many of the monopolists and aristocrats in our city would not consider it disgraceful to their noble children to have them placed in our public schools by the side of poor yet industrious mechanics."

Even as the party quarreled and split, one demand remained constant: more democracy in New York City. In particular, the Workingmen pressed for direct election of the mayor. They also asked that aldermen and assistants be paid, because "poor men cannot afford to spend their time without receiving an equivalent for their labor," and under the current system "none but large property holders can be elected." Workies wanted an end to compulsory militia service, an obnoxious obligation for men who couldn't afford to take time off from work, or to pay for substitutes as merchants did. They wanted smaller electoral districts, which would allow "*all interests* to be represented" and thus offset "the misrule of the dominant party in this state, and especially in this city"—a reference to Tammany, which they believed was under the corrupt control of "idlers, office holders, and office seekers."

The Workies were of mixed mind as to what to do with city government should they get hold of it. Some advocated an activist policy of mechanic's liens, aid to internal improvements, government funding of education, and an ongoing regulation of the municipal economy in the public interest. But a greater number denounced government intervention in the economy—both the grant of special corporate privileges and the maintenance of municipal regulations—as an unwarranted colonial holdover, a violation of democracy on a par with the now eliminated suffrage restrictions.

In 1828 the Common Council still appointed or licensed nearly seven thousand people, including butchers, grocers, tavern keepers, cartmen, hackney coachmen, pawnbrokers, and market clerks, together with platoons

of inspectors, weighers, measurers, and gaugers of lumber, lime, coal, and flour. From the Workingmen's perspective, licenses sheltered their privileged holders from competition that could lower prices. Regulations and fees indirectly taxed food and drink, as vendors passed on the costs they accrued in obtaining licenses, buying market stalls, paying fines, and bribing corrupt city inspectors. (Grocers, in particular, complained that inspectors had "a long Pocket for themselves.") The whole system was kept in place, Workies suspected, less for the public's convenience than to provide the government with revenue, which it could then share out with cronies and patronage recipients.

In an 1830 petition to the City Council, the Workingmen demanded an end to privileged monopolies in the local economy. They called for abolition of market laws and chartered licenses, the sale of all city-owned property in markets, an enhanced reliance on property taxes for revenue, the granting of permission to butchers and hucksters to sell anywhere in the city, the establishment of tax-free country markets (with adjacent taverns) that would entice farmers to the city, and the exemption of market produce from ferry or bridge tolls.

The closely watched trades—some of them well represented in the new party—were ambivalent about deregulation. Butchers, grocers, and tavern keepers were enticed by free enterprise but nervous about it. Some butchers came out for economic freedom: in 1829 one rebel, refusing to rent a market stall, opened New York City's first private meat shop. But city protection had served butchers well, and most demanded more of it, not less, asking the city to clamp down on unlicensed (and overhead-free) hucksters. Grocers complained of being pestered by inspectors, yet griped that the city didn't protect them from black, Irish, and female peddlers. Tavern keepers sought the freedom to sell alcohol on Sunday but also wanted authorities to crack down on unlicensed Irish grogeries. Bakers, after wobbling on the issue earlier in the century, had come out definitively against regulation in 1821. Calling themselves the "slave of corporation dictation," they demanded that buyers and sellers be allowed to bargain freely and that bakers be freed from special responsibility for feeding the poor. The Common Council repealed the assize in 1821, abdicating its authority over prices, but continued to require that bread be sold in standard-weight loaves, to lessen the possibility of fraud.

Cartmen, on the other hand, definitely favored regulation. American-born carters complained to the city fathers that Irish immigrants, who had been licensed during the war while Anglo-Dutchmen were off soldiering, were undercutting established rates and stealing customers. Mayor Colden limited future alien licensing to dirt carting, a field the Irish quickly dominated. When they continued to challenge the Anglo-Americans in other areas, the Society of Cartmen petitioned the Common Council to reaffirm their “ancient privileges.” The municipal government agreed, rejecting calls for the decontrol of carting, as the business and trade of the city depended on it, and in 1826 the council banned aliens from carting, pawnbroking, and hackney-coach driving; soon all licensed trades were closed to them.

One deregulatory demand that nearly all Workingmen supported was abolition of imprisonment for debt. Attacks on the practice, which the Humane Society had begun making in the 1790s, had accelerated in New York just after the war, winning passage of an 1817 law ending incarceration for debtors owing less than twenty-five dollars. In 1828, nevertheless, more than a thousand defaulters served time in city jail, without bed, fuel, or food, other than a quart of soup every twenty-four hours. Most debtors, to be sure, spent only brief periods in actual custody, as “gaol limits” had been extended to the lower wards of the city. The Workingmen’s first demand was only that these prison boundaries be extended to the whole city, because most of those affected by the law lived and worked in the upper wards. By 1830, however, they (along with businessmen) were petitioning Albany for a complete abandonment of the practice.

Workingmen pressed their positions through a new paper, the *Daily Sentinel*, launched in February 1830 by Workie printer Benjamin Day and five other directors. But by the time of the fall elections, the party’s internal conflicts had torn it apart. Drubbed at the polls, finished as an electoral force, by 1831 the Workingmen’s Party had disintegrated.

The Workies’ collapse had many causes, including factional division, political ineptness, simple inexperience, a lack of funds, infiltration by the opposition, press hostility, the pull of regular party loyalty, and the arrival (with the 1830s) of a fevered prosperity that turned attention from politics to trade unionism. Perhaps superb leadership could have offset these

handicaps, and if Frances Wright had in fact been at the party's helm she might have made a difference. But in June 1830 Wright had announced her return to Europe to a packed (and half-female) Bowery Theater crowd, and she departed on July 1, to Philip Hone's great delight, and that of his opposite political number, Tammanyite Mordecai Noah. Further sighs of relief attended Robert Dale Owen's closure in 1831 of the Hall of Science and its sale to a Methodist congregation.

If the independent workingmen's voice was stilled for the moment, their words had entered irreversibly into civic discourse. Fanny Wright's "doctrines and opinions and philosophy," Noah noted, "appear to have made much greater progress in the city, than we ever dreamt of." And labor's political awakening would have both immediate and long-term consequences for New York City. The short-term impact was registered in the Democrats' decision to woo disaffected Workies by assuming their language and their issues. Rhetorically, they denounced banks and condemned monopolies. Symbolically, they took the lead in organizing the 1830 parade celebrating the overthrow of the French monarchy. Practically, they helped enact such Workingmen planks as were compatible with entrepreneurial agendas. In 1830 legislators passed a mechanic's lien law. In 1831 the state abolished imprisonment for debt in all cases except where fraud was alleged. The same year brought support for direct mayoral elections, a reform effected two years later with an amendment to the city charter. Such concessions brought many artisans back to the Tammany fold, and the following year Workie wards voted Democratic.

THE SUN SHINES FOR ALL

A more long-term—and more indirect—legacy of the Workingmen's Party was the creation of a popularly oriented commercial journalism. In the *Free Enquirer*, *Workingmen's Advocate*, and *Daily Sentinel*, Workies and freethinkers had passionately protested the gentry's monopolization of knowledge, insisting that equal access to education, culture, and information was vital to a democracy. Most of their fire had been directed at New York's stratified school system, but they also blasted the city's press as being of, by, and for the mercantile and political elite.

Only the affluent could afford the dailies, which sold for six cents each (annual subscriptions cost a hefty ten dollars), and only the affluent cared to

read them. The papers featured ship arrivals and departures, market and financial conditions, importers' offerings, legal notices, verbatim congressional speeches, and vitriolic editorials denouncing freethinkers and trade unions or proclaiming the current party line. Editors, paid to merchandise wares and politicians, paid attention to little else, certainly not to the daily life of most New Yorkers. The lack of interest was reciprocated, and as a result the average circulation of all seven daily papers in 1835 was a mere seventeen hundred, with Colonel Webb's *Courier and Enquirer*, the largest, boasting only four thousand.

Working-class New Yorkers were not lacking in literacy or interest. For all the schools' limitations, they had helped nurture a plebeian reading audience, which publishers readily reached with religious papers, tracts, Bibles, broadsides, pamphlets, ballads, gallows confessions, and adventure tales. Well aware of this, the youthful labor journalists of the 1820s had attempted to bypass the established press and to break its monopoly of information and perspective.

One of these media rebels was Benjamin Day, the twenty-year-old journeyman printer who had helped launch the *Daily Sentinel* in 1830, when he was twenty. Son of a Massachusetts hatter, Day had apprenticed on a Springfield paper. Drawn to New York City, he worked for the *New York Evening Post*, then opened his own job shop; like many young activist printers, he became part of the workingmen's movement. During Day's tenure, however, the *Daily Sentinel* did not adopt innovations in content, style, or pricing. It relied on politics to win readers and did not long survive the death of the Workingmen's Party.

Day soon decided to start another mass circulation daily (in part to advertise his printing plant). He was encouraged in this by the example of London's *Penny Maga-zine*. Published from 1832 by the Society for the Diffusion of Useful Knowledge, ostensibly to educate and improve the poor, the *Penny Magazine* was cheap and hugely successful. By 1833 its circulation was twenty thousand, and many copies were being sold in the United States.

On September 3, 1833, Day launched the *New York Sun*. Unlike the sixpenny papers, which were printed on mammoth-sized paper (some were known as "blanket" sheets), the *Sun* was a tiny affair of four tricoloured pages on SVz-by-II-inch paper. With job printing his only source of income

—“Capital! Bless you, I hadn’t any capital,” he recalled later—Day started by imprinting two hundred copies an hour on a handcranked flatbed press. He experimented boldly, however, with pricing, distribution, format, and content. The *Sun* cost a penny, well within artisanal reach, and Day did not require prepayment of subscriptions. Instead, using a London plan, he sold bundles of a hundred *Suns* for sixty-seven cents, cash in advance, to newsboys drawn from the city’s pool of orphans and unemployed. If a newsboy sold all his papers, he pocketed thirty-three cents. Some plied regular routes, collecting six cents per customer each Saturday. Others hawked *Suns* on the street, adding their cries to the cacophony of oyster sellers and hot-corn girls.

The *Sun*’s slogan—“It Shines for All”—proclaimed Day’s intention of reaching a wide spectrum of New Yorkers. So did his assertions that the paper would be “vended at a price which the poorest laborer can afford,” while being “of a character (we hope) deserving the encouragement of all classes of society.” But if the popular classes were not the exclusive target, as had been the case with the *Sentinel*, the paper’s demotic thrust was obvious from what it did and did not cover.

Conspicuous by their absence were ponderous articles on national and world affairs. (Even had he wanted to, Day couldn’t compete with *the Journal of Commerce* and its twenty-four-horse express relays from Washington.) There were no announcements about pending arrivals of cargoes of bombazine; artisans didn’t care, and merchants could find out elsewhere. There was no partisan politics as traditionally understood—no vituperative harangues, no lengthy discussions of public affairs; though the *Sun* tended to support Democratic candidates, it was out of conviction, not patronage.

Missing also was the radical language, the incendiary tone, of the workingmen’s press; Day well remembered the *Sentinel*’s failure. Instead he proclaimed his mission in language acceptable to an elite eager to educate the disorderly classes so as to improve their behavior and productivity. In an early issue, Day stressed (echoing his London predecessors) that the *Sun* was “effecting the march of intelligence” by “diffusing useful knowledge among the operative classes of society.” Yet Day would firmly back unions, strikes, and the ten-hour day. The *Sun*, said its founder, helped produce a “decided change in the condition of the laboring classes” by enabling them

to “understand their own interest, and feel that they have numbers and strength to pursue it.”

What the *Sun* did have was local news that would interest an audience of artisans. Breezy, brightly written pieces sketched the daily life of ordinary New Yorkers. Snappy, even sensational stories covered unusual events —“fires, theatrical performances, elephants escaping from circus, women trampled by hogs.”

Crime news was made to order for Day. There wasn’t any competition—the blanket sheets found such stories embarrassing and bad for business—and it was cheap and easy to gather. For four dollars a week, Day dispatched unemployed printer George Wisner to record the vivid dramas of police court. With coarse humor and flippant style, the *Sun* offered accounts of domestic tribulation and drunkenness (husband beats and chokes wife to death in drunken rage), scandals (reverend arrested for rape), tales of thieves, whores, and arsonists. Chronicles of crime were not new, but crime news was.

“Police Reports” became the *Sun*’s most popular section for many reasons. Sex and violence were titillating. The narratives were familiar to readers accustomed to sensational street literature. They comfortably incorporated everyday speech, the kind of dialect, colloquialisms, and slang never found in elite papers. They provided New Yorkers with useful and important information about the way their city worked. They often contained a sharp-edged, critical component—reminiscent of the radical papers—in holding up instances of gentry pretension, hypocrisy, favoritism, violations of equal justice, abuse of state power, corruption. In one instance—the provision of gruesomely detailed accounts of executions, which had been recently privatized—crime news served to reassure a populace that remained highly suspicious of such closed-door dealings.

Crime stories were paralleled in popularity by the occasional hoaxes the paper concocted. In August 1835 Day began publishing a series of articles recounting life on the moon—spherical amphibians rolling about—as supposedly revealed by a powerful new telescope. These good-humored impostures, together with reports of curiosities and monstrosities, resembled crime reports in offering readers a chance to play detective and decide their truth or falsity. Both were forms of voyeurism at a distance,

dependent for their impact on the fact that some parts of the city were now as little known as the surface of the moon.

The *Sun* was a runaway success. Within four months its circulation of four thousand brought it abreast of Webb's *Courier and Enquirer*. By 1834 Day had made enough money to install a machine press with a capacity of a thousand copies per hour, equal to the demands of his paper's now ten thousand purchasers. A year later, with readership at fifteen thousand, he switched to a steam press with an hourly capacity of fifty-five hundred. During the moon hoax, daily circulation hit twenty thousand: four times that of the most successful sixpenny, more than the Methodists' weekly *Christian Advocate and Journal*, and more than the *London Times*. The *Sun* had become, for the moment, the biggest-selling paper in the world.

Day had promised that the *Sun* would be an "advantageous medium for advertising," and circulation figures like these brought advertisers flocking. Ads were not new, of course. The mercantile and political sheets had long filled six or eight columns of a page with tiny ten-line squares of text that, in minuscule typeface, called the attention of a select audience to goods and services. Day sold space on a cash, not an annual, basis and included "Help Wanted" notices for cooks, maids, coachmen, bricklayers, and men to open oysters in restaurant kitchens. These increased the paper's popularity with readers looking for jobs—or for servants—and though many of the elite denounced the *Sun* for pandering to the vulgar mob, businessmen were not about to pass up the opportunity to purvey their wares to the enormous local market it had revealed.

Success bred competition. In 1834 two former colleagues of Day's started the *New York Transcript*, placing it under the editorial control of Asa Greene. A native of western Massachusetts, Greene, a printer, had come to New York in 1829 at the relatively advanced age of forty and edited a comic weekly for several years. The *Transcript* offered his lighthearted commentaries, in the form of a letter written by a recent arrival to his country friend back home, which sensitively detailed urban manners and customs.

Like the *Sun*, the *Transcript* was a working-class-friendly paper. Not only did it support workers' right to organize unions, but one of the owners was himself a printer's delegate to a trade union body. Greene reported on local boardinghouse price increases, theater and sporting events, and the

Mechanic's Fair, along with meetings of the Common Council and sessions of the police court, which were humorously recounted and spiced with dialogue between magistrate and accused. Soon the paper was selling nearly as well as its penny rival within Manhattan, and even better in nearby cities and towns. Dozens of penny dailies now entered the field—some lasting but a few weeks—and flourishing imitations were started in Boston, Philadelphia, and Baltimore (several by veterans of Day's shop).

EXHILARATING THE BREAKFAST TABLE

One of the newcomers—the *New York Herald*—soon surpassed all others, including the *Sun*. Its proprietor, a gaunt Scotsman named James Gordon Bennett, was born in a Highlands hamlet in 1795 to a Catholic family. After study in a seminary in Aberdeen, Bennett broke with the Church and adopted the laissez-faire classics as his new sacred texts. In 1819 inspired by Ben Franklin's *Autobiography*, he sailed for the United States, becoming part of a resurgent Scottish migration. Bennett spent three years in Boston clerking for a bookseller and proofreading; then he worked for ten months in South Carolina on the *Charleston Courier*, one of the best papers in America, honing his writing skills and absorbing white supremacist views.

In 1823 Bennett settled down in New York City, where he did free-lance writing for party papers, specializing in economic analysis. His 1825-26 exposure of stock speculations drew considerable attention, and in 1826 Mordecai Noah hired him to report on Washington politics and society for the *New York Enquirer*. Bennett's informed, irreverent reportage, written in a flamboyant but authoritative style, won him considerable standing in the trade. When party pressure forced the merger of Noah's *Enquirer* and James Watson Webb's *Courier* in 1829, Bennett became associate editor of the new *Courier and Enquirer*. His steady rise through the world of party newspapers was halted in 1832: when the *Courier and Enquirer*, encouraged by money from Biddle's Bank, switched its allegiance to Jackson's opponents and muzzled the pro-Jackson Bennett, he quit. Bennett started his own Democratic paper in 1833, but the party, considering him too unpredictable, gave him skimpy support, and he finally abandoned the partisan press altogether.

Bennett applied, unsuccessfully, for jobs at the *Sun* and *Transcript*, then decided to start his own penny paper. Never having set type or operated a

press, Bennett needed a partner. He turned to a twenty-two-year-old printer named Horace Greeley.

Greeley, born to struggling New Hampshire farm folk, had arrived in New York in 1831, with ten dollars and a small sack of belongings, fresh from an apprenticeship in a small-town printshop. An earnest, downy-haired beanpole of a man, Greeley first found work setting type on projects ranging from an annotated Bible to William T. Porter's *Spirit of the Times*, a new weekly devoted particularly to racing news. Then he set up a printshop, purchased type on credit, and looked about for business. In 1832, approached by a physician with a yen to publish, Greeley agreed to collaborate on a twopenny paper, the *New York Morning Post*. The first issue appeared January 1, 1833, eight months before the *Sun* saw the light of day, but the doctor was a ponderous writer, and the paper went belly up within three weeks. When Bennett showed up, asking if he'd like to launch a penny paper, Greeley declined.

In May 1835, therefore, Bennett went ahead on his own. He rented a basement apartment on Wall Street, stretched some pine boards between a set of flour barrels for a desk, and began singlehandedly to produce the *Herald*. Like his penny predecessors, Bennett set out to reach a mass audience, but not because he had a message to convey. He had no prior association with the Workingmen's Party, no ties to New York City's laboring class, no particular interest in its welfare. He just wanted to make a lot of money, and Day's success had made clear that the road to riches ran through a mass market.

The *Herald's* proprietor also wanted to reach the city's elites for whom he was accustomed to writing. Besides, combining gentry with plebeian audiences would boost revenues. Bennett accordingly set out to combine the zest and local identification of the *Sun* and *Transcript* with the broader news coverage of the *Courier and Enquirer* and *Journal of Commerce*.

In the *Herald's* first issue, on May 6, 1835, Bennett announced his intention to transcend existing boundaries of class. His new four-page sheet was "equally intended for the great masses of the community—the merchant, mechanic, working people—the private family as well as the public hotel—the journeyman and his employer—the clerk and his principal." Aware that a penny paper would be automatically suspected of working-class proclivities, Bennett ingratiated himself with the mercantile

elite by denouncing Day as a “Fanny Wright infidel.” The *Herald* offered not radicalism but relief from the “dull business air” of the large morning papers. It would “exhilarate the breakfast table.”

As promised, Bennett delivered “brevity, variety, point, piquancy, and cheapness.” His prose was fresh, pointed, and zestful. And he offered far more for a penny than did the *Sun*. Bennett entered the national news race. In short order, his express relays were outpacing those of the *Courier* and the *Journal* by three hours, and by 1837 his news boats rivaled those of the mercantile press. Bennett also went after New York news, even more assiduously than Day. The *Herald* covered City Hall and the police, court trials and executions, sports and theater, docks and coffeehouses, and sermons and church meetings to boot.

Bennett investigated Wall Street with unprecedented accuracy and acumen. Many sixpenny editors had entered into secret and lucrative collaborations with brokers, hyping or disparaging stocks to their mutual advantage. Bennett savaged them for “catering to speculators, hypocrites, stock-jobbers, bankers, brokers, and political and moral rascals of all kinds.” He, Bennett, would deal “justly, honestly and fearlessly with every institution in Wall Street—every broker—every bank—every capitalist.” Again, he delivered. His first “Money Markets” column demonstrated that a recent “uncommon rise in the stock market [was] not produced by accident,” and he repeatedly blasted stock speculations as a “secret conspiracy of our large capitalists.”

Bennett’s stance won artisanal applause. His exposes of chicaneries shrouded from the general public echoed the old labor press’s attack on privileged monopolies. Yet the bulls and bears themselves pored over his daily column, so accurate were his analyses, and so poorly did the plungers understand the market. The result was precisely the one Bennett sought: where the *Sun* and *Transcript* didn’t penetrate the downtown financial world, and the *Courier and Enquirer* and *Journal of Commerce* were “never seen in the crowd,” the *Herald* reached all parts of town.

The same breadth of appeal marked the pioneering coverage of society he would develop over next few years. Converting gossip into news, and private lives into public commodities, Bennett reported on the doings at Broadway mansions and the social season at Saratoga Springs, often with a whiff of mockery. Ordinary New Yorkers delighted at this peek behind the

curtains. With classes segueing off to different parts of town, elite lives had become less accessible to the curious, the critical, and the covetous alike.

Patricians loathed Bennett's violations of their newly prized privacy. But they too bought the penny press, as fascinated as the plebeians with its revelations about personalities. "Everybody wonders how people can buy these receptacles of scandal, the penny papers," Philip Hone wrote in 1837, "and yet everybody does encourage them; and the very man who blames his neighbors for setting so bad an example, occasionally puts one in his pocket to carry home to his family for their and his own edification."

Even the *Herald's* advertisements were bright, shocking, useful, and broadly appealing. Where the blanket press might run the same ad for a year, Bennett demanded fresh copy every two weeks, eventually every day. He also opened his pages promiscuously to anyone who would pay. He started a "Personals" column that included communiques from women looking for husbands, mothers searching for lost children, prostitutes soliciting clients, abortionists seeking customers.

Caveat emptor was Bennett's guiding principle; complaints about advertisers were briskly dismissed. When one correspondent denounced Dr. Brandreth's Pills as a quack nostrum, Bennett replied: "Send us more advertisements than Dr. Brandreth does—give us higher prices—we'll cut Dr. Brandreth dead—or at least curtail his space. Business is business—money is money. . . . We permit no blockhead to interfere with our business."

And business was phenomenal. Within fifteen months, the *Herald* claimed a circulation of twenty thousand. Bennett plowed profits back into a new steam press (from Hoe and Company), a new building at the corner of Nassau and Beekman, a bureau in Washington, and a network of European correspondents, making the *Herald* the first American paper to offer systematic foreign coverage. Within four years of its founding, it surpassed the *Sun*—and the *Times* of London, assuming first place in the global circulation sweepstakes.

A GLANCE AT NEW YORK

In 1836 a Philadelphia journalist exploring New York and Brooklyn found people reading penny papers in virtually every street, lane, and alley.

“Almost every porter and drayman, while not engaged in his occupation, may be seen with a paper in his hands.” The penny press offered New Yorkers a broadly encompassing look at the range of groups that had clambered into visibility during the previous democratizing decades. It did not speak to or for any one of them in particular. It did not reflect, and help shape, a single constituency, as did the era’s many religious, ethnic, racial, and radical papers. It was not limited by eighteenth-century print culture’s pinched definition of urbanity and restrictive repertoire of urban types and settings. Instead, it addressed something that had never quite existed before except in republican theory: a “public” at large, a civic demos. In doing so, it offered New York’s citizenry the technical and textual means to grasp their city’s growing miscellaneity.

In 1837 this new way of seeing the city was transferred to urban guidebooks, when Asa Greene, editor of the *Transcript*, authored *A Glance at ‘New York*. Greene’s style was far livelier than his predecessors’. He included anecdotes, dialogue, and personal musings, described people and places with flair, and presented arguments illustrated with everyday events and characters.

Glance was the first critical guide to New York City. Greene felt no need to present the urban milieu in an unambivalently positive light, as his forebears had. Indeed he gently mocked New Yorkers for their insatiable need to proclaim their city biggest and best. Noting the negatives in sharp but jovial language, Greene cited corrupt municipal politics, inadequate public services (poor water and sparse parks), rampant hucksterism, superficial values, and, particularly, class stratification. Greene conveyed a sympathy for the city’s working classes that had never appeared in any previous guide. *Glance* had a political edge: it attacked the greed and opportunism of those in power while twitting fatuous nouveau riches.

Not content to rattle off a list of worthy civic institutions—hotels, theaters, churches, jails—Greene set out to capture the panorama of city life, embracing such novel subjects as rogues, mobs, monopolies, and hoaxes. This comprehensive way of seeing turned powerful floodlights on all corners of the civic stage. Its arrival, during the tumultuous decade of the 1830s, meant that these years of fevered prosperity and riotous contention would be the first in the city’s history to receive instant amplification in a

mass medium. From that day to this, New York, communications capital, would be the most closely watched city in the world.

The Destroying Demon of Debauchery

In the summer of 1829, an upstate Presbyterian evangelist named Charles Grandison Finney descended on New York City to establish the Kingdom of God in Manhattan. The revivalist's energetic and colloquial style—"We must have exciting, powerful preaching," Finney thundered, "or the devil will have the people, except what the Methodists can save"—had recently ignited a spiritual firestorm in sin-soaked towns along the Erie Canal. Unlike most millenarians, who believed Christ's Second Coming would inaugurate the thousand years of holiness promised in Revelations 20, Finney argued that Jesus' arrival would culminate—indeed be predicated upon—a ten-century reign of peace and justice. Finney's millennium would be attained by human action, not divine fiat: pious men and women who had saved themselves had now to save society.

Finney's upstate activities had brought him to the attention of the Manhattanbased Association of Gentlemen. This informal junta of transplanted Yankee merchants and bankers—among them Anson Phelps, Arthur Tappan, and David Low Dodge—had abandoned their parents' gloomy belief in predestination. Self-made men, they believed that sinners could be saved by applying the kind of disciplined effort that garnered success in the business world. They begged Finney to bring his crusade to (as Phelps put it) "our Stupid, Poluted, and Perishing City," promising him to put up the money for a "free" church that would allow the poor to attend without paying the pewrents still required by every denomination except the Methodists. Finney accepted, and by the fall of 1829 he had been installed as the temporary pastor of the First Free Presbyterian Church on Thames Street.

Finney's arrival under the auspices of the Association of Gentlemen was a signal that the cause of social reform in New York had entered a new and more aggressively evangelical phase. Those genteel Knickerbockers who had dominated the work of charity and benevolence from 1790 to 1820 were passing away—Divie Bethune in 1824, Thomas Eddy in 1827, De Witt Clinton in 1828—and even the venerable John Pintard, now approaching seventy, was beginning to slow down. The wealthy Yankees

who took over from them made no secret of their intention to do things differently. Nominally Presbyterians, they had lost patience with divines like Gardiner Spring of the Brick Presbyterian Church and Samuel Cox of the Laight Street Presbyterian Church, who opposed Finney-style revivals as theologically unsound as well as undignified. From the Yankee point of view, too, the older generation of reformers had been insufficiently concerned with a swarm of new threats to social stability and tranquility: trade unions, Tammany politicians, the Catholic Church, and the freethinkers flocking to Fanny Wright's Hall of Science.

Over the next half-dozen years, accordingly, the Association of Gentlemen stepped up their support of Finney by providing him with bigger and better church buildings. In 1832 they converted the former Chatham Street Theater into the Chatham Street Chapel, also known as the Second Free Presbyterian Church. The huge barn of a place, hard by the burgeoning Five Points, had been deserted by fashionable patrons, while working-class customers opted for its competitor, the Bowery Theater. Finney worried about the neighborhood—"Is not the location too filthy for decent people to go there?" he queried Tappan—but it could seat twenty-five hundred worshippers, and he moved in anyway. Several years later, in 1835, the association established him in the massive new Broadway Tabernacle (at what is now Worth Street) directly across from New York Hospital and near the new Masonic Hall and Columbia College. The tabernacle's great rotunda, with tiers of pews rising steeply from the central pulpit, served to focus all eyes on the preacher and carried his voice clearly to the throngs that came to hear him.

By the end of the decade, Finney's crusades in New York had spawned eleven "free" churches with several thousand members, all bundled into a Third Presbytery created by the Synod of New York (the alternative being schism). He saved disappointingly few working-class men, however: three-fourths of his followers consisted of working-class women, many of them recent rural migrants employed as domestics and seamstresses. (Frances Trollope wrote that evangelical congregations often consisted of "long rows of French bonnets and pretty faces," resembling "beds of tulips, so gay, so bright, so beautiful.") Most of the men Finney did manage to win over were affluent merchants, manufacturers, retailers, and professionals who, like the Associated Gentlemen, believed that an awakened Christian asceticism was

the answer to urban poverty and vice. Many more were drawn from the city's embryonic middle class—shopkeepers, small master craftsmen, clerks, salesmen, bookkeepers, and bank tellers—who embraced evangelicalism as a way to dissociate themselves from both the dissolute poor and the idle rich.

ONWARD, CHRISTIAN SOLDIERS

The real measure of Finney's impact on the city wasn't the number of souls he saved but rather the boost his preaching gave to a wide range of evangelical efforts during the 1830s. Reform projects that had once absorbed a relative handful now enlisted the energies and emotions of much greater numbers of middle- and upper-class New Yorkers.

Evangelical fervor revitalized the old American Tract Society, which by 1835 had over a thousand men and women distributing its publications in the city's stores, taverns, countinghouses, markets, asylums, and hospitals. The reinvigorated American Bible Society embarked on a "general supply" campaign to deliver a Bible to every family in the United States by the end of 1831 and actually managed to distribute 481,000 copies—well short of its goal but an impressive display of renewed organizational resolve and sophistication. Thanks largely to Finney, moreover, these groups, along with Sunday schools, home missions, and a steadily growing number of other such organizations, found it easier to raise money and develop a national outreach. Each May, generals and foot soldiers from moral uplift organizations throughout the country descended in great numbers on New York for conclaves at the Chatham Street Chapel or the Broadway Tabernacle, underscoring the city's position as headquarters of the Benevolent Empire. By 1830 the thirteen leading societies had already received contributions of \$2.8 million, compared to the \$3.6 million Congress had spent on internal improvements since the founding of the republic. Soon their annual receipts would surpass the annual federal budget.

Mainstream Christian denominations struggled to keep up with the evangelical juggernaut. Anglicans, under the leadership of Benjamin Onderdonk (consecrated as bishop of New York in 1830), established a Protestant Episcopal City Missionary Society to open free churches in poor neighborhoods. That initiative was followed by the Bible and Common

Prayer Book Society, the Protestant Episcopal Tract Society, and the New York Protestant Episcopal Sunday School Union, which by 1833 embraced twenty-four schools with some sixty-two hundred pupils. Finney-style exhortations had no part in the Anglican program, however. “The transformation of character we propose to effect,” said the Episcopalian New York Mission Council in 1832, would be achieved “by the simple agency of plain instruction and cheering counsel.”

In 1835, several years after the formation of the evangelical Third Presbytery, Finney’s adherents in the Presbyterian Church resolved to build a seminary to train a new generation of clergymen. Meeting at the home of Knowles Taylor—a prominent merchant, elder of the Bleecker Street Presbyterian Church, and treasurer of the American Home Missionary Society—they set in motion plans for the New York Theological Seminary. In 1839, a year after moving into its first building on University Place, it was renamed the Union Theological Seminary in the City of New York.

Evangelical Presbyterians also figured prominently in forging an alternative to the Episcopalian stronghold of Columbia College. Despite its central location, Columbia in the 1820s drowsed on the margins of New York’s intellectual life, expounding the classics to upper-class boys destined for careers in the clergy. But its critics were growing more numerous and vocal. Mercantile and professional families wanted their sons trained for commerce, not the cloister. Workingmen and democrats sought equal educational opportunity for all residents. Old Jeffersonians like Albert Gallatin argued that no proper college could function under clerical control. Powerful evangelicals like Eleazar Lord and the Rev. Samuel H. Cox pressed for a Presbyterian version of Columbia.

In the autumn of 1830 a three-day “literary and scientific convention” convened in City Hall to discuss proposals for a municipal institution of higher learning comparable to the new University of London (1826). After some sharp debate, the hundred-odd delegates agreed on a plan for a University of the City of New York (now New York University). When both the state and city governments refused to provide financial support, the university’s trustees raised a hundred thousand dollars from private donors, hired faculty, and tapped Gallatin to serve as its first president. Less than a year later, however, Gallatin resigned in disgust. Evangelical Presbyterian and Reformed ministers had succeeded in drawing up a curriculum for the

university that neglected the “rational and practical” learning he considered essential. By 1832, as classes got underway in rented quarters in Clinton Hall (at Nassau and Beekman streets), it was no surprise that twice as many Presbyterian students registered as those of any other denomination. Three years later, the university moved into its first permanent home, a white marble Gothic Revival building on Washington Square designed by A. J. Davis.

SPIRIT VERSUS SPIRITS

By the mid-1820s the massive growth of western grain production, combined with improved technologies of distillation and ever more efficient means of transportation, left New York awash in cheap liquor. It also triggered a new eruption of concern over the scope and consequences of excessive drinking. John Pintard remarked as early as 1821 that “grovelling drunkenness increases among the lower vulgar owing to the reduced prices of ardent spirits.” Growing numbers of well-to-do residents—already in revolt against the swilling customary on New Year’s and other holidays—were alarmed that alcohol was taking a heavy toll among their own kind as well, eroding ambition, dissipating wealth, and spawning domestic violence. So, too, manufacturers challenged the customary drinking rights of their employees as a threat to higher profits, while journeyman unionists and freethinkers denounced drunkenness as an obstacle to effective organization in the trades.

It was evangelical merchants and industrialists, however, who would inspire and lead the city’s first temperance movement. Hat manufacturer Joseph Brewster, for one, was an idealistic and determined Finneyite who also calculated that banning alcohol from the workplace could boost profits by up to 25 percent. He moved his family from a 4th Street mansion (today’s Old Merchant’s House museum) to a shabby Bowery dwelling on Rivington Street, joined one of the free Presbyterian churches, and began to hand out abstinence tracts (he slipped one inside each hat he sold) and to lead raiding parties on nearby saloons. Lewis Tappan likewise organized a network of Christian spies to infiltrate taverns and report infractions of long-ignored ordinances to municipal authorities.

When grocers, publicans, distillers, and the landlords who rented them space started to fight back, evangelicals assembled at the Masonic Hall in

1829 to organize the New-York City Temperance Society. The society's first president was banker Samuel Ward (of Prime, Ward, and King); its leadership included Tappan, engine maker J. P. Allaire, Eleazar Lord (president of the Manhattan Insurance Company), and other prominent businessmen and professionals. Over the next several years, the society launched its own newspaper, the *Genius of Temperance*, and began an aggressive recruitment campaign. By 1835 it had chapters in each ward, forty-five additional subsidiaries attached to individual churches, and societies for sailors, stonecutters, and silversmiths—better than fifty thousand members in all. (A parallel Brooklyn Temperance Society, headed by Adrian van Sinderen, first president of the Brooklyn Savings Bank, made equally rapid headway, as did the black-run Society for Temperance, which recruited through African-American churches.)

Members did more than pledge personal abstinence. They distributed tracts, addressed civic groups, launched boycotts, and pushed for legal restrictions. One measure of their effectiveness was a sharp drop in alcohol consumption (which fell, nationwide, from four gallons per capita in 1830 to less than two gallons a decade later); there was also a modest reduction in the number of liquor licenses, especially in working-class wards. The Brooklyn temperance movement won passage of an ordinance curbing the sale of liquor by the glass, after which the number of taverns fell from 178 to fifty, even as Brooklyn's population rose from over twelve thousand to nearly thirty thousand.

“THE DESTROYING DEMON OF DEBAUCHERY”

In 1831 and 1832, at the invitation of New York's temperance leadership, Philadelphia activist Sylvester Graham delivered lectures on the relationship between diet and disease. New Yorkers, Graham argued, had been fatally weakened in their ability to resist epidemics by the improper eating habits spawned by big-city life. Graham opposed the use of stimulants—not only liquor, wine, and cider but tea, coffee, and tobacco too. He advocated vegetarianism. He denounced urban bakers who used “refined” flour—stripped of husks and dark oleaginous germ and whitened with “chemical agents”—because it baked more quickly than traditional bread, even though the result was an almost crustless loaf without granular texture or nutritional value. He railed, too, against marketplace milk, much

of which came from cows fed on leftover distillery mash (swill), with the anemic, liquor-inflected product made presentable by the addition of chalk, plaster of Paris, and molasses.

Graham's proposed antidotes for such urban ills were—like most evangelical suggestions—personal, not social. Rather than calling for regulations on production, he advised New Yorkers to alter their consumption patterns. Ideally they should bake their own bread; he gave them directions for selecting, preserving, and grinding wheat, then fermenting it to produce the old-fashioned, whole-wheat bread that later bore his name. They should also consume more fresh fruits and leafy vegetables—perishables still in short supply in urban markets and considered unhealthy if not cooked.

In 1833 some of his followers opened a Graham Boardinghouse, a kind of temperance hotel where men (no women were allowed) could follow a Grahamite regimen. No alcohol, tea, or coffee was allowed, as the sign in front advised. Bells rang at five o'clock summoning residents to cold baths, followed by a breakfast of fruit, wheat pudding, tepid gruel, and cold water or milk, after which the lodgers—Arthur Tappan, Horace Greeley, and, when he was in town, William Lloyd Garrison were among the noted guests—went off to work in Pearl or Wall Street. They came back for a midday vegetarian meal accompanied by wheat-meal bread and cold filtered rainwater, then returned again in the evening for exercise and a cold-water wash before lights were doused, and clients locked in, at “precisely” ten o'clock.

Avoiding spirits and highly seasoned “flesh-meat” was an aid to sexual abstinence as well, as Graham told an enthusiastic audience at New York's American Lyceum (in a talk later published as a *Lecture to Young Men* [1834]). Male orgasms, he warned, were inherently destructive; the loss of vital semen lowered men's life force, making them easy prey to diabetes, jaundice, consumption, and premature death. Sex was as bad for business as it was for health. Reckless “spending” of sperm could lead to financial as well as moral and physiological bankruptcy. Properly subdued, however, sexuality, like nature, could be made useful—its energies harnessed, accumulated, put to productive purposes.

Unfortunately a saturnalia of carnality was underway in the city. The locus of the problem was the all-male boardinghouses where growing

numbers of country boys and immigrant youths were lodged, unsupervised by family, church, or community. These single young men, freed from constraints, drank in saloons, visited brothels, and practiced self-abuse (a “loathsome and beastly habit” that produced debility, weakness, dyspepsia, impotency, and “masturbatory insanity”). Such practices, moreover, were being picked up by children of the higher classes, transmitted via the debasing influence of servants or through the schools, where youths learned filthy habits from their peers.

Continence was the only answer. Sex was to be avoided before one got married—in one’s late twenties or thirties; interim masturbatory relief was strictly enjoined. Even with the conjugal state safely attained, sexuality was best proscribed.

The pursuit of sexual self-discipline became the subject of a flood of self-help books, tracts, manuals, and magazine articles addressed to males (passionlessness was presumed to come naturally to women). Abstinence, like temperance, was presented as a prescription for personal, social, and financial well-being. Alas, the theory availed its progenitor little: for all his careful rationing of intake and outflow, Sylvester Graham suffered a nervous breakdown in 1837 and spent the rest of his life a semi-invalid.

Grahamites evoked ridicule, some hostile but most affable: vegetarianism and coldwater cures, after all, were voluntary affairs. But reformers did not settle for reining in their own bodies, and when they set out to discipline the sex lives of other New Yorkers, they provoked an uproar.

As Charles Finney was winding down his first New York City revival in the spring of 1830, John Robert McDowall arrived in town. A twenty-nine-year-old Amherst graduate and Princeton divinity student, McDowall spent the summer as an American Tract Society missionary, with Arthur Tappan covering his expenses. Dispatched to the Five Points, he visited slum cellars, distributed Scripture, taught Sunday school classes, and gave temperance lectures. McDowall also began visiting brothels, where he led prayer meetings and remonstrated with the women and their customers.

McDowall also started a Sunday school and Bible class in New York’s almshouse and prisons, with access arranged by Finneyite supporter Anson Phelps. Pious genteel women, many recently converted by Finney, taught in

these classes, led prayer meetings, and, like McDowall, developed a particular interest in the problems of female convicts, most of whom were prostitutes.

In 1831 McDowall and his female adherents launched the New-York Magdalen Society with funding provided by Arthur Tappan and his male evangelical associates. The society opened a house of refuge for penitent prostitutes in the Five Points, modeled on the famous Magdalen Asylum in London, with McDowall as curate and on-site superintendent to “the daughters of guilt and sorrow.”

The Magdalens quickly ran into trouble. In the summer of 1831 McDowall issued a shocking pamphlet declaring that New York City had been overrun with harlots—ten thousand of them. Nor was their clientele limited to sailors and laborers, he charged; it included gentlemen from the most prominent and respectable families. Lewdness and impurity were tainting all sectors of civic society, and unless something was done, “multitudes will probably be immolated on the altar of the destroying demon of debauchery.”

McDowall’s statistics were wildly off, but he was responding to a real phenomenon. Commercial sex had become ever more ubiquitous. By the 1830s the Five Points was notorious, with twenty-seven of the forty-three blocks surrounding Paradise Square hosting brothels in whose windows girls in varying stages of undress paraded to lure street trade. In more genteel zones, the expensive carriages of judges, merchants, lawyers, and statesmen could routinely be seen lined up in front of their owners’ favorite parlor houses, and some clients went so far as to pay traditional New Year’s calls on madams. These gentlemen, some of them in flight from the new domesticity, could indulge their lustful pastimes reasonably sure that no one would trumpet their misdeeds.

This tacit approval of officially illicit sex extended to the vast numbers of visiting businessmen for whom parlor-house patronage was fast becoming a customary part of commercial transactions. During 1835 New York’s leading hotels housed nearly sixty thousand guests, many of them country merchants come to arrange credit and place orders. More than a few banks and businesses dispatched “drummers” to show them a good time. As one critic described the process in 1836, drummers invited potential clients

“to champagne parties, to the theatre, and to houses of infamy, with the offer to bear all the expense.”

Into this civic conspiracy of masculine silence stepped John Robert McDowall, loudly blowing the whistle. Not surprisingly, his *Magdalen Reports/as* greeted with an avalanche of criticism, which the *Evening Post* summed up by saying: “The report should never have been printed, and being printed should be as speedily as possible suppressed.” Gentlemen of standing argued that McDowall’s lurid picture of urban vice was itself prurient and pornographic—“a disgraceful document,” said Philip Hone. Even more shocking, as William Cullen Bryant observed, its statistics of whoredom had been read out at a public meeting “composed three-fourths of respectable females.” City boosters protested its slandering of New York’s fair name and pronounced it bad for business. Workingmen and freethinkers denounced it as yet another theocratic initiative by church and state busybodies. Some suggested that McDowall’s zealotry stemmed from a morbid fascination with vice. This accusation was not entirely off base; as Lewis Tappan remarked of his brother, Arthur—McDowall’s patron and one who also liked to boldly “explore [the] recesses of Satan”—he “gloried in all the soiling that attaches to one in such efforts.”

Knickerbockers who resented the rising social influence of New Englanders in the city were much in evidence at an August 1831 meeting in Tammany Hall that called for and swiftly obtained a grand jury investigation of McDowall’s charges. This body could locate a mere 1,438 working girls—a deflated claim the press found risible—but it nevertheless flayed Tappan and the Magdalen trustees. Members of the society, even female ones, were verbally abused and threatened with ostracism. In short order, the campaign for public reticence triumphed. Tappan, taken aback by the rage and respectability of his opponents, quit the Magdalen Society, McDowall resigned his chaplaincy in September, and by November the group had suspended its activities and disposed of its asylum.

Utterly isolated, McDowall was about to give up and leave the city when two groups of genteel Presbyterian women—most of them wives of businessmen or of ministers—joined his purity crusade, thereby transforming the debate over sexuality in the city.

In December 1832 the New York Female Benevolent Society (FBS) was formed to help fallen females who “manifested] a desire to return to the

paths of virtue from which they have swerved.” By May 1835 the FBS had opened the House of Reception, a refuge for prostitutes in Yorkville, four miles north of City Hall. Its bell-driven daily routine included scripture readings and sewing classes to train the magdalens for future jobs with Christian families. The FBS severely limited the appeal of their refuge, however, by refusing to accept any but “worthy” candidates, which required turning away “bigoted Papists” and impious Protestants. After two years they had gathered in only 145 penitents, and of these only four seemed “serious and industrious.” Worse, in the summer of 1836 inmates seized control of the institution, and the bitterly discouraged managers dismissed their charges, closed the building, and turned to dispensing tracts about the Seventh Commandment.

Prostitution Exposed, by “A Butt Ender.” A droll parody of the anti-prostitution campaign organized by McDowall and other reformers, the book conveniently supplies the names and

addresses for more than a hundred local courtesans and brothels. (General Research Division. The New York Public Library. Astor, Lenox and Tilden Foundations)

In May 1834, however, some of the FBS's more militant members had split off to form a new citywide group, the New York Female Moral Reform Society (FMRS). This body quickly won powerful evangelical backing, with Lydia Andrews Finney, the revivalist's wife, becoming its first directress and Arthur Tappan stepping in as its financial backer. The FMRS now appointed McDowall as missionary-general to New York's prostitutes, and he began leading teams of men and women on "active visits" to brothels. Arriving early on Sunday morning, just as the ladies of the night and their customers were waking up, the reformers stationed themselves across the street, knelt in prayer, and began reading Bible passages and singing hymns. When they tried this at some of the rougher venues in the Points and the Hook, the crusaders were often met with curses and threats. At the westside parlor houses, however, they seemed to have something of a deterrent effect: closed coaches would circle for an hour or so, then clatter off. Encouraged, McDowall and company upped the ante by noting down names of the more determined patrons and printing them in *McDowall's Journal*, alongside editorials excoriating brothels as "stagnant pools of moral filth" whose owners "ought to be executed."

McDowall also lit into New York's pornography trade. Charging that "obscene prints and licentious figures and paintings" were sold widely in the city, he collected a variety of "obscene books, prints, music-boxes, [and] snuff-boxes," which he displayed at a meeting of three hundred clergymen in May 1834. Out of probity or prurience, *McDowall's Journal* did well. Circulation that year topped fourteen thousand a month, with half the issues handed out around town, the other half dispatched to rural subscribers.

Another grand jury, impaneled in 1834 to investigate *McDowall's Journal*, declared it patently "offensive to taste, injurious to morals, and degrading to the character of [the] city." Even the Third Presbytery, the body that licensed McDowall to preach and supported his campaign, advised him to discontinue the journal. Accordingly he offered his press to the FMRS, which purchased it, renamed it the *Advocate of Moral Reform*, and staffed it exclusively with women—editors, typesetters, even financial

managers. The *Advocate* gathered 16,500 subscribers within three years, becoming one of the nation's most widely read evangelical papers.

Under the women's direction, the *Advocate* went beyond unmasking men who visited brothels to asking prostitutes who had "ruined" them—it being an article of faith with the ladies that many women "on the town" had been victimized by licentious males—and publishing the names of men whom its investigations showed to be guilty. It sued seducers for civil damages on occasion and launched a petition campaign to lobby public officials in Albany to make seduction a criminal offense.

The newspaper seethed with visceral antagonism to salacious males, and in its pages FMRS members raged against predators who "basely and treacherously" seduced and ruined trusting women. Behind the outrage at particular individuals lay a much deeper resentment of the "despotism" of "lordly man" in general. These pious wives and middle-class mothers insisted that men be held to the same requirement of sexual purity that women were. The double standard, said *the Advocate* in 1835, permitted a "state of licentiousness, systematized as it is in our cities," that constituted "a regular crusade against the sex."

Within a year of its formation, the New York Female Moral Reform Society had hired ministers, missionaries, and agents and had organized five auxiliaries in New York and another twenty-eight outside the city. By 1838 there were 361 auxiliaries and an estimated twenty thousand members, principally in New York State and greater New England. In 1839 the city group reorganized as a national operation, the American Female Moral Reform Society, and within two years it boasted 555 auxiliaries and a combined membership of approximately fifty thousand.

Male clergymen attacked this female initiative, as they had the work of the Female Missionary Society nearly two decades earlier, as being beyond women's proper sphere. But the Female Moral Reform Society strenuously resisted clerical injunctions. As an early issue of the *Advocate* asserted, "This work must be begun with ladies. They are the injured, and they must rise and assert their rights." Rather than meekly returning to the home, militant women elbowed male philanthropists aside and made a place for themselves in the quest for the Millennium.

"IS IT NOT MORE LIKELY THE WORK OF A WOMAN?"

At three A.M. on Sunday, April 10, 1836, brothel keeper Rosina Townsend was awakened by smoke billowing out of Helen Jewett's room. She screamed for the watchmen, who discovered Jewett's body—hacked up (“the bone was cleft to the extent of three inches”) and partly consumed by flames. The rear door was ajar. Just outside lay a hatchet and a blue cloth cloak belonging to one Richard P. Robinson. Townsend explained that Robinson had arrived the previous evening to spend the night with Jewett and had been there at eleven P.M., when she had served the couple champagne. The watch hastened to Robinson's lodging house. There they found pantaloons smeared with what appeared to be lime from the whitewashed fence behind the brothel. Charged with murder, Robinson was imprisoned at Bellevue.

The slaying of Helen Jewett became an instant sensation. “For the last ten days,” James Gordon Bennett wrote in his *Herald* on April 20, “this tragedy and the accused have occupied every tongue—been the leading topic of every conversation—is discussed in every drawing room and gin shop throughout the extent of New York. . . . No point of interest—no event—no contingency ever took place in New York, which has so completely divided public opinion, and created a general debate.”

Premeditated murders were rare—only seven had been reported in all of 1835—but the uproar over the Robinson-Jewett affair stemmed from more than shock. The protagonists were perceived, correctly, as emblematic players on the city's gender stage, whose relationship afforded the citizenry yet another opportunity to debate New York's rapidly changing sexual and class dynamics.

Helen Jewett, daughter of a poor Maine shoemaker, was keenly intelligent, extremely beautiful, and the possessor of social graces acquired in service to a prominent Augusta family. Since 1830, then aged seventeen, she had been a girl “on the town,” first in Portland, then in Boston, finally in New York City. From 1833 on she lived in a series of elegant brothels in the lower Fifth Ward, ending up at 41 Thomas Street in 1835.

Rosina Townsend ran an elegant establishment. Her girls met potential clients in fashionable venues like the third tier at the Park Theater or were screened and deemed acceptable by Madame Townsend herself. Many of the visitors paid a kind of court to the courtesans, in earnest emulation of bourgeois mating rituals. Helen, glamorous and erudite (she read Byron),

received from three to eight love letters a day, which she picked up at the post office or had delivered by public porters.

Robinson, a handsome, ruddy youth of nineteen who dressed in the height of fashion, was one of Jewett's most ardent suitors. Scion of a fine old Connecticut family, Robinson worked for Joseph Hoxie, a Yankee cloth merchant. Hoxie was a charter member of the New-York City Temperance Society, and he supported a lecture series promoting industrious habits and moral deportment among young clerks. So far as his employer knew, Robinson was an unblemished exemplar of proper behavior.

In fact, Robinson was a habitué of whorehouses. Since meeting Jewett in June 1835, Robinson had been visiting her several times a week. He sent her romantic epistles, books, literary periodicals. He went with her to the Park and Bowery theaters. He boasted of his relations with her to his friends, many of whom also shared her favors.

Like their plebeian male counterparts, Robinson and his confraternity of "sporting men"—clerks, cashiers, and fledgling merchants—adopted promiscuous bachelorhood as a way of life, defying the culture of chastity demanded by the evangelicals, and even the conventional proprieties adhered to by Knickerbocker businessmen. Many of these macho clerks lived on their own, as did the single male laborers in working-class boardinghouses, and were equally beyond the moral surveillance of employer, family, or church. Robinsonian dandies, in satisfying their sexual needs through the marketplace, benefited as well from the differential standard of sexual propriety for men and women.

In 1831 McDowall and his Magdalen Society had forced issues of sexuality into the public forum; they had been ruthlessly suppressed and civic silence restored. In 1834 the New York Female Moral Reform Society had redeclared war against male promiscuity, but its crusade remained a marginal and minority preoccupation.

The Jewett murder injected the issue of class into the debate about sex in the city at just the moment when the penny press had arrived, with the result that the conversation was catapulted into the mainstream of popular discourse. Traditional sixpenny editors had preferred not to talk about such sordid issues. Bryant pronounced the case a "disagreeable subject." But the *Herald*, *Sun*, and *Transcript* lavished oceans of lurid prose on the murder,

making it the most intensely covered story of the decade. And, as they took violently opposing positions on the guilt or innocence of the parties, their pugnacious exchanges generated additional excitement, further boosting the circulation of all three.

Bennett led off with a melodramatic recounting of his visit to the scene of the crime. His alluring description of Jewett's body—"the perfect figure, the exquisite limbs, the fine face, the full arms, the beautiful bust, all surpassed in every respect the Venus de Medici"—was a bit odd, to be sure, given that the corpse had been hacked and roasted. His report of an exchange with Madam Townsend, replete with verbatim dialogue and generally considered the first formal interview ever recorded in an American newspaper, was rendered similarly suspect by Townsend's denial, related in the *Sun*, that she had ever talked with him.

But Bennett was after more than mere facts—or what he called "dull police reports." He had a thesis to promote: that Robinson, despite appearances, was a "young, amiable, and innocent youth." In the role of murderer, Bennett cast a series of candidates. First he said one of the other prostitutes had killed Jewett out of jealousy. After all, he asked, given the brutality, "is it not more likely the work of a woman?" Then he blamed Townsend, an "old miserable hag, who has spent her whole life in seducing and inveigling the young and old to their destruction." He even implied that Jewett herself bore moral responsibility for her own death: in becoming one of the "licentious inmates of a fashionable brothel," she had violated the canons of true womanhood and put herself beyond the protective pale of respectability.

Like McDowall, Bennett expressed indignation at vice while closely portraying its lineaments for the delectation of respectable readers. Yet Bennett avoided McDowall's fate, partly by vigorously upholding the established class and gender order, which McDowall had challenged, and partly by fashioning a new journalistic persona. Bennett became the intrepid reporter, the public's representative, duty bound to expose even the most sordid aspects of New York's underworld. This proved a winning and lucrative formula: in one week, the *Herald's* circulation shot up to fifteen thousand per day.

Benjamin Day's *Sun* and the *Transcript* took the opposite tack. Robinson was no innocent boy but a villainous man about town. Jewett hadn't

seduced him; he had seduced Jewett, yet another instance of an upper-class dandy sexually exploiting a working-class woman. He had murdered poor Helen and now would now try to cheat the gallows with help from highly placed friends. This egalitarian analysis, worthy of the penny papers' Workie roots, accorded with assumptions many working-class readers brought to the issue.

After more than a month of discussion in the court of public opinion, the courtroom trial commenced at City Hall on June 2, 1836. Each of its five days was a circus. Even on the second morning, when it rained fiercely, five to six thousand would-be spectators thronged the area. Crowds of clerks—a Robinsonian clique—jammed the courtroom almost daily. They were permitted to whoop and cheer testimony favorable to the prisoner and hiss and boo prosecution witnesses.

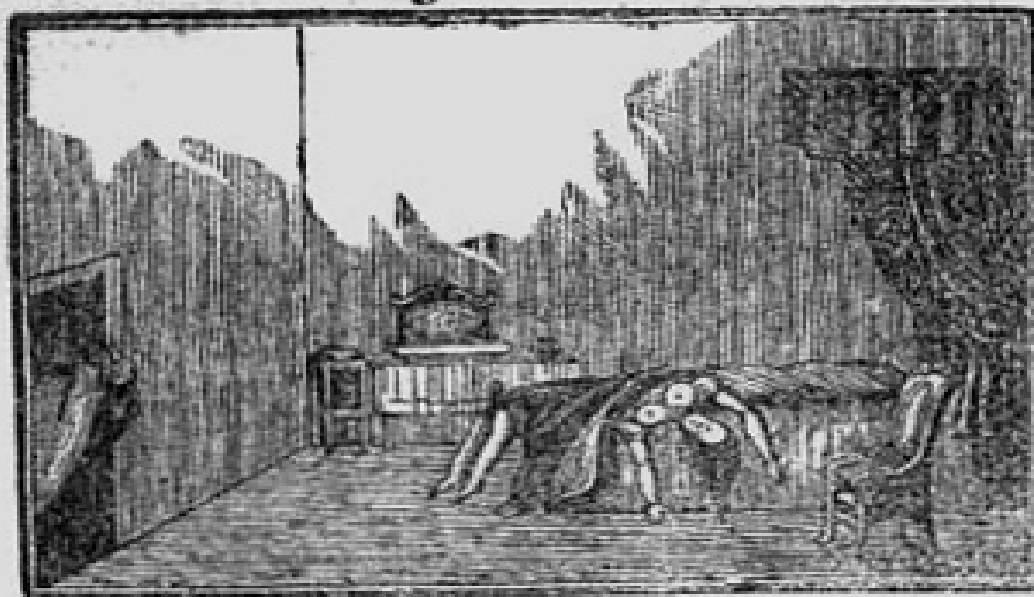

To defend Robinson, his employer hired three of New York's most celebrated lawyers: William Price, Hugh Maxwell, and Ogden Hoffman. The evidence against their client was circumstantial but plentiful. Robinson's roommate swore he had been out late the night of the murder. Townsend and a bevy of the prostitutes placed him at the crime scene. Townsend testified about motive as well, noting that Robinson, recently engaged to a young woman of good family, was anxious to retrieve letters he had sent Jewett, two score of which were found in her room.

In rebuttal, Robinson's lawyers produced a witness—a respectable grocer named Furlong—who insisted the youth had been reading papers in his shop a mile and a half from Thomas Street that evening. Well aware that many believed Furlong's testimony had been purchased with Hoxie's cash, the lawyers also attacked the credibility of the prosecution's witnesses—on *moral* grounds. Women like Townsend, who had led an “infamous and abandoned” life, could not be trusted to tell the truth.

Here the lawyers were bucking convention. Legally, madams had been treated like small businesspersons and protected against threats to their person or property—threats that had increased dramatically in the 1830s. Brothel riots, expressions of community disapprobation of sin, were an old story, but recently small groups of workingclass toughs had been bursting into fancy brothels, physically assaulting and sometimes raping the women, breaking furniture and windows. Some of these incidents were drunken sprees. Some were fueled by misogyny: brothel bullies found the prosperous independence of prostitutes intolerable at a time when working-class males' income and prerogatives were being undermined. Some were driven by class animosity: attackers were furious that upscale brothels barred their access to women who were readily available to clerks and merchants.

When ruffians went on rampages, prostitutes did not hesitate to initiate legal proceedings against them. In 1833, after three men had barged into Mrs. Townsend's Thomas Street house shouting indecent language, she had them charged with assault and battery. The municipality was prepared to defend prostitutes from attacks by lower-class antagonists; would they do so when the accused, by birth and association, was one of the city's elite?

The issue was decided by the presiding judge, Ogden Edwards. Judge Edwards was a distinguished member of the patriciate, a grandson of Jonathan Edwards and cousin of Aaron Burr. Originally a conservative Tammany man—at the constitutional convention of 1821 he had opposed universal suffrage—Edwards was active in the New-York City Temperance

Society. He now decreed that the testimony of prostitutes was likely to be as corrupt as their way of life. The judge instructed the jury not to credit their testimony unless it was otherwise corroborated. Robinson was acquitted in less than ten minutes.

The *Sun* denounced the verdict as a miscarriage of justice and an affirmation of class privilege. It noted that “an opinion is prevalent and openly expressed that any man may commit murder, who has \$1500 to give to Messers Hoffman, Price and Maxwell.” The Female Moral Reform Society’s *Advocate of Moral Reform* also bristled at the ruling, outraged that prostitutes’ testimony—and lives—were not deemed the moral equal of their clients’. Some elite males were outraged too—Philip Hone called the verdict the “foulest blot on the jurisprudence of our country”—but Robinson’s acquittal pleased privileged gentlemen determined to suppress challenges to their masculine prerogatives.

In the trial’s aftermath, antifeminists grew bolder. When Fanny Wright returned later in 1836 and attempted to renew her speaking campaign, she was met not simply with verbal brickbats—the *Courier and Enquirer* attacked her “disgusting exhibition of female impudence”—but with outright suppression. On September 23, maddened males at Masonic Hall drove Wright from the stage with hisses, pounding of canes, stink bombs, and a “volley of expressions of the most vulgar and indecent kind.” She soon found the doors of every major public hall in New York City shut against her.

White, Green, and Black

Just as debauchery, drunkenness, and Sabbath desecration were impediments to fashioning a heavenly city, so too was Catholicism, in evangelical eyes. Popery was idolatrous, theocratic, and despotic, and any further spread of its pernicious doctrines would hinder the Second Coming of Christ. Given the growing presence and power of Catholics in New York City, such a stance resonated widely within Protestant communities. Not only did the evangelicals' nativist denunciations of immigrant Irish win them plaudits from citizens who in other respects were put off by the pious crusaders, but they touched off violent sectarian confrontations in the streets.

At the same time the evangelicals were stirring up anti-Catholic bigots, they were denouncing slavery as an evil, one America had to purge if it were ever to attain a state of grace. Abolitionism, like nativism, would rouse rage in the city. Those who believed that tampering with the South's peculiar institution menaced Manhattan took to the streets, hell bent on suppressing antislavery.

THE COMING OF THE GREEN

When Thomas Addis Emmet died in 1828, he was perhaps the foremost lawyer in New York, ranked by many with Massachusetts's Daniel Webster, and his funeral, by some accounts, was the largest ever seen in the city. Emmet's death, though deeply mourned within the Irish community, coincided with the waning of support for his ideas and values. Together with the other distinguished middle-class emigres who had arrived in the aftermath of the failed 1798 United Irishmen uprising, Emmet had staunchly opposed religious sectarianism. He, his fellow Protestant attorney William Sampson, and Catholic physician William James MacNeven had organized the Association of the Friends of Ireland in New-York. The group had raised funds and rallied support for Daniel O'Connell's civil rights movement in Ireland and helped win emancipation for British Catholics in 1829. The Friends of Ireland, however, like the allied Society for Civil and

Religious Liberties, was vigorously ecumenical. So was the *Shamrock, or Hibernian Chronicle*, New York's first Irish-American paper (1810-17), which reflected the exiles' values. The Shamrock Friendly Association of New York (1816), too, sought to create a united Protestant and Catholic Irish-American community imbued with American and republican values. By forging alliances with highly placed Manhattan sympathizers of varying religious persuasions, the United Irishmen served as links between New York's growing numbers of laboring Catholics and the city's Protestant elite.

Over the 1820s, however, the nonsectarian integrationist vision of the '98ers came to seem less compelling to the Irish working class packing into the Five Points. Feeling engulfed and unwanted, they were drawn instead to a defensive ethnic separatism. They preferred the pages of the newly founded and distinctly pro-Catholic weekly, the *Truth Teller* (1825), which routinely excoriated Protestants who viewed the urban newcomers "with the most determined hostility, hatred and contempt." They liked the paper's bold attacks on the American Bible Society, which distributed only Protestant versions of the Scriptures, even though Catholics indignantly refused them. Immigrants purchased their Bibles instead, patronizing newly established Catholic publishing firms like John Doyle's on Broadway, which put out the popular edition of 1833 known as the Doyle Octavo.

Foreswearing the Shamrock Friendly Association, they turned to groups like the Hibernian Universal Benevolent Society (HUBS), organized by small businessmen and artisans of radical republican bent. Each July fourth, Hibernian painters, coopers, tailors, and cordwainers paraded proudly, displaying their ethnic insignias. Until 1830 the HUBS celebrated St. Patrick's Day with a procession that wended its through the city's Irish neighborhood from Harmony Hall to old St. Patrick's Cathedral. After that its destination was Father Varela's church on Ann Street (though a Cuban, Varela was hailed as a fellow nationalist and appointed as chaplain of the HUBS). After the parade and church services, celebrants moved on to the plebeian McDermott's Sixth Ward Hotel for open house festivities (covered in the *Truth Teller*) that were in sharp contrast to the more exclusive dinners of the Friendly Sons of St. Patrick at Bank's Coffee House or Niblo's Garden.

In the late 1820s and early 1830s, the marchers' ranks were rapidly reinforced. In 1827, when Britain repealed all restrictions on emigration, over twenty thousand Irish had flocked to the new world. By 1835 over thirty thousand Irish were arriving in New York each year, the majority of them poor, unskilled, male, young, and—for the first time in New York City's long history of Gaelic immigration—Catholic. Fed by this influx, the Church expanded at an unprecedented pace. "The Catholics have a considerable establishment in New-York," Tocqueville noted. It included such new additions as St. Mary (1826) on Grand Street, for the shipyard workers, and St. Joseph (1829) on Sixth Avenue, which served Greenwich Village contractors and builders. By 1833 Felix Varela's mission church to the Irish had evolved into two parishes, St. James and Transfiguration—the latter centered from 1836 in a former Presbyterian church on Chambers Street. (St. Paul's Catholic Church in Cobble Hill, Brooklyn, was completed the same year.) The diocese also established a "national" parish, a multiethnic response to a multinational city. In 1833 Bishop John Dubois approved construction of the tiny but quasi-autonomous St. Nicholas Church on East 2nd Street for the three thousand resident Catholic Germans who had up till then had worshiped, unhappily, with the Irish and French.

Newly fortified, the Catholic community displayed a new feistiness in its relations with the Protestant majority. In 1834, for instance, Bishop Dubois suggested to the Public School Society that at least in PSS No. 5 (on Mott Street near St. Pat's) it remove defamatory language from schoolbooks and allow after-hours use of the building for religious instruction, in order to "ensure the confidence of Catholic parents." Dubois promised the trustees he had no sectarian motives, no desire to proselytize, but the PSS insisted that its pan-Protestantism was truly "nonsectarian" and refused any accommodation. Balked, the hierarchy continued its piecemeal construction of an alternative parochial school system.

"POPERY OUGHT ALWAYS TO BE LOATHED AND EXECRATED"

As New York's Catholic Church changed during the 1820s—became more working class, more militant, more Irish, less middle class, less French and Spanish, less respectable—anxieties and resentments rose in various Protestant quarters. These concerns were heightened at decade's end by a

particular confluence of events. Catholic emancipation in England (1829) generated a flood of antipopery books and tracts decrying the new license; many of these were exported to New York, where they agitated local activists. The advent of Finney's revivals exacerbated tensions by generating millennial enthusiasm and heightening denominational aggressiveness. The sudden spurt of Irish Catholic immigration seemed menacing too, in the light of Vatican support for various reactionary European governments. Some believed it signaled an attempt by monarchists and despots to establish a beachhead in New York City, as a step toward infiltrating and overthrowing the republic.

In January 1830, accordingly, a small group of clerical and lay militants established the *Protestant*, an avowedly anti-Catholic weekly. In its initial number of January 2, 1830, the Rev. George Bourne declared that the paper's goal would be to expose the papacy's "present enterprising efforts to recover and extend its unholy dominion, especially on the western continent." This initiative was followed, in January 1831, by formation of the New York Protestant Association under the leadership of the Rev W. C. Brownlee, a Dutch Reformed pastor. The group began disseminating anti-Catholic literature and, in 1832, sponsoring public meetings to discuss the history and character of popery. Attendance at these biweekly gatherings soon swelled from three hundred to fifteen hundred (not counting the spinoffs in Brooklyn), in part because Catholics began showing up as well, to cheer on their spokesmen. Brownlee, somewhat incautiously, had dared Catholic priests to come debate the issues, only to find that Felix Várela and other apologists proved formidable opponents.

These battles spilled over into the sectarian press, with the *Truth Teller* leading the Catholic camp, and the Protestant side upheld in Brownlee's new biweekly, the *American Protestant Vindicator and Defender of Civil and Religious Liberty Against the Inroads of Popery* (1834). The *Vindicator's* prospectus (endorsed by twelve clergymen) announced that as "Popery ought always to be loathed and execrated," Brownlee would lay bare its "detestable impieties, corruptions and mischiefs." Agents fanned out across the country, offering lectures, selling *Vindicator* subscriptions, and inspiring local imitations of the New York Protestant Association.

Also in 1834, Samuel F. B. Morse, just back from Europe, published a series of letters in the *New York Observer*, an evangelical paper,

concerning a “Foreign Conspiracy against the Liberties of the United States.” The artist announced that in Vienna he had discovered the existence of a plot by European monarchs leagued in the Holy Alliance to flood the United States with Catholics. In another Morse series, issued as a pamphlet in 1835, the newly appointed NYU professor warned of “foreign turbulence imported by ship-loads” at the behest of “priest-controlled machines” and rhetorically demanded: “Can one throw mud into pure water and not disturb its clearness?” The answer was clear: Morse called on all New York patriots to stand tall against the growing power of the Catholic hierarchy and the onrushing influx of Irish.

“DAMNED IRISH!”

By March 1835 the Irish were in a fury. When the New York Protestant Association sponsored a meeting at Broadway Hall to discuss the question “Is Popery Compatible with Civil Liberty?” a crowd of Catholics forced their way in, broke up furniture, and destroyed the fixtures while the speakers escaped through the back passageway.

Catholic clergymen disavowed the Broadway Hall riot, but nativists seized on it as justification of their concerns. In June, with James Watson Webb, pugnacious editor of the *Courier and Enquirer*, serving as a prime mover, the Native American Democratic Association was organized—the first explicitly nativist political party in the United States. It established ward committees, set up its own newspaper (the *Spirit of ‘76*), and warned Anglo-American voters, chiefly small masters and journeymen, of the “swarms of foreign artisans who are more destructive to native American industry than the locusts and lice were to the Egyptian fields.”

Violence erupted again in 1835 when a Bowery saloon keeper announced plans to form an Irish militia company, to be called the O’Connell Guards in honor of the Irish patriot. The nativist press shrieked about a “foreign armed force stationed among us,” and on June 21, 1835, the American Guards, a Bowery gang proclaiming native ancestry, clashed with Irishmen in Chatham Square. The battle, fought with clubs and brickbats, took the life of a passerby—a physician, struck by a brick, fell to the sidewalk and was trampled by struggling combatants. Rioting spread throughout the Five Points and elsewhere in the city, until subdued by Mayor Lawrence and two hundred policemen.

That fall, the Native American Democratic Association ran its first ticket, on a platform demanding that only native-born Americans be permitted to hold office, but the new party, snarled in internal divisions, had little impact. Philip Hone wrote gloomily in his diary that December that “low Irishmen”—“the most ignorant, and consequently the most obstinate white men in the world”—were now able to “decide the elections in the city of New York.” In time, he feared, “the same brogue which they have instructed to shout ‘Hurrah for Jackson!’ shall be used to impart additional horror to the cry of ‘Down with the natives!’”

Nativists emerged in Brooklyn too; its populace, friendly to the Irish in the 1820s, had grown alarmed by the 1830s, their fears played on by politicians and editors (like Alden Spooner, who raised a hue and cry against “foreigners”). Here, too, Native American candidates did poorly and moderates remained in command: the Rev. Evan Johnson, rector of St. John’s Episcopal, used his 1835 Thanksgiving Day sermon to preach against nativism.

Seeking a more combustible issue, nativists spiced their theology with sex. In January 1836 Harper Brothers published *Awful Disclosures of the Hotel Dieu Nunnery of Montreal*, by one Maria Monk. (The Harpers, though nativists themselves, were concerned enough about their firm’s reputation to set up a dummy company to bring *Awful* out.) In the book, which Benjamin Day excerpted in the *Sun*, Monk told of her Protestant upbringing, her embrace of Catholicism, and her arrival at the Canadian convent, where she discovered that nuns were forced to have intercourse with lustful priests (those who refused were executed). Children born of these criminal unions were baptized, then strangled and thrown into a large hole in the basement. Monk, impregnated by one Father Phelan, escaped to New York City, tried to commit suicide, was taken to a charity hospital, and confessed all to a kindly Protestant clergyman.

The anti-Catholic press gave *Awful Disclosures* complete credence. Indeed the Rev. George Bourne of the Protestant Association capitalized on the furor to launch a new organization, the Protestant Reformation Society, and more ministers joined the antipopery crusade. Catholic clerics, led by Father Várela, charged that the “revelations” were a manufactured smear, and so they proved to be. Maria’s mother came forward to say her daughter’s tale was the product of a brain injured in infancy when the child

had run a slate pencil into her head. Growing up wild, Maria had been confined in a Catholic Magdalen asylum. She had escaped, with the aid of a former lover, and come to New York, where leading nativist ministers—including the Rev. Bourne—had written up her “disclosures.”

Many nativists doggedly refused to doubt Monk’s story until Colonel William Leete Stone, the mildly antipapist editor of the *Commercial Advertiser*, examined the convent in the fall of 1836 and pronounced the priests and nuns completely innocent. Monk’s star now faded quickly, but not before it had helped spark another outburst in the streets.

In 1836, with excitement still running high, a nativist crowd resolved to attack St. Patrick’s Cathedral. Forewarned, the faithful rallied. The church’s cemetery had just been enclosed by a high brick wall, in which loopholes were now cut for muskets. More armed men lined Prince Street, the expected avenue of attack. Others tore up cobblestones and hoisted baskets full of them to the upper stories along the route. As the anti Catholic army roiled up the Bowery, its advance scouts reported back on the fearsomeness of the Gaels’ military preparations and the fortress-like impregnability of their walled cathedral. Disheartened, the nativists retreated, and their movement, for the moment, subsided.

LIFE ALONG THE COLOR LINE

On July 4, 1827—Emancipation Day—all the city’s black churches held services of prayer and thanksgiving. The largest celebration was in African Zion Church (at Church and Leonard). In his oration, church trustee William Hamilton placed the day in historical context, recalling the bloody events of 1741, the complex relation of blacks to the Revolution of ‘76, and the years of postwar degradation. Then he joyously proclaimed that “this day we stand redeemed from a bitter thralldom.” “No more,” he rolled on, “shall the accursed name of slave be attached to us—no more shall *negro* and *slave* be synonymous [*sic*].”

Then the celebrants quietly dispersed, refraining from a more public jubilation lest they be assaulted by whites hard at their Independence Day revels. Instead they gathered the next day, four thousand strong, near St. John’s Park. Then they paraded through the principal streets to Zion Church

and on to City Hall, where the grand marshal, with drawn sword, saluted the mayor as the crowd roared cheers.

The city's blacks called for making July fifth their annual day of commemoration and reserving the fourth for bitter reflection on the continuing disparity between America's rhetoric and its reality. For as the Rev. Peter Williams Jr. said: "Alas! the freedom to which we have attained is defective." It remained the case, he sadly observed, that in New York City "the rights of men are decided by the colour of their skin." Even the briefest of strolls around segregated Manhattan would have quickly confirmed the accuracy of Williams's assessment.

All the new forms of transport drew the color line. Blacks were banned from cabins on Hudson River steamers and restricted to the exposed deck, on spring day and stormy night alike. The Rev. Williams himself had been refused passage on an American packet bound for Europe and been forced to sail on an English vessel. Blacks were not allowed on street stages, and when a black man hailed one of the new omnibuses going up Broadway, the driver warded him off with a whip, convulsing white bystanders with laughter.

Many commercial facilities were also off limits to African-American New Yorkers. Vauxhall Gardens flatly denied them admission; the Park Theater sequestered them in a roped-off section. An English visitor in 1819, questioning a black barber as to why he had rejected a prospective black customer, was told that if he hadn't the shop would have lost all its white patrons. A black minister was refused a cup of tea by a "foreigner in a cellar cookroom" as the "customers would not put up with it"—customers who included agents of the American Bible Society.

Blacks were barred from the Free School Society's institutions, as well as the charity schools of most denominations. A light-skinned African-American Presbyterian minister found his children rejected from Presbyterian schools "on account of their complexion, they being mixed blood, a few shades below the pure white." The Quakerrun African Free School was exclusively for blacks and provided a good education, but as one graduate noted, the diploma wasn't much help. "What are my prospects?" he asked. "To what shall I turn my head? Shall I be a mechanic? No one will employ me; white boys won't work with me. Shall I be a merchant? No one will have me in his office; white clerks won't

associate with me. Drudgery and servitude, then, are my prospective portion.”

Even servitude couldn't be taken for granted. Irish women were rapidly displacing black women in domestic service jobs, driving some to the streets to hawk fruits or vegetables, or themselves. Most black men found work as waiters, coachmen, servants, or unskilled laborers, though their political powerlessness barred them from most licensed trades (notably jobs as cartmen) and public offices (such as weighers and measurers). Hackney drivers and chimney sweeps were an exception, as their ranks had been opened to blacks by grateful Federalists.

Many black men still took to the sea, as sailors, stewards, or cooks, so many that in the late 1820s the African Free School added navigation to its curriculum. Though wages and working conditions were miserable as ever, foredeck gangs were substantially integrated, forecastles (the cramped bunkrooms below decks in a ship's forward end) maintained a rough equality, freedmen could get wages equal to those of whites, a ship's job came complete with room and board, and often one's compatriots constituted the majority. In 1835 nearly 25 percent of the black men sailing out of New York City were members of predominantly black crews.

Although blacks formed mutual aid societies—like the African Clarkson Association (1829)—to provide sick benefits, burial allowances, and widows' allotments, with economic options so pinched, many nevertheless wound up in public institutions. Here too they received “special” treatment. The almshouse was segregated. Until 1833 the House of Refuge refused to accept black juvenile delinquents. And blacks landed in jail more readily than whites, in part because authorities arrested them for minor infractions ignored when committed by Caucasians.

Things were no better in most churches. Trinity had actively encouraged formation of St. Philip's as a separate (though closely watched) institution, but the General Theological Seminary continued to reject black applicants, and when the New York Diocese did vote to admit a black man to candidacy in holy orders, it stipulated that neither he nor any congregation he might head would be entitled to a seat in the diocesan convention. White churches that received blacks at all sent them aloft to “Nigger Heaven” or shunted them to a “Nigger Pew” (with seats marked *B.M.* for Black Members). Whites who deeded pews to their children generally covenanted

that blacks never be permitted to purchase them, lest this depreciate the value of adjacent pews.

Finally, of course, there was the all but total exclusion from the polls.

Some whites, unsatisfied with this segregated status quo, wanted blacks out of the city altogether. The American Colonization Society (ACS, 1817), whose New York branch was run by the cream of Manhattan society, advocated shipping blacks to Liberia in Africa, or elsewhere out of the country. David Hale, editor of *the Journal of Commerce*, declared that New York City would be much better off without its black population, and Tammany spokesman Mordecai Noah agreed. After all, he asked in 1826, “what do our colored citizens do but fill our almshouses and prisons and congest our streets as beggars?”

As late as the latter 1820s, leading evangelicals like Arthur Tappan and Anson Phelps backed the American Colonization Society’s efforts, with Phelps actually serving as president of the organization’s New York branch. In Brooklyn, Adrian Van Sinderen, president of the Long Island Bible Society and the Brooklyn Temperance Society, also headed the Brooklyn branch of the ACS (founded in 1830). It was only when Arthur Tappan realized how deeply the New York African-American community detested the back-to- Africa project that he swung the evangelical battalions in a radically different direction, and that realization, in turn, came through his affiliation with the city’s black Presbyterian community.

During the 1820s prosperous evangelicals, dismayed by what they saw as the ignorance and viciousness of poor African Americans, helped found and finance a black congregation. In the process, they cultivated some outstanding African leaders, most notably Samuel Cornish. Born free in Delaware in 1795, Cornish had moved to Pennsylvania in 1815, where he was tutored for the ministry by members of the Philadelphia Presbytery. Licensed to preach, he was recruited by New York evangelicals to missionize poor blacks in the Bancker Street area. In 1821 Cornish set up a rough-hewn church, held two or three services there on Sunday, conducted a Sunday school, gave Bible lectures, held prayer meetings, and visited families in their homes. The next year he drew together the twenty-four initial members of the First Colored Presbyterian Church. In 1824, with loans from the presbytery and financial aid from Jacob Lorillard, tobacco merchant and real estate investor, the group built and settled into a brick

home on Elm Street near Canal, with Cornish formally installed as pastor. (It would later relocate to Duane and Hudson, then to Frankfort and William, where it would remain for the next twenty years.)

Samuel Cornish soon tested the limits of denominational support by refusing to draw sharp lines between the black community's theological and political concerns. He began by speaking out against the American Colonization Society and then, in 1827, took an even more decisive step. For almost ten years, the city's white press had cooperated with the ACS by refusing to print the anticolonization resolutions passed by black gatherings in New York and across the country. Cornish now met with a small group that included the Jamaican-born John Russwurm, recently graduated from Bowdoin College (only the second black college graduate in the United States), and church leaders William Hamilton of AME Zion and Peter Williams Jr. of St. Philip's. In March 1827 they launched *Freedom's Journal*, the first black newspaper in the United States. By the summer it had well over twelve hundred subscribers, with perhaps several thousand reading at least parts of each weekly issue.

Freedom's Journal, as edited by Cornish and Russwurm, covered activities in the African-American community, both the extraordinary (like Emancipation Day) and the everyday (marriages; funerals; the doings of mutual relief, literary, temperance, and fraternal societies), together with advertisements from local black businessmen. Its pages presented a portrait of the community strikingly at variance with the negative picture promulgated by the ACS. Not that the paper denied the existence of a rougher element. But Cornish noted that whites constituted, proportionately, a substantially larger percentage of almshouse residents than blacks. And while he conceded that the per capita number of blacks in prison was higher than whites, he argued that "the coloured man's offence, three times out of four, grows out of the circumstances of his condition, while the white man's, most generally, is premeditated and vicious." Cornish did deplore coarse conduct by unrefined and uneducated blacks—which he attributed to slavery, not emancipation—but believed they should be uplifted, not exiled. *Freedom's Journal* exhorted its readers to eschew "loose and depraved habits" and cultivate sobriety, industry, honesty, and self-discipline; like Fanny Wright, the editors hailed education as the way to overcome economic deprivation. They also ran inspirational biographies, published

articles on the black revolution in Haiti, of which they were intensely proud, and proclaimed that “every thing that relates to Africa, shall find a ready admission into our columns.”

Freedom's Journal did not hesitate to lash whites and denounce racism. The paper called for the abolition of property requirements for black voters, denounced the colonization project, and condemned fellow Presbyterians for excluding blacks from church-connected academies. Most critically, *Freedom's Journal* demanded the immediate abolition of slavery. While Cornish and Russwurm did not advocate a slave rebellion in the South—though their Boston agent, David Walker, would do so in 1829—their call for the immediate confiscation of property in slaves was an extremely advanced position, one that not even William Lloyd Garrison would adopt until 1830.

Influential white Presbyterian clergymen were upset by Cornish's denunciations of the American Colonization Society and by what they deemed his insufficient appreciation for their altruism. This created an awkward situation at a time when Cornish was visiting white churches to solicit funds for First Colored Presbyterian. In September 1827, therefore, having completed his agreed-upon six months, Cornish resigned as editor and accepted instead a position as agent of the African Free Schools. (Working with black women who formed the African Dorcas Association in 1828, he managed to double pupil enrollment in a few years by opening four new schools nearer the black community and by mending and providing clothes for children to go to class in.)

father was from Madagascar—Wright had attended the African Free School and in 1825 been admitted to Princeton Theological Seminary, where he served as one of *Freedom's Journal's* fifteen agents, getting many students and faculty to subscribe. On graduating in 1828—the first Afro-American alumnus of a theological seminary—Wright was engaged by the Presbytery of New York. He rapidly expanded First Colored Presbyterian's membership, was installed in 1830 as its pastor, and would go on to transform a small struggling institution into the second largest black church in the city, one heavily involved in educational, reform, and protest efforts.

Freedom's Journal, meanwhile, had fared poorly under Russwurm's sole control. The young man had been won over to the support of the American Colonization Society, and he began printing articles (usually by whites) in favor of colonization, though still including articles (usually by blacks) opposing it. Finally, on March 28, 1829, repudiated by his community, Russwurm resigned; the ACS sent him to Liberia as superintendent of public schools, and the paper ceased publication. Cornish started a new one to replace it, but the *Rights of All* lasted only a few months, and for much of the next decade, the black community's newfound voice fell silent.

“CRUSH THIS HYDRA IN THE RUD”

Before doing so, however, it had won some powerful converts. Editor Samuel Cornish's anticolonization broadsides had unsettled Arthur Tappan. So had the staunch opposition of Peter Williams Jr., rector of St. Philip's, who in an Independence Day speech in 1830 pointedly evoked anti-immigrant sympathies by noting: “We are natives of this country, we ask only to be treated as well as *foreigners*.”

White evangelicals could hear the black antislavery ministers in part because they felt quite comfortable with them. They shared religious values, after all, as well as a belief in temperance and self-improvement. In 1833, for example, the Revs. Cornish and Wright founded the Phoenix Society of New York, declaring that the condition of “people of colour” could “only be meliorated by their being improved in *morals, literature*, and the *mechanic arts*.” Such acceptance of the need to refine, educate, and employ New York's African Americans appealed to Tappan, who signed on as treasurer and donated the funds to hire Cornish as general agent.

This extremely unusual degree of association—in some cases outright friendship—between middle-class blacks and whites in New York City helped galvanize an antislavery movement. Tappan reversed course on colonization, as did Garrison up in Boston, where he started the *Liberator*, an antislavery paper, in 1831. Soon Garrison came out with a sharp attack on the American Colonization Society, a polemic that received wide circulation with the help of financial assistance from Arthur Tappan.

Before long the silk merchant essayed bolder interventions, urged on by Charles Finney, who declared slavery one of the evils America had to shed if it were to attain the millennium. Tappan set out to form an integrated antislavery organization. He secured the collaboration of black ministers Williams, Wright, and Cornish, and he also recruited youthful white evangelicals from the Third Presbytery, seat of Yankeedom in New York. William Goodell, editor of the *Genius of Temperance*, signed on. Joshua Leavitt, editor of the *New York Evangelist* (and, like Garrison and Tappan, a sometime resident at the Grahamite Boardinghouse), also saw the abolitionist light. So did the Rev. George Bourne, editor of the anti-Catholic *Protestant Vindicator*, and Presbyterian minister Samuel H. Cox, a close friend of Cornish and Wright and, like Bourne, a religious bigot, though he focused his ire on Quakerism (“infidelity in drab”).

In the spring of 1833 Tappan launched the *Emancipator*, a newspaper devoted solely to abolition, and underwrote its distribution to clergymen across the North. Next, he and his associates set about organizing a New York Anti-Slavery Society. They decided they would formally inaugurate it whenever English abolitionists succeeded in their campaign to end slavery in the British West Indies. Such a transatlantic linkage would underscore the fact that the abolitionists’ views, rather than those of slaveholders and their apologists, were becoming the norm of the “civilized” world. When news reached New York in September 1833 that Parliament had voted for emancipation, Tappan announced an organizational meeting for 7:30 Wednesday evening, October 2, at Clinton Hall.

On October 1 a worried group of colonizationists met in the office of James Watson Webb, editor of the *Courier and Enquirer*. The American Colonization Society was in deep financial trouble. Its Liberian colony was faring poorly. It was smarting from rebukes (by Arthur Tappan and other

temperancites) about its importation of liquor. And now abolitionist rivals were poised to take the field.

For Webb, the abolitionists presented a clear and present danger not just to the ACS but to New York City itself. Though he proudly traced his lineage to Puritan Massachusetts, Webb was an ardent Episcopalian and a member (by marriage) of New York's wealthy mercantile class. A staunch traditionalist, he had appointed himself the journalistic defender of the city's patriciate. Webb was particularly concerned to guard against any dilution of old American bloodlines by inferior breeds—above all, blacks—and to his way of thinking, Tappan's newest venture threatened just such miscegenation. If slaves were emancipated but not exiled, they would have to be assimilated. Given that many freed slaves would move north, the abolitionist enterprise might mulattoize New York society.

On the morning of Tappan's planned meeting, Webb's *Courier and Enquirer* fulminated: "Are we tamely to look on, and see this most dangerous species of fanaticism extending itself through society? . . . Or shall we, by promptly and fearlessly crushing this many-headed hydra in the bud, expose the weakness as well as the folly, madness, and mischief of these bold and dangerous men?" He urged "patriots" to assemble at Clinton Hall a half hour before meeting time to take remedial action. During the day placards went up around town, addressed (ostensibly) TO ALL PERSONS FROM THE SOUTH (and signed "Many Southerners"), summoning people to Clinton Hall to show their displeasure. Tempers flared yet higher when it was learned that William Lloyd Garrison planned to attend.

That evening at least fifteen hundred New Yorkers arrived at Clinton Hall, yelling for the blood of Tappan and Garrison, only to find the building locked. The trustees of Clinton Hall, having learned of the proposed onslaught, had withdrawn permission to use it, and Tappan's troops had surreptitiously shifted uptown to Finney's Chatham Street Chapel. By the time the crowd of "highly respectable citizens" (in the words of a later newspaper report) learned of the new venue and arrived to storm the building, the New York Anti-Slavery Society had whipped through its organizational meeting, elected Arthur Tappan president, and slipped out the back door. The abolitionists were in business.

Indeed New Yorkers now seized the mantle of national antislavery leadership from the Garrisonians in Boston. On December 4, 1833, sixty

black and white delegates founded the American Anti-Slavery Society (AASS), establishing its national headquarters at 143 Nassau Street and requiring all members of the Executive Committee to be residents of New York City. Arthur Tappan was named president. His brother, Lewis, joined the Executive Committee, along with some white merchants and the black ministerial trio of Cornish, Wright and Williams.

The worst fears of negrophobes had been realized. New York had become a center of antislavery agitation—at who knew what cost to the city's business links with the South. Worse, the integrated organization had put blacks in positions of responsibility and signaled an assault on local segregation by inviting blacks into white evangelical churches (though continuing to seat them separately). Tappan and team—having told New York it had problems with drink and sex—now informed the city it had a racial problem, which it would not be allowed to ignore.

WHITE SLAVES AND “SMOKED IRISH”

Abolitionists hoped to win support from New York's white working class. Most radical leaders were disciples of Tom Paine and Robert Owen, both of whom were ardent enemies of servitude. Fanny Wright was antislavery. So was George Henry Evans, editor of the *Workingman's Advocate*. Evans, indeed, specifically opposed colonization, defended free speech for abolitionists, and urged workers to support their project, insisting that “EQUAL RIGHTS can never be enjoyed, even by those who are free, in a nation which contains slaveites enough to hold in bondage two millions of human beings.”

Many white workers agreed with Evans that slavery was unjust: republican artisans considered chattel slavery the antipode of liberty. Many artisans and shopkeepers were among the three thousand who signed an abolitionist petition submitted to Congress in 1830, calling for an end to slavery in the District of Columbia. The plebeian-oriented *Sun* occasionally printed antislavery material, and the *Transcript* defended abolitionists' right to speak.

Nevertheless, most New York laborers hated the men in command of the abolitionist apparatus and refused to separate the message from the messengers. Abolitionism was inextricably linked to other evangelical

initiatives that many workers found objectionable. Evans, a freethinker, rejected Tappan's revivalism and Sabbatarianism and wondered if the abolitionists weren't "actuated by a species of theological fanaticism" in hoping "to free the slaves more for the purpose of adding them to their religious sect, than for love of liberty and justice."

Worse, many of the wealthy merchants who championed black slaves were in the front ranks of those condemning workers who rallied to defend their rights (the Tappan-initiated *Journal of Commerce* had led the assault on Workie-ism). Tappan and his colleagues drew a sharp line between slavery and capitalism. Under slavery, the misery and poverty of working people was clearly attributable to the slaveocrats who owned them. Under capitalism—given the evangelical premise that ascribed success or failure wholly to individual character—a working person's poverty could not be laid at his employer's door.

The absolute clarity of this evangelical distinction between free and unfree labor seemed a good deal muddier to those whose lives had been abraded by capitalist development. To such men, setting the plight of distant slaves above that of local workers seemed hypocritical. Some labor radicals, including George Henry Evans, were drawn for a time to the metaphor of "wage slavery" (or "white slavery") as a linguistic device for emphasizing the analogies between their own sinking condition and that of already submerged bondsmen.

True, New York laborers had their political independence, no trifling matter. But the Revolution had been fought for economic independence as well, and by that criterion, the growth of wage-work, the declining respect for manual labor, the rise of renttenantry, the transformation of proud craftsmen into "hirelings"—all these together constituted a disturbing trajectory, whose end point might yet be dependency, even bondage, for whites as well as blacks.

For most New York artisans and laborers, however, the metaphorical equation of Northern wage-work and Southern slavery was not simply overdrawn but psychologically intolerable. Such men opted for a different linguistic strategy, one that sharply differentiated their condition from that of slaves by referring to capitalist employers as "bosses" rather than "masters" (reserving the older term for the small workshops where an owner was master of his craft, not his men).

There was another, uglier vocabulary that could be used to underscore the gulf between free and unfree labor: the language of racism, which insisted on the difference between “white men” and “niggers.” The problem was, the emancipation of New York City slaves made it more difficult to sustain such a sharp symbolic separation between whites and blacks. Emancipation had erased any grounds for assuming that the black person one passed on the street was of inferior legal status. True, white supremacy had been written back into the state constitution, denying nearly all black men the right to vote, at just the time all white males were being awarded the franchise. Unfortunately the argument used to justify that denial was not per se racist but rather the assertion that African Americans were dependent, powerless, and therefore easy pawns of the rich and powerful. But this was uncomfortably close to Chancellor Kent’s grounds for seeking to deny the suffrage to economically dependent white wage-workers. Once the provision was in place, however, it was but a short step to arguing that it rested on blacks’ inherent incapacity for self-government, just as some southerners were busily justifying slavery itself as the result of an innate black “slavishness” rather than of any forcible imposition of unfreedom.

White workers who rejected the evangelical gentry’s insistence that the poor were responsible for their own poverty accepted the premise when applied to blacks. If slavishness and slavery were attributes of blackness, and citizenship a function of whiteness, then whites were at least guaranteed that declining economic status would never lead to political disfranchisement. Such a position further undercut the appeal of “wage slave” imagery: one could not easily boast of being a citizen while claiming to be a slave.

Whites relied on more than language to distance themselves from unfreedom: they insisted that worksites be segregated on race lines. Few white artisans faced a direct challenge from African Americans: skilled black craftsmen were increasingly rare, a situation guaranteed by white refusal to accept black apprentices. Laborers, unskilled workmen, and servants were in more direct competition, though in most categories whites clearly held the upper hand. Still, it was increasingly felt that the mere presence of blacks degraded a job category (the expression “to work like a nigger” entered American English at this time). Only their complete expulsion from a trade could truly preserve its dignity, one reason New

York's blacks were being steadily driven from all but the most "servile" occupations.

Segregation in living arrangements served the same differentiating function: whites received psychic reassurance from not having to share schools, churches, playhouses, or pleasure grounds with blacks. There was, however, a yawning loophole in New York's system of urban apartheid: neighborhoods were not segregated. Low-waged, or intermittently employed, or widowed, or orphaned, or unskilled whites, could and did easily find themselves domiciled in the same slum quarters as blacks. Living next door to African Americans (occasionally even in the same household) effectively stripped away all the hard-earned badges of racial difference. This was humiliatingly underscored when the gentry—including abolitionists like Arthur Tappan—moved to lily-white enclaves where it was all but certain that any black faces in evidence belonged to domestic servants, not residents. Even this was less and less the case, as Irish domestics replaced African Americans in gentry households and as black women in domestic service opted for living with their own families.

Nothing undermined the separation of colors as rapidly as sexual fraternization, raising as it did the dreaded specter of what the era called "amalgamation." The growing hysteria over amalgamation was exacerbated by the attenuated patriarchal power of laboring males. Not only were they seldom in a position to govern an independent household, but their generic gender authority had been put in question. Nothing rubbed this in more painfully than seeing "their" women have sexual relations with black men—or worse, bear black men's children, thus mulattoizing "their" posterity.

Nowhere did these fears flame more fiercely than in the densely integrated Five Points, where interracial sex was a common fact of life. Four working-class wards contained over half the black population and had the highest black-to-white ratios in the city. Interracial liaisons came easily, moreover, in an area where, unlike in gentry enclaves, women like men were constantly out-of-doors. Especially galling was the fact that numerous Five Points saloons and brothels housed both black and white prostitutes, accommodated a mixed clientele, and in some cases specifically featured miscegenational sex; many blacks with leading roles in the city's vice economy had white wives or mistresses. As had been true since Dutch days,

it was in the urban underworld that New York's races mixed with greatest abandon.

One solution to this blurring of racial borders was to violently reinscribe them. The same Callithumpian bands that roistered through upper-class neighborhoods on New Year's also paid their disrespects to blacks. They singled out for attack the sites where blacks and whites indulged in common sensual pleasures: brothels, taverns, the homes of interracial couples. They also policed places where African Americans had managed to create community institutions that signaled their aspirations to dignity and demonstrated their moral equality. In 1828 a Callithumpian procession paused at the African Church in Elizabeth Street, where the congregation was holding a "Watch Night." They smashed the windows, demolished the doors, tried (unsuccessfully) to pull down the building, solaced themselves by beating churchgoers with sticks, then resumed their march. Such assaults weren't limited to holidays: rowdies routinely disrupted services at St. Philip's, knowing that unsympathetic magistrates wouldn't intervene, and butcher boys from the Centre Street Market delighted in setting dogs on students at the nearby African Free School.

Racial anxieties ran particularly high in the city's Irish-American community. More than any other white group, they lived side by side with Africans. They took on the same jobs—"nigger work"—laboring as degraded apprentices, domestic servants, prostitutes, seamen, and casual laborers. When they submitted (of necessity) to oppressive and despotic treatment, they were derided for "slaving like a nigger."

The advent of abolitionism, moreover, created particular problems—and possibilities—for Irish Americans. The Irish at home had never been particularly race-conscious, and some of their greatest champions, like Daniel O'Connell, would strongly support the abolitionist cause. But evangelicals and employers condemned the Irish for drinking, brawling, and irregular work habits in much the same way they condemned black behavior, labeling both groups alike lazy, improvident, and irresponsible. Some New York gentry placed ads in the *Herald* for cooks, washers, and ironers that specified "any color or country except Irish." Anti-Tammany nativists challenged the immigrants' right to citizenship, which, given the new-forged connections between race and nationality, was tantamount to questioning their whiteness. And just as the English had long characterized

their neighboring islanders more harshly than they had Africans, plenty of Anglo New Yorkers routinely used adjectives like *low-browed*, *savage*, *bestial*, *wild*, and *simian* to describe the Catholic Irish “race.” More disturbingly, the Irish were sometimes referred to as “niggers turned inside out,” as, conversely, blacks were occasionally termed “smoked Irish.”

One way to avoid the taint of blackness was to loudly assert whiteness, and the Irish quickly learned that in New York City blacks could be despised with impunity. Another route to permanent certification as members of an Anglo-Celtic racial majority was through affiliation with Tammany Hall. Northern Democrats had bonded with southern planters in a common negrophobia; now racism would do similar duty on the home front, smoothing divisions between New York’s Angles and Celts, allowing the party to swell its ranks from both sides. The theater, too, allowed white working people of all backgrounds to come together as an audience to laugh at derogatory representations of black “others.” Not surprisingly, minstrel songs singled out abolitionists—particularly Arthur Tappan—for merciless ridicule. Indeed abolitionism and blackface ascended the political stage arm in arm.

“HE CALLED MY SAVIOUR A NIGGER!”

In May and June of 1834, Arthur and Lewis Tappan stepped up their abolitionist drive. Among other initiatives, they underwrote formation of a Female Anti-Slavery Society. The participation of white ladies in a mixed-race movement jangled the nerves of New York racists—which were soon further tautened by pronouncements from the Rev. Samuel Cox, the antislavery (and anti-Catholic) cleric.

Arthur Tappan was a pewholder in Cox’s Laight Street Church. One Sunday morning on his way to church, Tappan encountered Samuel Cornish on the street. As Cox’s institution was nearby—two miles closer to Cornish’s home than where the black clergyman usually worshiped—Tappan invited him in, and the two sat together in Tappan’s pew. This led to a tremendous row, with some church members threatening to resign and the elders insisting that Tappan not repeat the offense. (Arthur would never again be seen in public with any of his African-American associates, even one as light-skinned as Cornish.) Cox, however, chided his congregation for its intolerance. Arguing that as Christ was probably of a dark Syrian hue, he

might well have been ejected along with Cornish, Cox denounced “nigger pews” and called for church integration. He was instantly subjected to city wide attack. As one merchant spluttered, “And would you believe it? he called my Saviour a nigger! God damn him!”

By June lurid rumors were flying around town (recycled by colonizationalist champion James Watson Webb in his *Courier and Enquirer*). The abolitionists—so the stories went—had told their daughters to marry blacks. Arthur Tappan had divorced his wife and married a Negress. Presbyterian minister Henry Ludlow was conducting interracial marriages. Abolitionists were encouraging black dandies to parade up and down Broadway on horseback to seek white wives. William Leete Stone, secretary of the New York Colonization Society and editor of the *Commercial Advertiser*, joined in stoking popular fury, assuring his readers that amalgamation appealed only to those of “morbid or vicious tastes.” A startled English traveler reported that even the “nicest people” talked about “sexual passion, with a vehemence of manner, and in a tone of earnestness, utterly abhorrent from the generally received notions of propriety.”

By July racial tensions were at full boil. On the fourth, an integrated group met at Chatham Street Chapel to celebrate New York’s emancipation of its slaves seven years earlier. Angry spectators complained the meeting looked like “the keys of a piano forte,” and rioters proceeded to break up the assembly with hoots, stamps, and shouts of “Treason.”

The celebration was rescheduled for July 7. The chapel’s sexton gave the mostly black group permission to use the building’s large hall. Normally it was used on Monday evenings by the New York Sacred Music Society, but the society’s president had agreed to use a smaller room. The sexton, however, had not explained to the chorister the racial composition of the supplanting group. When the musicians arrived they were enraged to find a black choir seated in *their* stalls. Hotly ordering the intruders out, they also tried to drag the speaker from the stage. This triggered a full-scale brawl, which the outnumbered whites lost; indeed, they were pitched out of doors and windows.

The police came and arrested six African Americans. A large white crowd forced the remaining blacks to flee. Excited rumors flamed through the city, fanned by the colonizationist press. Webb described the incident as a Negro riot, in which innocent whites had been beaten, and blamed it all on

“Arthur Tappan’s mad impertinence.” Stone’s *Commercial Advertiser* reported that gangs of blacks were threatening to burn the city. “If this state of things is to be suffered to continue,” Stone shrilly declared, “neither white men nor women can much longer leave their doors in safety.”

On Wednesday evening, July 9, one of the hottest nights of the year, three interconnected riots broke out. Early on, two or three thousand whites gathered at Finney’s Chatham Street Chapel to break up a planned antislavery meeting. When the abolitionists, forewarned, failed to show, the crowd broke in and passed resolutions calling for black deportation. One young white man preached in a “mock negro style” (so the newspaper *Man* reported), and his fellows “struck up a Jim Crow chorus” in the style of Daddy Rice’s popular Bowery act.

At about the same time, another crowd, composed chiefly of butcher boys and day laborers, converged on Lewis Tappan’s Rose Street home (he and his family had fled to Harlem). Spurred on by well-dressed merchants, the rioters smashed windows and doors, demolished the interior, dragged Tappan’s artwork and furniture to the street, piled it high, and set it ablaze. A Gilbert Stuart portrait of Tappan’s father-in-law was being carted to the bonfire when one rioter shouted, “It’s Washington! For God’s sake don’t burn Washington!”—and the republican hero (as they supposed) was borne safely off. Mayor Lawrence arrived with the watch but was shouted down, three cheers were raised for Webb, and the police were driven off with brickbats.

Some of the anti-Tappan group, joined by rioters from Chatham Street, now descended on the Bowery Theater, where a benefit performance was underway for George Farren, the playhouse’s English stage manager. The Britisher had allegedly cussed out Yankees and called them jackasses. In addition, the English were associated with the antislavery cause. Four thousand people stormed the theater. Perhaps a quarter of them broke in and drove Edwin Forrest and the cast from the stage. The riot was quelled only when Thomas Hamblin, the Bowery’s manager, came out waving two American flags, apologized for the Farren benefit, then summoned a performer to sing “Yankee Doodle” and “Zip Coon,” popular anthems of country and color.

Violence escalated over the next two days. Crowds moved methodically through the city assaulting precise targets. Messengers darted to and fro,

keeping rioters apprized of the whereabouts of the forces of order. Battle plans were advertised in handbills or spread verbally in marketplaces. At some points the belligerents formed up into squares, putting smaller men armed with stones on the inside, and sturdier clubwielding ones on the outside to ward off the military, which they believed had been forbidden to fire at them.

The crowds went after the homes, businesses, and churches of white “amalgamators.” Throngs stoned Arthur Tappan’s Pearl Street store until his employees, armed with muskets, drove them away with the help of a troop of one hundred watchmen. At the Laight Street Church, on the corner of Varick, rioters began smashing windows as one shouted, “Dr. Cox says our Savior is a nigger, and [damn] me if I don’t think his church should be torn down!” Another contingent broke into Cox’s home on Charlton Street. When the police and two squadrons of cavalry showed up, rioters ripped down fences for clubs and hurled paving stones but were driven off. Later in the evening, several thousand headed to Spring Street, where they attacked Henry Ludlow’s church, demolishing its organ and pews and tearing down its galleries. To ward off a cavalry charge, they carried out the wreckage and built a barricade, which they bolstered by chaining carts together. The Twenty-seventh National Guard Regiment hacked its way through with axes and dispersed the crowd—which then reassembled on Thompson Street to trash Ludlow’s home.

A second set of targets consisted of churches and institutions associated with black abolitionists. The African Baptist Church on Anthony Street was among those pelted with rocks, the African schoolhouse on Orange Street was heavily damaged, and a huge crowd totally demolished Peter Williams’s St. Philip’s African Episcopal Church (and his home as well).

The greatest ferocity was reserved for the black community in the Five Points area—though isolating it from the white community with which it was so intermixed proved challenging. Taking a cue from Exodus, rioters spread the word that white families should keep lit candles in their windows and stand before them, so their homes might be passed over. Households with dark windows or dark faces were sacked, torn down, or burned. All night long, individual blacks were caught and beaten. Roughly five hundred fled their homes, many to the watch house in the Park. No one was killed,

however, and guns were kept under wraps (though a black barber on Orange Street did fire off his pistol as whites stormed in).

On Friday, Mayor Lawrence, himself an active colonizationist, weakly urged citizens to refrain from further violence, while agreeing that the abolitionists' program was "repugnant." By that evening, however, Lewis Tappan sensed that "the 'respectable' portion of the community, that had, thus far, looked on with indifference, or a willingness to see the hated band of abolitionists punished to a certain extent by popular violence, began to be alarmed for the safety of their own property."

And indeed the Twenty-seventh, which had handled the nativist outbreaks easily enough, was having serious trouble dealing with these upheavals. It didn't even try to intervene in the Five Points, where the rioting was heaviest. Saturday promised worse. Mayor Lawrence, deluged with desperate communications from citizens, estimated that sixty-two sites had been slated for destruction, including businesses, churches, schools, newspapers, the prison, and the state arsenal. With violence threatening to spread, the press demanded bringing it to an immediate end—by firing on the crowd if necessary.

Lawrence now issued a second, stronger proclamation and swore in one thousand volunteers as special constables. Irish laborers, who had been noticeably absent from the affray, now volunteered in the hundreds to aid in suppressing rioters perceived to be nativists. The New York First Division was ordered out and its officers authorized to hand out ammunition. Troops paraded through the streets and took up stations at such key sites as St. John's Park and the arsenal. Cavalry squadrons patrolled all through the night. The upheaval tapered down. By Tuesday evening it was over.

When it came time to apportion blame, some denounced scaremongers Webb and Stone for whipping up the crowds. Some denounced the rioters and declared civil disorder intolerable, no matter what its cause. But the bulk of respectable and popular opinion alike argued that the abolitionists had brought it on themselves.

In this repressive atmosphere, abolitionists made some tactical retreats. The American Anti-Slavery Society (AASS) plastered handbills around the city, denying it encouraged intermarriage. It sent an official disavowal of amalgamationist proclivities to the mayor. Lewis Tappan, who left his house

on Rose Street unrepaired as “a silent Anti-Slavery preacher,” was criticized by fellow abolitionists for allowing black and white choirs to sing in the same church, even though seated separately. And when Tappan later requested that a black minister address an antislavery gathering, nervous colleagues insisted that “the time has not come to mix with people of color in public.”

Abolitionists also suffered some defections. Under strong pressure from Bishop Onderdonk, Peter Williams Jr., pastor of the ruined St. Philip’s, resigned from the AASS—though he refused to recant his principles and declared the abolitionists “good men, and good Christians, and true lovers of their country, and of all mankind.” Charles Grandison Finney, shocked at New York Christian businessmen’s approval of racist outrages, resigned the country’s leading pulpit and retired to Oberlin College, a Tappan-backed institution in northern Ohio.

After a year of lying low, however, the abolitionists aggressively expanded their operations—albeit outside the city itself. In May 1835, employing the skills and resources they had used in fashioning the benevolent empire, the Tappans set out to inundate the entire United States—South as well as North—with antislavery propaganda. In 1834 the AASS had distributed 122,000 pieces of literature. In 1835 its highspeed presses pumped out over a million tracts—graphically illustrated exposés of slavery’s horrors. The AASS also circulated newspapers, plaster statuettes of slaves in chains, handkerchiefs, medals, emblems, and blue chocolate wrappers. Mixing business and politics, Lewis also advertised the sale of silk prints depicting “The Poor Slave.”

This amazing mass communication machine provoked anxiety throughout the North and outrage throughout the South. Mainstream northern opinion had not been overly worried about the impact on the Union of ravings by a few fiery Bostonians. But now the abolitionist movement was being directed from New York City by masters of the new media, possessed of awesome organizational skills. Within four years the AASS would boast 1,350 auxiliaries and a million members nationwide. Conservative regional elites in Illinois or Ohio could handle local radicals: gentry-directed riots to suppress home-grown abolitionists multiplied throughout the North. But competing with New Yorkers presented a more formidable challenge. Indeed Manhattanites’ newfound ability to

disseminate a political gospel, coupled with their command over capital and credit, was positively alarming.

White Southerners were infuriated. Inflamed by the torrent of tracts that began reaching their ports, by mid-August of 1835 they were hysterical. Vigilantes stopped, boarded, and searched ships and stages, hunting for subversive literature; they patrolled slave quarters to make sure none had gotten through. They denounced the New Yorkers in blazing speeches at torchlit parades. A band of men broke into the Charleston post office, carried off mailbags newly arrived from the Hudson, and used the intercepted abolitionist tracts and magazines to kindle a huge bonfire. In it they burned effigies of Arthur Tappan and Samuel Cox, as thousands cheered.

Some southerners were not satisfied with symbolic gestures. East Feliciana, Louisiana, posted a fifty-thousand-dollar reward for the delivery of Arthur Tappan, dead or alive. Some demanded the Tappans be extradited. This, however, got New Yorkers' backs up, angering even those opposed to antislavery agitation. "I do not choose," said Philip Hone, "to surrender the power of executing justice into the hands of the slaveowners." Governor Marcy flatly refused to consider such requests.

Balked, southerners organized an economic campaign against Tappan's firm—one of the first attempts to bankrupt a national business. Some called for a boycott of all New York City goods. Alarmed delegations from the Chamber of Commerce pleaded with Arthur to call off his campaign. "You demand that I shall cease my anti-slavery labors," he responded fiercely, "*I will be hung first!*" Webb in the *Courier and Enquirer* seemed quite prepared to oblige him, demanding that "modern haberdashers of murderous negro tracts" be crushed like "reptilian eggs."

By mid-August, excitement was so intense that the AASS barricaded its doors with inch-thick planks. The mayor of Brooklyn instituted sundown-to-sunup patrols in Arthur Tappan's new neighborhood (he had moved across the East River after the riot of 1834). "I have not ventured into the city," wrote abolitionist Lydia Maria Child. "'Tis like the times of the French Revolution, when no man dare to trust his neighbors."

The abolitionists were spared another dose of violence, for two reasons: city authorities wanted no repetition of the previous year's lawlessness, and

federal authorities intervened to quash the AASS outreach effort. Charleston's postmaster had asked New York City's postmaster, Samuel Gouveneur, to extract antislavery tracts from his southbound mail. Gouveneur agreed and informed the postmaster general that he planned to deny postal access to Tappan and his colleagues. The issue went up to Andrew Jackson, who informally authorized Gouveneur's embargo on "offensive papers" and explicitly denounced the AASS in his Annual Message. For the moment, the abolitionists were stymied.

THE RAILROAD THAT RAN UNDERGROUND

The mercantile elite were not prepared to turn Arthur Tappan over to planter justice, no matter how much they despised his politics. But they did not yet contest the right of southern slaveocrats to reach into New York City itself when their intended targets had black skins.

Since emancipation, New York had become a haven for fugitive slaves—and slavehunters. Under the provisions of the federal Fugitive Slave Act of 1793, anyone claiming that a person residing in the North was a runaway from the South had only to appear before a local magistrate, personally or represented by counsel, and submit "proof" of ownership; an affidavit would do.

"Blackbirders"—stalkers who were not above seizing free blacks and shipping them into slavery—began prowling the city on a regular basis. Their only opposition consisted of sporadic and spontaneous riots by local African Americans. In 1819 forty blacks on Barclay Street tried and failed to rescue a man being taken by a slavecatcher and a city marshal to a Hudson River steamboat dock. In 1826 blacks bombarded a slavecatcher giving evidence at City Hall with bricks, sticks, and stones but were suppressed by the police and given severe sentences.

By the 1830s bounty hunting had become big business. One lawyer, F. H. Pettis, offered to search for and return runaway slaves for \$250 a head. Blackbirders Elias Boudinot and Daniel D. Nash ran an operation known as the New York Kidnapping Club, notorious for snapping up victims. Straight-out kidnapping was illegal, but if blackbirders brought a captive before City Recorder Riker and produced (paid) witnesses to swear he or she was a recent runaway, Riker usually authorized deportation.

With young girls being snatched on trips to the water pump, black parents began keeping their children off the streets after dark. Then, with white abolitionists on the defensive or concentrated on their national campaign, the city's African Americans formally organized for their own protection. On November 20, 1835, David Ruggles led in setting up a New York Committee of Vigilance. Ruggles, a migrant from Norwich, Connecticut, had opened a bookshop and circulating library at 67 Lispenard Street, specializing in antislavery publications. Now he became the eyes and ears of the black community.

Ruggles identified slavecatchers by name in the *Emancipator*. He pointed them out to blacks on the street. He publicized descriptions of missing Afro-Americans. He went door to door in fashionable neighborhoods inquiring as to the status of black domestics, implementing a New York law that freed any imported slave after a residence of nine months. At hearings of accused runaways before Recorder Riker, Ruggles presented counterwitnesses, though, as they were usually black, their testimony seldom helped. He also boarded incoming ships, to see if slaves were being smuggled in, and on one occasion won an indictment against a Frenchman from Guadeloupe. (Such actions were denounced by the *New York Express*, a militant Whig organ, as an embarrassment to trade.) Ruggles had to change lodgings repeatedly to foil efforts at kidnapping *him*.

The Vigilance Committee also aided those they called "persons arriving from the South." They explained to fugitives their rights, protected them from blackbirders, and established them in new locations. In his first annual report, presented at Theodore Wright's church in 1837, Ruggles announced that the group had protected 335 persons from slavery. The following year he sheltered the young Frederick Douglass for two weeks, before sending the penniless fugitive on to New Bedford, Massachusetts.¹ The bulk of funds for the Committee of Vigilance's work—efforts Lewis Tappan later praised as crucial to the developing Underground Railroad—was (Ruggles acknowledged) "obtained by the efforts of the Ladies, who collect from their friends one penny a week." In Brooklyn, Bridge Street African Methodist Episcopal Wesleyan became a major underground station, eventually providing refuge, food, and clothing for hundreds of escaped slaves. Some whites too took serious risks: Quaker Isaac T. Hopper's home,

at no Second Avenue, became a noted way station, and in 1835 Hopper was accused of harboring a fugitive slave in his store on Pearl Street.

The Vigilance Committee was not always successful. On July 23, 1836, George Jones, a “respectable” free black man, was arrested at his workplace, an attorney’s office at 21 Broadway, supposedly for assault and battery. At first he refused to go along with his captors, but his employers advised him to submit, promising they would help. However, once in custody, Jones was whisked before Recorder Riker, where several notorious blackbirders declared him a runaway, a proposition to which Riker assented. Less than three hours after his arrest, Jones, bound in chains, was dragged through the streets of New York “like a beast to the shambles” and carried south. Ruggles described the kidnapping in the *Sun*. The piece, widely reprinted, helped Ruggles win public support for granting accused “fugitives” a trial by jury—a right secured five years later.

34

Rail Boom

New York's rival coastal cities, badly undercut by the Erie Canal and facing commercial catastrophe, retaliated by building their own canals, but frenzied ditch digging availed them little. Boston was just too far from the western wheat fields, and its capitalists shifted their funds into manufacturing. Philadelphia's businessmen, lacking New York's break in the Appalachians, redirected their investments into mining. Baltimore was closest to the fertile West, but constructing a canal proved prohibitively costly. With the daring of desperation, at a town meeting in 1826, its citizens decided to build a railroad. In 1827 the Maryland legislature chartered the Baltimore and Ohio, and on July 4, 1828, Charles Carroll, last surviving signer of the Declaration of Independence, broke ground for the B&O amid fireworks, floats, and speeches.

The B&O planned to use horses for motive power. Locomotive engines had been around since England's Richard Trevithick had built the first one back in 1804, but as of the mid-1820s they were still cumbrous affairs, suitable only for hauling coal cars. Then, at trials on the Liverpool and Manchester Railway in the fall of 1829, George Stephenson's *Rocket* proved astonishingly successful, confirming that the future belonged to steam. The B&O, realizing it had to switch from horses in midstream, turned for help, oddly enough, to a New Yorker.

Peter Cooper, of mixed Dutch, English, and Huguenot ancestry, was the son of a Methodist hatmaker who had moved his family down to the city from Newburgh in 1808. After trying his hand at hatting, brewing, coachmaking and cabinetmaking, young Peter made a go of selling a cloth-shearing machine he'd developed. In 1816, however, Britain's postwar dumping spree drove his customers out of business, and the twentyfive-year-old Cooper opened a grocery store in Bowery Village. He also continued tinkering with mechanical devices; among his inventions was an endless chain for drawing Erie Canal boats, which won De Witt Clinton's applause but was never used.

In 1821 Cooper bought a glue factory at Sunfish Pond, amid clover fields and buttonwood trees near the village of Kip's Bay. When the new Bull's Head market opened nearby, providing a plentiful supply of cows' and calves' feet, Cooper devised new methods for using them to produce glue, gelatin, household cement, isinglass, and neat's-foot oil. He thus became the premier supplier of such items to the city's tanners, paint manufacturers, and dry-goods merchants. He also became a pioneer polluter: his factory so fouled the pond's waters that it had to be drained and filled in 1839.

Cooper invested his profits in land purchases around town. In 1828, convinced the proposed new B&O would send Maryland's land values skyrocketing, he purchased three thousand acres near Baltimore and began large-scale development there. While leveling hills and draining swamps, he discovered iron ore. Immediately he set up furnaces and forges, positioning himself to sell rails to the B&O.

When the company on which his future depended ran into technical trouble, Cooper promised to invent them an engine. "I got up a little locomotive," he later explained, cobbling it together from old wheels, musket barrels, and a small brass steam engine he'd built in New York City. In August 1830, with Cooper at the controls, *Tom Thumb* hauled a carload of B&O officials at the breathtaking speed of eighteen miles per hour. Investors now snapped up B&O bonds, and the B&O used the proceeds to buy Cooper's iron rails, making him his first fortune.

Now it was New York that faced a threat to its canal-based preeminence, and powerful Manhattanites quickly jumped into railroading. By 1831 the Mohawk and Hudson Railroad Company—with Stephen Van Rensselaer as titular head, John Jacob Astor an active director and major stockholder, and officers and promoters with such august names as Jay, Fish, Stuyvesant, Schuyler, and King—had completed a link between the Hudson and Mohawk rivers, connecting Albany and Schenectady.

Its success sparked a rail boom. Entrepreneurs and communities deluged the legislature with requests for corporate charters. Funds flowed into lines linking other Erie Canal towns, and within a decade through service was available from Albany to Buffalo. In 1832 New York City promoters won a charter for a New York and Erie line that would cut out Albany and slice diagonally across the state to Dunkirk, on Lake Erie, from Piermont, on the

Hudson. The Erie's backers—including leading merchants (Eleazar Lord), bankers (James Gore King), and land developers (Samuel B. Ruggles)—also had the clout to win three million dollars in state credits toward construction.

While these distant enterprises were getting under way, closer to home another set of investors had set out to connect the two ends of Manhattan Island. Banker John Mason and two large landholders interested in promoting their uptown real estate won a charter in 1831 for a New York and Harlem Rail Road, and its initial stock offering of \$350,000 was immediately oversubscribed. The Common Council granted the NY&H the right to operate cars over a double track from City Hall to the Harlem River along Fourth Avenue—and did so with great good cheer, as most of the incorporators were associated with Tammany, and many of the aldermen received blocks of stock as thank-you presents. Workingmen's spokesman George Henry Evans protested this cozy symbiosis, arguing that while the road was a good idea, it wasn't necessary to "give a regiment of rich aristocrats the exclusive privilege of increasing their wealth by the profits of it. We have already too many laws to favor *capitalists*." In 1831, however, the Court of Chancery upheld the legislature's right to delegate the power of eminent domain (an attribute of sovereignty) to a railroad (a private corporation), even if that company would permit only its own cars to use its tracks.

Construction of the Harlem began in February 1832. The rails were bolted not to wooden ties but to foot-square granite blocks, which, as they rose several inches above street level, made crosstown traffic a teeth-jolting ordeal. In the meantime, John Stephenson, a local omnibus operator, built *the John Mason*, which closely resembled a traditional stage, driver perched above in front. In November 1832 horses pulled the *John Mason* along the Bowery from Prince Street (near old St. Patrick's Cathedral) up to 14th Street, speeding its thirty passengers along smoothly at a seven to twelve miles per hour clip. Soon the New York and Harlem's tracks reached Fourth Avenue and 27th Street, where the line built a depot complex that included company offices, a produce terminal, and stables for the horses.

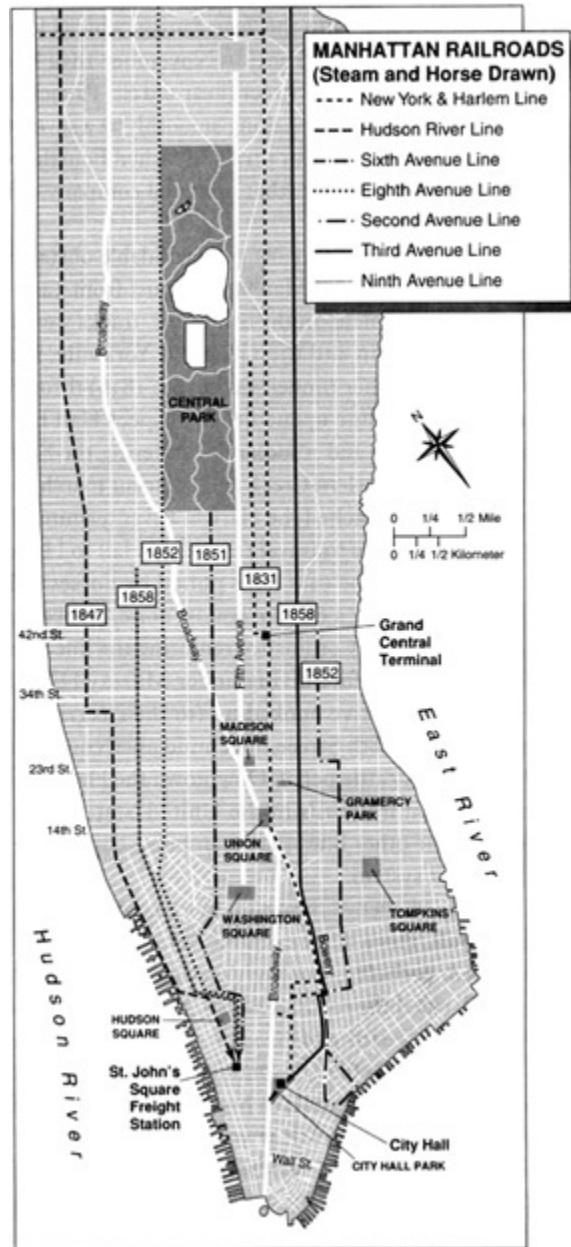

In the fall of 1833 the tracks reached their first formidable obstacle, Murray Hill; driving a tunnel (still in use) through solid Manhattan schist from 32nd Street to 42nd Street would take until 1837 to complete. In the

meantime, tracks were laid on wooden ties through mid-island rural terrain and the village of Yorkville, near 86th Street. Between 92nd and 94th streets, another tunnel was cut (in 1836) through the domelike rise of Mount Pleasant, where the line opened the Prospect Hall hotel, in hopes of enticing passengers to visit the fields and woodlands bordering the East River. Finally the engineers and laborers forded Harlem Creek and adjacent marshlands with a 658-foot timber viaduct, and from there reached the Harlem River terminus by 1837.

By 1838, therefore, it was possible to travel from City Hall to Harlem for twenty-five cents, but south of 27th Street the cars were pulled by horses. The NY&H had intended to use engines all the way, but a clamor against noise, smoke, sparks, and danger—one blew up in 1834—led to a city ordinance requiring the line to use horses in its lower regions. At 27th Street, just before diving under Murray Hill, the horses were unhitched and a little steam locomotive hooked up (to the chagrin of Peter Cooper, whose house at Fourth Avenue and 28th Street, once amid open country, now lay a block from the station and the railroad's cattle pens). Downtown the Harlem's cars—the first street vehicles to be operated on iron rails in the United States—became known as “horsecars,” and, along with the other lines that soon followed, they became a regular part of the downtown transport system.

In time the horsecar would challenge the omnibus for control of the city's streets. It was more stable, easier to pull, more maneuverable, and lower to the ground, and it could negotiate cobblestoned, potholed thoroughfares far more smoothly. In the thirties, however, omnibuses still ruled the roads. There were eighty in service by 1833, 108 by 1837. Indeed the *New York Gazette and General Advertiser* suggested in 1834 that New York might well be termed “the City of Omnibuses,” as they generated much of downtown's “noise and bustle.” Asa Greene, in his guidebook, *A Glance at New York* (1837), reported that it was “almost as much as your life is worth” to cross Broadway south of City Hall Park. “To perform the feat with any degree of safety,” Greene counseled, “you must button your coat tight about you, see that your shoes are secure at the heels, settle your hat firmly on your head, look up street and down street, at the selfsame moment, to see what carts and carriages are upon you, and then run for your life.”

Negotiating Brooklyn's streets was nowhere near as hazardous, but there too the transportation revolution had arrived. In 1832 the state legislature chartered the Brooklyn and Jamaica Rail Road, with the aim of linking the two oldest communities on the western end of Long Island. In 1834 (the same year omnibuses were introduced to Brooklyn) the line received permission to lay track down Atlantic Street. But it had barely started running its first locomotives (in 1836) when it was subsumed by the far more ambitious Long Island Rail Road (LIRR). The LIRR, chartered in 1834, was intended in part to foster the economic vitality of Kings, Queens, and Suffolk counties—whose farms were being outpaced by the fertile enterprises of Genesee and Cayuga counties now accessible via the Erie Canal—by enhancing the exchange of market garden produce for urban manure. Primarily, however, the LIRR was intended to speed travelers between New York and Boston, through the center of the island, by connecting Jamaica with the harbor at Greenport. Most local traffic in Brooklyn and Queens would continue to be handled by stagecoaches traveling along turnpikes (privately owned toll roads), though a glimpse of the far future arrived in June 1833 when Charles Durant lifted off from the Battery in a balloon and sailed eastward to a safe landing in Jamaica.

SMOKESTACKS AND SPECULATORS

Peter Cooper wasn't the only one who realized that railroads needed tracks, engines, and boilers. New York's iron foundries and machine shops, already flourishing in tandem with the city's shipyards, expanded to meet the new needs. Happily, the local iron furnaces could now count on expanded and regular deliveries of coal, as the completion in 1832 of the Morris Canal across New Jersey had linked New York's harbor to the Lehigh River. In 1830, moreover, a German-American ironmaster had smelted iron ore with

anthracite coal at a laboratory furnace in the city, a process he patented in 1833, thus helping launch a new era in the commercial manufacture of iron.

Demand generated additional supply. The Allaire Works, hitherto the city's biggest, faced new competition from the Novelty Iron Works (1830), Browning and Dunham's North River Iron Foundry and Locomotive Engine shop (1837), and the Morgan Works (1838). Harmon Hendricks's Soho Copper Works boomed as well with the demand for boilers, flues, and boxes. Hendricks, joined by his sons, Uriah and Henry, had moved their operations to Belleville, New Jersey. Eventually, most railspawned metal and machine work would follow them across the Hudson—Paterson, in particular, would lead the country in producing locomotive engines—but for the moment New York City remained a major site of industrial production and innovation.

The coming of the railroad also revitalized the city's capital markets. Transactions had been relatively sedate on the New York Stock & Exchange Board (NYS & EB) in 1830, when shares of the Mohawk and Hudson Railroad first traded there. By 1831, however, with investors scrambling after the NY&H offering, a frenzied boom in stocks of the new technology got underway. By 1835, at the height of the mania, rail trades had outstripped those in all the NYS&EB's hundred-plus listed stocks and bonds. Total volume reached six thousand shares a day, with orders pouring in from across the country.

Much of the investment business was handled by private bankers and loan contractors who bought up trustworthy securities and sold them to investors seeking safe and steady dividend income. The city's most substantial investment banker, the so-called king of Wall Street, was Nathaniel Prime. Reputedly the third wealthiest man in New York in 1830, Prime avoided speculative operations, and his conservatism appealed to continental capitalists who, frightened by the Revolution of 1830, were seeking a secure haven for their funds. Europeans who had soured on Latin American loans and been excited by the Erie's success now joined English investors in pouring cash and credit into the U.S. market. Much of this new money was channeled by the House of Baring into state (especially New York) and federal bonds. Even during the runaway market of 1832-34, when the Barings curtailed their involvement in anticipation of a crash, the

house continued to deal with substantial firms in New York City, primarily Prime, Ward and King.

Browning and Dunham's foundry stood on the Hudson River shore at the foot of North Moore Street. Water color, 1837. (The Metropolitan Museum of Art, Bequest of Edward W. G. Arnold, 1954. The Edward W. C. Arnold Collection of New York Prints, Maps and Pictures)

The Barings were right to be cautious, for the rail boom had provided an opening for traders far less circumspect than Nathaniel Prime. Younger men, despised by their seniors as gamblers, seized on the opportunity for speculative scheming. Playing the stock market, after all, was much easier than dealing in real estate. Securities could be bought and sold quickly, and the invention of "margin trading" (a form of securities purchase on credit that was indigenous to the United States) allowed one to play at the table without anteing up huge sums: five dollars to a broker could buy fifty dollars' worth of stocks.

Railroad issues were risky, glamorous, and potentially highly profitable—perfect for the adventurously inclined investor. But speculative traders didn't often bother with assessing a company's real-world chances. Instead

they manipulated the virtual reality of the market itself. By the early thirties warring cliques of bulls and bears were driving prices up and down, using underhanded maneuvers that were not only legal but were widely admired for their daring.

Jacob Little, the New York stock market's first full-time "operator," was one of the most famous and successful of the manipulators. Little, a tall, tense, preoccupied-looking man, started out on Wall Street clerking for a private banker. He opened his own office as a money broker in 1822, joined the NYS&EB in 1825, and by the 1830s was known as "the Napoleon of Wall Street." In his heyday, 1832-35, Little speculated in cotton, securities, canals, and above all railroads, with spectacular success.

Little was credited with inventing—and was certainly a master of—the "manipulated short sale." He would promise to sell someone shares of stock, shares he didn't yet own, for delivery in, say, sixty days. Then he would launch a campaign to drive the price of the stock down, perhaps by planting false rumors about the company's impending insolvency. If all went well, just before the sixty-day limit expired, he had forced the shares well below the price he had promised to sell them for. He could then buy the shares, make his delivery, and pocket the difference between what he had paid for them and the price the buyer had obligated himself to pay. The spread could be enormous.

Politicians who could influence a railroad's destiny were quick to follow Little's lead. State Senator Kemble made a speech opposing any enlargement of the NY&H's capital. When the news of impending scarcity hit Wall Street, the price of Harlem stock rose. At the top of the market, Kemble's broker sold short. Kemble then pushed a bill through the legislature enlarging Harlem's capital, and the price plummeted. As these were early days, and such behavior was still considered inappropriate, Kemble was expelled from the Senate.

Bulls countered such bearish tactics by trying to "corner the market" in a contested stock. If they could round up most available shares, they could block bears from buying the amount of stock necessary to fulfil their contracts. Better still, if they secured a complete monopoly, they could hoist the price as high as they chose, forcing bears to buy at the inflated price, then sell at the lower, promised one—likely driving them into bankruptcy.

Profits of 200 percent were routine for successful corners. In the 1830s boom, corners were common.

Little was a master of this tactic too. In 1834 he drove Morris Canal and Banking stock from ten dollars a share to \$185, the price at which shorts were forced to buy from him. The following July he cornered NY&H—with the road itself still only in construction—and realized a profit of over 60 percent. These unearned windfalls enraged many, and in 1836 it was proposed to outlaw such practices. But the NYS&EB argued that regulation would only drive business to Philadelphia, and the legislation was not passed.

Speculation raised moral hackles, but it also helped the city's economy by generating a volume of trade that, together with respectable investment transactions, kept New York's financial markets extremely "liquid." Both buyers and sellers knew that the NYS&EB could execute trades at short notice. New York thus became ever more a pacemaker of the nation's financial activities. Its market quotes were reproduced in Philadelphia, Boston, Baltimore. Its brokers became the country's largest traders in state, federal, bank, canal, and insurance company offerings and the primary promoters of new issues. More than any other economic factor, railroad financing helped solidify New York City's role in the national credit system.

PIONEERS OF CAPITAL

Those seeking less volatile outlets for accumulated pools of capital turned to western land. In the Black Hawk War of 1832, the Sac and Fox Indians were defeated in their attempt to reoccupy former homelands, paving the way for a burst of settlement into Illinois and the Wisconsin Territory. Along with the Conestoga wagons came New York money men—pioneers of capital—eager to speculate in western acres.

In 1833, with the embers of war still warm, Charles Butler and Arthur Bronson traveled by steamboat, horse, and canoe, loaded with cash and connections to local notables like General Winfield Scott, military commander in the area, who pointed out choice sites. Butler and Bronson (son of Isaac Bronson) bought town lots in as-yet-little-known places like Chicago (population five hundred), picked up great swatches of rich

agricultural land in Indiana, Illinois, and the Michigan Territory, and constructed a network of agents—leading citizens, Indian agents, and military personnel—to handle their buying in the future.

John Jacob Astor garnered western holdings too. At first Astor had been hurt by the wars, which by driving the Indians west cost his American Fur Company its cheap labor supply. But when many of the locals who had been dependent on the now defunct fur trade went bankrupt, they paid their debts to Astor with land claims, leaving him in possession of prime real estate just as immigrants began to swarm in.

Settlers and speculators ignited a land-buying frenzy. In 1830 the U.S. government had sold a respectable two million acres of public land. In 1833 it moved nearly four million acres, in 1835 over twelve million went, and in 1836 twenty million followed. For the easterners who had gotten there first, average net proceeds (after deducting agent's share, lawyers' fees, travel, and other administrative costs) hovered close to 20 percent, though windfall profits of 100 to 500 percent were not uncommon, especially on city property.

Much of the New York capital flowing into western lands traveled via the medium of trust companies, financial institutions established to manage old Knickerbocker and recent Yankee fortunes. These outfits were always on the lookout for prudent long-term investments—they happily settled for modest dividends of 6 to 9 percent in exchange for stability of income—and western real estate seemed like just the thing.

The New York Life Insurance and Trust Company, one of the earliest such institutions, was established in 1830. The company was dominated by conservative bankers, merchants, and land investors, many from the city's highest social and economic echelons. Individual investors like Astor, Bronson, Kent, Lorillard, Prime, and Stuyvesant anted up a million dollars for the capital pot. Banks and foreigners added an additional five million (England's House of Baring, with fifteen hundred shares in 1834, was by far the largest single holder of its stock). New York Life and Trust then invested judiciously in farm mortgages. Its agents examined the value of the land each borrower proposed to buy, checked the borrower's status and character, and refused loans to pioneer settlers, subsistence farmers, or "men who are irresponsible, improvident and intemperate," in Charles Butler's words.

Twenty-five more such trusts were set up in the 1830s. Some of them competed to boom the value of their respective properties. In 1835-36 a Bronson-led firm built up Cassville, Wisconsin, laid out streets named after its New York investors (Prime, Ward, Arthur), and tried to make it the territorial capital, but a rival consortium, led by John Jacob Astor, succeeding in getting the governmental seat awarded to Green Bay (then called Astor).

New York land speculators were hard at work in the South too, especially after gold was discovered on Indian lands and President Jackson picked up the pace of forced dispossession. The Indian Removal Act of 1830 secured the evacuation of remaining Choctaw and Chickasaw by 1833, and the Cherokee were gone by 1835. In the latter year, the coast now clear, Butler formed the American Land Company. Pooling a million dollars from wealthy men and politicians in New York City, Albany, and Boston, it soon owned about 350,000 acres in eight states, 70 percent in cotton lands. A similar entity, the Colorado and Red River Land Company, had amassed half a million acres by 1835.

Texas proved particularly attractive. Samuel Swartwout, collector of the Port of New York and a close friend of Sam Houston, created the New Washington Association in 1834 to purchase and develop Texas land. Swartwout and his Manhattan associates strongly supported the “Texian” revolt against Mexico, and after Houston’s victory at San Jacinto in 1836, a Swartwout-convened meeting of four to five thousand people in Masonic Hall backed recognition of Texas.

New York’s growing financial, landed, and political involvement in the South and West provoked mixed responses there. Many local merchants, bankers, and agricultural entrepreneurs relied on eastern capital for new infrastructure, long-term mortgages, and credit for land and slaves. They considered the charges for procuring capital and marketing their commodities to be reasonable, or at least unavoidable, costs of doing business.

Others feared the political consequences of financial dependency. Southern planters remembered their subordinate position in the British Empire and worried about falling into a neocolonial relationship with northeastern capital. Some westerners feared they were in one already, pointing to the Ohio Life Insurance and Trust Company as evidence. Ohio

Life was the West's largest financial institution, but 70 percent of its stock was controlled by easterners, primarily New Yorkers. Branson and Butler had written its charter, selected its officers and stockholders, raised its capital, and won an amazingly nonrestrictive charter from Ohio (in part by liberally dispensing stock to influential Cincinnatians). As the state had bound itself not to repeal or even amend this charter until 1870, one opponent worried that by that time "it will have so wormed itself into the vitals of the land, that nothing short of revolution can put it down." Outcries appeared regularly in Ohio newspapers against the "Wall St. Gentry of New York," noting that in 1836, with other easterners, they owned over 70 percent of all bank stock in the state. Such protests were met with blunt rejoinders from New Yorkers, reminding westerners of the stark facts of economic life. Ohio, having rejected public financing of internal improvements, was "an interior state new and without surplus capital [and] could do nothing without the aid of capitalists of the City of New York."

BANK WAR

For all the grumbling about Wall Street, the country's most vigorous protests were still directed against "Chestnut Street," for it was in Philadelphia that the country's most powerful financial institution—the Second Bank of the United States—made its Greek Revival home. The BUS was the only bank in the nation with a federal charter, the only one allowed to have branches in more than two states, the only institution in which the U.S. Treasury deposited its funds. It was, as its name implied, the government's fiscal agent, and it had the de facto authority of a central bank.

Since his accession to power in 1823, Nicholas Biddle, the bank's brilliant and wellborn president, had skillfully forged a reliable national currency, sustained an ample but controlled growth of credit, and provided some security against economic fluctuations by acting as lender of last resort. These accomplishments—and the prosperity associated with them—had won him many supporters.

They had also won him enemies. Westerners and southerners seeking rapid development disliked his tight control over credit, and President Andrew Jackson saw in Biddle's bank a Money Power that menaced the republic. In 1829, though the bank's federal charter still had seven years to

run, Jackson announced his preference for having a publicly owned and treasury-operated institution at the helm of the country's finances. New York City's leading Tammany politicians quickly concurred, as did upstate Democrats led by Martin Van Buren.

Many Wall Street financiers were also vexed by the Philadelphia institution. They bristled at what James Hamilton (Alexander's son) called its ability "to exercise a dangerous power over the monied and mercantile operations of the great city of New York." Wall Streeters also resented competition from the BUS, which had a branch in Manhattan itself. It galled them, too, that as the federal government's official depository, its coffers and profits were swelled by customs revenues extracted from New York merchants. A lot of money was at stake. In 1828 New York custom duties paid all federal expenses apart from interest on the debt, and receipts were rapidly increasing. The Custom House staff was growing rapidly, and in 1834 the U.S. government would break ground for a grand Greek Revival headquarters, designed by Town and Davis at Nassau and Wall (today's Federal Hall). Leading bankers, it was reported to Jackson, were unhappy at "the wrong done to New York in depriving her of her natural advantages by the legislation of Congress, which undertook to make Philadelphia the financial centre of the Union."

Nevertheless, the Bank of the United States had powerful supporters in New York City—bankers, politicians, and conservative businessmen who had developed ties to Biddle's operation because it was an inescapable fact of financial life, and who applauded Biddle's demonstrated wizardry at stabilizing national money markets. Some key journalists backed Biddle too, in part because he lucratively backed them. After receiving a "loan" from Biddle, James Watson Webb of the Jacksonian flagship *Courier and Enquirer* took his paper into the camp of those supporting the bank. Tammany Hall denounced Webb as a traitor, and William Leggett, an assistant editor of the Democratic *Evening Post*, approached him on Wall Street, saying, "Colonel Webb, you are a coward and a scoundrel, and I spit upon you." They exchanged blows until a crowd pulled them apart, but not before Leggett scored with another gob. Political editors were a truculent breed. Leggett's boss, William Cullen Bryant, took a cowskin whip to William Leete Stone of the *Commercial Advertiser* in 1831, who riposted with a sword cane, a thrust Bryant parried with his whip until onlookers

broke them apart. In 1836 James Watson Webb would assault James Gordon Bennet in the middle of Wall Street.

By 1831 Jackson's various opponents had coalesced into a new political party, the National Republicans, which nominated Henry Clay to run against the president in 1832. Clay got Biddle to apply for an early recharter, which Congress granted, only to have the president veto it. In New York, Tammany firmly supported the veto and held an enormous antibank rally on Jackson's behalf. George Henry Evans and former members of the Workingmen's Party supported the president too, believing that many of the artisanate's problems stemmed from the control of finance by a privileged class. Many Workies advocated eliminating all banks, not just Biddle's, and relying on "hard money"—a purely metallic currency.

The alliance of Jacksonians and Workingmen alarmed conservative Democrats like John Jacob Astor. Many broke ranks and condemned Jackson's veto, thus splitting the Democratic Party. Jackson triumphed nevertheless in his 1832 reelection bid, winning 59 percent of the vote in New York City, and promptly declared full-scale war on Biddle's "Monster." He announced he would soon remove all U.S. funds from the BUS and transfer the money to selected state bank depositories.

During May and June of 1833 Jackson toured the Northeast to test his policy's popularity. Huge and affectionate crowds turned out—nowhere more so than in New York City. When the president landed at Castle Garden, a hundred thousand people jammed the Battery and its adjoining wharves and housetops to watch Jackson mount a horse and lead a procession of cabinet members, governors, congressmen, and mayors across the wooden causeway connecting the old fort to Manhattan. Unfortunately for his followers, the moment Jackson reached dry land, the bridge collapsed behind him, tumbling the assorted notables into the shallow waters. No one was seriously hurt, and the grand parade of dripping-wet dignitaries proceeded up Broadway to City Hall Park, led by the president on horseback, with the crowds huzzahing lustily for Old Hickory. And when seven state banks were chosen to receive the federal deposits, three of the "pet banks" (as his enemies dubbed them) were in New York City.

Biddle struck back. Convinced that only a massive economic crisis would galvanize the citizenry into demanding that Congress overrule Jackson, he jammed on the fiscal brakes by engineering a credit contraction.

Withholding loans and calling in debts, Biddle singlehandedly deflated the national economy, producing widespread financial prostration, especially in New York. By Christmas, stocks on the NYS&EB were plummeting. “Panic prevails,” wrote Hone, who himself lost thirty thousand dollars in two months. With many dealers and merchants verging on bankruptcy, disaster rippled through the city; laborers were discharged by the hundreds.

Biddle remained remorseless. “All the other Banks and all the merchants may break,” he said, “but the Bank of the United States shall not break.” As he hoped, delegations of businessmen now descended on Congress with pleas to restore the deposits. The president declared that the distress was only affecting “brokers and stock speculators and all who were doing business on borrowed capital” and that “all such people ought to break.” When New York financiers went to plead with him in person, an angry Jackson thundered, “Go to Nicholas Biddle,” as he was the one with the millions.

Jackson’s opponents—National Republicans and Conservative Democrats—denounced the autocratic “King Andrew” and coalesced into a new “Whig” Party. The name, first suggested by Colonel Webb in the *Courier and Enquirer*, invoked Revolutionary-era resistance to King George III and gained rapid acceptance. In April 1834 the fledgling Whigs entered the political lists in New York City.

BANK RIOT

On the morning of April 8, voters slogged their way to the polls through rain-muddied streets. Over the next three days, for the first time in the city’s history, they would be casting ballots in a mayoral election; the city charter had been amended in 1833 to finally give New Yorkers the right to elect their own chief magistrate. With the Bank War at its height, the city’s election was widely viewed as a referendum on the president’s policies. Daniel Webster declared that Whig hopes for winning national power “rely mainly upon the success of the great struggle which is to take place in New York.”

The election would also measure the ability of Whig amateurs to compete with Tammany professionals. The new party’s inner circle was comprised chiefly of merchants, bankers, and rentiers—powerful paladins

like Philip Hone, Arthur Tappan, Samuel Ruggles, and Cornelius Vanderbilt—but they were not seasoned political operatives. The Whigs chose the ruddy-faced Dutchman and former Democratic congressman Gulian C. Verplanck as their mayoral standard-bearer.

Democratic orators branded Whiggery a tool of the city's elite and portrayed the coming contest as “one of the rich against the poor” (William Cullen Bryant) or the “bank aristocracy against the people” (George Henry Evans). Whigs retorted that Democratic ranks too were laced with men of wealth and position—starting with the Democrats' mayoral candidate, banker Cornelius Lawrence—though they did not deny their party's affiliation with the rich and influential, and indeed denounced Lawrence as a traitor to his class.

Whigs were well aware, however, that winning the mayoralty would require popular support. Some Whig employers bluntly relied on economic muscle, threatening to dismiss employees who voted Democratic. Others solicited support on the basis of converging class interests—the old Alexander Hamilton strategy. At a Masonic Hall rally Whigs appealed to the traditional interdependence of merchants and “all trades connected with commerce”—winning some converts among cartmen, draymen, porters, sailors, ship carpenters, coopers, stevedores, riggers, and longshoremen. Whigs also appealed to American-born workers' growing resentment of the Catholic Irish. Tammany, they said, was using the new immigrants to consolidate municipal power, and in fact Irishmen had flocked to the party that had courted them.

With the stage thus set for confrontation, James Watson Webb, the combative *Courier and Enquirer* editor and former soldier, took command of Whig troops. On Tuesday, April 8, pro-Whig sailors fitted out a float-size frigate. They named it the *Constitution*, mounted it on wheels, attached Whig pennants to its rigging, and hauled it through the streets with two bands and five hundred seamen following along behind. The parade marched through Broadway and Greenwich Street, picking up a thousand more supporters from among the vast pool of idled employees (Whig employers had decreed afternoon business shutdowns for the duration). After being vigorously cheered at the Merchants' Exchange on Wall Street, the crowd headed into the heavily Democratic Sixth Ward. At the polls there, Whigs insulted the locals, with one invader shouting, “We should get

along well enough if it were not for the low Irish.” Words led to blows, and the Whigs were driven from the area. Webb proclaimed the repulsion a “REIGN OF TERROR” in his *Courier and Enquirer*, and at a Masonic Hall conclave that evening, Whigs resolved to march en masse into Democratic terrain the next day.

On Wednesday hundreds of Whigs proceeded “in military order” into the heart of the Sixth Ward, bellowing epithets such as “damned Irish.” Gaelic Democrats retaliated by attacking Whig headquarters on Broadway. In the ensuing battle, shots were exchanged and many were injured. The Tammanyite crowd then headed to Wall Street, determined to destroy the *Courier and Enquirer*’s office. Webb, forewarned, erected a barricade of bundled papers and retired to the roof with thirty young merchants, seventy muskets, one hundred pistols, and six loads of paving stones. When rioters filled the street below, Webb threatened to shoot the first man who moved toward his property, and eventually the crowd dispersed.

On the third and final day of the election, fifteen hundred Whig freemen again did battle with Jacksonians armed with clubs and brickbats, and when the mayor tried to intervene he was knocked to the pavement and struck on the head with a stick. Hundreds of youthful Whigs now cleaned out the gun shops on Broadway and marched to the state arsenal at Elm and Franklin streets, led by such prominent merchants as Simeon Draper. They broke in and began passing out arms. Irishmen raced to the site. Soon an estimated twenty thousand merchants, mechanics, cartmen, and laborers filled the area. “We were indeed in the midst of a revolution,” said the *Sun*. With Armageddon in the offing, the mayor called out the troops—twelve hundred infantry and cavalrymen—and order was restored.

The election proceeded with military guards stationed at the arsenal, City Hall, Merchants’ Exchange, and the local branch of the Bank of the United States. Huge crowds milled around Masonic and Tammany halls while the votes were counted. Finally it was announced that Mayor Lawrence, the antibank Democrat, had defeated Verplanck, the Whig, by the whisker-thin margin of 180 votes out of thirty-five thousand cast, but the fledgling Whig Party captured a majority of the Common Council.

“THE CITY IS REDEEMED,” crowed the *Commercial Advertiser*. To celebrate what Hone called a “signal triumph,” the Whigs threw a Castle Garden banquet on April 15. Tables were set for ten thousand, but the

multitudes jamming the Battery were great enough to require several shifts. Hundreds of boiled hams and rounds of beef, along with three pipes of wine and forty barrels of beer, disappeared down the collective gullet. Afterward, thousands marched up Greenwich Street to where the visiting Daniel Webster was quartered; he gave a fiery speech of congratulations. The later inauguration of Mayor Lawrence was the occasion for a turbulent gathering of his Democratic supporters, but Tammany had been badly shaken.

Happily for the Democrats, the Bank War now moved to a victorious conclusion. Biddle had overplayed his hand, his colossal arrogance alienating even his supporters. When elder statesmen like Albert Gallatin and Isaac Bronson demanded Biddle relax the pressure, the Philadelphia!! refused, and New Yorkers mobilized to fend off his attack. The Safety Fund made available a multimillion-dollar line of credit to member banks, enabling them to defy Biddle and stabilize the markets, and another state agency, the Canal Commission, permitted the banks maximum use of its massive revenues, further helping undercut Biddle's strategy.

With New York holding the line and angry denunciations of Biddle's abuse of power sweeping the country, House Democrats mustered a majority for a resolution upholding removal and opposing recharter. Even Whig politicians felt compelled to abandon the BUS. By summer Biddle had given up, his bank was on the road to extinction, and New York City had emerged from the crisis as the undisputed financial capital of the country.

Business revived quickly, and in New York City support for Whigs eroded just as rapidly. Aided by a burgeoning labor movement, Tammany swept the fall 1834 elections. Discouraged by their swift rise but even swifter fall, downcast Whigs didn't even contest Mayor Lawrence's reelection bid in April 1835.

CITY BUILDERS

The Bank War interrupted the 1830s boom but failed to stop it. With the dramatic imbroglio over, stock speculators, railroad promoters, and real estate investors resumed their fevered dealings. Land developers, in particular, set a torrid pace, especially in New York City itself, and speculative building emerged as one of Manhattan's (and Brooklyn's)

largest enterprises. Annual investment in new construction exceeded three million dollars, rivaling the stakes in shipbuilding, shoemaking, and clothing manufacture.

Ground zero for the building boom was the commercial area at the island's lower tip, as a rapidly expanding mercantile and financial community tried to elbow itself into the seventeenth-century streetscape. Lot owners petitioned for wider roads, and the city responded with a massive program of prying open narrow and gloomy lanes. Between 1831 and 1834 Pine, William, Ann, Cedar, Hanover, and Exchange Place were among the many streets that had their residential houses relocated or, more often, torn down and replaced by purely commercial structures. The successful conclusion of the Bank War galvanized the process, with the victors determined to build a central business district worthy of the city's new status. The year 1835 brought a surge of street widenings—Mill, Stone, and John streets were among the stretched thoroughfares—and a new surge in the erection of Doric banks.

Uptown, a residential-based boom was underway, spurred by developers seeking to profit from housing the exploding population. Manhattan had contained roughly 124,000 residents in 1820, 167,000 in 1825, and 200,000 in 1830. Fed by a tripling in the rate of immigration, by 1835 the population topped 270,000, and with the annual overseas influx doubling again, Manhattan was headed toward an 1840 total of 313,000. During the 1830s New York was the fastest-growing city in the United States, and at some point during the decade it surpassed Mexico City in population, becoming the largest city in the New World.

Between 1821 and 1835 the population of every ward tripled or quadrupled, generating crowding, congestion, and soaring real estate prices. The value of land in Manhattan went from \$64.8 million in 1826 to \$87.6 million in 1830 to over \$143 million in 1835—then shot to \$233 million within the next twelve months, for a total rise of 280 percent over the previous decade. These numbers reflected both speculative expectations and actual improvements. Developers built commercial structures and private dwellings at a fantastic pace. In 1834, 877 commercials and 654 residentials went up; in 1835, 1259 and 865 of each were added; and in 1836, 1826 and 868. Buildings grew taller, too. In 1824 three-fourths of all new buildings had been two stories high, and none was over three; in 1834, a third of the

structures surpassed three stories, and over two-thirds of the city's new stores (15 percent of all new construction) had three or more floors.

The money for all this flowed in from private investors, many of them old landed families. Stuyvesants, Livingstons, Roosevelts, Goelets, Cuttings, Rhinelanders, Lenoxes, Lispenards, Brevoorts, and Bayards plunged into the real estate market, as, of course, did John Jacob Astor. Financial institutions also invested, after New York State removed restrictions on banks' ability to make loans on urban land. Merchants, professionals, and shopkeepers, too, combined their savings with mortgage-backed loans to build speculative housing on an ever larger scale. A survey in 1831 showed that over six and a half million dollars had been loaned out on mortgages, two-thirds of it from individuals residing in the city, another third from "incorporated companies."

Most actual construction continued to be undertaken by small, independent contractor-entrepreneurs, who put up perhaps one to three houses a year and operated on the thinnest of margins. But a handful of developers emerged on the order of London's Thomas Cubitt, a carpenter who had risen to preside over much the biggest construction firm England's capital had ever seen. Cubitt supervised the raising not of single buildings or even rows of them, but whole ensembles of houses, arranged in squares, crescents, and terraces—the grand estate developments like Bloomsbury, Belgravia, and Pimlico that blossomed in the 1820s and 1830s.

The New Yorker who most closely approximated Cubitt's accomplishment was Samuel Bulkley Ruggles, though his social status was quite different from the Londoner's. Ruggles, born in 1800 in New Milford, Connecticut, grew up in Poughkeepsie, where his father was a prominent lawyer. After graduating from Yale in 1814, he studied law, moved to New York in 1821, set up his own practice, and married Mary Rosalie Rathbone, daughter of a rich merchant. Her financial and social patrimony helped him establish close ties with the old Knickerbockracy, many of whom found payment of taxes and street assessments on their inherited estates to be a growing burden. Ruggles suggested he could turn their assets into profitable sources of income. Noting that canal development had helped push the value of Manhattan's taxable real estate from fifty-two million dollars in 1825 to ninety-five million in 1831, he predicted that the impact of railroad

construction would be even greater. “Within five years after the railroad from Albany shall reach Lake Erie,” Ruggles declared, “the real estate upon this little rocky island will be taxed at 250 millions of dollars.” It made sense, therefore, to buy and build. Ruggles had used his wife’s inheritance to purchase farmland from the Stuyvesants and other families, often drawing them into jointly financing his speculative ventures. In 1831 he gave up law altogether and plunged into real estate full time. By 1833 Ruggles had purchased over five hundred building lots, many of them in contiguous bunches, most of them heavily mortgaged.

One such pieced-together block of land covered roughly the area between 19th and 22nd streets and Third and Fourth avenues, with the former Gramercy Farm as its twenty-two acre core. The terrain—swampy in spots, hilly in others—was traversed by the spring-fed Crommessie Vly, which over the years had gouged out a gully almost forty feet deep on its way to the East River at 18th Street. In the early 1830s Ruggles undertook a mammoth landscaping job that eventually required moving approximately a million horsecart loads of earth, at a cost of \$180,000.

At the center of his rearranged domain, Ruggles laid out Gramercy Square. Inspired by the example of Trinity’s St. John’s Park, he deeded the square collectively to the owners of the sixty surrounding plots he had platted out. Ruggles sought taxexempt status for the private park, and the Board of Aldermen agreed (in 1832), expecting that it would soon be surrounded by valuable (and taxable) properties. They were right. By 1833, when the square was fenced in, most of the lots had been sold, despite their distance from town. Actual housing construction, however, would be delayed until the 1840s.

To enhance access to Gramercy Square, Ruggles prevailed on the state legislature to insert a new north-south artery between Third and Fourth avenues. He named the northern extension Lexington Avenue, for the famous battle, and the southern strip Irving Place, honoring Washington Irving, though the writer never lived there. Irving Place served another function for Ruggles, as it led to his second mammoth enterprise, Union Square.

Union Place, as it was known until Ruggles got it changed to Union Square, was situated, as the name implied, at a junction of many roads. Left open by decree of the grid commissioners, it remained in the early 1830s a

collection of vacant lots—apart from some shacks and a potter’s field. In 1832 Ruggles obtained a fifty-year lease on most of the area between 15th and 19th streets, then got the city to approve opening Fourth Avenue north of 17th Street. In 1834 he convinced the Board of Aldermen to enclose, regulate, and grade the square (with much of the cost assessed to the Ruggles-owned land between there and Gramercy Park). Finally, Ruggles built curbs and sidewalks along the new streets. Then he sold most of his leases and, in 1839, built a four-story house for himself on the square’s east side, into which he moved from his Bond Street quarters. In time Ruggles would be surrounded by affluent neighbors, but, as at Gramercy Square, actual construction would await the next decade.

Due west of Gramercy Park, on Manhattan’s Hudson River side, another grand project was afoot on the domain of Father Christmas, Clement Clarke Moore. Once his resistance to lower Manhattan’s northward sprawl proved futile, Moore had decided to make the best of things and systematically developed Chelsea as a fashionable quarter, anchored by the green grounds of the General Theological Seminary. Working with James N. Wells, the Hudson Street carpenter who had developed Trinity’s St. Luke’s property, Moore laid out streets. Again, smoothing out Manhattan’s cragginess took heroic efforts: Eighth Avenue had to be beveled down by six to twelve feet to reach the required grade. By 1832, his friend John Pintard noted, Chelsea was laid out with streets “where, but a few years ago, all was open country.” Soon Moore was leasing lots, with restrictive covenants to guarantee the proper tone.

Laborers excavating Union Square, engraving by James Smillie, c. 1831. The leveling of Manhattan's original terrain for real estate developers like Samuel Ruggles was done by pick and shovel. This view looks south from what is now 18th Street, with Broadway on the right and Fourth Avenue on the left. (I. N. Phelps Stokes Collection. Miriam and Ira D. Wallach Division of Art, Prints and Photographs. The New York Public Library. Astor, Lenox and Tilden Foundations)

Way across town, where the high, dry land west of Second Avenue tumbled down into marshes that ran on to the East River, the Stuyvesant family took the lead, albeit reluctantly, in developing Tompkins Square. For quite some time, they and other swamplords (including Pells, Fishes, and Astors) had refused to underwrite the mammoth job of draining and filling their boggy empire. At one point they threatened to dump the property back on the city as not worth improving. Thus prodded, and having taken note of the “depressed state of property in this part of the city,” the municipal

authorities allocated sixty-two thousand dollars of taxpayers' money to compensate the landowners (in particular, the Stuyvesant family) and set aside another twenty-two thousand to transform the muddy flat into a park. Opened in 1834, Tompkins Square was surrounded the following year with an ornamental cast-iron fence, then studded with shade trees. This upgrade immediately lofted the value of all the swamplords' nearby holdings, and boosters predicted a brilliant and genteel future for the neighborhood.

The city supported the Stuyvesant and Ruggles developments so handsomely largely because it was running out of money. As expenses for infrastructure and poor relief soared, traditional revenues had failed to keep up. For over a century the municipal corporation's treasury had relied mainly on rental income from its own property (water lots, wharves, common lands) and on license and franchise fees. By the 1820s, with these sources no longer generating sufficient revenues to cover expanding costs, city officials relied more on property taxes.

Previously, property (especially "farmland") had been taxed lightly or not at all, one reason eighteenth-century merchants had regarded it as such a good investment. But as land values catapulted, the city began to demand a portion of the profits, and total assessments leapt from just over two hundred thousand dollars in 1830 to over \$1.1 million in 1837. With their fiscal fate now tied to the value of private holdings, aldermen adopted a policy of aggressively enhancing the value of private property, in the name of promoting the public good.

Street openings were central to this strategy. The municipality's Street Committee steadily expanded its building program, and in 1835, responding to numerous complaints about limited access north of 14th Street, it decided to open all grid-plotted thoroughfares up to 42nd Street. Ignoring the grid designers' egalitarian inclinations, however, it began subsidizing creation of elite neighborhoods. Partly this was simply a matter of sanctioning exceptions in street design, like the creation of residential squares—elements that enhanced a location's status and raised its values. Occasionally this entailed actively constructing new spaces with public money, as at Washington Square, which now completed a thirty-year transformation from ugly duckling to civic swan.

Originally sodden marshlands, the area had been drained in the 1790s and become a graveyard for paupers and fever victims, receiving more than

twenty-two thousand bodies over the next two decades. It also served occasionally as execution ground, with prisoners carted up Christopher Street from Newgate Prison and hanged from an elm before jeering crowds (the resident gravedigger doubling as hangman). After the yellow fever epidemic of 1823, with Greenwich booming just to the west and Bond Street burgeoning just to the east, the city barred further burials and routed new corpses north to what is today Bryant Park. In 1826 the city purchased additional land here (paying a hefty seventy-eight thousand dollars) and created the Washington Parade-Ground, a setting for militia exercises. It opened to the public that July 4—the Declaration’s jubilee anniversary—with an old-fashioned fete in which two roasted oxen, two hundred hams, and a plentiful supply of ale were disbursed to the crowd of ten thousand.

Though heavy guns sometimes caved in the parade-ground’s surface, exposing the yellow-shrouded corpses of fever victims, it quickly became a plebeian gathering spot, attracting visitors from nearby Greenwich. Almost immediately, however, developers began raising handsome new town houses along the square’s southern border. Then, from 1828, northside farmers and estate owners began subdividing their property and erecting aristocratic rowhouses. In 1831 Sailors’ Snug Harbor leased a northside stretch from Fifth Avenue to University Place to developers, imposing restrictions to guarantee homogeneity. By 1833 another Greek Revival terrace had emerged, spanning 1 to 13 Washington Square North, known collectively and colloquially as “the Row.”

Washington Square, like its Hudson Square prototype, drew posh residents. Many decamped uptown together from homes near the Battery. Bankers and merchants predominated, including former mayor Allen, who arrived in 1835. Most families came from New England or Scottish backgrounds and worshiped at the Presbyterian Church on Christopher Street.

Rising out of Washington Square like a thermometer from its bulb, Fifth Avenue was not yet an address to boast about, having only recently graduated from open stream to muddy rutted road. In 1824 Fifth was opened to 13th Street, covering over the Minetta Waters that continued (as they do today) to course beneath its surface. The road reached 21st Street by 1830, and 42nd by 1837, but remained sparsely populated, certainly by gentry. The first sign of its future eminence was the construction in 1834,

by Henry J. Brevoort Jr., of a Greek-ornamented mansion (perhaps designed by Town and Davis). It lay at the northwest corner of Fifth and Ninth Street, in the midst of what remained of the farm that Henrick Van Brevoort had bought back in 1714, and it represented the profits the family had accrued by selling off portions over the years and investing the proceeds in the stock market.

SECOND CITY

New York's gains, at first, seemed Brooklyn's loss. Manhattan's expansion had created a powerful up-island real estate lobby of landowners, speculators, developers, and politicians, and this phalanx was determined to thwart any move by New York's increasingly feisty neighbor to lure potential customers across the East River.

One mechanism for stanching any such outflow lay in New York's continuing control of the river and its ferries. Under its colonial charter, the municipal corporation's boundaries lapped to the shores of Long Island. It also had exclusive authority to license ferries across the East River. It used this to ensure that its lessees remained untroubled by competitors, thus allowing them to keep both their fares and payments to the city high.

Brooklyn villagers pleaded with New York's Common Council to award leases to men who would run the ferry as a public utility instead of charging whatever the monopolized traffic would bear. They petitioned as well for boats to go to new locations, like Atlantic Street. Manhattan dismissed such requests. As one alderman baldly admitted in 1834, he legislated for New York, not Brooklyn, "and if I shall think that the establishment of this ferry will abstract from the southern extremity of New York and centre of its commerce of population which would otherwise reside upon this island, I am bound to vote against it."

In 1834 Brooklyn abandoned direct appeals and turned to the state for support. Fashioning novel legal weaponry, the villagers attacked New York at a vulnerable spot, the independent authority of its venerable municipal corporation. Chancellor Kent had justified its right to control water traffic as being in the interest of the public, by which he meant residents of the city. But Brooklynites argued that the "public" encompassed the entire state and that the ferry's paramount function was to serve that public's

convenience, not generate revenues for the corporation by exacting tribute from its smaller neighbor. New York should be made to treat its franchise as an administrative responsibility delegated by the state—of which, they pointedly reminded Albany, it was but a creature—or to transfer its ferry-licensing power to a state commission. If the courts accepted this reasoning, one of the last perquisites of the “private” corporation would vanish.

In March 1835 stockholders of Fulton Ferry decided to compromise. They agreed to permit New York City to grant a license to a different group of investors. The Common Council agreed, though it designated the new ferry’s terminus as Whitehall, Manhattan’s most remote and inconvenient point. Tensions eased. New York had bought itself a ten-year truce in the ferry wars. (Concessions were made on the Hudson side too: in 1833, New York and New Jersey settled their boundary dispute by fixing Manhattan’s boundary in midriver, not at water’s edge as long claimed.)

New York proved unable, however, to stave off Brooklyn’s emergence as a full-fledged city. Since its formation, the town around the ferry landing had been growing at a rate exceeding Manhattan’s. The Village Council wanted enhanced authority, both to press disputes with its bullying big neighbor and to promote local development by installing street lights, clearing pigs from the streets, and cleaning up grogshops. The council also sought more substantial headquarters, cramped as it was in the upper floor of the Apprentices’ Library, which, since a fire in 1832 had destroyed the new Flatbush courthouse, it had been forced to share with the county government as well.

In 1833 a bill to incorporate Brooklyn as a city passed the Assembly. New York’s opposition killed it in the Senate. In 1834 Brooklyn tried again. New York officials countered with a remonstrance requesting that all of Kings and Richmond counties be made part of New York City. Brooklyn won, aided by upstaters. An act passed April 8, 1834, invested their community with the privileges of a city. But Brooklyn’s charter was quite different from New York’s. This city was to be an administrative agency, not a private and propertied corporation. It had specific responsibilities, as well as things it was forbidden to do—like regulating the prices of any commodity except bread, or infringing the chartered rights of the Corporation of the City of New York. The new city promptly set up wards, elected aldermen, and chose its first mayor, George Hall—son of a Flatbush

Irish farm family, an Erasmus Hall graduate, and a leading temperance advocate.

In July 1834 a town meeting began to talk of building a City Hall that would outdo New York's. This suited Hezekiah Pierrepont perfectly. In 1833 Hezekiah had sent his son Henry Evelyn Pierrepont to Europe to study cities. Like Ithiel Town, he came back enamored of crescents and squares. The Pierreponts decided to map out the old Livingston lands behind Brooklyn Heights in the same grand manner. The terrain was still open country, however, and nearly a mile from the waterfront. To lure commercial and professional interests it needed an anchor. A grand City Hall would do nicely. In May 1835, accordingly, the Pierreponts and Remsens sold Brooklyn a triangular site at the intersections of Fulton, Joralemon, and Court streets. In 1836 a cornerstone was laid for a Greek Revival structure. It would be by far the most conspicuous building in Brooklyn, rivaling anything in fashionable Manhattan.

The formation of the City of Brooklyn stimulated the cupidity of many local landowners and touched off an extravagant binge of speculation in town lots. This fever soon spread way beyond Brooklyn proper. For miles in all direction, farms were surveyed, subdivided, laid out into streets, and sold off at auction sales—at the manic pace of the land booms in Manhattan and out west.

To the north, on the other side of Wallabout Bay with its Navy Yard, flourished Williamsburgh. Incorporated as a village in 1827, Williamsburgh extended its borders in 1835, set up a board of trustees to manage itself, built large wharves along its stretch of the East River, and started a new ferry to Peck Slip (over the strenuous opposition of New York). In 1836 a company of gentlemen purchased a farm and estate traversed by the present Grand Street. There they erected fourteen first-class model homes for a planned model city, which they trumpeted in lithographic property maps as a great investment opportunity. The population jumped. Merchants established residences along the shore. And just to Williamsburgh's north, the village of Green Point experienced a similar heightening of expectations. In 1832—34, Nezhiah Bliss, a Connecticut Yankee ironworker who married into one of the original Dutch families, bought up farmland, had the area surveyed, and laid out streets and lots.

Activity was equally frenzied below the City of Brooklyn's southern border of Joralemon's Lane. Two and a half miles from the ferry lay Hoyt's (or Prospect) Hill, where Charles Hoyt had planted streets back in 1826. By 1833, amid a marketing blitz of lithographic maps and auction sales, Hoyt was harvesting his speculative profits. At the same time, the hills, marsh meadows, and mill ponds of Red Hook were fetching astonishing prices: one ten-acre patch went for forty-seven thousand in 1833. In 1834 the old Van Dyke lands were transmuted into the Red Hook Building Company, which issued stock on Wall Street. In 1835 poplars, cedars, locusts, and sassafras were hatcheted down. Hills were tossed into marshes, and old mill ponds, like that on which Nicholas Luquer had raised oysters and ground grain for Pierrepont's distillery, passed into history. The Red Hook Building Company's ambitions outpaced its abilities, however, and in 1835 it was taken hold of by Messrs. Voorhees and Stranahan, who organized the Atlantic Dock Company, which in the next decade would construct an engineering masterpiece.

Still farther south, across Gowanus Bay, the land rose again toward the wooded Heights of Gowanus. It was here, in 1832, that Henry E. Pierrepont proposed to build a city of the dead. Pierrepont had been inspired by a visit to Mount Auburn Cemetery, the country's first rural, parklike necropolis, which had opened in 1831 in Cambridge, Massachusetts. He was also inspired by a vision of the fortune he could make importing corpses from Manhattan.

New York had banned burials south of Canal Street, and by 1830 several enterprising businessmen had opened New York Marble Cemetery as a profit-making venture. The city's first nonsectarian cemetery—its 156 underground vaults were open to the wealthy of any faith—was situated on a half-acre plot just west of Second Avenue between Second and Third streets. An inscription blazoned on its east wall read PLACE OF BURIAL FOR GENTLEMEN. It was so successful they opened a second one, a block east, in 1832. Further annexes were ruled out the following year by the real estate boom, which drove the value of downtown lots to such heights that the City Council extended the ban on new interments north to 14th Street. Pierrepont saw an opportunity here and, once Brooklyn had become a city, proposed creation of Green-Wood Cemetery, a plan that would come to fruition in the next decade.

Below the Heights of Gowanus, Brooklyn rolled south to the sea. Here the landscape of scattered farms and villages was largely untouched by the 1830s boom, with one exception. At its southwestern rump, across the Narrows from Staten Island's easternmost extension, federal defense spending catalyzed new development. On June 11, 1825, the cornerstone was laid for Fort Hamilton, commencing a seven-year, half-million-dollar construction project. Wharves rose along the shore for landing supplies. Fort Hamilton village, also known as Irishtown, grew up on the bastion's northwestern side. Its shacks housed construction workers, many of them recent immigrants, and the Irish women who did laundry and opened small stores. By the mid-1830s stage service connected the fort with New Utrecht, two and a half miles away, and from there, via Gravesend and Flatbush, with the City of Brooklyn.

In November 1831 Fort Hamilton received its first garrison, the fifty-two men and two officers of Battery F of the Fourth U.S. Artillery Regiment. During the peaceful 1830s the citadel remained undermanned, but the village continued to grow. There was only one church, however—Dutch Reformed—so many soldiers had to travel to Brooklyn or New York to worship. In 1834, accordingly, soldiers and locals joined in building St. John's Episcopal Church just outside the fort (its cornerstone was laid in 1835). In 1836, seeking to supplement its grandly named dirt roads, the city engaged a company to build a railroad from Brooklyn to the fort, then on along Gravesend Bay to New Utrecht, Bath, and Coney Island.

Grand schemes were conceived far to the east of Brooklyn too. For a century and a half the conservative farmers of New Lots had gone about their traditional business. In 1835 things changed abruptly. John R. Pitkin, a wealthy Connecticut merchant, began buying up large portions of land (above today's New Lots Avenue) from local villagers. He intended to found a great city—East New York—that would rival Manhattan. The new metropolis would have access to cheap food from local farmers, low rents that would allow manufacturers to undercut competitors, and a vast transportation center all its own along the shores of Jamaica Bay. By 1836 Pitkin had assembled a vast tract, laid out streets and lots, and prepared a prospectus that spoke glowingly of future buildings, markets, factories, parks, and schools.

In 1835 Pitkin had jumped border boundaries to Queens, where he launched another model village, Woodside (later Woodhaven). But the county in general remained unaffected by the boom. Flushing's population remained stable at about two thousand and was only incorporated as a village in 1837, while Jamaica's railroad-spurred growth remained in the future. Staten Island too remained largely isolated from the speculative fever. One group of speculators formed an association to develop the island's northeastern sector as a resort center, to be named New Brighton. They borrowed \$470,000 from bankers and erected a large hotel and some houses, but the enterprise didn't get much farther. The area did attract "Commodore" Vanderbilt, however; in 1835, now among the city's richest men, he built a porticoed and Corinthian-columned house on the family farm, between Stapleton and Tompkinsville.

GOOD TIMES

Philip Hone, an active player in the real estate game, was a very happy man in 1835. Land values, he noted elatedly, had soared "beyond all the calculations of the most sanguine spectators," with the consequence that "immense fortunes have been made and realized within the last three months." Abounding in newfound wealth, Hone set out to enjoy himself.

New York's boom-era Knickercrats spent their off-work hours differently than did their evangelical class counterparts. While Arthur Tappan and his colleagues were stamping out sins, Philip Hone and his comrades were merrily indulging them. Hedonism was not universal, to be sure: reaction to good fortune varied with the individual. Old Nathaniel Prime had speculated heavily in stocks, bonds, and real estate and had won big. He retired in 1832, vastly wealthy, his sons well launched, his daughters well married. But Prime became seized by a strange fantasy. He grew convinced he was becoming poor and would die in the almshouse. Unable to shake this monomania, he cut his throat with a razor and died instantly.

Something akin to Prime's anxiety infected even Hone's optimism, for the noted bon vivant's pursuit of the good life mixed celebration of pleasure with a search for security. He and his peers fashioned one enclave after another dedicated to gregarious fun—men's clubs, opera houses, pleasure gardens; each was as much a sanctum as a playpen. They were places, as

were the elite's exclusive neighborhoods, where a newly flush bourgeoisie could experiment with an aristocratic lifestyle, safely segregated from the hoi polloi of an increasingly democratic city.

In June 1836 a little group met at the athenaeum and formed the Union Club, choosing as first president Samuel Jones, chief justice of the Superior Court of New York City. As Hone explained to his diary, the intention was to create an establishment of four hundred "of our most distinguished citizens." It would "be similar in its plan and regulations to the great clubs of London, which give a tone and character to the society of the London metropolis." The Union Club was an instant success. Merchants and lawyers from the city's established families flocked to it. Even James Gordon Bennett was asked to join, though he declined, publicly and noisily, in the pages of his *Herald*, on the grounds it refused to admit females ("Society without woman is a farce," he declared). Undeterred, the Union Club leased the Le Roy house at Broadway and Leonard, where local businessmen, out-of-town visitors, and bachelor men-about-town could entertain in exclusive and comfortable surroundings, which included the services of a chef from Paris and a cellar stocked with excellent wines.

Not all Knickerbocker nightlife was so relentlessly male. Soirees were all the rage in the boom era, as gentry couples gathered at the homes of their friends for late supper, music, and games. Hone regularly invited sixty or so to evenings featuring tableaux vivants. Costumed ladies and gentlemen arrayed themselves before elaborate backdrops as "Madonna" or "Lady Jane Grey" or "Highland Chief" or formed groups to depict a "Scene from Waverly" or "Cato's Death." Women also attended the round of elaborate parlor parties customarily triggered by society weddings, such as the 1834 union of Charles Augustus Heckscher with the daughter of John G. Coster, which dismayed even Hone with its costliness.

In 1833 the Knickerbockracy flirted with grand opera. Lorenzo Da Ponte, librettist of Mozart's *Don Giovanni*, had introduced the masterpiece to New York in the mid-1820s, arranging a staging of it thirty-nine years after its world premiere. (Da Ponte translated his libretto into English and sold copies in the lobby.) Opera had not proved a social success, however, which the dogged Da Ponte put down to the absence of a proper theater. He therefore convinced a group of patricians to subscribe \$150,000 and construct the Italian Opera House, the first building in the United States

designed exclusively for that purpose. But its multicolumned, Greek-white exterior and sumptuous, gas-lit interior drew but a few hundred regular attendees. The first season ran a deficit; the second was a terminal disaster. New York simply lacked the social and cultural structures—state subsidies, aristocratic patronage—that underlay Europe’s operatic system. Its burghers were prepared to consume culture as aristocrats did, but not to underwrite it as aristocrats were expected to do. Besides, the whole business still seemed a bit culturally rich for Knickerbocker blood. No matter how much they envied European elites their prestigious cultural emblems, Knickerbockers were not yet prepared to emulate them. The New York Opera Company was liquidated, its palace sold off.

Pleasure gardens were more the local style, and here too exclusiveness was key to success. After 1830 the upper classes deserted the *déclassé* Vauxhall and turned to William Niblo’s new concern, established in 1828 at the northeast corner of Broadway and Prince. Niblo’s Garden surpassed all others in elegance and respectability, its status sustained by high entrance fees, expensive food, and urbane entertainments. Its only competitor for posh patronage was Contoit’s New York Garden, across from the Park, a cozy and quiet resort for wealthy and well-bred ladies and unchaperoned genteel couples. Waiters in white jackets and aprons dispensed lemonade, pound cake, and vanilla, lemon, or strawberry ice cream of a Sunday afternoon, and from sundown to midnight it was illuminated by colored whale-oil lamps on stanchions and branches of trees.

Broadway, etching by Thomas Horner, 1836. This view, looking north from Canal Street, captures the fast pace of Manhattan's principal artery during the 1830s boom. Niblo's Garden can be glimpsed in the distance, on the corner of Broadway and Prince Street. (Eno Collection. Miriam and Ira D. Wallach Division of Art, Prints and Photographs. The New York Public Library. Astor, Lenox and Tilden Foundations)

From the pleasure gardens to the blooming new gentry preserves, from Vanderbilt's mansion to the rising village of Harlem, from one side of the harbor to the other, the sound of hammers and saws was everywhere as the rail and realty boom shifted into hyperdrive. But the feverish "good times," hailed so exuberantly by those who underwrote the construction and investment boom, were experienced quite differently by many other New Yorkers.

Filth, Fever, Water, Fire

The 1830s boom improved living conditions for many working people, notably the two-fifths of the city's artisans who worked in the building trades, erecting the thousand-plus structures going up each year. The street contractors, stonecutters, and yard owners who paved, curbed, and guttered the city's roadways, as well as many of the cartmen who hauled commodities over them, could aspire to the comfortable housing going up above Houston and below 14th Street. Some entrepreneurial contractors, especially those who invested in land, rocketed to the ranks of the wealthy.

But the majority of the working class saw their living standards deteriorate, partly because of boom-fostered inflation—especially the rapidly rising rents exacted by those the City Inspector (in 1835) called “mercenary landlords”—but primarily because constructing housing for poor people wasn't profitable. Some speculative developers did erect three-story brick structures, partition each floor into four rooms, and rent out each of six two-room “apartments” to one or more families. In 1833 industrialist James Allaire raised Manhattan's first “tenement” house on Water Street near his foundry: a four-story, sixty-foot-deep, barracks-style building for his workforce.

On the whole, however, speculative builders—especially those operating on thin credit margins—had little incentive to house the poor. Nor did established landlords have reason to replace their rundown, two-story, brick-fronted wooden houses with better structures. Given the tremendous housing shortage and most workers' continued need to live within walking distance of their jobsites, landlords harvested tremendous rents just by packing people into preexisting buildings. Indeed, the more they reduced maintenance and let their properties deteriorate, the more the city reduced their tax assessments, thus boosting their profits.

As ever more people crammed into ever more dilapidated quarters, the consequences of crowding became blatantly apparent—to both eye and nose. New York, it was widely agreed, was the filthiest urban center in the United States; Boston and Philadelphia gleamed by comparison. This

dubious distinction, ultimately rooted in the perverse dynamics of the housing market's response to immigration, was exacerbated by the city government's hands-off approach to the increasing production of garbage.

Since the turn of the century the Common Council had had ample authority from the state to oversee sanitary conditions, but the aldermen had made infrequent or incompetent use of their power. Municipal collecting remained lackadaisical at best. Great heaps of mud, garbage, and animal excrement piled up in the streets, forming a stinking mash labeled "Corporation Pudding" by a disgusted citizenry. To this base were added the noxious by-products of slaughterhouses, tanneries, dyers, distilleries, glue works, bone boilers, and stables, which had once been banished to the periphery but had now been overtaken by rapid expansion and were back in town. Roving herds of scavenging pigs made some inroads on the resulting accumulation, but what goes in must come out, and the porkers added their own contributions to the vile stew.

So did humans, albeit more indirectly. Excrement was still stored in privy-vaults—temporary holding bins placed beneath backyard outhouses. An 1823 city ordinance had required they be made of stone, be sunk at least five feet deep, and pass city inspection. In practice, brick or wood remained common, many were shallowly positioned, and exemptions were liberally granted. But no matter how well or ill they were made, the city's privies were not prepared for the torrent of shit that now descended on them, courtesy of a proliferating population. One (admittedly notorious) building between Christopher and Grove housed forty-one families, all of whom shared one indescribably disgusting privy, but the routine state of affairs was bad enough. When porous vaults were situated higher than adjoining basements, their contents oozed downward into the living quarters of invariably poorer neighbors. And when backed-up privies overflowed, which was often, or when storms produced local flooding, human effluvia was swept into the streets, where it mingled with the rest of the awful offal.

Privies were emptied periodically by "necessary tubmen"—one of the few jobs reserved exclusively for blacks. Hired by the city, they were mandated to carry their loads in closed carts, in dead of night or early morn, though this hardly mitigated their impact. In stifling summer months New Yorkers slept with their windows open, and the stench from passing "night carts" was powerful enough to wake the most somnolent. Also, to brace

themselves for their revolting labors, some tubmen fortified themselves with strong liquor, and their consequently raucous behavior generated additional complaints, particularly in working-class neighborhoods.

Their routes run, the tubmen either laid their burdens down in landfill areas, dumped them directly into the rivers (where they quickly coated the docks with slime), or delivered them to fertilizer dealers who mixed them with sawdust and spent charcoal, producing a light manure they sold to farmers. The one thing tubmen were *not* allowed to do with human waste was put it in the sewers.

Sewers were for water, not garbage of any description, and had been since drains were first built in Manhattan in 1676. The first sewers had been open trenches for carrying off storm water from low-lying areas and preventing hazardous accumulations. By 1800 such trenches were common; made of stone, brick, cement, or planks, they ran down the center or along the sides of streets. They were built wide enough to permit access for cleaning, but the breadth made them slow running, stagnant, and foul; to avoid decomposition by the sun, some were dug six feet deep, or below low-water mark. The covered-over sewer under Canal Street, in the absence of air traps, continued to reek on warm days, and the resulting decline in property values was long remembered.

In 1819 the Common Council had explicitly prohibited the use of sewers to carry off fecal matter. It further required installation of grates at the junction of common sewers with household drains, which allowed flood water in and kept solid wastes out. Dr. Hosack argued against this, proposing instead adoption of water closets connected to sewers that would then convey “every species of filth” to the rivers. He admitted, however, that the requisite flushing process would depend on New York’s obtaining a far more abundant source of water than currently available.

The city’s water was not only scarce, but brackish, and it was fast becoming deadly. In 1829 researchers from the Lyceum of Natural History estimated that in every twenty-four hours New Yorkers deposited over one hundred tons of excrement into the alluvium, from whence, accompanied by other soluble waste, it percolated down to the water table. In the 1830s, due to the increase in privies and to seepage from old graveyards, downtown wells were bringing up a tainted brew.

With pure water now a scarce commodity, it became allocated according to marketplace rules, by ability to pay. The poor continued to use city wells, including the ancient “tea water pump.” Artisans bought water, at a penny a gallon, from enterprising carters who carried hogsheads of “pure” country springwater around the city; it too was often polluted. Even the well-to-do had problems, if they relied on Aaron Burr’s old gambit, the Manhattan Company. The firm expanded its skimpy service at a sludge-like pace, just enough to keep its banking privileges from being revoked. As the city moved north, the Manhattan’s waterworks grew more remote from more people (the company didn’t operate above Grand Street). By the end of the War of 1812, its scant twenty-three miles of wooden pipes delivered perfunctory service to its select (and increasingly furious) clientele. Municipal authorities, albeit reluctant to take on one of the city’s leading bondholders, came around slowly to the notion that water was a public good, which should be publicly produced.

In 1821 Mayor Allen again proposed diverting the Bronx River into a municipal reservoir. In 1825 the state chartered a private company to bring water down from Westchester, but nothing much was done until 1829, when the city built its own reservoir. A huge cast-iron tank—forty-three feet in diameter, twenty feet high, with a capacity of 305,422 gallons—was set atop an octagonal stone tower twenty-seven feet high, at the corner of the Bowery and 13th Street. Water was carried from here south to the city by iron pipes, one running down Broadway to Canal, the other down the Bowery to Catherine.

Farther than this the city would not go. For the affluent and powerful, the absence of abundant fresh water remained an annoyance, not a crisis. But in the slums, the consequences of pollution, squalor, and crowding were about to become lethal.

CHOLERA

In 1832 the cholera roared into town. New Yorkers had seen it coming. They had read in their papers of its devastating march across Asia and the trade routes to Europe, reaching Poland, then France, then England. City authorities knew the plague might well ride the sea lanes to the Hudson, but did next to nothing with this foreknowledge.

New York's old Board of Health certainly had authority to act. Yet it had been lulled into quiescence in the ten years since the yellow fever epidemic of 1822. Its approach to disease prevention, moreover, now concentrated almost exclusively on quarantining ships from dangerous southern waters. Even there, it was under constant pressure not to render too hasty a diagnosis that would cut off the flow of trade and profit. The board, one critic noted caustically, was "more afraid of the merchants than of lying."

As spring turned to summer, the corporation's inactivity spurred men of medicine to demand action. The Medical Society, which represented two-thirds of the city's licensed physicians, urged immediate cleaning of streets, yards, and vacant lots, disinfection of privies and cesspools with quicklime, and establishment of a network of emergency hospitals. The city administration responded with an apathy partly rooted in the conviction—widely shared, but advanced most ardently by evangelical clergymen—that the plague, should it come, would pass over the virtuous parts of town and descend, like God's wrath, on its sin-infested quarters. Ministers told the pious that the path of righteousness was the road to health. Temperance activists plastered Manhattan's walls with notices like QUIT DRAM DRINKING IF YOU WOULD NOT HAVE THE CHOLERA. (There was nothing like the possibility of suffering and death for bringing sinners to their knees, wrote Lewis Tappan, with something approaching glee.)

Physicians' belief in "predisposing causes" also suggested the likeliest victims would be those who, through indulgence in vice, intemperance, and filthy living habits, had weakened and predisposed themselves to the disease. Science and religion thus sailed on parallel courses, with their essential interconnections drawn out most clearly by Sylvester Graham, who lectured that liquor, impure foods, and sexual dissipation undermined the body's ability to resist the cholera. Bon vivants ridiculed the Grahamites and advised citizens to fortify themselves with a hearty diet of meat, spices, and brandy.

On June 15 the Albany steamboat brought word that the cholera had forded the Atlantic, wreaking havoc in Quebec and Montreal. By June 18 it was reported at Ogdensburg. Mayor Walter Bowne proclaimed a severe quarantine. No ship was to approach closer than three hundred yards to the city, no land-based vehicle to come within a mile and a half. The *Courier and Enquirer* printed a cholera extra of ten thousand copies. Apothecaries

posted handbills advertising opium, camphor, and laudanum. On June 20 a large group of clergy and prominent laymen met at the American Bible Society and called for a day of fasting and prayer. They were seconded by the Common Council, but workingmen's advocate and freethinking editor George Henry Evans urged his readers to ignore the recommendation as an "insidious and dangerous encroachment" on the separation of church and state.

Late Monday night, June 26, an Irish immigrant named Fitzgerald came home violently ill; he recovered, only to have two of his children die after being struck by the identical agonizing stomach cramps. The city fathers pressured the Board of Health into declaring them the victims of nothing worse than diarrhea, a common summer complaint. But many physicians had seen and diagnosed Asiatic cholera, and beneath the blanket of official silence, word spread fast.

Methodists began prayer meetings each morning. June 29, the day of fasting and humiliation, was observed in scores of churches. The Medical Society, fed up with the dilatory Board of Health, stated publicly on July 2 that cholera had struck nine people and that only one had survived. John Pintard attacked this "impertinent interference" with the constituted authorities and asked if the doctors knew the disaster their announcement would wreak on the city's business.

On July 3 Leggett reported in the *Evening Post* that a great exodus had begun. For all the certainty about their moral and physiological invulnerability, the city's comfortable classes weren't about to stake their lives on it. The roads, Leggett noted, were lined with "well-filled stage coaches, livery coaches, private vehicles and equestrians, all panic struck, fleeing from the city, as we may suppose the inhabitants of Pompeii or Reggio fled from those devoted places, when the red lava showered down upon their houses." Oceans of pedestrians trudged outward with packs on backs. Steamboats bore refugees up the Hudson, among them Sam Ruggles and his family—he would correspond with his Gramercy Park contractor from Newburgh—generating substantial profits for Commodore Vanderbilt. Every farmhouse and country home within a thirty-mile radius was soon filled with lodgers. By the end of the first week in July, almost all who could afford to flee had fled; by the *Post's* estimate of August 6, that figure eventually reached 100,000, roughly half the population.

Of the other half, 3,513 died, most of them horribly, the lucky ones swiftly. The young editor Henry Dana Ward wrote his parents that some “are taken like lightning from the midst of their families and daily work.” One paper reported smugly that a prostitute who had been adorning herself before her glass at one was in a hearse by half past three.

Cartloads of coffins rumbled through the streets but couldn’t keep up with demand. One day Finney noticed five hearses drawn up at five different houses, all at the same time, all within sight of his door. In other neighborhoods, dead bodies lay unburied in the gutters. At the potters’ field, putrefying corpses lay in shallow pits, the prey of rats.

As the city reeled, some sought to calm hysteria among the better-off still in town or camped nearby, by noting that, as predicted, the plague was mainly scything the poor. John Pintard, observing that the plague was “almost exclusively confined to the lower classes of intemperate dissolute & filthy people huddled together like swine in their polluted habitations,” drew the terrible conclusion that the sooner this “scum of the city” was dispatched, the sooner the fever, deprived of fodder, would pass. Most New Yorkers who stayed in town, however, sprang into action in an effort to succor or rescue plague victims, sinners or no. The Board of Health assumed governmental functions. Streets, lots, cellars, and docks were cleaned of a decade’s accumulation of filth and strewn with lime. The clothes and bedding of the sick were taken out and burned, the fumes filling the air.

With thousands of wage-earners thrown out of work by the abrupt cessation of the city’s business, private citizens and churches established a Committee of the Benevolent. A July 16 meeting at the Merchants’ Exchange collected about seventeen hundred dollars for poor relief; thousands more dollars flowed from prominent merchants. The committee divided into fifteen subcommittees, one for each ward. These groups paid local residents for “cleansing and purifying their own dwellings,” established soup kitchens, and distributed food and clothing. This was hands-on charity. Gentlemen searched out “the abode of poverty, filth, and disease” and administered “personally to the wants of the wretched inmates” while “not omitting to warn the wicked of their evil ways, and point them to the Great Physician of the Soul.”

As reported in this daily tally of its victims, the cholera epidemic raged through the streets of the Five Points and other crowded downtown districts with particular severity. (© Museum of the City of New York)

For some, the poor swam into focus for the first time. At the height of the epidemic Mrs. P. Roosevelt noted that while ordinarily “no one notices

the poor” who are “frequently are to be found lying in the streets,” now they were being “picked up and taken to the hospitals.” “Only on occasions such as this,” she reflected, “is the true extent of the misery of the City known.”

Despite earnest solicitations by the Board of Health, the trustees of the privately run New York Hospital (who included Philip Hone and James DePeyster) flatly refused to accept cholera patients. The brunt of the onslaught therefore fell on Bellevue, the public institution. By July 7 it had already admitted 555, of whom 334 would die by August 8. Soon the place was swamped with the quick and dead alike. Patients lay on the floors crying for water. There were often forty bodies at once in the deadhouse, as the morgue was known. Before it was over, Bellevue would admit two thousand people, over a sixth of all victims, and tally six hundred deaths.

To supplement its work, the Board of Health established five cholera hospitals around the city—in the Hall of Records, a school, an old bank, an abandoned workshed, and a workshop at Corlear’s Hook (the arrival of the latter precipitating a mass exodus of workers from adjoining shipyards). Most poor people forcibly blocked efforts to remove their sick to these hospitals, regarding them as charnel houses run by incompetents. Doctors and city officials who insisted were attacked and brutally beaten.

Following precedents from earlier battles against yellow fever, the authorities set out to disperse the deadly concentrations in the slums. A Committee to Provide Suitable Accommodations for the Destitute Poor evacuated tenants, over the protests of anguished landlords. It moved them to buildings and shanties around town (including one at 10th Street and Avenue C for “colored people in health”), which they leased from other landlords, often at extortionate rents. It then arranged with the commissioners of the almshouse to supply food, medicines, and clothing. The Court of General Sessions discharged all prisoners convicted of misdemeanors and removed felons from the penitentiary and Bridewell to temporary shelter at Blackwell’s Island.

Many churches closed down, especially the wealthier ones whose flocks had fled (St. George’s shut for almost a month), but many clergy and religious stayed and did heroic work. The Catholic Church won highest praise, with the Sisters of Charity and Father Várela singled out. (It was said that Várela “lived in the hospitals.”) The Episcopal Mission Society

expanded its outdoor relief efforts. Evangelist Finney stayed at his post and caught the disease; he survived but was incapacitated for months.

By the third week in July, with the epidemic at its height, great swathes of the city were deathly silent, their streets deserted. Then it ended. Moving on almost as rapidly as it had blown in, the cholera continued its journey along the trade routes, through the Erie Canal towns of western New York, down the Ohio Canal to the Ohio and Mississippi rivers, tracing the pathways of the market economy with a finger of death.

In August the number of new cases began a steady decline. By the second half of the month, refugees began to trickle back. On August 29 medical authorities pronounced the city safe. Pintard was thrilled at the commercial resurrection. All was “life & bustle,” he rejoiced, with stores all open, sidewalks lined with bales and boxes, streets crowded with carts, and “clerks busy in making out Bills.” Beneath his notice, hundreds of beggars, vast numbers of them newly orphaned children, plied the streets. Benevolent ladies started up a Brooklyn Orphan Asylum to deal with the youthful survivors.

Stocktaking in the aftermath generally followed the lines of prior opinion. The Rev. Gardiner Spring saw in the pestilence “the hand of God,” with His sanitary and salutary purpose apparently having been “to drain off the filth and scum which contaminate and defile human society.” Sabbatarians declared the disease “owing to vices which a proper regard to the Sabbath would check more effectually than anything else.” Others blamed drink and slovenliness, including the governor of New York, who opined that “an infinitely wise and just God has seen fit to employ pestilence as one means of scourging the human race for their sins, and it seems to be an appropriate one for the sins of uncleanness and intemperance.”

The immigrant poor, who had fared worst, came in for the greatest opprobrium. The Board of Health reported that “the low Irish suffered the most, being exceedingly dirty in their habits, much addicted to intemperance and crowded together into the worst portions of the city.” They were poor—due, of course, to their own idleness and fondness for drink—and poverty was the “natural parent of disease.” Philip Hone brought a more succinctly brutal indictment: “They have brought the cholera this year, and they will always bring wretchedness and want.”

Radicals insisted cholera was the result not of divine intervention but of human injustice. “It may be heretical,” said George Henry Evans, “but we firmly believe that the cholera so far from being a scourge of the Almighty is a scourge which mankind have brought upon themselves by their own bad arrangements which produce poverty among many, while abundance is in existence for all.” Certainly there was a correlation between poverty and mortality. But poverty was not a moral failing, Evans wrote that August in the *Workingman’s Advocate*, it was “occasioned by unjust remuneration of labor.” He urged New Yorkers to impose a graduated income tax that would secure funds from the wealthy to make recurrence of the disease impossible. Other radicals called on the city to create a park at Corlear’s Hook for working people, akin to facilities it was helping develop at Washington, Gramercy, and Union Squares; this was vetoed as too costly and unlikely to generate significant new tax revenues.

WATER

On one thing, there was general agreement: New York City needed fresh, clean water. Even those who saw divine intervention at work didn’t contest physicians and sanitarians like William MacNeven and John Griscom who pointed to the polluted drinking supply and the poisonous vapors rising from the streets as major contributors to the plague.

In October 1832 the Common Council appropriated a thousand dollars for an inquiry into how to fetch water to New York. A December report concluded that the Croton River in upper Westchester County was the best source for an “inexhaustible” supply. In 1833, at the Common Council’s behest, the legislature authorized creation of the New York State Water Commission, headed by former mayor Stephen Allen, to supervise the city’s ongoing investigations. Surveyors declared the Croton feasible, but the cost of building an aqueduct was pegged at five million dollars, an alarming estimate that abruptly halted proceedings.

Opposition to the enormous expense might have postponed or even precluded the project, but for the existence of *another* proaqueduct lobby. This coalition of landowners, speculative developers, banks and insurance companies feared a different urban scourge—fire. Fire threatened to undermine the real estate boom of which they were primary beneficiaries. Fires had been decimating rich areas, not just poor ones, and with

increasing frequency in the thirties. The year 1834 had been a terrible one for property owners in the dry-goods district, the worst to date, and fire insurance companies had been hit with claims approaching a million dollars. Afflicted businessmen joined the campaign for new municipal initiatives, arguing that public costs were justified by private savings.

New York's fire prevention efforts to date had concentrated on extending the "fire limits," the part of the city where special building codes regulated the material and design of private and commercial structures. In 1812 the fire limits covered Manhattan south of Chambers Street. In 1815 they were extended to a line crossing the island just above Washington Square. In 1833 they jumped north to Second Street, and the following year, to 14th Street.

The city also abandoned reliance on church sextons to sound the alarm in case of fire, shifting to purpose-built bell towers, with the number of clangs indicating in which of five fire districts a blaze had been reported. Because these wooden stanchions too often fell prey to flames themselves, in April 1835 officials placed a twenty-four hour sentinel in the cupola of City Hall to clang a large, newly installed fire bell and hang a light in the direction of any perceived blaze.

To enhance the water-for-fire supply the Common Council had built a stopgap network of some forty cisterns, usually beside a church, to catch rainwater (at times convicts were set to filling them). In the event of a conflagration, fire engines were dragged to the nearest cistern, or if it was dry (as was often the case, given low levels of rainfall), firemen would link their machines in a chain to the nearest river. Neither method, however, could generate enough pressure to reach the upper levels of newer, taller buildings. The 13th Street Reservoir, once connected to hydrants, proved capable of lofting water to the roofs of most three-story houses, even without engines. The number of hydrants grew rapidly, accompanied by street boxes containing coiled hemp hoses, and some predicted that eventually there would be a hydrant on every block, making engines obsolete. However, one big tank could not handle simultaneous blazes nor drive water to the tops of the four-to-five-story warehouses going up downtown.

Sam Ruggles was deeply concerned—doubly so because he, like many large property owners, including Mayor Cornelius Lawrence, held

substantial shares in fire insurance companies. Insurance company directors, moreover, were heavily represented on the Common Council and on the New York State Water Commission, and together with the landed interests they formed a formidable lobby. Additional support came from the manufacturing and service sectors. Industrialists needed water. The New-York Gas-Light Company's well was drying up. Chemical works, sugar houses, brewhouses, distilleries, tanners, dyers, and soap makers: all faced dwindling liquid resources. Many businesses also relied on steam engines—there were sixty of them around town in 1834—and taverns, hotels, livery stables, and cake shops were all increasingly parched.

The water lobby was spurred on by another outbreak of cholera in 1834, which drove the number of reported deaths up 50 percent over that of 1833, in sharp and sorry contrast to Philadelphia's success in curtailing the disease, widely credited to a vigorous street-washing campaign. The *Sun* pronounced acquisition of an aqueduct to be a matter of "our city's honor and our city's pride." The penny presses' blanket rivals, including the *New York Commercial Advertiser*, joined them in calling for Croton water.

The conjoint pressure burst through remaining opposition, now chiefly from the Manhattan Company and from uptown property owners who feared weakened demand for their real estate if water came to the lower wards. In February 1835 the Common Council, citing both health and safety crises, finally wrested the water supply from Burr's progeny. The aldermen authorized a reinvestigation of the Croton project and its submission to a popular referendum. In preparation for the April 1835 vote, Ruggles and his colleagues paid the cost of printing pro-Croton tickets and of hiring poll watchers. When the results were in, 17,330 backed the idea, 5,963 opposed it. Support was highest in the elite First Ward, resistance strongest in the poorer districts, where many believed they would be priced out of access. By July 1835 preconstruction surveys were underway.

New York had taken decisive steps toward revolutionizing its water supply. But action came too late to prevent or contain the greatest fire in the city's entire history, one of the most destructive anywhere since London had been ravaged 169 years earlier.

FIRE

On the frigid evening of December 16, 1835, high winds pummeled downtown Manhattan. The temperature kept plunging; before the night was over, it would bottom out at seventeen degrees below zero. Just before nine P.M., as Watchman Hayes passed the corner of Exchange and Pearl streets, he smelled smoke and summoned other watchmen. They quickly discovered the source in a five-story warehouse, (Subsequent investigation “incontrovertibly established” that stove coals had ignited gas escaping from a broken line.) Forcing open the door, they found the interior all aflame. They watched helplessly as the inferno blew through the roof and jumped across the narrow and crooked streets, whipped by the wind. Within fifteen minutes, fully fifty of the area’s tightly packed buildings were ablaze.

The watchmen spread the alarm. The new City Hall sentinel clanged his bell. The jail next door took up the pealing. Church belfries chimed in.

The firemen who now crawled out of their beds, exhausted from fighting two bad fires the night before, were members of a shorthanded and demoralized department. The cholera epidemics had taken a heavy toll on their ranks, which in any event had not kept pace with the growth of population. The city had more than doubled in size since 1823, but the number of volunteers in 1835 stood at fifteen hundred, up only 285 over the same period. Chief Engineer James Gulick, the six-foot-two idol of the department, had cut down on slugfests between companies for control of hydrants, but feuds still festered. Some of the firemen’s troubles were of their own making. The manly volunteers stubbornly insisted on dragging their hand-operated engines to the scene, rather than permitting horses to be used, and had no tolerance whatever for the new steam fire engines London had deployed since 1829.

Even had they been in peak condition, the firemen faced an impossible task. By midnight the freezing winds had lashed the fire to an awesome and unmanageable ferocity; many thought the last days of Pompeii the only fitting comparison. The sky was lit so brightly the glow could be seen in Poughkeepsie, New Haven, and Philadelphia, where firemen turned out thinking their suburbs were aflame. Help came from near and far. Brooklyn sent company after company by ferry. A locomotive was rushed from Jersey City to Newark and returned with a train of flatcars loaded with fire engines. One company came all the way from Philadelphia.

As the flames roared down to Water Street—jumping “like flashes of lightning,” Philip Hone recalled later—arriving volunteers discovered that all the wells, cisterns, and hydrants were frozen solid. Gulick sent a dozen engines to the East River. It was frozen too. Hook-and-ladder men took their axes, ran to the ends of the piers, chopped holes in the ice, dragged an engine over, rigged up a series of machines along Coenties Slip and up Water Street—only to discover that water froze in the hose. By jumping up and down on the lines to break the ice clots and pouring alcohol into the engine pumps, they worked up some feeble streams, only to have the wind hammer the water back in their faces. Some, reduced to “the apathy of despair,” stood about helplessly, pouring brandy into their boots to keep their feet from freezing. Others turned to salvage operations, dragging tons of silks, satins, laces, and shawls out of warehouses. One phalanx piled a thirty-foot-high mountain of goods in the center of Hanover Square, only to watch it vanish in flames that vaulted out from the warehouse of Peter Remsen and Company. Later, there were bitter complaints about the predatory behavior of cartmen who charged exorbitant rates for moving possessions away from flames and refused to serve any but the wealthy.

aquatint by Nicolino Calyo, 1836. All that remained of the
Merchant's Exchange was the burned-out shell on the left. (©
Collection of The New-York Historical Society)

The fire headed north, seizing the marble and supposedly fireproof Merchants' Exchange. Heroic rescuers saved the trading records charting the speculative movements underway at the New York Stock & Exchange Board. But efforts to salvage the statue of Alexander Hamilton failed, and the would-be recovery men just escaped being buried in the collapse of the great sixty-foot cupola.

Around four A.M. the Tontine Coffee House went up. Foreman Mills, of Eagle Engine No. 13, realized that if the flames crossed Wall Street the upper half of the city would go. Two buildings were blown up to block the fire's passage by depriving it of fuel. The gambit worked and, with Mayor Lawrence's permission, was deployed more vigorously. Lawrence dispatched Charles King, editor of the *New York American*, to the Navy Yard for officers and sailors to do the demolitions and for the necessary gunpowder, but these supplies proved inadequate. While Mayor Lawrence and Colonel Hamilton raced from grocery to grocery scraping together portions of powder, and others ransacked the arsenal tearing open cartridges, King and a boatload of marines fought their way through the ice-obstructed river to the Red Hook Point powder house and ferried back enough twenty-five pound kegs to prevent the inferno from crossing Coenties Slip.

By morning the fire, though balked, raged uncontrollably. Its domain—from Maiden Lane to Coenties Slip, from William Street to the East River—was a thirteen-acre ocean of burning waves. As if alive and determined to break out, it forayed out into the river, from which boats had been hastily removed: gallons of blazing turpentine cascaded down the shore and rolled across the ice, setting a few vessels on fire. The conflagration took another night and day to burn itself out. Even then, thick black clouds spewed into the winter sky. It would not be completely quenched for two weeks.

Troops were brought in the first night to control looting. Sentinels stood guard for days amid ruins littered with charred merchandise: scorched silks, laces, prints, a "mountain of coffee" at the corner of Old Slip and South Street. The night of the fire, over ninety people were seized in the act of

carrying away property; the next day, two hundred more were arrested. Hone ranted to his diary about “the miserable wretches who prowled about the ruins, and became beastly drunk on the champagne and other wines and liquors with which the streets and wharves were lined.” Worse, they “seemed to exult in the misfortune, and such expressions were heard as ‘This will make the aristocracy haul in their horns!’”

In the aftermath, voracious demands for information spurred the new penny press to innovative heights. The *Sun* published a morning edition of twenty-three thousand and an “extra” of thirty thousand, for a record-shattering one-day circulation of fiftythree thousand. The *Herald*, in its December 21 issue, used illustrations for the first time: one two-column woodcut showed the remains of the Merchant’s Exchange; another mapped the area of destruction. Nathaniel Currier, a twenty-two-year-old lithographer from Massachusetts who had set up shop on Nassau Street the previous year, leapt to prominence with his prints of the fire; one of them inspired a scene in Harrington’s New Grand Moving Diorama, which opened at the American Museum in 1836.

In succeeding days, the press and others counted costs. Eighty buildings had burned on Front Street alone, 674 in all. Almost every structure south of Wall and east of Broad was to some degree a casualty. Estimates of losses in buildings and merchandise ranged from eighteen to twenty-six million dollars, more than three times the cost of the Erie Canal. Twenty-three of the city’s twenty-six fire insurance companies went bankrupt. Four thousand clerks were temporarily thrown out of work, along with thousands of cartmen and porters.

The most telling statistics, however, were these: only two people died in the fire—a function of the commercial district’s almost complete lack of residential housing. And within a year, five hundred new buildings had been built, the area entirely restored, indeed dramatically improved—testimony to the underlying strength of the mercantile economy and the tremendous momentum of the real estate boom.

PHOENIX

On December 19, less than two weeks after the fire, city officials, bankers, brokers, manufacturers, and merchants met to map the course of recovery.

A committee of 125 citizens—“all the best and most influential men in the city,” said Hone—turned to the tasks of thanking neighbors (Philadelphia, Brooklyn, Newark), providing emergency relief, investigating the fire, and applying for aid from the federal, state, and city governments.

Former treasury secretary Albert Gallatin and Mayor Lawrence went to Washington, where Lawrence argued that the national government should consider itself as “a large capitalist, with an overflowing treasury . . . whose duty it is to promote the welfare and prosperity of the people.” Congress kept its treasure to itself, though it did authorize the Treasury to remit duties already paid on imports newly destroyed and to extend the time importers had to pay duties on goods that survived.

Philip Hone’s delegation fared better in Albany. In January 1835 the state authorized the city to float a loan of up to six million dollars, a new precedent for disaster relief. Municipal authorities borrowed a million, then provided loans at 5 percent, increasing the credit available in the city. The Canal Commission doubled this line of credit by shifting another million of its funds to the city’s banks, thus allowing them to accommodate strapped customers and forestall mercantile failures.

In the meantime, business went on virtually uninterrupted. The stock exchange resumed trading after four days. Over six hundred dislodged firms set up operations in temporary accommodations nearby, driving rental prices in lower Manhattan up by 100 to 150 percent almost overnight. That instant boomlet triggered a far bigger one. The area’s businesses had long been trying to insert their nineteenth-century institutions into seventeenth-century streets by widening them one at a time, at great expense. The calamity, by demolishing the old structures, opened the way to transform crooked alleys into straight, broad, gas-lit thoroughfares. City officials announced plans to render “the entire surface of that section much cleaner, drier and more eligible for the transaction of business than it has heretofore been.”

This promise, coupled with the bid-up of prices by dislocated firms, sent land values soaring. Within a month, Hone noted, lots in the “burnt district” were selling “at most enormous prices, greater than they would have brought before the fire, when covered with valuable buildings.” One parcel of lots purchased earlier in the century for ninety-three thousand dollars now yielded \$765,000 at auction.

Postfire reconstruction started almost instantly, with Arthur Tappan first off the mark. At dawn the day after, he told his clerks: “We must rebuild immediately.” One went to fetch an architect; the rest fitted up temporary quarters. At noon *the Journal of Commerce* carried a notice announcing the store was open for business as usual, “by the blessings of God,” and by midafternoon workmen began clearing the still warm rubble.

In short order, the new-style high-rise, Greek Revival granite warehouses were going up everywhere, with iron shutters and independent foot-thick brick walls as fire protection. Even buildings still standing were transformed; masons knocked out the old brick and brownstone ground floors and hoisted stylish granite piers into place. Block after block took on a dignified new look. The Delmonicos, whose establishment had been wiped out, bought a triangular plot at the junction of Beaver, William, and South William (formerly Mill) streets. Work started in August 1836 on a three-and-a-half-story brick-and-brownstone structure with marble trim; in a nicely defiant touch, the marble porch pillars were brought from Pompeii. By December the carpets and gas fixtures were being fitted into the luxurious first- and second-story saloons—of an “appearance far surpassing anything of the kind in the city”—and the third floor had facilities for private dining, evoking Parisian splendor, as did the immense wine vaults for sixteen thousand bottles.

Grandest of all was the new Merchants’ Exchange. Within a week of the fire, the Merchants’ Exchange Company solicited plans, choosing an aggressive Greek Revival design by Isaiah Rogers, with a twelve-columned Corinthian colonnade. A million dollars in subscriptions was raised by February 1836. By April construction was underway on the site of its predecessor, expanded to cover an entire block. Built of Massachusetts granite—not a sliver of wood was used in constructing the floor—it featured an enormous central hall surmounted by a vast saucer dome eighty feet in diameter. When it opened for business five years later, it would include offices for insurance companies, bankers, brokers, the Chamber of Commerce, and, later, the New York Stock and Exchange Board, as well as a reading room stocked with papers from every state in the union and countries overseas, together with a foreign letter office. It was frequently compared to the Paris Bourse.

All along Wall Street, banks and insurance companies began demolishing their former residences—those red brick facades, fanlight doorways, and dormer windows that now seemed so old fashioned—and erecting stone-front porticoed Doric temples. Within a few years, the street boasted perhaps the greatest concentration of classical columns built since the fall of Rome. By the anniversary of the catastrophe, Hone observed, “fine and commodious stores, much improved in their appearance and construction” nearly covered the “burnt district.”

Ramifications rippled outward. The fire expelled much of the dry-goods trade from Pearl Street, making it more strictly a financial center, and many firms shifted west toward the fashionable quarter around lower Broadway. Retail shops—jewelers, watchmakers, bookstores, merchant tailors, hatters, confectioners, carpet and fancy drygoods stores—spread northward up the thoroughfare. Broadway became a business district up to and beyond the City Hall Park area, where numerous publishers, law firms, and newspapers now clustered.

This development touched off a pell-mell flight of the wealthy. Private dwellings were turned into boardinghouses, converted into offices, or torn down to make way for warehouses and shops. A writer in the *New-York Mirror* in April 1836 reported: “It is said that in one year, there will be scarcely a private residence or boarding house below Wall Street.” He added, “Ladies will, hereafter, scarcely extend their promenades further down than the Park; and what will become of the Battery, heaven only knows.” Some suggested the corporation sell it off to private owners for storehouses and dockyards, though this touched off a preservationist uproar that saved the park for the present.

Hone himself was swept away in March 1836 when he sold his house at 235 Broadway, across from City Hall, to the owner of the adjacent American Hotel, who wanted an annex. Hone received sixty thousand dollars for a building he had purchased fifteen years earlier for twenty-five thousand dollars. “I have turned myself out of doors,” he wrote wryly, “but \$60,000 is a great deal of money.”

If the new Merchants’ Exchange was the symbol of the Wall Street financial district, then Astor House, a block from Hone’s former residence and just across from the Park Theater, became the emblem of the expanding commercial sector. Astor had long been attuned to the fortune awaiting

those who cultivated the city's entertainment and hostelry industries. In his prior ventures as landlord-impresario, including the Park Theater, Vauxhall Gardens, and the City Hotel, Astor had let others take the lead, then moved in to absorb a going concern. Now he decided to be an innovator. Even before the great fire accelerated downtown development, Astor had grasped that the area around City Hall, having been on the town's periphery for two hundred years, was emerging as New York's new civic and commercial center, with its park and churches, theaters and newspapers. By the mid-1830s, moreover, there was an enormous flow of tourists and visiting businessmen—over seventy thousand annually (nearly half the city's population of two hundred thousand). Astor would capitalize on this traffic with a mammoth luxury hotel to rival Boston's Tremont House.

When it opened in 1836 many thought the Greek Revival structure the “grandest mass” in town—not beautiful, but impressive. Five stories of Quincy granite were arranged around a central courtyard. Its 309 rooms at times housed up to eight hundred guests. Each floor offered bathing and toilet facilities—a real novelty, something even the finest mansions and elegant boardinghouses usually lacked. Astor House also featured gas lighting provided by its own plant, as well as a table d'hôte eatery at which guests and city merchants could choose from among oyster pie, round of beef, roast wild duck—in all, thirty meat and fish dishes each day. Soon its main hallway was bustling with guests, the street in front was piled with luggage, and a New York institution had launched its long career.

FEVERED FINANCE

The city's economy did more than simply rebound from the triple blows of cholera, Bank War, and fire; it shifted into overdrive. Peter Cooper had hoped the great blaze—which in his opinion had been a “flagrant providential warning”—would curb the frenzied speculation on Wall Street, but in 1836 the volume of trading on the NYS&EB soared upward. Land transactions in the city set astonishing records. The value of Manhattan real estate, registered at \$143 million in 1835, mounted to \$233 million within twelve months. Most of this also represented speculation, Governor Marcy warned in 1836, with plots and buildings being purchased “not for the purpose of being occupied by the buyers, but to be again put in the market, and sold at still higher prices.”

The surge was stoked by a tremendous expansion in the availability of credit. Money was cheap and plentiful, inspiring diligent entrepreneurs and speculative manipulators alike to expand their operations with borrowed funds. State banks, freed from Biddle's fierce scrutiny, pyramided their modest specie bases into mountains of paper credit, and across the country legislatures chartered over two hundred new banks in three years, pushing the total to over six hundred. In New York State the Bank Commission fought to slow the increase, and the legislature refused all new charter proposals in 1835. But 1836 brought a torrent of new banks, many of which quickly issued notes far beyond any reasonable ratio to their holdings of specie. The nation's specie supply was itself rising, in the form of a fortuitous glut of silver, occasioned by a rising Mexican output of the precious metal and a declining demand for it in Britain and China. Banks bulging with bullion multiplied their treasure by pumping out more paper banknotes. In addition, by 1836 the tariff and land sale revenues pouring in to the federal government had extinguished the national debt. The treasury, awash in a two-million-dollar surplus, was obliged under the new rules to turn it over to the pet banks, some of which, engorged with cash, went on a reckless lending spree. All told, the country's money supply, which had jumped from \$144 million in 1831 to \$172 million in 1834, climbed to \$276 million in 1836.

This touched off an inflationary firestorm. The cost of living rose rapidly through 1834 and 1835, then shot up 66 percent in the first two months of 1836. Philip Hone noted in his diary: "Living in New York is exorbitantly dear, and it falls pretty hard upon persons like me, who live upon their income, and harder still upon that large and respectable class consisting of the officers and clerks of public institutions, whose support is derived from fixed salaries." Beneath the range of his troubled gaze lay the great mass of the population, upon whom the great upward leap in the cost of living wreaked far greater havoc than it did on any of the victims he'd mentioned.

Indeed the disparate ways New Yorkers experienced the inflationary spiral was characteristic of their differential experience of the boom years as a whole. For some it meant fabulous profits and pursuit of pleasure; for others, degraded work, higher prices and rents, poorer living conditions, a rigidifying class structure, and a new determination to organize in defense of a crumbling way of life.

36

The Panic of 1837

On Sunday, June 5, 1836, handbills went up around the town. Headlined THE RICH AGAINST THE POOR! they denounced Judge Ogden Edwards, who had just acquitted Richard Robinson of the murder of Helen Jewitt, as “the tool of the Aristocracy, against the People!” A week later, a gigantic evening rally drew nearly thirty thousand workingmen—roughly one-fifth of New York’s adult male population—to City Hall Park, where they berated the judge again, hanging and burning his effigy for good measure. This time, however, the huge throng was not protesting Edwards’s role in acquitting Helen’s killer but rather his sentencing of twenty journeyman tailors who had been found guilty of going on strike.

The tailors’ trial capped an employers’ effort to crush New York’s fledgling labor union movement, which had been launched three years earlier by workingmen caught in the boom era’s downdraft. In 1833 inflation had sent the cost of food, fuel, and rent climbing. To restore their real wages and reverse their declining control over the workplace, skilled journeymen set out to make Manhattan a union town.

In the spring of 1833 the Journeymen House Carpenters struck for higher wages. Other sweated carpenters joined them, multiplying the union’s ranks fivefold. The Typographical Association of journeyman printers rallied behind the carpenters’ walkout. Journeyman tailors offered support. So did stonecutters and painters.

With fraternal backing, the carpenters won. Almost immediately the allies formalized their ad hoc mutual assistance compact. Representatives of nine crafts formed the General Trades Union of the City of New York (GTU), an organization, the carpenters declared, that would stand as “one great phalanx against the common enemy of workingmen, which is *overgrown capital* supported by AVARICE.”

The GTU made clear, in the preamble to its constitution, that an irreparable breach had opened up between masters and journeymen—former partners in the Trades—to the latter’s detriment. “We the JOURNEYMAN ARTISANS and MECHANICS of the City of New York,”

the document proclaimed, believe that “as the line of distinction between the employer and employed is widened, the condition of the latter inevitably verges toward a state of vassalage while that of the former as certainly approximates towards supremacy.”

Unionists denied their labor was a mere commodity, something to be regulated by the marketplace. Wage-work could be squared with a just society only if journeymen were paid the full value of their labor, that value to be determined by the workers themselves. Unionists were not mindlessly opposed to mechanization, chairmaker John Commerford stressed, but they wanted assurances that any worker facing replacement by a new machine would be secured “from want, until he could obtain a situation at least as good as that from which he was about to be driven.”

The General Trades Union swiftly established a vivid presence in the city. On Evacuation Day (November 25) of 1833—the “anniversary of our entire liberation *from foreign* thralldom”—the GTU’s now twenty-one member organizations underscored their separation from former craft masters by parading, four-thousand strong, along the Bowery and Broadway. For the first time in New York City’s history, organized labor was independently on the march.

The new movement sprouted a panoply of union songs, banners, and insignias. It launched a newspaper—the *Union*—to complement George Henry Evans’s popular *Working Man’s Advocate*, his new prolabor organ the *Man* (1834), and the editorial support offered by the *Sun* and *Transcript* penny papers. In 1834, moreover, New York workers formed (and dominated) the National Trades Union (NTU), a clearinghouse for reports on the state of labor around the country. It too started up its own paper, the *National Laborer*.

Though dominated by native-born journeymen, the GTU reached out to newly naturalized immigrants in the city. To discourage ethnic division in its ranks, the organization prohibited discussion of religion and eschewed organized politics.

Not everyone was welcome in New York’s house of labor, however. Blacks and women were left outside; indeed the GTU and NTU opposed female labor altogether. Having seen employers use women operatives as wedges to transform the textile, shoemaking, and tailoring trades, the men

insisted that women's place was in the home, supported by adequately waged fathers or husbands. The tailoresses once again made bold to disagree, with one seamstress demanding: "If it is unfashionable for the men to bear the oppression in silence, why should it not also become unfashionable with the women?" The sewing women attempted once more to organize on their own, but faced with male unionists' stubborn patriarchy, their efforts proved evanescent.

GTU-backed strikes mounted steadily between 1833 and 1835. Many skilled journeymen, day laborers, sailors, and canal workers won higher wages and better conditions. New York workers also pushed successfully for a ten-hour day. Skilled shipwrights, then-labor irreplaceable in the booming riverfront yards, won the right to hang their own "mechanics bell" at the corner of Stanton and Goerck streets, on a twentyfive-foot-high tower next to Isaac Webb's yard. Signaling the end of each ten-hour day, the bell overrode the customary "dark to dark" schedule, and President Jackson ordered the Navy Yard to adopt the new standard.

One of the GTU's most vehement demands was the abolition of prison labor, which undercut wage levels and forced laborers to compete with "felons and scum." Stonecutters and masons were incensed that New York building contractors could purchase marble cut and hewn at Sing Sing. The Manufacturers of Marble Mantels and 325 journeyman marblecutters joined in petitioning the state legislature to outlaw the practice. The GTU also condemned the "State Prison Monopoly." All to no avail.

When the newly established New York University contracted in January 1833 to purchase prisoner marble for their University Building going up on the east side of Washington Square, workers resorted to direct action. On the evening of October 24, 1833, roughly 150 men marched to the Broadway and 4th Street marble works of Elisha Bloomer, a contractor notorious for his use of prison products. Hurling rocks and brickbats, the crowd smashed Bloomer's doors and windows and broke some marble mantels. The mayor called out the Twenty-seventh Regiment, which dispersed the protestors, then camped out on Washington Square for four days and nights to forestall further outbursts. Continued union pressure did wring a weak ban on prison labor from the state legislature, but the law had little effect, and NYU continued to use Sing Sing stone.

In 1836 unions expanded their organizing drive in a desperate attempt to keep up with rocketing inflation. “The *nominal* value of every article of necessity has been greatly increased,” union leader Seth Luther told a Brooklyn labor audience, and working people were being “compelled to pay enormous rents or to be turned out of doors.” Yet despite climbing costs, Luther noted, the “price of labor has not received a proportionate advance.” Tailors, stonecutters, shoemakers, and cabinetmakers launched industrial actions—ten major turnouts in the skilled trades alone. Coal heavers and other unskilled laborers walked out as well. Even manure carters struck for an increase in pay from the Common Council.

As usual, the most convulsive strikes came on the waterfront. In February stevedores and riggers marched from ship to ship, pulling hundreds off the job, effectively shutting the port. Police efforts to disperse the strikers landed one watchman in the hospital with a fractured skull. The strike spread. One body of stevedores hived off from the docks and marched through the streets of the commercial district. Hundreds of laborers cleaning up postfire debris downed tools and joined them. High Constable Hays coaxed the fire workers back to their job, but the ongoing disruption of commerce led the mayor to call out the Twenty-seventh Regiment yet again. The troops paraded at City Hall Park in a show of force daunting enough to drive the stevedores back to work. For the first time, New York City had used the military to break a strike.

Despite this success, employers were thoroughly alarmed. In 1833 there had been virtually no labor movement. Now, in 1836, two-thirds of New York’s workingmen were enrolled in fifty-two confederated unions. Businessmen counterattacked by organizing pugnacious employer-only trade associations, like the Society of Master Tailors, which attacked unions for subverting the civic weal. Labor, the businessmen declared, *was* just like any other commodity, and its value should be set by the free market. Labor unions might in the short term interfere with the market’s “natural” workings and extort higher wages from businessmen, but this would only drive up prices, thus hurting consumers while making New York products uncompetitive. In the end strikers would only bankrupt their employers and liquidate their own jobs.

Workers, employers argued further, should pursue individual not collective improvement. An industrious and virtuous workman, especially if

he stayed sober, would surely rise in society. Workingmen should quit unions, practice self-discipline, and join groups like the New-York City Temperance Society, which under evangelical merchant Robert Hartley's leadership explicitly opposed trade unions.

Employers' groups adopted tougher tactics too. Early in 1836 the Society of Master Tailors' member-bosses cut wages and announced they would not employ union men. Journeyman tailors responded by launching a GTU-supported strike and by establishing cooperative workshops as an alternative to the wage system. February's use of troops to end the dockworkers' strike only redoubled the tailors' militancy. Battles broke out among strikers, strikebreakers, and policemen. Other unions "turned out" too, so many that Bennett's anti-union *Herald* perceived "a general movement over the city."

The master tailors now turned to the courts, encouraged by a recent upstate ruling from Chief Justice Savage of the state supreme court. Declaring trade unions "monopolies of the most odious kind and injurious to trade," Savage found that "a man has the right to work as he pleases" and that existing law forbade strikes. In late March the boss tailors, citing this precedent, won a conspiracy indictment against twenty strikers. In response, the unions took to the streets. Several thousand workers marched up Broadway with bands and banners, proclaiming their right to regulate their own wages and denouncing banks, politicians, and corporations. "Are we not on the eve of another revolution," the *Herald* wondered, such "as we witnessed among the mechanics in 1829?"

The tailors' trial began in May, Judge Ogden Edwards presiding. Edwards, a Whig and soon-to-be-nativist, had no love for labor unions. His charge to the jury followed Savage closely in stigmatizing them as illegal combinations. This enraged the *Union*. In a June 1 tirade, the labor paper warned that "if an American judge will tell an American jury that the barriers which the poor have thrown up to protect the growing avarice of the rich are unlawful, then are the mechanics justified the same as our own fore Father's [*sic*] were in the days of the revolution, in ARMING FOR SELF-DEFENSE!!" Handbills were plastered throughout the city declaiming that "*the Freemen of the North are now on a level with the slaves of the South !*, with no other privileges than laboring that drones may fatten on your life-

blood!” Blazoned with a coffin, it summoned freemen to City Hall, where “the Liberty of the Workingmen” was to be interred by Judge Edwards.

On June 6 Edwards delivered the tailors’ sentence, levied heavy fines totaling fourteen hundred dollars, and lectured the courtroom that “in this favoured land of law and liberty, the road to advancement is open to all, and the journeymen may by their skill and industry, and moral worth, soon become flourishing master mechanics.” Labor unions, Edwards added, were a foreign idea, “mainly upheld by foreigners.”

“DOWN WITH MONOPOLIES!”

Over the next week, union men collected money in taverns and shops to pay the men’s fines, while arranging for the giant rally at City Hall Park on June 13. Though the assembled multitude cheered the incineration of Edwards’s effigy, they opted in the end for a less incendiary strategy, agreeing with orators that the outlawing of strikes called for a counteroffensive at the ballot box. Since the two major parties, speakers argued, were as one in their efforts to “crush the laboring men,” the gathering resolved to form a “separate and distinct party, around which the laboring classes and their friends can rally with confidence.”
